NEVER SAY DIE
editorial by Wayne Green

WELL, 1984 IS HERE

It hasn't turned out much like Orwell's book, thankfully. Actually, these should be great days for hams. After all, here we are right in the early stages of the electronic revolution—something amateur radio helped in a great measure to get started. The revolution has taken some twists, so only those hams with a flexible attitude have managed to keep up with what is going on.

Indeed, I find that I have to spend a good deal of my time just trying to keep up with the onrush of technology. This means talking with people, reading several hundred technical magazines a month as well as a few books, and getting to shows—a lot of shows. They are worthwhile for me because I can see the gear, ask questions, and learn more in a short time.

Okay, you may want to know what the bottom line is of all this activity on my part. I'll tell you. . .take it easy. First, as far as amateur radio goes, you may suspect that all is not well. This is heyday time for the gloom and doomers, with ARRL membership dropping like a brick, more and more dealers going bankrupt, more of our American manufacturers becoming invisible, and the sunspots diminishing.

I prefer to look on the bright side. Here we have a new OSCAR up there begging for use. We have several new modes of communication begging for activity such as packet radio, crossband repeaters, on-the-air bulletin boards—stuff like that. With low-cost computers and chips, experimenters have never had it so good. We can build circuits in an evening that would have filled several relay racks a few years ago—so let's have at it. You build 'em and I'll publish 'em—okay?

You might like to know that we're seeing some progress with some of my other ideas. I'd like to prove what can be done in high-powered education—turning out high-tech kids with a strong business education. If you think about it, you'll realize that this would be a way to give them a super start in a career. And there is some progress with my idea for getting ham clubs started in every high school in the country. Despite the obvious need for technical people, I've run into more resistance with this idea than I expected.

Now, in case you're interested in an overview of tech-

QSL OF THE MONTH

This month's flashy winner, submitted by Jim Houston ZS6BUR, surely brightens up ham-shack walls around the world.

To enter your QSL card in *73*'s QSL of the Month contest, put it in an envelope with your choice of a book from *73*'s Radio Bookshop and mail it to *73*, Pine Street, Peterborough NH 03458, Attn: QSL of the Month. Entries not in envelopes or without a book choice will not be eligible.

Breakthrough in Boston: The Birth of Crosslinking

W1UKZ built this box. It's small and it works. The question is whether you're ready for it.

David P. Allen W1UKZ
19 Damon Road
Scituate MA 02066

A sage once said that a new idea is simply a rearrangement of old facts. This is certainly the case with crosslinking: All of the ingredients are well known and no new technology is involved. But the effect of putting them all together in a new operating mode has proven to be extraordinarily exciting to all who have participated. Let me explain just what crosslinking is.

Fig. 1 shows diagrammatically how crosslinking works. The basic idea is for an individual amateur to configure his low-band and two-meter rigs so that three operating conditions can be maintained:

1) When the amateur keys his microphone, he transmits simultaneously on *both* a low-band frequency and a two-meter frequency. One microphone keys both rigs.

2) When the amateur *listens*, he pushes a button which feeds the audio output of whichever band he is momentarily listening to into the microphone input of the other transmitter and keys that transmitter.

3) When listening to a station on the other band, he pushes a button and reverses that process. He may interrupt this back-and-forth flow at any time simply by keying his microphone.

If this all sounds like a manually-operated repeater, you are *almost* right; however, there are some very important differences. A little background will help to explain how this new operating technique emerged.

Background

For the past five years, I have had the pleasure of conducting the East Coast Apple Net on forty meters. Every Saturday morning we gather at 9 am eastern time on 7260 kHz to chat about computers in general and Apple computers in particular. This has proven to be a very popluar net since so many hams are also computer enthusiasts. Because of the general popularity of computers, I have known for a long time that we have a "lurking," voiceless audience of people who have an abiding computer interest but no amateur license. There are also many licensed amateurs who do not have low-band privileges.

"Why not," thought I, "conduct the net on *both* 40

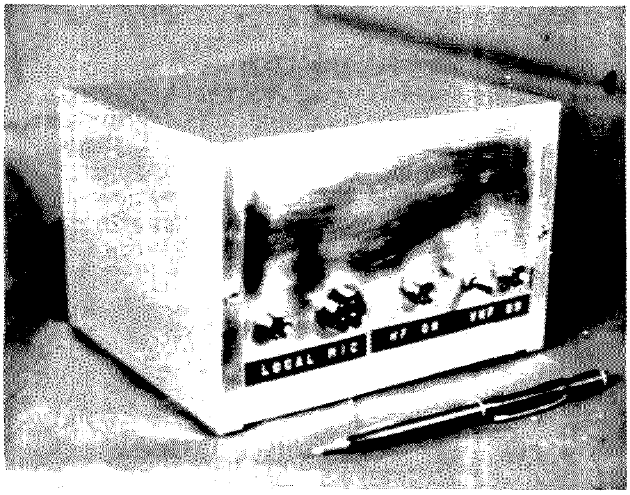

Photo A. Front view of the logic box.

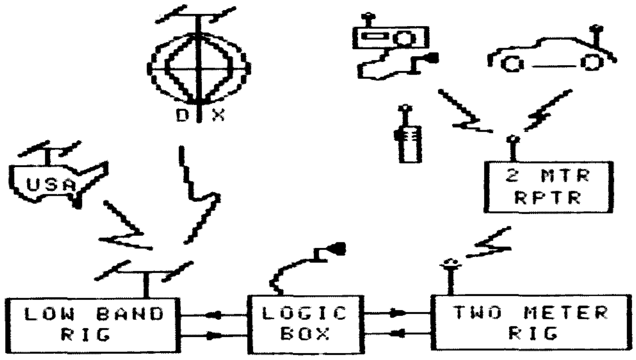

Fig. 1. Diagram of how crosslinking works.

meters and 2 meters and thereby enable a wider participation in the net?" There did not seem to be any technical reason standing in the way of this evolution. Crossband operating is as old as amateur radio itself, and I had all the hardware (almost) necessary to try it. Just one experiment with holding microphone to loudspeaker showed two things: (1) It had great possibilities, and (2) a missing black box was needed to make it work properly.

That was the generating force for the "logic box," shown in Fig. 2. More about that later. There was another consideration which might offer a much greater handicap to carrying out this idea. It's called "FCC rules and regulations." Amateur Extra class licensees would have no problem with any conceivable permutation of operating frequencies, but how about lower-class licensees? If it were illegal for a Technician to join the net on two meters and have his voice heard on forty meters, then I was just spinning my wheels with further conjecture on this idea. It obviously was time to go to the horse's mouth.

Conversation with the administrators of amateur operations at the FCC in Washington completely dissolved any apprehensions I had about the proposed operating procedure. All amateur participants would be licensed for the frequencies upon which they were transmitting and over which they had control. All conversation relayed by my facilities was clearly covered in the definition of what I was licensed to transmit. I was not proposing a repeater-type operation, which would be both illegal on the low bands and which would allow lower-grade licensees to control emissions on frequencies for which they were not licensed. Surprise, surprise! No bureacratic ground-breaking was involved! I was, in fact, sent on my way with an encouraging endorsement for trying out a new operating technique. Who says the bureaucracy is never administered with good judgment and understanding!

So, the decks were cleared for action. But there was still the problem of how to oversee the net and to control the flow of transmissions. The three points defined above seemed to describe all the elements of the technique that I was looking for. I wanted to be able to switch the audio to flow in either direction from one band to another at any time. I felt that a little momentary toggle switch would allow me to perform that function best. And I wanted to be able to break into the transmission pattern at any time with my voice, so my microphone switch should override whatever mode was going on. One other corollary mode comes about from pushing the mike button. When I finish talking, *both* rigs default to the listening mode so that I can monitor both bands at any time.

Hardware

The circuit necessary to control both rigs turned out to be a little more complicated than I had thought. Fig. 2 shows the result, which I have called the logic box. Three relays are involved, one for each band control plus a third relay for my microphone keying and to provide latching for the other two relays. Since the logic of the operating called for a momentary switch closure to *open* rather than close the ground circuit of the latched-up relays (a logic negative), I inserted a simple transistor switch to invert the mechanical switch logic. Thus, either latched-up relay RY1 or RY2 can be dropped by operating the transistor switch through SX1 or by removing the latching voltage by closing the push-to-talk switch on the microphone and dropping RY3.

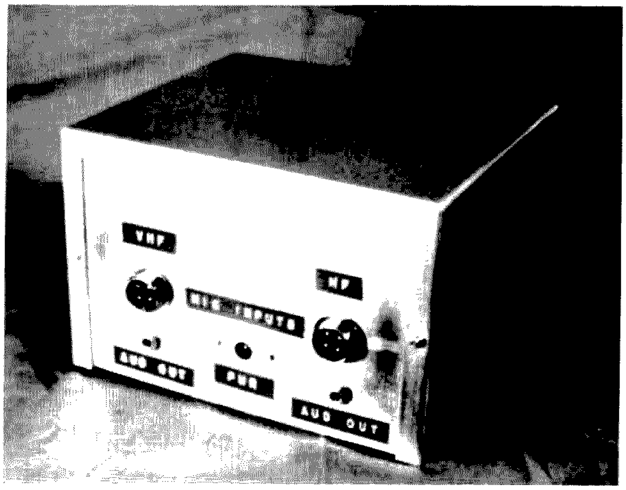

Photo B. Rear view of the logic box.

The LEDs were put in to remind me of my last official act and clearly remind me of what the current transmission flow was. Relays were used because the widespread variation of keying methods for the current crop of transceivers is enormous. Varying polarities and voltages are made totally irrelevant by the good old relay. I can use the logic box with any transceiver I can lay my hands on.

Photos A and B show the front and back of the logic box. The inside is a typical prototype mess (so I won't let you in), but it all works exactly as planned. I decided to use the "standard" four-pin microphone connector used by so many transceiver manufacturers and readily available at Radio Shack. The speaker audio is bridged from the transceiver at the auxiliary audio-output jack and fed into the logic box through the mini-jack connector. Power for the relays is provided by any 9-12-volt calculator-type power supply that can furnish on the order of 200 milliamperes.

I was concerned about the varying levels of audio among the microphone and loudspeaker outputs. This turned out to be a reasonable concern. My first attempt was just to "brute-force" the audio through and see what happened. It worked, but not well. Here's what I had to do.

No ordinary microphone seems to be up to the task of feeding two rigs at once. The main problem is the widely varying input impedances of various transceivers plus the generally low output of most microphones. The solution for me was an amplified Astatic D-104 microphone. The power amplifier in this microphone turns the mike signal into a relatively

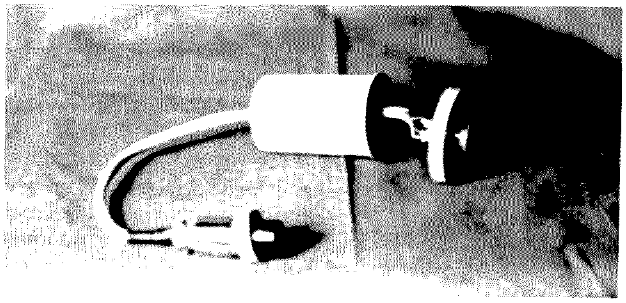

Photo C. The mini-jack connector.

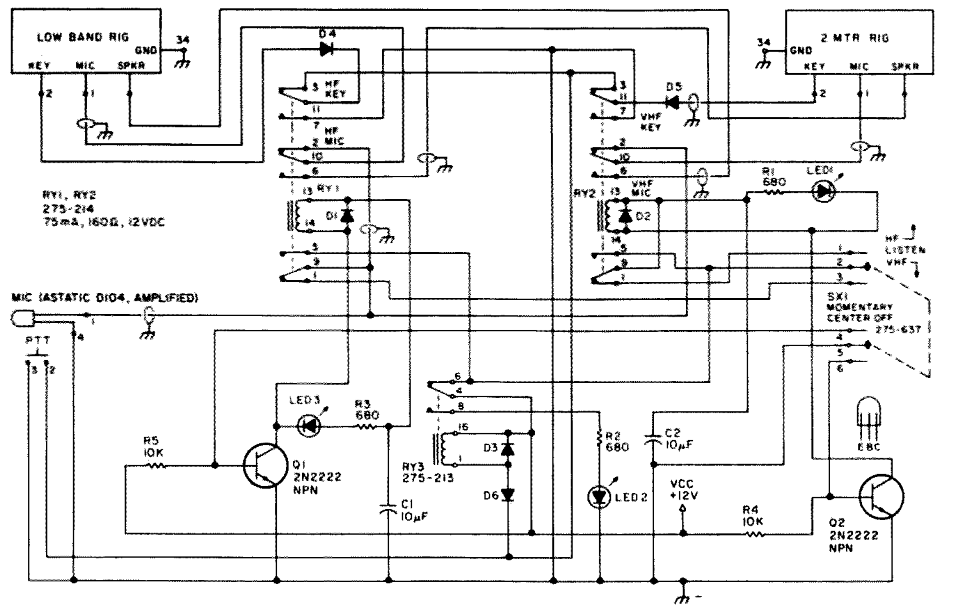

Fig. 2. Schematic of the W1UKZ logic box.

low-impedance output with some power behind it. Since the impedance of the microphone amplifier is lower than *either* transceiver mike-input impedance, there is plenty of audio available for each. Most two-meter transceivers have very efficient agc circuits in their mike-input circuits so I did not have to monitor that signal input. The low-band rig I am using (an Atlas 210X) gives me meter monitoring of the audio input and a gain control to manually adjust it.

Experience proved that the audio levels needed just a little more balancing. I wanted to be able to set the loudspeaker levels for each rig for comfortable listening and to have that be about right for the mike inputs. In my case, this meant padding down the audio from the transceivers rather heavily. I cobbled up some loss-pad cables, consisting of my standard four-pin microphone connectors and mounting the male end, normally living as a chassis-mount configuration, on the plastic cap of a discarded 35mm film container. (See Photo C.) Inside the container is a 560k-Ohm resistor in series with the hot audio lead, providing the necessary padding. Holes for the cable and connector take about ten seconds to make with a Princess soldering iron! Of course, I could easily have inserted the padding resistors inside the logic box, but this would have limited the universal nature of coupling the box to my rig configuration. For me, putting the pads in their own junction cables was best.

One other hardware consideration doesn't appear on the diagram. My next box will have a simple switch to disable the keying lead to either rig. This will make it unnecessary to disconnect the 2-meter input when I want to key only the low-band rig. Since I am using SSB on low bands, switching off the signal to the low-band rig is as simple as turning down the mike gain control. That facility is not available on two-meter transceivers.

One other hardware consideration should be mentioned. I discovered that almost *all* commercially-available two-meter transceivers have an unpublished duty-cycle specification. In my case, with the Kenwood TR-7800, it is three minutes of transmitting followed by one minute of listening. To transgress on that specification is to run your rig *very hot*—hot enough to do damage to the final transistor stage. This is true even at low-power options. In crosslink operations, transmissions longer than three minutes are commonplace, so a fan was in order. A cooling fan directed at the heat sink of the two-meter rig totally solved this problem. All those RTTY enthusiasts should note this potential problem since two-meter RTTY operating will certainly run into the same condition.

Operating Experience

So, how does it work? On the net operations it was an instant success. The net immediately acquired a handful of stations not previously heard from. In addition, many comments from other hams who, although not inclined to join the net by announcing their presence, found it very convenient to be able to go about their Saturday morning chores while carrying around a handie-talkie to monitor the proceedings of the net. Of course if they were so inclined, they could break in at any point to make their comments heard.

The real excitement for this operating mode has come from an unexpected direction. Since I had the capability, I decided to explore the advantage of crosslinking for less formal purposes than net operation. Instant success!

The procedure used has been to find an under-used repeater and call "CQ DX." Of course, this conventional invitation goes out over both the low-band and two-meter frequencies. Some puzzlement is expressed by two-meter listeners who hear "CQ DX 20" and suspect the contents of my coffee cup. An understanding quickly ensues, however, and before you know it, there is a round table under way on the two-meter repeater involving one or more DX stations. The excitement generated by this technique was wholly unexpected.

The first comments came with wild enthusiasm from Technicians who suddenly found themselves able to experience the pleasure of DX operations for the first time. With this occasional taste of upgrading experience, they proceed with redoubled enthusiasm on the path of license upgrading. But General, Advanced, and Extra class licensees have been equally vociferous in their endorsements. As explained to me, there is something really neat in being able to walk on the beach with a handie-talkie and chat with a Russian amateur near Moscow! The two-meter mobilers, on the way home through dismal traffic conditions, also are excited about working on their DXCC while engaged in stop-and-go traffic.

And the DX stations! Well, they stand in line just waiting for an opportunity to join the crosslink. Operationally, I have tried to encourage more than one DX station at a time, if the DX stations can hear each other, so that the benefits of two-meter round-table conversation may be employed.

Parts List

Quantity	Item	Description	Radio Shack #
2	RY1, RY2	4PDT relay, 12 V dc	275-214
1	RY3	SPDT relay, 12 V dc	275-243
2	Q1, Q2	NPN transistor	276-1617
1	SX1	DPDT switch, mom.	275-637
3	LED1, 2, 3	Indicating LEDs	
3	R1, R2, R3	680-Ohm resistor, 1/4 W	
2	R4, R5	10k-Ohm resistor, 1/4 W	
2	C1, C2	10-uF, 15-WV capacitor	
3		Microphone socket	274-002
2		Microphone plug	274-001
3	D1, D2, D3	Diode	276-1620
1		16-pin DIP socket (for RY3)	
2	Socket, RY1, 2	Relay socket	275-221
1		12-V-dc power supply	273-1652
1		Power-supply jack	274-1549
2		Audio jack, 1/8"	274-253

A typical drive-time round table recently found stations in Northern Ireland, England, Holland, Italy, Corsica, and Central Nigeria in a round table with five or six two-meter mobile stations on their way home from work! Another time found a one-Watt mobile station in Portsmouth, New Hampshire, talking with a station (ONØ) in the Aland Islands off the coast of Finland. His route was via a two-meter repeater in New Hampshire to my station on the south shore area in Boston, over to Europe. Not bad for one Watt!

The permutations of this technique are probably already cycling through your mind. The band combinations obviously are not limited between just 20 meters and two meters. And rag-chews don't have to involve only DX stations. How many different ways can *you* think of which might have lots and lots of good amateur radio fun involved, while at the same time challenging us to develop new hardware and operating techniques? How about different operating modes from just voice transmissions? A mixture, maybe . . .

New Techniques and Considerations

Here are some things I have learned already and some things that are as yet unresolved:

● Two-meter and DX-band operating procedures differ markedly. Two-meter operators use a speech-shorthand technique which needs modification when DX stations, some with limited English capability (and with some QRM and QSB problems thrown in), get added to the two-meter round table. DX stations seem very, very interested in the everyday experiences commonly discussed on two meters but rarely mentioned in DX conversations. Two-meter operators need to be clear in identifying their stations, using phonetics for their callsigns when necessary.

● Depending upon the skill of the operator at the host crosslinking station, rapid conversational gambits, common to two meters, can be employed. I think this type of exchange should be encouraged, but time will tell.

● Crosslink operators must be very careful not to allow transmission by unlicensed persons to enter the crosslink when stations in countries not supporting third-party traffic are involved. Since this is a brand new operating world for many Technician licensees, they are often unlikely to remember third-party proscriptions.

● All crosslink operators should keep very complete logs. This is not required by any FCC rule or regulation; it is simply to be able to reconstruct what went on for purposes of QSLing and other record keeping. How the rest of the world views the establishment of DX records for recognized purposes is yet to be established. At least one ham has started his own path toward DXCC via crosslinking.

● Amazingly enough, this technique both serves to conserve frequencies on the crowded low bands and provides new opportunities to develop greater employment of lesser-used bands, such as six meters. Clearly, six DX stations and six two-meter stations employing only one low-band frequency and two two-meter frequencies is band conservation. If the VHF frequency were on six meters, then the other part of the new equation would also be true.

● All is not just sweetness and light when new operating conditions appear. Those stations who like two-meter-repeater operation the way it is may object strenuously to a new idea which invades their otherwise untrammeled domain. Crosslink operators can expect to be invited off some repeaters. Crosslinking *can* use up a lot of repeater time, and those areas where repeaters are in short supply can anticipate even greater discussion about how repeaters should be employed. Maybe repeaters will need to be established primarily for crosslinking. Crosslinking on direct VHF frequencies needs to be developed.

● In the same vein, the cordial atmosphere which normally exists on repeaters during drive time needs to be conserved. When a crosslinking control station connects with a low-band station who wishes to crosslink, what happens? If there are stations on the repeater waiting to chat, all well and good. But suppose that two-meter connections have not yet been established? What then? The crosslink control station needs to assess carefully how courteously to enter a two-meter repeater with a DX station tagging along. Sometimes, two-meter stations just don't want "foreign" stations to enter their discussions and are not prepared to modify their technique to accommodate language and listening difficulties. How to establish a new operating protocol for this new ham radio technique needs to be discussed.

Crosslinking, I suspect, may become one of the most exciting operating techniques to be adopted since the entrance of single sideband. It comes with great opportunities and a variety of operating procedures yet to be developed. It does *not* require *any* new hardware developments. *You* can begin crosslinking as soon as you return from your local Radio Shack store with less than $20 worth of parts. If that doesn't make this idea pretty exciting, I don't know what will! ■

Grenada Log

With a body-bag rig and gas from a bike, a ham hustled home the news. Here's history happening.

Bob Cunningham K1XR

Fitzwilliam NH 03447

Tim Daniel N8RK
PO Box 485
Peterborough NH 03458

"An invasion on 20 meters?" Those were the words Steve Mendolsohn WA2DHF heard with disbelief when he answered the telephone at a little after six on the morning of Tuesday, October 25th, 1983. Over 2000 miles away on the island of Grenada, Mark Baratella KA2ORK had been up for three hours, making ham radio history. Operating from his second-floor room at the Grand Anse campus of Saint George's Medical School, Mark had become an essential link between the island and the rest of the free world.

This was how and where it began: The social and political events leading up to the rescue mission on Grenada are well known. In the days prior to October 25th, ham radio played an important but not a primary role. That all changed, however, when Mark was summoned by medical school administrators. With phone service nonexistent, the telex dead, and the extremely unusual sound of aircraft circling overhead, Mark swung into action.

His ham gear, which had been dismantled and hidden after the days-old coup, was retrieved from its hiding place—a body bag in the school's anatomy lab. Five minutes later, KA2ORK/J37 was calling CQ on 20 meters. No response . . . the band was dead. Thankful for having a five-band trap dipole, Mark made a quick change to 40 meters. Tuning across the quiet band, he happened onto an early morning QSO between an operator in Texas and a K4 in Georgia.

"Break . . . Emergency . . . Break!" Naturally, the reaction was skeptical. By now Mark was hearing antiaircraft fire in the distance. After confusion about third-party agreements was laid to rest and it was established that this was a true emergency—not a late-night bootlegger—the K4 telephoned Dr. Steve Lomazow N2DRA, Mark's QSL manager.

Due to the conversations of preceding weeks, Dr. Lomazow was more than aware that such a phone call might happen. The 40-meter frequency, however, caught him by surprise. Enlisting the help of his wife and son, Dr. Lomazow soon had a dipole connected to his rig, hastily set up near the dining room phone.

The predawn path between New Jersey and Grenada was a good one, but to ensure top-quality signals, Dr. Lomazow enlisted the aid of KC2PK, whose directional antenna and one-thousand-Watt transmitter were put on the air. There was little hesitation . . . KC2PK's daughter was on the island.

Mark told Dr. Lomazow that there were rumors of an invasion and asked him if he could confirm it. N2DRA's phone calls to CBS, NBC, and ABC turned up nothing. (By now conditions on 40 meters were deteriorating. The group moved to 20 meters where they set up shop on 14.250 MHz.) However, tipped off to the fact that something was happening in the Caribbean, the networks began to investigate.

Enter Steve Mendolsohn WA2DHF. His first reaction to the awakening phone call from his office, CBS Network Operations, was, "Your average invasion does not take place on 20 meters!" But after tuning in 14.250, Steve quickly changed his mind.

During KA2ORK/J37's transmissions, listeners now could not mistake the distinct sound of small-arms fire and jet aircraft. According to Steve, "It was beginning to sound like there was someone who was not just down vacationing for a DX contest!" As the word got out, hams who were close to the media were besieged with phone calls. For example, Steve logged 46 such inquiries.

As it grew light outside, in Grenada, one of Mark's fellow students used his previous military experience to monitor the activity around them. From this rooftop crow's nest, he began to identify the ships just off the beach and the aircraft overhead as belonging to the USA. Even though they were in imminent danger, Mark and the students were fascinated by the technical

expertise of the military in action.

To augment the information that they were receiving from official sources, the press desperately wanted to speak with someone on the island. With the phone and all other forms of communications dead, again, the only alternative was ham radio. Mark was inundated with on-the-air requests from the international, national, and local US media and amateur operators who were assisting the media. He refused all interviews, going so far as to deny Dan Rather any comments. (After Mark returned home, he met Mr. Rather and explained the situation and how ham radio functions.) What Mark did was to report nothing but facts. He told only of events that he could see himself or were reported to him firsthand from spotters on the roof.

Shortly after Mark started operating his Swan 500, the area lost commercial power—not an unusual event on a small Caribbean island. Prepared for this, the school had a diesel-powered generator on standby. Risking nearby gunfire, a few students made their way across campus to the generator. They fueled it, checked the oil, and started it. It had oil, but there wasn't any in reserve and it was running low. It ran for almost 18 hours before freezing up. As a last resort, they had a small Honda generator of about 500 Watts capacity. Mark put the new generator out on the balcony and started it up. After reducing his power, he started to transmit. Every time he keyed the mike, the underpowered generator groaned. However, it did the job; on-the-air signal reports were unchanged. They had enough gasoline to operate this power supply for an additional 5 to 10 hours.

It was actually needed, however, for only 3 more hours. At that time: "It's Now! . . Get Down! . . Get Down Now!" Those were the words one of Mark's friends used when he was instructed to get him from his second-floor "shack." The Rangers were there and it was time to evacuate. Mark pulled the plug and headed downstairs. The rescue helicopters were arriving at the beach, four and five at a time. A line of Rangers pushed the students down the beach and into the awaiting choppers. Mark wished that he still had his rig operating, as mortar fire was coming in and the helicopters were firing their cannons back to protect the students. Over 200 people were evacuated in about 15 minutes.

After a short flight to the recently-secured airport, the group had a few hours to collect their thoughts before being flown by jet to Barbados. On Barbados, Mark was able to phone home. After reassuring his family, topmost on his mind was letting the amateur-radio fraternity know that they were all safe. Another quick plane ride to South Carolina, and the ordeal was over.

Mark's overall impression of the entire operation was reassuring. Amateur radio proved itself again. Yes, there was malicious interference. There was also interference which was the result of some well-intentioned but nonetheless frivolous transmissions.

Licensed since his late teens, Mark epitomized the important role that young people can play in amateur radio. For KA2ORK/J37, WA2DHF, N2DRA, KC2PK, and countless others, the day 20 meters was invaded will not be forgotten soon.

The authors would like to thank WA6ITF, N2WS, WA2DHF, N2DRA, and last but not least, KA2ORK for help in researching this story.■

Instant Pane Relief

This is the only notch filter for windows we've ever seen. If you can figure it out, you'll beat the feedline flu.

Gary L. Eldridge KC8UD
3219 Mirimar Street
Kettering OH 45409

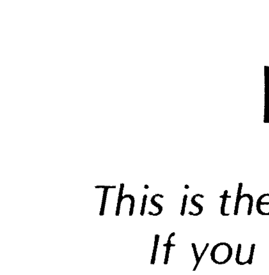

Fig. 1.

Feeding any number of coax cables through a window from the ham shack to the antenna farm is sometimes a problem when the window has to be kept open a slight amount to allow clearance for them. Not only does rain blow in at times, but during the winter a tremendous amount of heat can be lost through such gaping gaps—not to mention insect invasions in the summer.

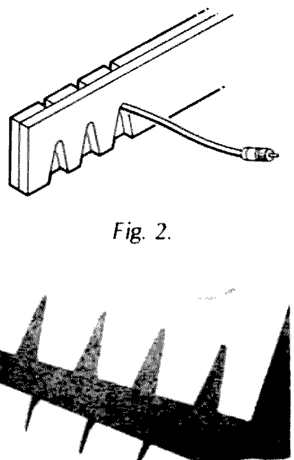

Fig. 2.

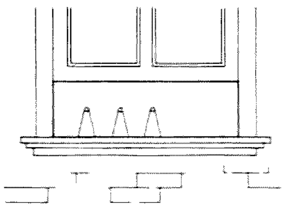

Fig. 3.

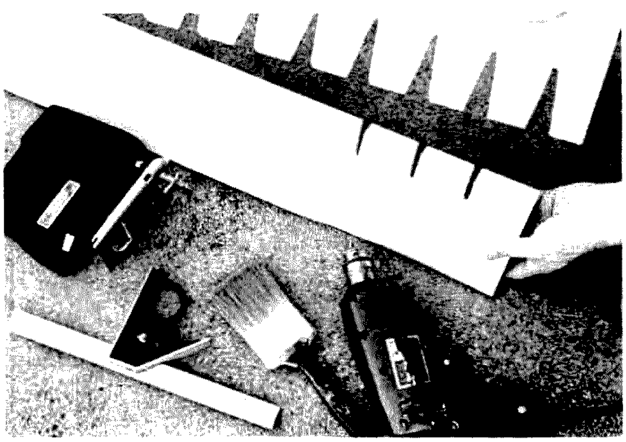
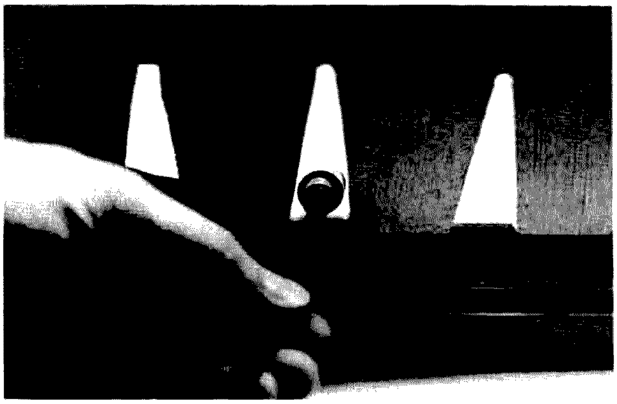
Some have taken it so far as to make a permanent installation, such as drilling holes in the side of the house, running the cables out, and then filling the holes with a weather-resistive material. That's good for home *owners* only.

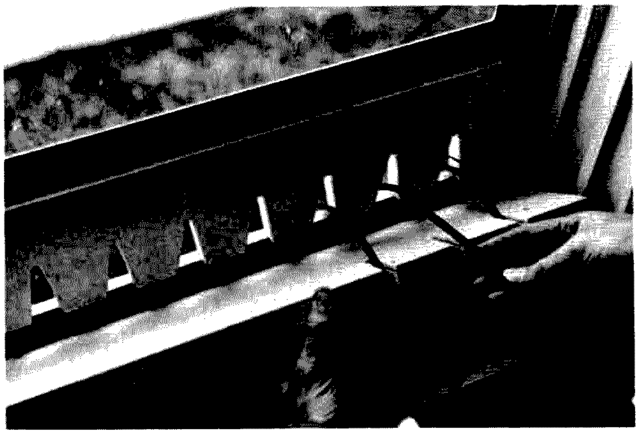
An easier and much less



Tools needed, and finished boards.



Inserting connector through outer board.



Guiding lines through inner board.

defacing method is to cut a board the same width as the window and close the window as far as possible down onto the board to make a tight fit. When a cable needs to reach outside the shack, a hole is simply drilled in the board and the cable is brought through.

With this method, I have found that almost every time I want to run a cable out the window the cable I have chosen to use inconveniently has connectors on both ends. Since a tight fit and a good seal requires that the hole in the board should be only large enough for the cable itself, that means that the connector has to be cut off before the cable can be inserted into the hole or removed from it.

However, by looking at the illustrations you should have no trouble in understanding the method I have found which facilitates a weather-tight seal and easy insertion or removal of any size cable without having to remove the connectors.

The method employs two boards cut to the width of the window. The boards are sandwiched together and the window is closed down onto the boards. Each time a new feedline must be brought through, just drill a hole in the center of the two boards and cut slots from the holes to one edge of each board. The slots are cut in opposite directions in the two boards so that the board which faces the outside has its slot going down and the board facing inside has its slots going up.

The slots in the outside board should be cut in a wedge shape so that when the inside board is moved out of the way, the connectors on the cables can pass through the wider end of the slots without having to remove the outer board at all. This way you can seal the outer board by caulking it or using duct tape and thus the board never has to be removed. This requires several holes and slots to be pre-cut in the outer board before it is fixed in place.

When any cable is removed, the small hole that is left behind can be filled easily with a small dab of putty, a piece of wood dowel, or cloth.

This method works well not only for coaxial feedlines but for twin-line as well since the wood helps keep the twin-line away from any metal window framing which might have some effect on the impedance of the feedline. ■

Lines in; window weatherproofed.

Sound Off!

Here's the perfect S-meter add-on for the repeater that has everything. The higher the beep, the better the signal.

Think you've seen every kind of attachment to a repeater that there is? How about this one—an audible S-meter? If you're wondering about why in the world you would need an audible S-meter on your repeater, think about all the times that you wanted to compare rigs, optimize antenna direction or location, or just know how well you were making the repeater from a particular mobile location. If your luck was like mine, you found that no one was around at that time, or, if they were, they couldn't stay while you fiddled around with your rotator or carried the antenna back and forth across the roof a bunch of times. And even if they did stick around, didn't you ever wonder how they could determine by ear whether you were 70% or 80% full quieting?

Well, this little circuit will solve all those problems for you. Now you can make any of those tests all by yourself and know for sure whether that last change you made helped or hurt you even if no one's around. Generally, what it does is sample the first limiter voltage, amplify it, and feed it to a voltage-controlled oscillator which returns a beep proportional to your signal strength. The higher the beep, the stronger you are (up to full quieting). I've got mine on WR3AGU 147.81/.21 at Mehoopany, Pennsylvania, and it's been working great for about a year. It's set up to give a continuously variable tone beep between .2 uV and 1.0 uV. The tone frequency range is 800 Hz for .2 uV and about 2800 Hz for 1.0 uV.

All the other junk you see in the schematic diagram does things like delay the beep to give your receiver time to recover after transmit, set up a sample-and-hold circuit to hold the limiter voltage momentarily when you let up on the mike, and discharge that voltage after the beep is output, etc. More on that later in the circuit description. Depending on where you hook it up on your repeater, it can serve a dual purpose of indicating timer reset and signal strength.

The circuit isn't very complex and it shouldn't be hard for anyone with the time and initiative to design a PC board for it.

Circuit Description

IC1 is a dual op amp with a very high input impedance. This is necessary so as to not load down the first limiter stage to which it will be connected. The gain of the stage is variable and is adjusted by the 1-meg-dc amp gain control. More about this adjustment later. The output of this IC is fed through D1 to the second half of IC1. D1 ensures that the 2.2-uF tantalum capacitor is not discharged when the output of IC1a goes lower than the voltage on the 2.2-uF capacitor.

These components form a sample-and-hold circuit which holds the voltage developed by IC1a for a short time when the input signal disappears. IC1b serves as a voltage follower/impedance transformer. Its high input impedance does not load down the 2.2-uF capacitor and its relatively low output impedance feeds the MC4024 vco. The MC4024 is a voltage-controlled oscillator. The audio output frequency of this chip is deter-

Circuit board.

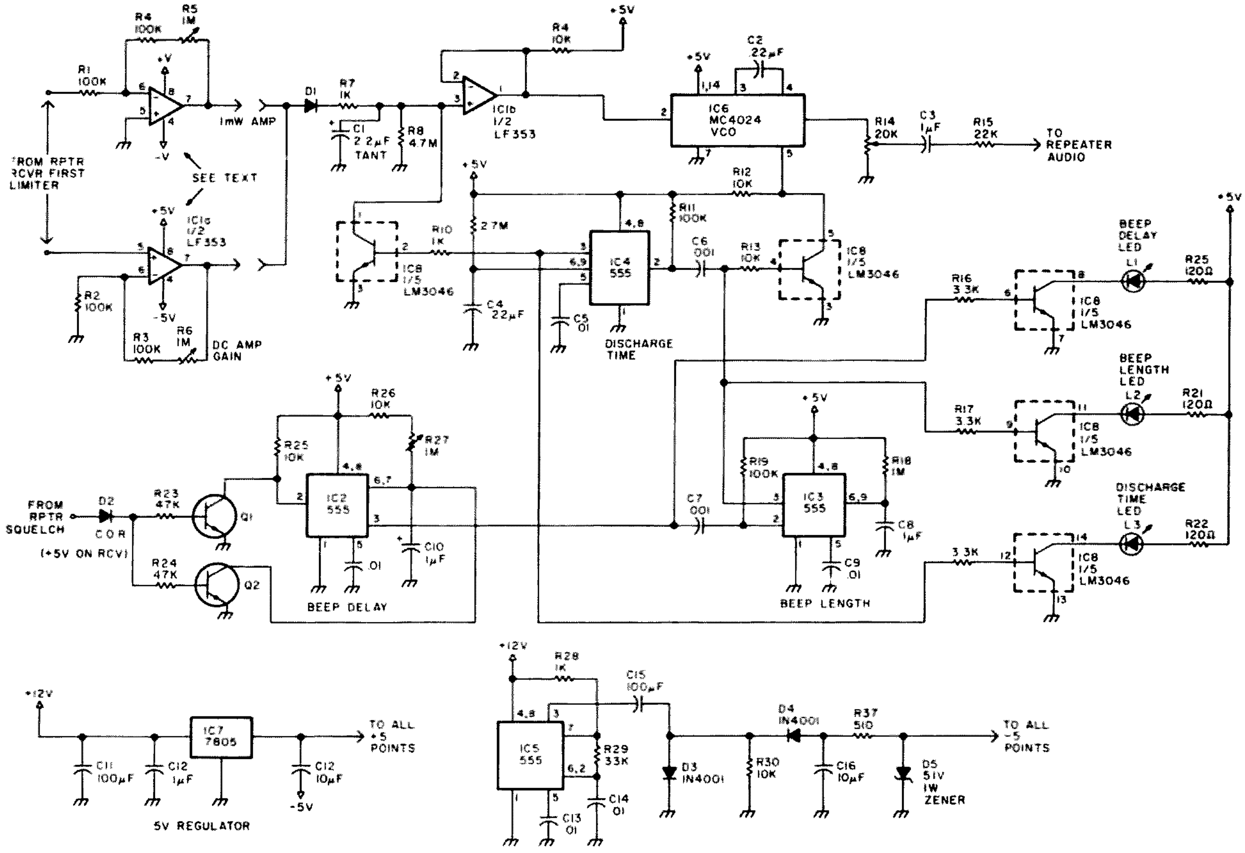

Fig. 1. Schematic.

mined by the voltage at its input. With the values shown, output frequencies between 800 and 2800 Hz will be generated when pin 5 is high.

The repeater COR is connected to the anode of D2. The COR must go above 2.0 volts on receive and remain below 1.0 volt when idle. The standard 0-volt low and 5.0-volt high is ideal. When a signal is received, IC2 (set up as a retriggerable monostable) is reset and its output is held high while a transmission is being received. When the received carrier disappears, IC2 then times out (how much later is determined by the 1-meg pot and the 1-uF capacitor) and output pin 3 goes low. This delay is to ensure that you release your mike button. Instead of an immediate return beep, a delay is introduced which allows time for receiver recovery.

When IC2 goes low, it triggers IC3 which is set up as a monostable. When pin 3 of IC3 goes high, it biases on the B section of the LM3046 transistor array, bringing pin 5 of the MC4024 vco low for a finite time allowing it to output a beep. After IC3 times out, its output pin 3 goes low, shutting off the vco and triggering IC4. When IC4 is triggered, its pin 3 goes high and biases on the A section of the transistor array. This discharges the 2.2-uF tantalum and readies it for receipt and storage of the next voltage level.

The other three sections of the LM3046 transistor array are used, together with their respective LEDs, as logic monitors to indicate the status of the three timers. All five sections may, of course, be replaced by five discrete transistor devices if you wish.

The fourth 555 is used in the astable mode to convert +12 volts dc to a low-current −5-volt supply needed for the proper operation of IC1. The 7805 is a three-terminal device used to regulate the +12 volts supplied to +5 volts needed for IC1 and other portions of this circuit.

Adjustment

There are only three adjustments to be concerned with. The one-meg pot associated with IC2 is adjusted to provide the amount of delay you would like after the carrier disappears before the beep is heard. The proper amount of time is what sounds best to you. Adjustment is best done while in actual operation.

The one-meg-dc amp gain associated with IC1a takes a bit more to adjust. If you have access to a Cushman or other service monitor with a calibrated output, things are much easier.

With a service monitor: (1) Remove the LM3046 from its socket (you did use a socket, didn't you?). Short pins 5 and 3 of the socket with a thin jumper wire to permanently enable the MC4024. (2) Disconnect one end of the 2.2-uF capacitor. (3) Set the dc amp gain to minimum resistance. (4) Key up the repeater and adjust the 20k-level pot in the output of the vco to about 3-kHz deviation. (5) Apply a signal to the receiver which is just enough to break squelch. Adjust the dc amp gain slowly until a slight rise in tone pitch is noticed. This causes IC1a to output the dc level at this point which is needed to begin controlling the vco. Any larger signal will be further amplified and applied through IC1b to the vco, resulting in a higher tone from the vco. The stronger the signal, the higher pitched the tone.

Without a service monitor: (1) Perform steps 1, 2, 3, and 4 above. (2) Have some-

one with a very weak signal transmit. Adjust the dc amp gain as described in step 5 above.

The Input Stage

IC1a's input is connected to your repeater's first limiter stage. The voltage at this point will most probably increase with an increase in signal strength. In this case, the non-inverting stage configuration is used. If it is necessary to connect to a point in your first limiter where the voltage decreases with increasing signal, then use the inverting configuration shown.

The audible S-meter has proven to be a worthwhile addition to the 81.21 repeater (WR3AGU) and I'm sure you'll find it a useful and novel feature on your repeater.

I'll be happy to answer any questions regarding this circuit. Please include a stamped self-addressed envelope. ■

Parts List

Resistors (all ½ or ¼ Watt unless stated otherwise)

R1, R2, R3, R4, R11, R19		100k
R5, R6, R27	part # TR11-1 meg $.39	1 meg pot

Some Alarming Techniques

These burglar-proof circuits will stump second-story men and amaze possible thieves—as well as you.

The most cost-effective way to protect life and property against fire, theft, and vandalism is with an electronic alarm system. Wayne Green has been telling us for years of the market potential for amateur radio operators in the alarm business. Having once been in the alarm business, I agree with Wayne and in this article I will share the common circuit techniques and a schematic for a simple but sophisticated residential alarm control panel.

Closed Loop or Open Loop?

For an alarm to be reliable, its operation must not be defeated by a loose connection or broken wire in the system. Most intrusion alarms use a closed loop—a continuous loop of wire with normally-closed switches wired in series. When one of the switches is open or the metallic tape on a protected window is broken, the alarm panel responds to an open circuit on its input terminals. This type of loop is self-testing; there is only one way to make up the loop, this being with all switches closed and wires connected. Fig. 1 illustrates an example of a simple alarm control panel circuit for closed-loop operation.

An open loop consists of a chain of normally-open switches wired in parallel. Some technique for testing the integrity must be provided, since a break in the normally-open loop would render part of the loop inoperative.

Fig. 2 illustrates the use of an end-of-line diode to monitor a normally-open loop. In this circuit an ac signal is impressed on the control-panel end of the loop. During one half of the cycle the end-of-line diode conducts, supplying current to the trouble relay. Should one of the switches close, the alarm relay would drop out, setting off the alarm circuit. Should the loop open or ac power fail, the trouble relay will drop out, alerting the operator to trouble on the

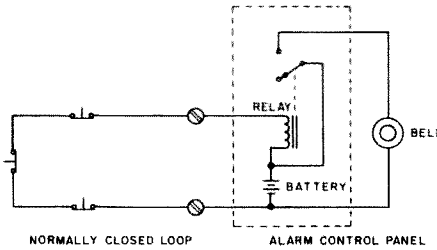

Fig. 1. Schematic of a simple closed-loop alarm using a relay, battery, and bell. The closed loop is self-testing because the loop must be made up before the alarm is turned on.

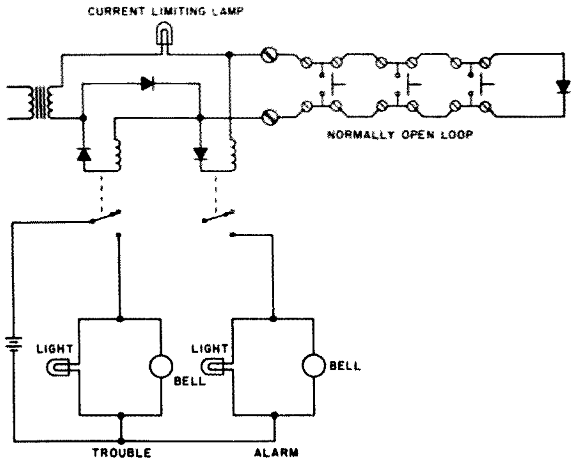

Fig. 2. Open-loop two-wire system, using end-of-line diode, relays, and ac power supply. These are used in fire-alarm systems.

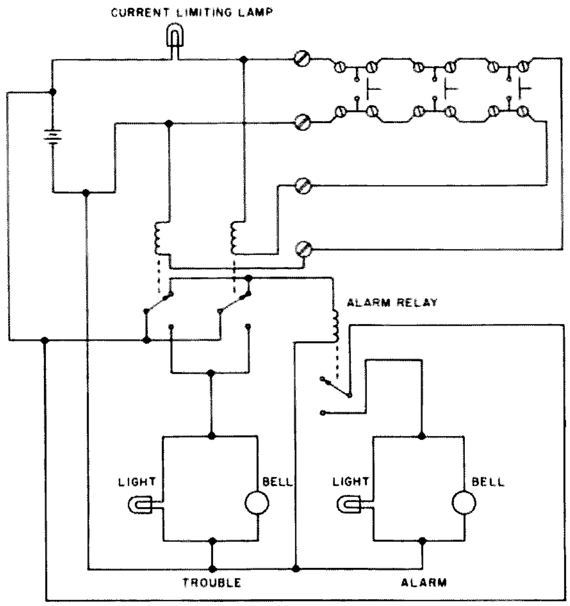

Fig. 3. Typical four-wire open-loop alarm circuit using alarm relay. These are also used in commercial fire-alarm systems.

line. There are other end-of-line techniques for detecting open-loop trouble; each has some problem and is considered not as good as a four-wire loop.

The Four-Wire Loop

A four-wire loop is shown in Fig. 3. This circuit uses two relays to sense the integrity of the loop. If either relay drops out, a trouble alarm is sounded. If the open loop is shorted, both relays drop out, as does the alarm relay.

This four-wire circuit uses a single dc power supply and may be supplied by a backup battery in case of ac power failure. It should be noted that in case of relay or power failure, this circuit will fail in the trouble or alarm mode. The normally-open switches used in this type of alarm have four sets of screws for the incoming and outgoing pairs to ensure that a switch does not get left out of the loop because of a poor connection. The open loop is normally used for fire-alarm systems which are left on continuously.

Entry and Exit

An intrusion alarm is usually turned off for part of the day and activated for part of the day. The operator must be able to turn the alarm system on and off without causing an alarm. There are two techniques for this: a high-security keyswitch mounted outside the protected perimeter and the time-delay system.

The high-security keyswitch technique uses a keyswitch with a cylindrical tumbler to bypass part of the closed loop, as shown in Fig. 4. To arm the alarm system, the operator first checks the integrity of the loop at the control panel and turns on the alarm. The operator then exits through the doors and areas bypassed by the outside keyswitch. After securing the exit door, the high-security keyswitch is opened, putting the bypassed switches back in the loop. To enter the protected perimeter these steps are reversed; first the outside switch is closed, then the operator proceeds to the alarm panel and turns the alarm off.

Entry and exit delays may be used in low-security systems where the intruder would not expect to find an alarm system, such as in a residence. When the system is turned on, the operator has a preset exit delay period before the alarm system is armed. This period is normally adjustable from a few seconds to a couple of minutes. This gives the operator time to set the alarm and exit the perimeter without setting off the alarm.

Another delay must be provided for entry. Here the operator may break the protected perimeter and still be given time to go to the alarm-system panel and turn it off before the alarm sounds. Obviously, the intruder may be given the same opportunity to find and silence the alarm before it sounds. Fig. 5 gives us a schematic for an alarm circuit which provides for entry and exit delay.

The entry and exit delays are fixed by the choice of timing capacitors C1 and C2 and resistors R10 and R11 connected to IC3; with 1 megohm and 10 μF respectively, the delay is about 14 seconds. This is about the minimum practical delay time.

Half sections of IC2 are connected as R-S latches to hold information about the system status. System status and loop integrity are indicated by LEDs. Also included is a power supply for the system with battery backup. Normally the batteries are dry cells which are tested and replaced periodically.

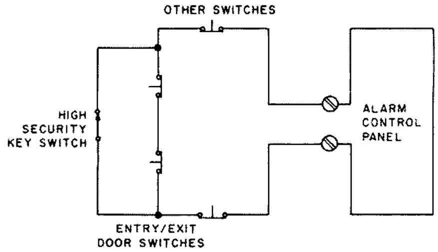

Fig. 4. Example of how a high-security keyswitch is used to bypass entry/exit doors. This type of circuit is used on commercial intrusion alarms.

Parts List

R1–R6	2.2kΩ, ¼-Watt
R7–R9	330Ω, ¼-Watt
R10, R11	1 megohm, ¼-Watt
C5, C6	4.7-uF tantalum
C1, C2	10-uF, 16-volt electrolytic
C3, C4	0.01-uF ceramic disc
D1–D3	1N4001
D4–D6	Light-emitting diode
S1–S3, S7	Normally-closed switches
S4–S6	Normally-open, momentary-contact switches
IC1, IC2	7400 quad two-input NAND; +5—pin 14, Gnd—pin 7
IC3	556 dual 555 timer; +5—pin 14, Gnd—pin 7
IC4	7805 5-V regulator
RY1	5-V low-current relay

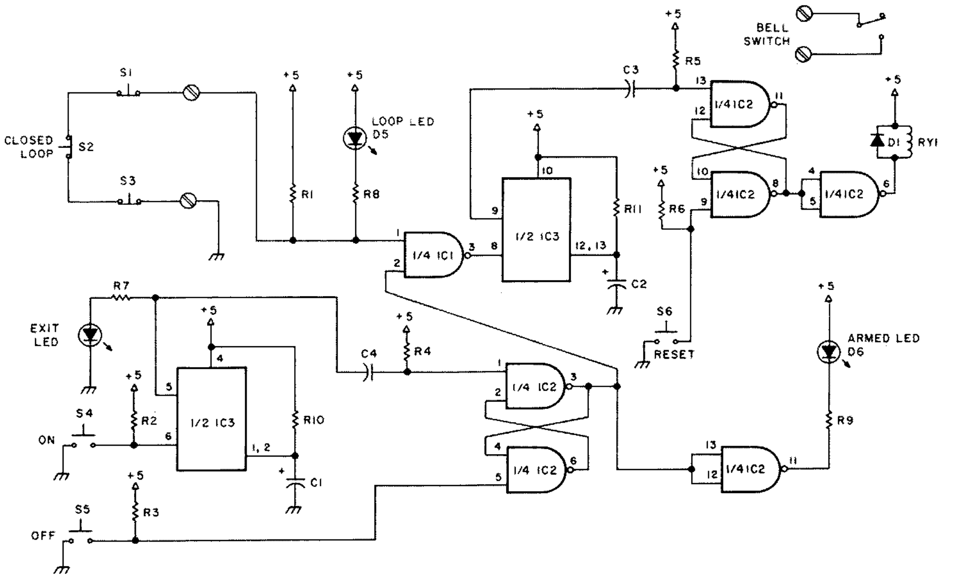

Fig. 5. Schematic diagram of an alarm control panel suitable for residential use. Entry/exit delay is included.

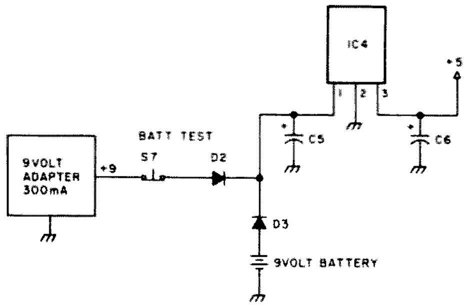

Fig. 6. Power supply for Fig. 5. The battery is usually dry cells which are periodically tested and replaced.

Summons

The systems described here all rely on a local bell to scare the intruder away and/or notify the occupants. Commercial alarms must also notify the police or fire department or some other private security office. Normally this is done over leased phone lines—pairs of wires leased from the phone company which connect the alarm panel to the central office.

In simple systems, a normal status is indicated by plus six volts dc, trouble is indicated by zero volts, and an alarm condition is indicated by negative six volts dc. In most locations, the exact nature of these signals has already been established and any new systems must conform to the existing standard. The central office receiver may vary from a plug-in zero-center meter, with latching relay and buzzer, to a small computer console which types out the name, address, and time of any alarm. Usually a small charge is levied for the use of the central system by the city or private company.

Parts Procurement

Commercial-quality alarm components are available from Ademco, Bourns, FBI, Moose, Napco, and Universal. These units are well engineered and built like tanks to provide years of trouble-free service. Residential-quality units are available from Midex, Seeker, Eico, and Solfan. Many of these have entry and exit delays and may not be suitable for commercial use. These are available from suppliers in many metropolitan areas.

Selling the System

For those interested in making a business out of selling and installing alarm systems, the thing being sold here is security, not a bunch of alarm panels, wires, switches, lights, and bells. The buyer wants to feel that he, his property, and his family are safe from fire, theft, and burglary. He wants his system to be reliable; if it fails to operate properly he wants it repaired immediately, even if it's 2 am. Once he has the security of an alarm system, he will not want to be without it. For this reason, alarms are usually sold with a service contract or lease. Remember: The customer probably won't know a thing about how his system operates.

There exists a good potential in many areas of the country for someone who can understand these simple circuits, organize a business, and be reliable in the installation and maintenance of alarm systems. For those not interested in a business, a do-it-yourself residential alarm offers a cheap, effective insurance against loss due to fire, theft, or burglary. ■

Join the Packet-Radio Revolution—Part III

Don't mess up. Packet protocols and procedures are all-important, says WA7GXD, and he's been right so far.

Now that you have a background as to what packet radio is and what it takes in the way of hardware to get a packet station on the air, it is time to go into a little more detail on the communications protocols used in packet radio.

As mentioned in Part I of this series, protocol is taken to mean the formal rules governing information transfer. There are many different types of protocols used in amateur radio today. Every time you check into a net, there are procedures to follow. If you get involved in a roundtable discussion, less formal rules may apply. If you wish to use a busy repeater, there are, again, procedures to follow. In fact, any time you wish to communicate (and sometimes when you don't wish to!) there are rules. Some are formal, such as in parliamentary debate, while others are not.

In packet radio, the protocols used are designed to enable many users to access a given channel for point-to-point communication with maximum reliability. And since computers are used (the Terminal Node Controller—TNC—is a computer), the rules must be very explicit. Because computers lack judgment, all possibilities for confusion must be defined and worked out. Thus, protocol design is a *very* critical part of designing a packet-radio system.

Do other amateur digital-communications systems have defined protocols? The answer is yes! In RTTY, the 5-level Murray (Baudot) code is used in the United States, while in Europe the CCIR Alphabet Number 2 is the standard. Holding a marking tone between characters, unshift-on-space, data rate (60, 67, 75, or 100 wpm)—these are all part of RTTY protocol. In ASCII, the 7-level code itself is part of the protocol, and in amateur usage, most of the applicable RTTY standards have been carried over, including such things as 170-Hz shift and the 2125/2295-Hz tone pair.

As digital communications have progressed, more rigidly-defined protocols have emerged. AMTOR, perhaps the most sophisticated RTTY system in amateur use, has evolved as an error-reducing communications system and is defined in CCIR Recommendation 476-2. In commercial packet work, the International Standards Organization (ISO) has proposed a 7-layer model for packet-switching networks (see Fig. 1).

The first level, called the Physical Layer, deals with interfacing the user's terminal to the packet system. In the case of amateur packet radio, it is also the radio interface and the modulation scheme. While there is no standard in amateur practice at this time, there have emerged several de facto standards. RS-232 is the common interface between the packet system (usually a TNC) and the terminal. 1200 baud is the normal signaling speed on the packet side, using AFSK with 1000-Hz tone spacing using tones of 1200 Hz and 2200 Hz. Since there is no standard among amateur radio manufacturers for audio connectors or pinouts, no standard is possible for this physical interface.

The second level is the Link Layer. This deals with the actual format of the frames of information that make up a packet. It cares nothing for the data in the packet, but rigidly defines the address and control fields as well as the flags and the Frame Check Sequence (FCS). It is at this level that amateurs have come to agreement and adopted a standard called AX.25 level two. This protocol was first publicly proposed by AMRAD and adopted, with certain modifications, at a special meeting called by AMSAT in October, 1982. It was first put on the air by Tucson Amateur Packet Radio (TAPR) on the then-new TAPR TNC in December, 1982, and has since been coded into software for the Vancouver Amateur Digital Communications Group (VADCG) TNC by Hank Magnuski KA6M and others.

The next level, the Network Layer, is the focus of much experimentation today. When implemented, it will provide for inter-group linking as well as support multiple connections for, say, a roundtable with positive frame acknowledgment.

The functions of this level overlap somewhat with level four, the Transport Layer. It is the successful operation of amateur packet radio at these levels that will herald a new era in amateur-radio communications,

opening the way for an extensive, high-speed, highly-reliable communications network on a continental scale. Experiments with Phase IIIB, HF gateways, and the like are precursors to amateur level three.

The last three layers, Session, Presentation, and Application, deal with such things as CRT screen control, character sets, and the like. Amateur packet operation has managed to blur these areas with standard usage. For example, ASCII is the normal mode of character encoding. Bulletin boards are running at level two.

In fact, the definition of the digipeater function in AX.25 level two is actually a level three "kludge" to allow limited intermediate linking. This is not necessarily bad; it just shows that amateurs tend to adopt and adapt until things suit them for the unique environment in which we operate.

At the lowest level, an RS-232 interface has become the de facto standard for communicating between a TNC and a computer or terminal. The TNC looks like a modem (Data Communications Equipment, or DCE) while the computer or terminal is defined as Data Terminal Equipment (DTE).

A Protocol-Related Problem

Even at this low level, problems may arise. What if the receive buffer in your computer gets full, or the lines you are reading start to scroll off the screen of your terminal? What if the packet channel is so clogged that the transmit buffers in the TNC are getting full? These problems are solved by the application of a *flow-control algorithm* (computerese for a method of solving a problem—hopefully one that doesn't introduce other problems!).

Flow control is handled in the TAPR TNC by both hardware and software, although the software has to recognize the "hardware" solution.

In the case of the terminal (or computer—we'll use "terminal" to mean both) wanting to tell the TNC to stop sending data, the terminal may either (a) set the TNC's Request-To-Send (RTS) line false or (b) emit an X-OFF character (usually Control-S) to the TNC. In the first case, the TNC will immediately stop sending data to the terminal. In the second case, if the TNC has been told to, it will recognize the X-OFF character and cease sending data. Note that if the TNC is operating in a so-called transparent mode, only the hardware solution may be used, since in this mode the TNC passes all data, ignoring commands.

To resume data flow to the TNC, the CTS line may be set true (if the hardware control was used) or the X-ON character (typically set as Control-Q) may be sent to the TNC. (With the TAPR TNC, the X-ON and X-OFF characters may be user-defined and the default characters are given here.)

In the case of the TNC wanting the terminal to pause in sending data, it will set the Clear-To-Send (CTS) line false, returning it true when ready to again receive data from the terminal. Thus, flow control between the TNC and terminal is defined and provided for in the TAPR TNC "user interface" protocol.

The above discussion is a simple example of the sorts of problems that must be solved in defining a usable protocol for digital communications. While the details can become quite involved, the rest of this article will deal with the issues in a more general framework. The idea is not to make you an instant protocol expert but to give you some insight into the general workings of amateur digital communications with particular emphasis on the recently-adopted AX.25 packet-radio protocol. First, however, let's take a look at how amateur packet protocols developed.

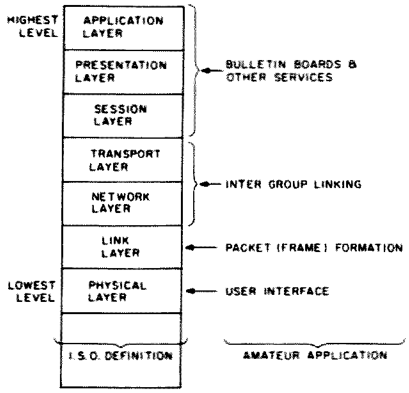

Fig. 1. ISO 7-layer protocol model.

Early Packet-Radio Protocols

At the risk of oversimplification, there basically are two ways of handling packet communications. One is to have a master-control station acting much like a net-control station in traditional amateur practice. The other is to have all stations equal, as in casual amateur operation. Not surprisingly, both methods have been used in amateur packet radio. Since the Canadians were allowed packet operation first, they implemented both first.

One system was developed in which a master-control station would *poll* each station in its list and each station would in turn pass along any traffic. The advantages are apparent: Everyone takes his turn and any potential conflicts in using the frequency are thereby resolved. The disadvantages are more subtle: How does one get on the list, and what happens if the list is long but only two or three stations are active? Do the few active users have to wait for the inactive stations to be interrogated by the master station between every transmission? And of course there may be a real problem if the master station goes down.

Another system was developed in which each station had its own identification and could attempt to access the channel at will. The possibility of "doubling" (called a *collision* in packet jargon) became real with this system, but communications were somewhat more robust because a central controller wasn't needed. And you didn't have to figure out how to get on the list.

The polling system is used in very few active packet areas now, and a variation of the second system became the de facto standard. Developed by the Vancouver Amateur Digital Communications Group, the Vancouver protocol spread with the VADCG TNC. Nearly all early work with packet radio in the United States was based on this TNC and protocol.

Features of the Vancouver Protocol

The Vancouver protocol allowed two stations to *connect* and carry on point-to-point communications with positive acknowledgment via a *handshake*. High-Level Data-Link Control—*HDLC* (see Part I of this series, September, 1983, issue of *73*) was used for assembling and disassembling packet *frames*, and Non-Return to Zero Inverted (NRZI, pronounced nurzi) encoding of the data stream was used to allow clock recovery, since HDLC is a *synchronous* pro-

tocol (as opposed to the *asynchronous* RTTY format with start and stop bits attached to every character).

In addition, this protocol allowed the use of a *digipeater* for allowing stations to connect that couldn't connect directly. A digipeater is similar in this respect to a voice repeater, although it is really very different. It performs the same Frame Check Sequence (FCS) on an incoming packet as any other packet station, rejecting those that are corrupted. It then generates a new, and slightly different, packet which it sends. The modifications are in the address (and possibly the control) field, much like the changing preamble in message traffic. The digipeater is thus more like an automated traffic-handling station than a repeater.

The Vancouver protocol also allowed a packet to contain multiple *frames* of information. Up to seven frames could be sent in one transmission, and the acknowledgment (ACK) would contain a number indicating how many frames were successfully received. This had the advantage of increasing the amount of data that could be sent in a given time period (called channel *throughput*) by reducing the number of times the channel had to be "turned around" to acknowledge receipt of data. At 1200 bits per second (bps), radio performance becomes the rate-limiting factor.

Finally, the Vancouver protocol provided for certain types of *supervisory* frames for control of the data link.

Unfortunately, there were problems, or more properly, limitations with the system. For one, only a single digipeater was allowed. What if two stations wanted to connect that needed two, or even three, intermediate relays? How could multiple stations exchange data and still get positive acknowledgment from the other stations? What if a station found itself in range of two digipeaters (overlapping networks)?

The greatest limitation, however, was in the addressing scheme. In conformance with commercial HDLC implementations, and to allow the TNC's HDLC control chip to screen incoming packets, a single-byte addressing scheme was developed. Due to part of the HDLC standard, only seven (7) bits are allowed in an address byte, meaning only 128 addresses can exist on a given channel. The digipeater had to share in all of this, certain address fields had to be reserved for various reasons, and the result was that a maximum of 31 stations could be on a given channel.

This may not seem like a problem since that would be a very congested channel, but the hardware used required that the station's special ID code be burned into the TNC's memory. Since not everyone in an area is likely to be on at any given time, 31 *addresses* can be very limiting because it then implies only 31 packet stations can exist in an area, active or not. What if a visitor comes into the area with the same address as a local? Who assigns the addresses? What if a person is in range of two or more networks, and his address is used in more than one of them? The list goes on.

Dynamic Addressing

At the time TAPR was forming, the protocol issue was taken very seriously. The hardware for the TAPR TNC has provision for changing addresses, and many other parameters, by inclusion of a *nonvolatile* memory chip that requires no battery backup yet can be changed by the user with a simple command (see Part II of this series, October, 1983, issue of *73*).

A protocol was designed that would have an "address server" to assign addresses to any stations that came on frequency. When the station checked out, its address would be removed from the active list, making room for other active users to join in. The "net-control" station would poll the users on the list from time to time to see if they were still on channel to prevent a station that had "died" from hogging an ID. The first station on a channel would become the address server, and this function could be passed on to any other station by command. Further, if a station detected the absence of the address server, it could then take over the function.

Finally, the address server would send out a broadcast message to all stations whenever a station came on or left the channel. This would allow a user to check the "system-status table" in his TNC to see who was on! It also would smooth the transition if the address server went down for any reason.

This *TAPR/DA* protocol is presently under continuing development and may be undergoing on-the-air tests by the time this appears in print.

Unfortunately, the protocol is fairly complex and the team implementing it in software has met with delays beyond their control. Further, adapting it to existing VADCG TNCs may be impractical without extensive modifications to that TNC.

AX.25 Level Two

In October, 1982, in conjunction with the AMSAT annual meeting, Tom Clark W3IWI called a meeting of the various packet groups to settle on some sort of level 2 protocol (the level at which the TNCs communicate with each other). The reason was very simple. With the successful launch of the Phase IIIB satellite, a digital-communications channel with predictable reliability would be available. If the various packet groups were all doing their own thing, a Tower of Babel would result with no two groups speaking the same language (protocol). This would result in either (a) chaos, or (b) extreme underutilization of the channel resource. Therefore, a common protocol had to be defined sufficiently in advance of the satellite launch to allow it to be coded in software and tested on the air.

Represented at the meeting were AMRAD (Washington based), PPRS (San Francisco based), SLAPR (St. Louis based), TAPR (Tucson based), and of course, AMSAT (also Washington based). New Jersey was also represented, and the groups' membership base covered most active packet sites. Unfortunately, the various Canadian groups were unable to attend.

Several proposals were espoused, with each group defending its particular approach(es) to the problem. Tom's strategy, essentially, was to lock everyone in a room with no departure allowed until agreement was reached. Surprisingly enough, it worked! What eventually emerged from the meeting was a modified form of the AMRAD AX.25 level-two protocol, which is an adaptation of the commercial X.25 packet-switching protocol, level two.

Essentially, this protocol provides for the various functions of the earlier Vancouver protocol with a number of additional features. Point-to-point connections are allowed, with positive acknowledgment of frames. Up to seven frames may be included in a packet. Flow control between packet stations is defined, so a receiving TNC may tell a sending TNC to stop sending traffic for a while (to prevent buffer overflow). A digipeater is allowed, and its functions defined. HDLC frames are

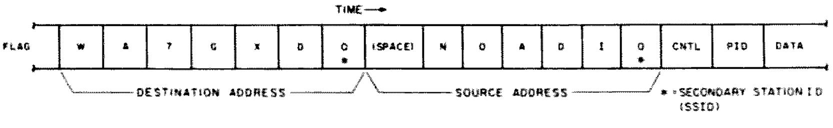

Fig. 2. Typical AX.25 non-digipeated address header.

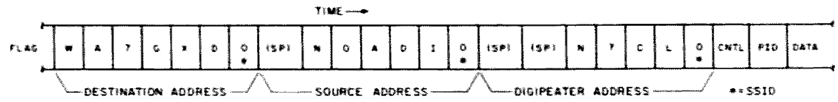

Fig. 3. Typical AX.25 digipeated address header.

used, with NRZI encoding and zero-bit stuffing.

The major differences lie in the addressing scheme. Whereas the Vancouver protocol allowed only 31 or so stations, the AX.25 system effectively allows over ten times the licensed amateur population to be active at once!

Why is this so important? Recall that the Vancouver protocol used single-byte addressing. The problem of a new packet station coming on channel becomes real when a channel exists that allows over 50% of the world's amateurs (theoretically) to have access at one time, as in the case of the Phase III satellite.

In AX.25, the amateur station callsign is encoded into a 7-byte field. This allows for a six-character callsign with an additional byte as a qualifier. This may be necessary when, for example, a packet station has multiple TNCs that must operate under one station call. This occurs fairly frequently, with some amateurs providing a bulletin-board service or a gateway station in addition to their "normal" packet station.

Both the sending station's and the intended receiving station's callsigns are in the address field, making it 14 bytes in length. A digipeater may be *specified* (you could be in range of multiple digipeaters), in which case its callsign must be included, making the address field 21 bytes in length.

Recognizing that future protocols may emerge, the packet group decided to append a Protocol IDentification byte (PID) to the control field of the frame to let the receiving station know which protocol was in use, and AX.25 was assigned an identifier.

The advantages of this system are numerous. No longer must an amateur worry if another station has the same ID when he receives a packet. Many users may be accommodated (from an addressing point of view) with no effective limit. Monitoring of a channel becomes simplified, with a monitoring station able to identify (by callsign) the source and intended destination of every packet receivable at his location.

Of course, nothing is free, and AX.25 has its costs. The main problem is that the address field is quite long, being 21 bytes if a digipeater is used. At TAPR, we wanted to play with multi-hop packeting, so we allowed up to eight digipeaters to be specified. This makes for an address field of up to 70 bytes! This is a lot of overhead merely to send a zero data-length ACK.

Another limitation of AX.25 is that it doesn't allow for the typical amateur practice of roundtable discussions. Since a station may connect only to *one* other station, some sort of monitor mode must be enabled to see activity from other packet stations. If the "monitored" FCS is corrupted, the packet is discarded. In the case of very weak signals, it is common to miss a lot of the monitored activity. Some provision must be made to accommodate this type of networking, and it will most likely take place at level three. This problem appears to be unique to amateur packet requirements at present, so we must pioneer and develop this capability.

The lack of multiple connectivity poses another problem. Suppose a station has a computer mailbox or bulletin-board service available on packet. Since only one connection can be maintained at a time, only one user can check in at a time. If others wish to check for messages, etc., they must wait until the first user disconnects. If he suffers a power outage or otherwise leaves the air without properly disconnecting, the mailbox station will lock up until reset. Thus, other users are denied access.

There undoubtedly will be further experimentation with link-level protocols, but AX.25 forms a sound basis and a common language for such development to build on.

A Typical Connection

To illustrate the functioning of packet protocol, an example of a typical connection sequence follows. (Note that in packet parlance a connection is merely establishing contact with the desired station.) Let's say that station WA7GXD wishes to connect to station NØADI. WA7GXD would type at his terminal: C NØADI.

A packet would be sent that could be represented as—: FLAG : NØADI : WA7GXD : SABM : FCS : FLAG:.

Note that the destination station callsign precedes the sending station callsign. The control field SABM means "Set Asynchronous Balanced Mode," which is data-communications talk for "connect me to the other guy and treat us as equals—no one is a control station."

Assuming NØADI is on frequency and his TNC is allowed to accept a connection request (he is not already connected with someone else), his station would respond with—: FLAG : WA7GXD : NØADI : UA : FCS : FLAG :.

In this case, the callsigns are reversed and the Unnumbered Acknowledgment (UA) is sent in the control field to ACK the connect request. At WA7GXD's terminal, the following message would be displayed: ***CONNECTED WITH NØADI, while NØADI's terminal would display: ***CONNECTED WITH WA7GXD. At this point the TNCs would enter the CONVERsation mode. Now any information entered at either station will be transmitted to the other station.

When the QSO ends, one station, say NØADI, will place his TNC in the Command Mode and enter: D WA7GXD, at which point his TNC would send out a packet like—: FLAG : WA7GXD : NØADI : DISC : FCS : FLAG :, where DISC is the control code to disconnect, and WA7GXD's TNC would respond—: FLAG : NØADI : WA7GXD : UA : FCS : FLAG :, and each terminal would then display: ***DISCONNECTED.

While in the connected mode, any information entered at one station's TNC will be sent to the other station and positive acknowledgment utilized to ensure that the receiving station in fact received the frame cor-

FOR FURTHER INFORMATION

The ARRL publishes the *Proceedings of the Second Amateur Computer Networking Conference* held in San Francisco in March, 1983. Copies are available from League Headquarters for $9.00 postpaid. Topics covered include the complete AX.25 specification, papers on the software and hardware aspects of the TAPR TNC, and other developments such as AMRAD's HF packet modem and Sweden's SOFTNET system.

Tucson Amateur Packet Radio's *TNC Manual* covers operation of a packet station in detail. Complete information is given on the TAPR TNC, including construction and checkout. Appendices include radio hookup and the complete AX.25 specification. This manual is available from TAPR for $20.00 postpaid in the US and Canada.

TAPR also publishes the bimonthly *Packet Status Register*, which is devoted exclusively to packet radio. Membership is currently $12.00 per year.

AMRAD, PO Drawer 6128, McClean VA 22106, publishes the monthly *AMRAD Newsletter*, which contains columns on packet radio. Annual dues are currently $15.00.

rectly. If the receiving station does not send the required ACK, the sender will repeat it. This goes on for up to *RETRY* times (RETRY being a user-entered parameter telling the TNC how many times to retry sending a packet before giving up and assuming the path no longer is usable between the stations).

The reasons that the sending station may not receive and decode an ACK are many. The receiving station may not have sent it due to (a) corrupted or garbled data bits, (b) someone else transmitting over the packet (a collison), (c) the receiving unit failed, (d) etc. The ACK may have been sent but not received correctly by the sending station for the same or other reasons.

In order to minimize the chances of a transmission getting stepped on or collided with, a station wishing to transmit will first listen and ensure that it doesn't hear any packet activity. Only then will it transmit. Further, if it is retrying a transmission, it will wait an additional *random* amount of time before transmitting. This helps ensure that two stations don't get "locked" and continually collide with each other.

If the retry count is exceeded, the station attempting to send will then report to the terminal:

***DISCONNECTED
RETRY COUNT EXCEEDED.

Thus, the operator is kept informed of any changes in the state of the communications channel, and valuable channel time isn't wasted in continually trying to maintain contact with a station that may not even be on the air.

From the above example it can be seen that the protocol issues involved in packet radio can be very complex, but that if properly approached, the result can be extremely reliable communications and efficient sharing of amateur frequencies.

Applications

No discussion of packet radio techniques is complete without some mention of the mulititude of practical applications of packet radio in the amateur environment.

Apart from FCC-mandated "advancement of the state of the radio art," packet provides unique opportunities for experimentation and public service.

Consider the aftermath of a tornado, earthquake, volcano, or other disaster. Usually, the first emergency traffic to be handled is done via amateur radio, especially if the damage is severe enough to knock out commercial lines of communication. In many cases, the traffic entered into the communications system far exceeds the ability of the system to handle it. The network becomes saturated and delays increase. It may take hours or even days to get all the messages handled.

Typically, voice or CW traffic nets are limited to a realistic rate on the order of tens of words per minute. Fatigued operators are subject to errors in copying and otherwise handling the information. As time wears on, the error rate increases.

RTTY or ASCII offers some improvement in system capacity, but errors are still likely.

On the other hand, packet offers the capability for operators to enter traffic without having to listen first (the TNC does that for them) and allows error-free communications to occur on a channel at nearly 1200 wpm (not quite 1200 due to ACK delays and the like). Multiple messages can be "in flight" at any given time, and the TNCs can sort it all out. Since the TNC likely is coupled into a computer system at some point, traffic can be passed to commercial lanes as they become available. Automatic logging of third-party traffic becomes trivial. And system capacity is on the order of 20 times that of RTTY. The capacity is even greater compared to CW or voice nets, especially when operator fatigue is considered.

As another example, consider the computer-minded amateur. Perhaps he has developed a program he wishes to share with another amateur. He can place his TNC in *transparent* mode, where it passes all data offered to it, and send a binary file dump to the other amateur, who passes it directly to his computer. Errors are trapped before the data is passed through, so the recipient can be sure that if he receives the program, it is right.

Another system used extensively on packet right now is the bulletin board, or computerized mailbox system. Amateurs may leave messages for other amateurs or get general information items, etc.

PACSAT is a proposed system much like a bulletin board except that it will be on board a future AMSAT spacecraft. Having as much as 2 megabytes of memory, PACSAT will fly in a Low Earth Orbit (LEO) similar to OSCAR 8 or UoSAT. The PACSAT concept is a pioneering one in the use of low-cost space technology since it is far cheaper to inject a satellite into an LEO (say, via a $10,000 Shuttle Get-Away Special) than to inject one into a geostationary slot (for a few million dollars). Further, there are many more LEO-launch opportunities than there are geosynchronous ones.

PACSAT will enable a low-power ground station with relatively unsophisticated antenna systems (a whip will do!) to leave and retrieve messages with PACSAT. Since we all don't live and work on the same schedule, PACSAT opens up a brand new opportunity for non-real-time "store-and-forward" communications.

For satellites such as AMSAT Phase III, which require a fairly complex ground station, packet offers the opportunity for several stations to share a common satellite link. By means of gateway operation, where one packet station has the needed equipment to track and communicate through the satellite, other packet stations can use the facility by operating through the gateway much like using a digipeater to increase a station's effective range. Similarly, HF and high-speed UHF/mi-

crowave links may be established with a gateway concept to allow other packet stations to utilize the resource.

Resource sharing in itself is an exciting application of packet radio. Perhaps a club is heavily involved in computing and wishes to purchase a high-capacity data-storage medium, such as a 100-megabyte Winchester drive. If the unit is networked into a packet channel, the various users may access it at will.

Of course, some of these activities, such as resource sharing, will require higher levels of protocol to be defined and developed, but the potential is there and they undoubtedly will get implemented.

Wrap-Up

This series of articles has introduced you to packet radio as it presently exists, with a short look into the anticipated future. An overview was given in Part I, where certain fundamentals were presented and a packet station analyzed.

Part II went into some detail covering packet hardware, with the specific example of the TAPR TNC given. Sufficient information was presented to enable the ambitious constructor to build a TNC for packet operation (and kits are now available).

This last installment has given an overview of packet protocols and applications. While not exhaustive in any sense of the word, some history and examples have shown the types of issues involved and the present level of packet communications capability.

For further details on amateur packet radio, I encourage you to write to Tucson Amateur Packet Radio, PO Box 22888, Tucson AZ 85734-2888. ■

The CW Stationmaster

Regeneration turns the worst signal into a CW symphony. And that's not all you get when you build this station accessory.

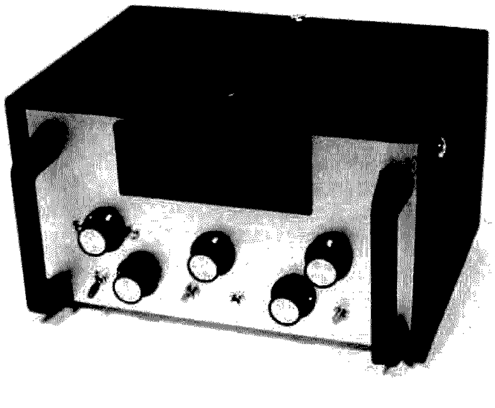
Every CW operator has (at least) two desires: to improve his ability to copy code through QRM and to be able to gauge accurately how fast he or the other fellow is sending. CRASH is a device which will enhance both abilities and provide a few extra options for the CW fan.

CRASH—Code Regenerator And Speedometer Hybrid—uses modern phase-locked-loop circuitry to provide good CW regeneration for clear copy. In addition, it counts the code speed of both transmitted and received signals. As a bonus, the unit serves as a code-practice oscillator that permits the instructor to adjust his speed accurately.

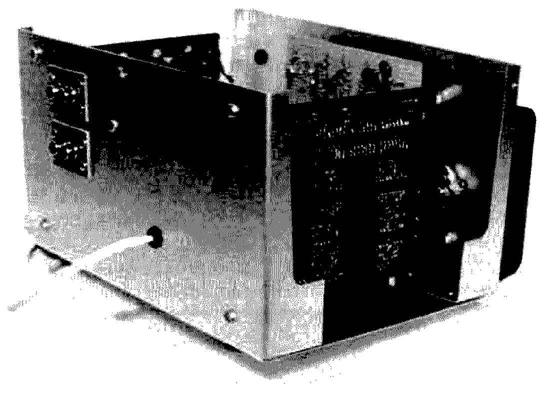
The hybrid part of the name CRASH derives from the sources of the ideas that went into its development. WB4TYL developed a very straightforward CW speedometer, "The Confidence Builder" (*73*, September, 1980, p. 134). One of the drawbacks of the unit was that it did not work well with received signals, since it responded to all signals in the receiver passband. The cure for this problem emerged from W3BYM's "Golden Articulator, a CW Regenerator for Amateur Receivers" (*Ham Radio*, October, 1980, p. 64). The heart of this unit is an LM567 phase-locked-loop tone decoder with a very narrow passband. Combining the two circuits became an easy task, since both made extensive use of LM555 timers, very handy devices indeed. The remaining chips are standard TTL ICs, plus an optocoupler and an LM386 audio amplifier.

By combining the two circuits, with additions and modifications, we achieve the following results:

- a CW regenerator with a narrow, variable frequency passband for single-signal reception;



Front view of completed CRASH unit.



Internal view.

• .-. -.-- ..-- -.- -.- .- .-.-/-..- ...

- automatic or manual return from the regenerator function to receiver audio;
- a CW speed counter which updates every five seconds;
- provision to count either transmitted or received code speed;
- a code-practice oscillator suitable for training Novices through Extra-class hams by precisely setting the practice speed;
- optically isolated keying of the unit in the CPO function;
- digital output for audio input, hence the possibility of keying other devices, such as a computer or TV readout;
- relatively simple circuitry through extensive use of 555 timers;
- a design amenable to one-stage-at-a-time building and adjustment.

Even if you do not want to copy CRASH as a total unit, there may be some useful ideas in it for other projects around the shack.

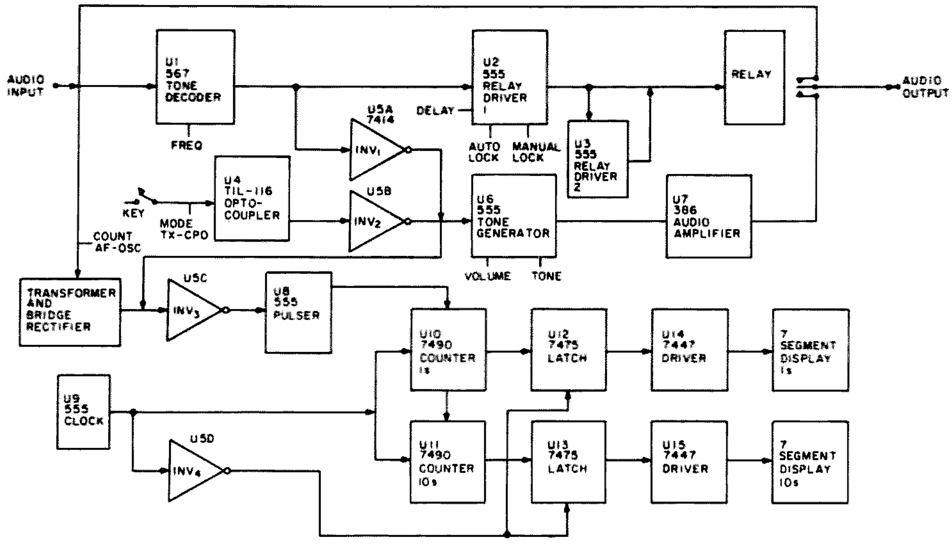


Fig. 1. Block diagram of CRASH.

Functional Analysis

Although the circuit diagrams (Figs. 2 and 3) appear complex, the functions break down in a very direct manner. Fig. 1 provides a block diagram of the entire unit to make clear what happens to CW entering at the audio input jack. Since there are so many 555s, each has been given a functional name for easy identification.

When receiving CW, the 567 tone decoder is the first step in the signal processing. It has a very narrow bandwidth, even with high inputs: 14% of the audio frequency. Over the range of the decoder (400 to 2000 Hz) this amounts to 56 to 280 Hz, a figure excellent for CW, but also capable of producing ringing in most filter designs. Since we throw away the audio at this point and create our own in a later stage, ringing is no problem.

From the decoder, which produces a digital low when a signal is present, we move in three directions. One is to a tone generator (555) which produces new CW in the astable mode. Adding the LM386 amplifier lets us change the square-wave output into something a bit less harmonic-laden, but still not a pure, monotonous sine wave.

The second direction is to a pair of 555 relay drivers. The first has variable delay time and is activated by the presence of CW plus a short press of the spring-loaded toggle switch. There is also a manual switch to change from receiver audio to regenerated CW. The second relay driver has a fixed 2-second period and is activated by the first when its cycle ends. This permits time for continuing CW to reactivate the first driver, thus holding the relay in for the entire transmission.

The third direction from the decoder is to the 555 pulser which triggers the counter. For each leading edge of a dot or dash, the pulser sends a very short (10-ms) pulse which the counter section counts during a 4.7-second period. The readout provides a display of the code speed.

The counter section itself is very standard and might be considered obsolete in the face of new combined devices available for counting and readout work. A 555 clock provides adjustable 4.7-second highs to enable counting and a brief .1-second low for resetting and latching. The 7490s build the count during the high, and their last count is latched in the 7475s by the low while the 7490s reset. The latched count is converted to 7-segment display format by the 7447s and read out on the common anode displays. The counting section runs continuously in all modes of operation of CRASH, and thus can tell us the received speed, the transmitted speed, or the CPO speed.

Back at the main board, there is a provision for switching in speaker audio to the pulser through a step-up transformer and a bridge rectifier and filter. One section of a 7414 Schmitt trigger inverter provides a sharp square signal to cue the 555 pulser. This section is most useful in checking transmitted speed by using the sidetone. Since the sidetone will rarely be in the passband of the decoder, it will not register unless we retune (a bad idea) or unless we use a wideband circuit (a better idea).

The tone generator and pulser also can be triggered directly so that we can use the CRASH unit as a code-practice oscillator. Since all my equipment is set up for negative-voltage keying, an optoisolator/coupler (TIL-116) with a negative supply permits me to switch to the CPO mode and key a compatible voltage. The inverter provides the necessary high for the tone generator and pulser. In fact, the inverters shown but not mentioned are also placed in the circuit just to make sure that each device receives a controlling signal of the proper high or low state, as needed.

For the entire unit, a relatively simple power supply suffices. The five-volt supply needs to be very well filtered (since we are working with audio and not just digital signals) and well regulated (for TTL chips). In fact, the combined digital-audio techniques represent a second reason for calling CRASH a hybrid circuit. The negative supply is uncritical; with component adjustment, anything from −15 to −50 volts will work.

Circuit Details

Having run through the entire unit, let us look at some of the circuit details that bear mentioning, either because we might want to

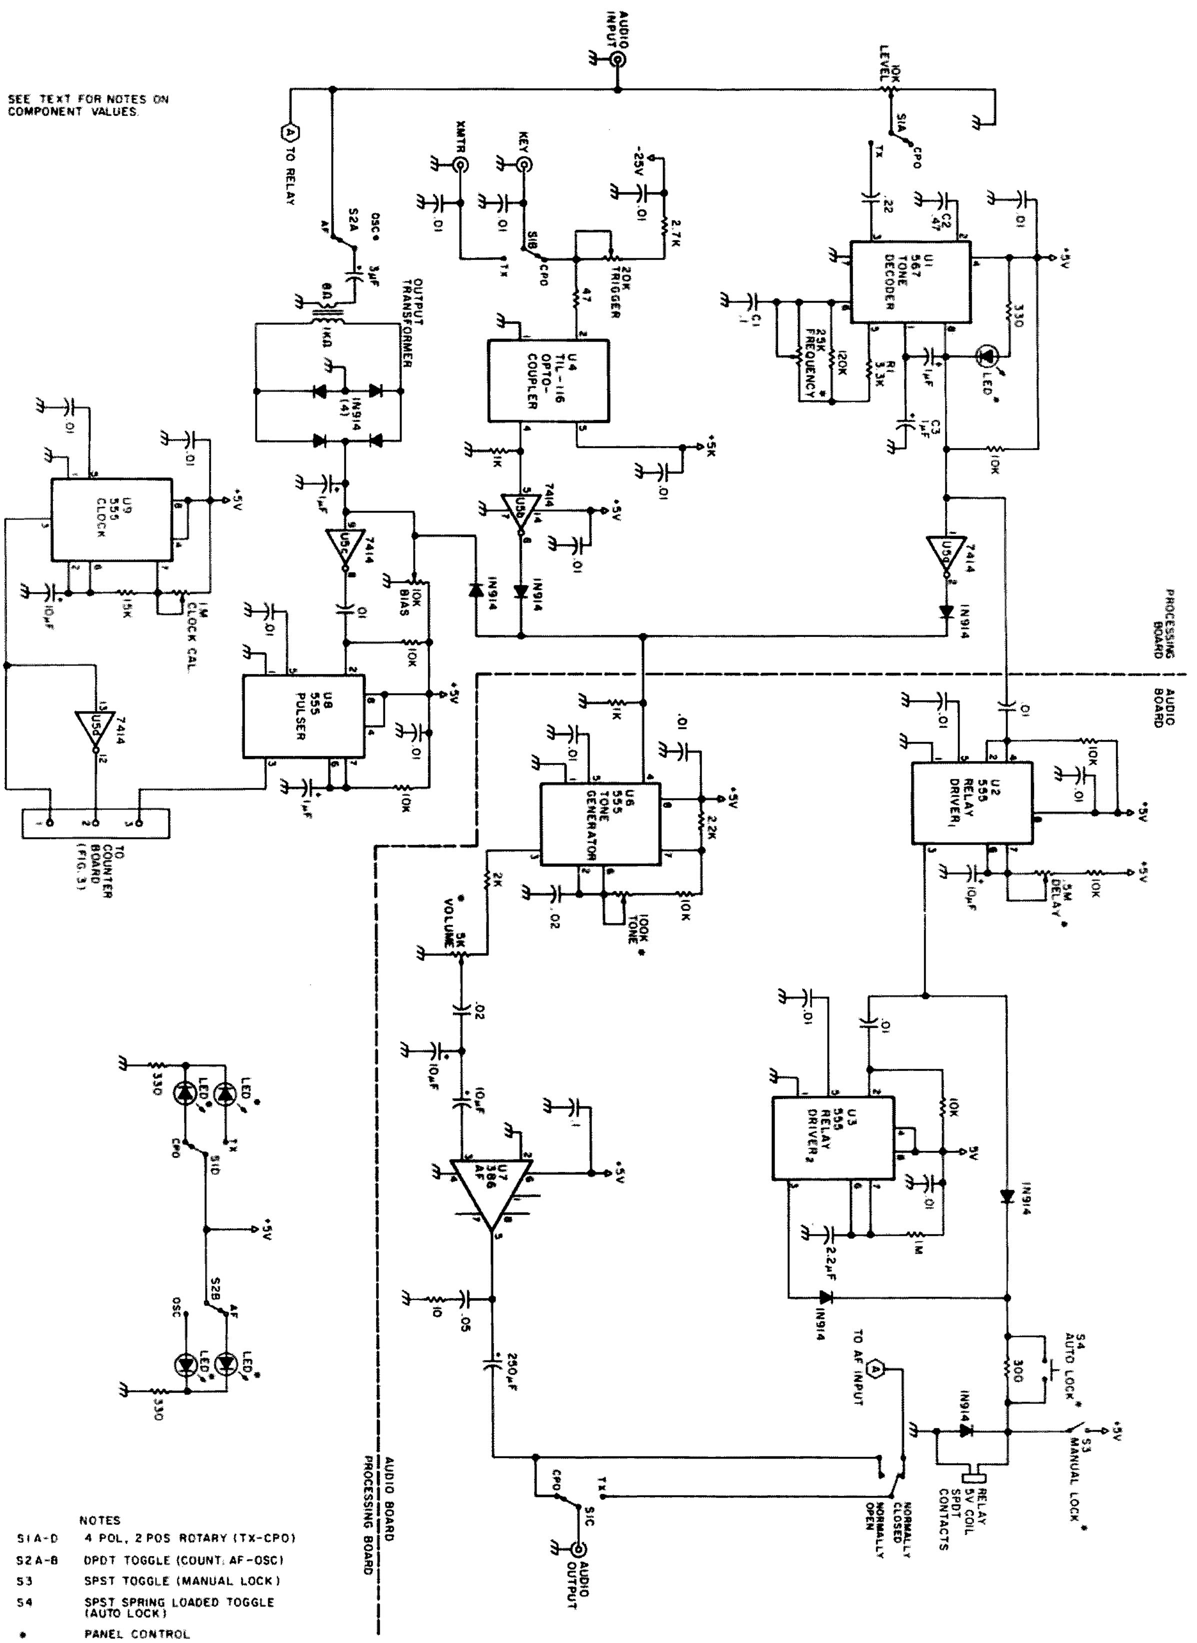

Fig. 2. Processing and audio sections of CRASH.

experiment with them or because some caution may be in order. Fig. 2 will aid us here.

The 567 tone decoder chip is extremely versatile, and a data book will provide you with enough information to experiment with values. The frequency range of the unit with the resistor and capacitor values shown at pins 5 and 6 runs from a little over 400 Hz to just above 3000 Hz. The last thousand Hz are extremely compressed, and 2000 Hz is the useful upper limit for tuning in signals. If you prefer a different range, the frequency is determined by the formula $F_O = 1.1/R1C1$, where R1 is the series-parallel combination of the 25k pot, the 120k resistor, and the 3.3k resistor, and C1 is .1 uF. The minimum resistance should be no less than 2k.

With most received signals, the input signal level will run above the 200-mV level at which the decoder limits and the bandwidth levels at 14%. For maximum speed of the decoder, that is, the fastest rate of cycling in response to received code, C2, the bandwidth filter should be derived from the formula C2 = 130 uF/F1, where F1 represents the lowest frequency to be used. This gives a value of .325 uF, and hence the .47-uF capacitor shown. C3, the output filter, should be about twice the value of C2 as a minimum, hence the 1-uF unit. The 1-uF feedback capacitor between pins 8 and 1 provides suppression of chatter, that is, multiple on-off cycling at the leading and training edges of the dots and dashes (a phenomenon which does not disturb the tone generator, but which produces some unbelievable code-speed indications). Since the highest cycling rate for the unit is given by the decoder frequency divided by 20, and since for practical purposes the highest code speed is about twice this value (in terms of

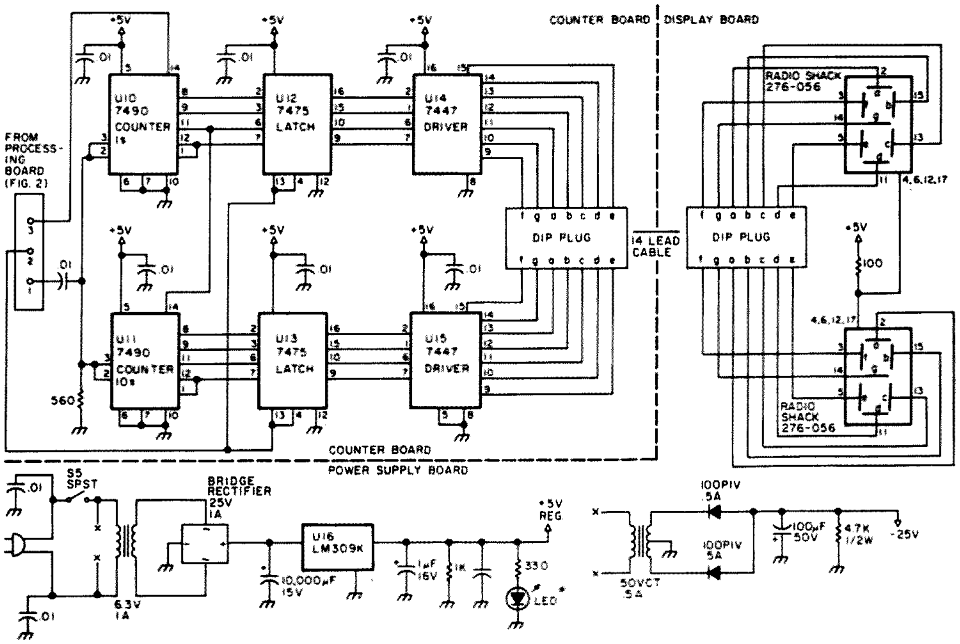

Fig. 3. Counter, display, and power supply sections of CRASH.

dots and dashes, not in terms of bauds), the values shown may be a bit low for those who listen to lower-speed code in the main. Static, which is random in tone and hence sometimes is in the passband of the decoder, may activate both the tone generator and the counter. Experimenting with values for C2 (and adjusting C3 accordingly) can overcome this at some loss of tracking at the very highest speeds. The feedback capacitor should also be enlarged in such cases.

A single 7414 chip provides all the inverters needed for the entire unit—with two left over. The 7414 inverters are Schmitt triggers which provide extremely sharp rise and fall slopes. About the only place they are essential is just preceding the pulser to sharpen the rectified audio into a good digital pulse to key the pulser cleanly. The two inverters feeding pin 4 of the tone generator could have been combined into a NAND gate (¼ of a 7400) as shown in Fig. 4, with the remaining sections used as inverters by tying together their inputs. This would have saved the use of diodes and

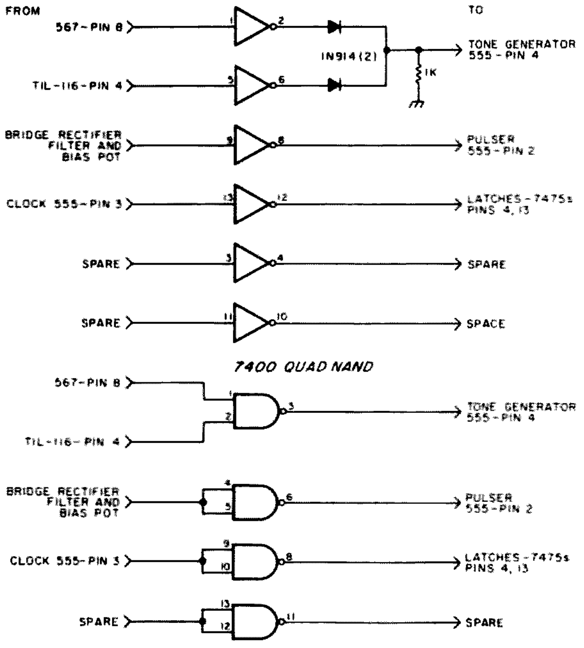

Fig. 4. Using a 7400 in place of the 7414.

the 1k ground-return resistor. Either system should work well.

All of the 555s are used in standard ways as either monostable timers or as astable oscillators. Among the monostables are the relay drivers. The first has a variable time period of .1 to 5 seconds, which is controlled from the front panel. The second is fixed at 2 seconds. This system is more reliable than the original, which used a large capacitor across the coil of the relay. The value of the requisite capacitor will vary according to the coil characteristics; the present system makes the delay in opening the speaker to receiver audio independent of the re-

lay. The 300-Ohm resistor between the output diodes from the 555s and the relay may require some adjustment depending on the relay you have in hand. The Auto switch is a spring loaded toggle which shorts out the resistors and keys the relay when a signal has activated the first driver. Since the voltage needed to pull in a relay is greater than that needed to hold it in, the relay remains in the circuit as long as either one of the drivers is activated. The 555 is triggered faster than its output falls, so there is no noticeable voltage drop during the transition from the first to the second driver. The Manual switch allows you to hold in the relay independently of the Auto circuit.

The other monostable 555 is the pulser whose 10-millisecond pulses permit tracking of CW to a very high speed.

The tone generator is a standard audio range astable circuit for the 555. Volume and tone controls are provided on the front panel. With the values shown, tones from 200 Hz to 3000 Hz are available. Contrast this circuit, where the wave has nearly equal positive and negative halves (or nearly equal on and off times), with the clock 555, which places the large resistor value between Vcc and pin 7. Here the "on" time is very long and the "off" time very short. The 4.7-second on time can be adjusted using a digital stopwatch (averaging several tries) or by allowing the counter to show the speed of a known transmission, such as a timed code-practice session. The 1-meg pot shown should be a miniature trimmer with 10 to 15 turns; otherwise, the adjustment will be very tricky. The .01 capacitor from the clock to the 7490s provides a count-clearing pulse that drops again through the resistor to permit gathering a new count.

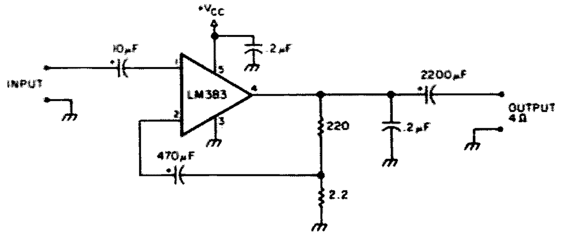

Fig. 5. An alternative audio amplifier.

The inverter provides the positive pulse to the latches to clear their old count and take on a new one for display. At the 7-segment readout, the single 100-Ohm resistor provides a simple means of lighting the units; however, brightness will vary depending on how many segments are lit simultaneously. For constant brilliance, use a 300-Ohm resistor in each lettered leg and omit the 100-Ohm unit in the supply line. Note that the lead zero is suppressed. The schematic shows the units in reverse order of visual indication—be sure to get the tens unit on the left. For common cathode displays, use 7448s instead of the 7447s and reverse the supply voltage.

Supplementing the basic circuit are a number of features. The optoisolator/coupler permits use of the unit as a code-practice oscillator. The internal LED of the TIL-116 (or just about any other available similar unit) is fed negative voltage through a multi-turn pot trigger-level adjustment. Use the minimum current that will key the output transistor cleanly, since there is little load on the circuit. The 47-Ohm resistor between the pot and the TIL-116 is a safety feature limiting the maximum current the LED can draw.

The LM386 is an extremely easy chip to use as an amplifier. It provides about a quarter Watt of power at 5 volts, far more than enough for a single CW tone. The 1-uF capacitors at the input make triangles out of the 555 square waves. Under load, these bend into hybrid sine and square waves, which are very pleasant to listen to for long periods of CW. The series resistor and capacitor to ground in the output might be omitted at the risk of what National Semiconductor calls "bottom side fuzzies," a distortion to the negative peak of the waveform. I was able to produce this effect easily, so I recommend retaining this simple insurance of good reproduction. If you desire more power, Fig. 5 shows an alternative amplifier using the LM383. This one will fill an auditorium with sound if your speaker is big and good enough.

The transformer and bridge circuit are miniature parts, the transformer being a reversed transistor output unit for driving speakers. The diodes (like all others, except in the power supply) are 1N914 equivalents. One uF should work as the filter, but you might wish to verify first that the inverter swings cleanly and that the counter gives accurate readouts. The bias pot, another multiturn unit, should be set for about .8 volts. More precisely, adjust it for a level that permits audio signals of moderate level to cleanly swing the inverter.

Switching within the unit may look complex, but actually is straightforward. The TX-CPO 4-pole, 2-position rotary changes several things at once. The speaker audio reaches the decoder in the TX position. In the CPO mode, the amplifier (LM386) output is switched to the speaker rather than allowing the relay to control it as in the TX mode. The key is switched from the TIL-116 circuit (CPO) to the transmitter (TX). Finally, a pair of LEDs are switched to indicate the mode. Other switches are the two relay driver control switches, a DPDT toggle to place the audio input into the bridge and counter circuit (with LEDs to indicate what is being counted), and the power switch. One other LED appears in the decoder circuit to give a visual indication of tone-decoder signal lock and the code being received.

The power supply is normal in every respect, with an LM309K regulator in the +5-volt line. Note the heavy filtering in this supply to suppress hum. Those who work with digital circuits are accustomed to using about 3000 uF in such circuits, but audio requirements are much more stringent. The negative supply is unregulated and uses a small transformer from the junk box. Since its only function is to provide voltage and current to the optoisolater/coupler, not much of either is needed and any small transformer from 15 volts up will work. Although the LED in the TIL-116 requires only about 1.7 volts, the higher initial voltage provides room for adjustment of LED current to the lowest level that will key well.

Construction

Duplication of CRASH exactly as shown is a fairly straightforward task, but it may not be the best way for you to go. Many of the circuits can be replaced with others you prefer, and as long as each works at TTL levels, substitution should present few problems. Many extra features can be built into the unit to serve your CW needs, so before building, try modifying the design to fit your desires. After all, this is how CRASH happened in the first place—by a combination and adaption of ideas used by WB4TYL and K3BYM. The odds are

.-.-/... .-. -.-- .... .

you can come up with some new design wrinkles and improvements.

Construction of the CRASH unit is a matter of taste. All will fit in a Radio Shack 9" by 5" by 6" cabinet, as the photo shows. Fig. 6 shows a sketch of a layout for inside the cabinet, while Fig. 7 suggests some board layouts by reference to the ICs. Although the prototype was built around two boards—one for processing, the other for the counter—I recommend using three. The processing board is overcrowded after circuit modification and adjustment.

Radio Shack digital experimenter boards (#276-156) for use with edge connectors (#276-1551) make convenient bases for the components, and Fig. 7 is drawn with these boards in mind. The counter board contains the 7490s, the 7475s, and the 7447s lined up in rows as in the schematic. The ouputs to the display board use a 14-line DIP connector set. A slightly larger set would permit running the power and ground connections as well.

The processing board should contain the 567 decoder, the 7414 inverter chip, the 555 pulser, the 555 clock, the transformer and bridge circuit, and the TIL-116 optoisolators. A separate audio board should contain the 555 tone generator, the 386 amplifier, and the two 555 relay drivers, along with the relay. The three boards might be mounted vertically in the case. The power supply is built on perfboard and mounted on standoffs at the bottom of the case for good weight balance. The display board also uses perf material and is held to the front panel by standoffs attached to the lugs on the bezel for the readout. Since most bezels are large enough for up to six digits and we only need two for this project, indicator LEDs (six of them) are mounted on the display board against a black foam background. This minimizes panel work and makes an effective blackout display when power is off.

Since the photo of the front of the unit was taken before the addition of the lettering, the panel control knobs are as follows, from left to right: decoder frequency, relay delay, TX-CPO switch, regenerator tone, and regenerator volume. The toggle switches along the bottom of the panel are, also left to right, ac power, auto relay, manual relay, and audio-oscillator counting. Were I to build a second version of this unit, about the only change I would make is to add a 2:1 or 3:1 vernier to the decoder frequency control, since tuning is just a bit tight at higher audio frequencies.

Because the unit mixes digital and audio functions, it is easy to slip into digital habits and ignore the fact that ground loops and hum pickup are potential problems in layout. Besides using a high level of filtering in the +5-volt supply, some extra precautions will minimize problems. Use short ground leads and attempt to ground all parts of each circuit to a common pad or small area. Group the main audio circuits together especially the 555 tone generator and the 386 audio amplifier. Use shielded leads from input and output terminals to the boards, and between boards, for all audio lines. On each board, run a 47-uF or 100-uF electrolytic to ground at the power entry point and bypass each chip with at least a .01-uF disc ceramic capacitor.

Since you will be using the unit in the presence of your transmitter and with the keyline running into the unit, good rf practice is also essential. Bypass both ac lines where they enter the case with .01-uF disc ceramic (1000-volt units, which are getting harder to find at discount prices). Also bypass the key jack and the transmitter jack with .01 units. Since rf can instantly disable many ICs, especially at transmitter leakage power levels, the more bypassing, the better. It should not affect dc levels in the keying circuits. When you develop your own layout, be generous in this department. If in doubt, bypass it. Finally, be sure the case is at dc ground potential. Some of the anodized cases make it difficult to get a good ground contact, so be sure to use a good tooth washer at contact points.

Since this is a one-of-a-kind unit, I regret that no circuit boards are available. However, The Radio Shack epoxy experimenter boards are fun to use, and where perfboard is recommended, the wiring is easy and straightforward. The toughest problem will be to have patience during construction.

When you build the unit (if you do build one), I recommend one of two procedures. Either build the unit a stage at a time, or at least omit the power lead to every chip until it is time to check out the circuit. The first step, as in all projects, is to build and test power supplies. Once these are ready, we can work progressively through the rest of the stages.

A good place to start is with the counter board, which can be built complete, along with the seven segments of the display board. Since there are few components besides jumpers between ICs, visual inspection should prepare you for testing under power. Next, verify the clock 555 as operating by checking its output (and the output from its inverter section) with a VTVM. If all is well, connect to the counter board. Only the right (ones) digit should light and show zero (although there may be a spurious count when power is applied). For test purposes, you can key 5 volts through a resistor (say 1k) to the counter input to verify counting. If all is well, time the counter with a stopwatch. An easy way to check periods is to tap the key a few times so that the count changes at the end of the period. The

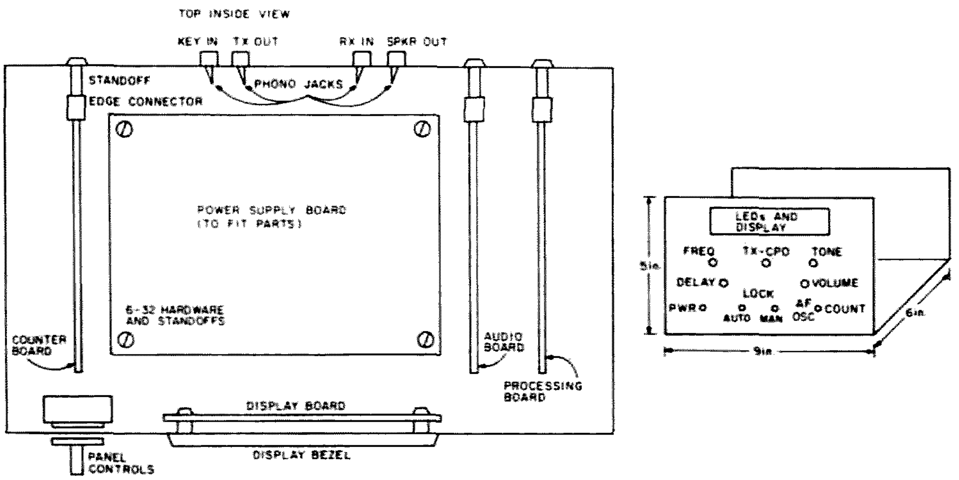

Fig. 6. General layout sketch for CRASH.

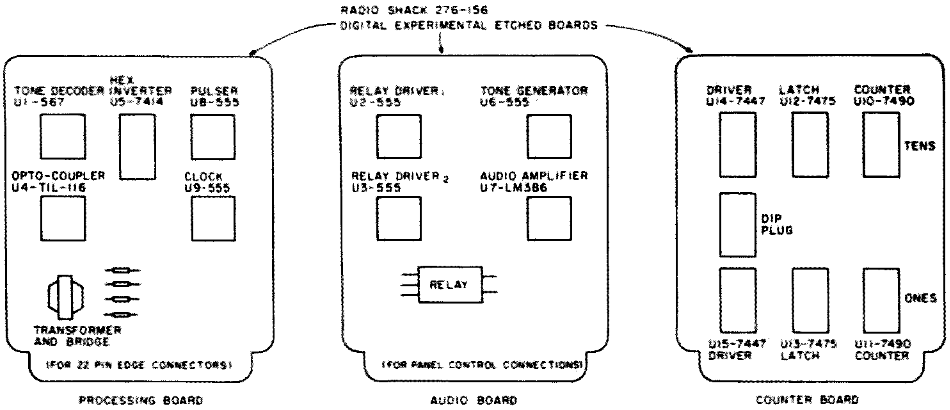

Fig. 7. Suggested board layouts for CRASH.

target for reasonably accurate code-speed readouts is 4.8 seconds per total cycle.

The next step is to verify the 555 tone generator. In the absence of the tone decoder and TIL-116 keyer, key the tone generator by applying +5 volts to pin 4. When you are satisfied with its volume and tone ranges, add the 386 amplifier. If you have a scope, you can check the waveform and adjust the capacitor network between the 555 and the 386 to suit your taste. The 555 can overdrive the 386, so check the output with a scope if you can. Adjust the coupling capacitor (shown as .02 uF in the schematic) so that the waveform just begins to flatten at full volume.

At this point, you can move in several directions according to your preference. Now is a good time to wire the TX-CPO switch and adjust the TIL-116 optoisolator/coupler. Begin with maximum resistance on the 20k multi-turn pot and reduce the resistance until pin 4 of the TIL-116 shows clean keying without hanging, as indicated by a VTVM. The object here is to get clean keying of the tone generator with minimum current to the LED. Since the inverter requires little current from the phototransistor output of the TIL-116, there is little need to overdrive the system.

We can now count our own code speed as we key the optocoupler, since the inverter which keys the pulser is driven. Adjust the bias 10k multi-turn pot until the output of the inverter (pin 9) also shows clean keying without hanging, as indicated on a VTVM. About .8 volts of bias will suffice, and we will readjust this control in a moment. For now, we should see our code-speed readout on the seven-segment displays every 4.8 seconds. To be sure that counting is good, key the unit a known number of times (that is, 2 to 12 or so dots) within a counting period and wait for the readout to correspond. In this way, we can check that the counter and pulser are giving us proper performance.

At this point, wire the AF-OSC switch and the input to the transformer. The OSC position is blank, since the incoming count connection is made directly to the pulser's inverter. Audio from the speaker, however, goes directly to the transformer through the switch to count the sidetone oscillator during transmit periods or to count received signals when the band is clear. An audio generator with a few volts output at low impedance will aid you to readjust the bias 10k pot so that the keying is clean. Weak signals may not push the voltage to the inverter high enough to trigger the inverter, but once connected to the receiver, the sidetone should key the counter easily. You may want to tweak this adjustment later when the unit is connected to the station rig.

We have saved the tone decoder 567 for last. Using the audio generator so that the 567 has about .2 volts at its input and with the TX-CPO switch in the TX position, locate and lock the audio signal with the frequency control. 700 to 900 Hz should put the control about midrange using the series-parallel resistor combination given. If you key the audio line, the tone generator should follow without delay and the count should be accurate. If the count goes very high, even at slow keying, you probably are experiencing chatter and may want to increase the feedback capacitor between pins 8 and 1 from the 1-uF value shown. The LED from Vcc to pin 8 should also track the keying.

Assuming that all is well to this point, check the unit with on-the-air signals on a fairly clear band. If the 567 responds too readily to noise (anything from QRN to internal receiver pops), you may want to increase the values of the capacitors at pins 2 and 1 of the 567, remembering to keep the larger about twice the value of the smaller. This will slow down the response of 567. We cannot eliminate all response to noise without cutting off higher speed CW, but we can find values that will keep the counts fairly accurate and eliminate hash from the keying of the tone generator.

At this point, the CRASH unit should be operational and ready for dial decals, case covering, and regular use in the shack.

Operation and Modification of CRASH

Operating CRASH is simple but requires some adjustment of your habits. When receiving CW, find the desired signal with the frequency control. The LED will track the code when the signal is in the passband of the 567. If the signal drifts, it is probably better to ignore the regenerator and concentrate on the station. Stable signals, however, will stay in the passband. Once the signal is acquired, use either the auto or the manual toggles to switch to the regenerator.

Since CW without QRM and QRN sounds strange at first, you may initially dislike the effect. Part of learning to like clear reception is choosing tone and volume settings that please your ears. You may find that you prefer a lower volume than with received signals, and the tone you choose may be something different from where you usually tune signals in the receiver passband. Experimenting with signals on relatively clear bands is the best way to match the unit to your preferences.

Although the 567 tone decoder accepts a wide range of input levels, receiver characteristics limit the useful range. Weak signals beyond the receiver agc limit can fade below the 567's ability to lock, and excessive volume may be accompanied by enough noise pulses to hold in the relay continuously, even without a signal. The level control can be adjusted to provide the 567 with input voltages tailored to your own habits with the receiver volume control. However, you may have to adjust receiver volume to suit the 567 if you of-

ten move from noisy bands with high signal levels, like 80 meters, to quiet bands with weak signals, such as 15 meters in the evening. Considerable experience using the CRASH unit may be needed before you settle on the final compromise setting of the level pot.

Although the unit operates well as is, CRASH is a good project for trying out new ideas. For example, Fig. 8 shows the insertion of an amplifier to isolate the audio to the speaker from the inputs of the transformer and the 567. Any amplifier which limits the voltage at the output in a controllable way should work here. Fig. 8 also shows an extra transistor in the relay circuit, in case you wish to drive relays of other than 5 volts, or in case you want to drive a heavier load.

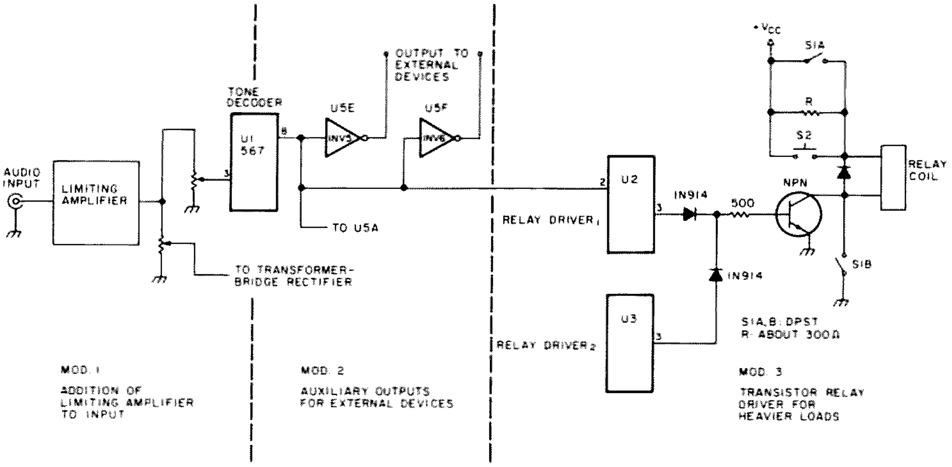

Fig. 8. Some modifications to CRASH.

In addition to these options, which have been tried but are not used in this version, the CRASH unit provides possibilities for external connections. Since the 567 bandwidth is narrow and its output is digital, the unit can also be used to key other devices. Fig. 8 shows inverters as buffers to other devices, such as a MORSE-ASCII converter system for television or a computer readout of the CW. How you do this is open to many options, and a system is under development here for driving a TRS-80 III. Once you have brought the unit this far, then computer keying, automatic logging, and other station conveniences are only a dream and a soldering iron away.

In short, the CRASH unit not only works well as a CW regenerator and code speedometer, but it also forms the basis for a number of other station options. But that is the way it usually goes with ham projects: One thing leads to another and nothing is ever finished for good. There is no telling what a good CRASH will lead to next. ■

Top Drawer, Micro-Style

Building circuits is fun, but drawing them isn't. Let your Apple do your drafting.

Bill Smith K3LF
RD 2, Cold Spring Creamery Rd.
Doylestown PA 18901

Using a microcomputer to assist in designing circuits is a natural. I recognized this shortly after acquiring my Apple computer and proceeded to build a library of electronic-design programs. My library covers such things as audio filters, timers, multivibrators, and many op-amp circuits. Most of the programs were entered from magazine articles such as those found in back issues of *73*. These programs are a real asset when designing or trying to "ballpark" component sizes for a particular application.

As helpful as these programs are, they have one major weakness: They have no way of displaying the circuit diagram. To make matters worse, they usually refer to components as "R1" or "C3." To find out where "C3" is located in the circuit, you have to find the article from which you entered the program and hope that the author included a circuit diagram with all of the components labeled correctly. If you are like me, you will probably find that you lent that particular magazine to a friend who just left town for a sabbatical in South America!

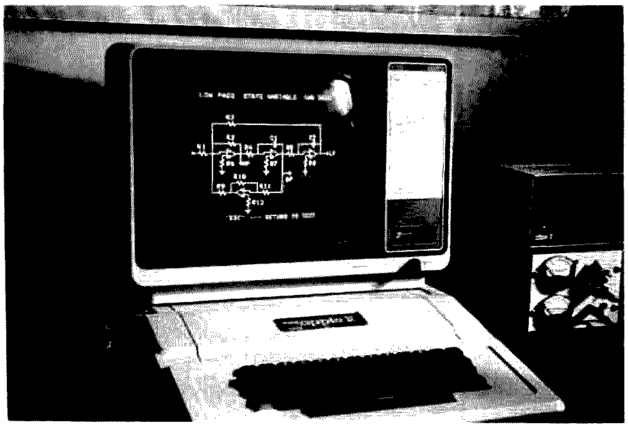

Fig. 1. Schematic of an active audio filter as it would appear within a program. This is typical of the type of schematic which may be incorporated in your programs.

Well, hang on, help is on the way. This article describes how you can incorporate that schematic diagram within your program so that it will be available at the touch of a button.

I have devised a system that uses the excellent HIRES capability of the Apple II to your best advantage. I decided that the system to be used should be fairly easy to implement; I did not want to spend hours entering a diagram for each program. I needed a system that would be flexible so that I could enter all types of electrical schematics, not just one unique circuit. Lastly, the system had to allow me to enter fairly complex circuits.

With all of these points in mind, I embarked on a six-month project to develop the system described here. I call it my "EGG" (Electronic Graphics Generator), and it really works.

The EGG is nothing more than a shapefile with up to 200 shapes and a system to map the shapes onto the HIRES screens. (Currently there are 135 shapes in the shapefile but I have set up the file to handle up to 200 for any future expansion.) The first 59 shapes are characters generated by the Apple's text generator. These shapes are used for labeling circuits and components and for any text desired on the HIRES screen with the circuit diagram. Shapes 60 through 65 are Greek letters common to electrical diagrams (such as lambda for wavelength), 66 through 99 are the actual electrical components, and the remaining shapes are used for connecting the components and drawing rectangles representing ICs.

The Apple HIRES screen dimensions are 280 points horizontal by 192 points vertical. I used these dimensions to determine the optimum size for each shape in my shapefile. Each shape is drawn within a grid that is 15 ×15 with the origin of the shape located at the center of this grid. Using these dimensions, I could accommodate 18 shapes horizontally and 12 shapes vertically for a total of 216 shapes

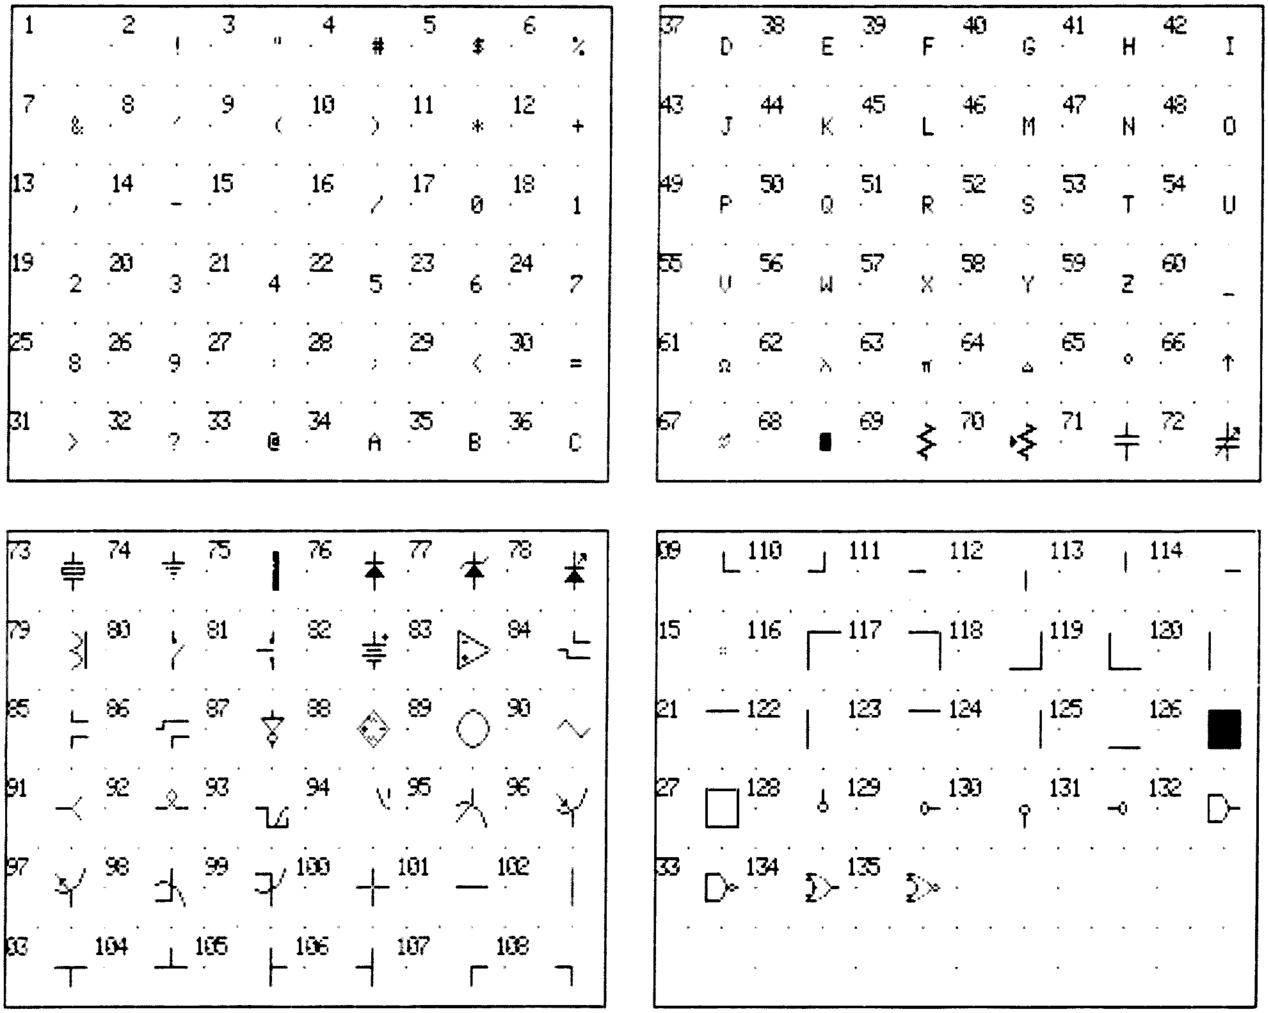

Table 1. These are the shapes in the shapefile along with their respective shapenumbers. You may add an additional sixty-five shapes to the file if you can think of any to add.

on each screen. With two HIRES screens available, I could have up to 432 components in my circuit, more than enough.

Practically speaking, the number of components you will be able to fit on the screen will be much less as labels and connecting lines take up some space. To date, the largest diagram I have used contained 28 components and it easily fit onto one screen. With a little effort you should be able to get as many as 50 components on a screen and still have them labeled properly. Fig. 1 is an active audio filter which I recently used in a program. As you can see, this is a moderately complex circuit but it fits on the screen well and all of the components are easily recognizable.

As mentioned, the shapes are all centered in a square measuring 15 spaces times 15 spaces. This is an important point and I want to explain it in more detail. If you examine shape 76, a standard diode, you will notice that the leads are centered on the 15×15 grid. I have enlarged this in Fig. 2 so it may be seen more readily. You will find that all of the components have their leads exiting on a center line, either horizontal or vertical. If I draw two of shape 76 and each is rotated 90 degrees, with one centered 15 spaces above the other, the leads will appear to connect as shown in Fig. 2. Having the origin of all of the shapes located in the center allows us to use the ROT (rotate) command so that we can draw the diode as

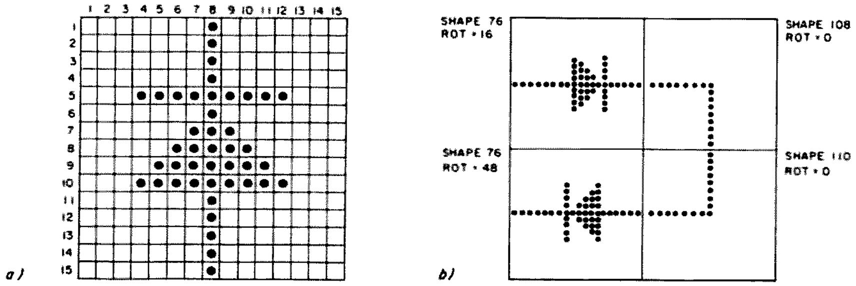

Fig. 2.(a) Shape #76 as it would appear under a magnifying glass. (b) This drawing shows how the shapes are rotated and combined to form schematics.

shown, and you will find that the leads exit the grid centered on either side. By maintaining this convention throughout the shapefile, I have made it possible to draw any of the components in any of four orientations with their leads available for easy connection to the next component.

By now you should have a good idea of how the shapefile is set up. Next, I will describe how to use it to get diagrams into your programs. There are two methods. One is quick from a programming point of view but takes longer to execute and uses more room on your diskettes. The other takes a little longer to program but executes quickly and takes little storage room.

The first method is to use the schematic draw-and-edit program accompanying this article. This program makes it very easy to draw, label, and edit a diagram. Once the diagram is drawn, the entire map of the HIRES screen is saved to disk. This method is quick. (The schematic in Fig. 1 took about ten minutes to draw and edit using the EGG program.) The main drawback to this method is that each screen must be loaded from disk when needed. It takes about 34 sectors to store this much information, and it takes about 8 seconds to read it in from disk. This 8-second delay in the middle of a program is mildly disconcerting but certainly acceptable.

The second method is to enter into your program the necessary BASIC language statements to draw the shapes during program execution. Using this second method to generate the diagram of Fig. 1 took less than one second during program execution but requires about thirty minutes of programming.

Using the EGG program is really quite easy as it is menu-driven and contains many useful edit commands. There are two levels of menus. The first level is used to select which HIRES screen you are interested in using and the second level allows selection of various

Program listing 1. This is the actual shapetable. This should be entered exactly as shown beginning at address hex 8000.

operating modes. From this second level you may save a HIRES screen to disk or load one into memory from disk, and you may enter a new schematic, edit one already in memory, or return to the first menu. If you select the enter or edit mode, you will next see the HIRES screen either blank or with the last schematic you put there. You also will see a small arrow and a three-digit number in the upper-left corner of the screen. The arrow indicates the rotation applied to the next shape to be drawn, and it may be turned by pressing the R key. The three-digit number shows the shape number to plot next.

To plot a shape, move the cursor to the desired place on the screen using the I, J, K, and M keys. Enter the shape number and push P (Plot). Some other available commands are Erase, Finish, and Text. This last command puts you into the text mode so that you can add text to your schematic.

The edit commands in the text mode are similar to those in the diagram mode except that you use the CTRL key to get the function desired. To get the text onto the screen, just type the characters desired and they will be plotted automatically. In both text and diagram modes you can move the cursor through your drawing without affecting the drawing. I have included a comprehensive set of instructions within the program and about two minutes of practice is all you will need to start diagramming. If you don't feel up to entering the EGG utility, you can always use the second method of putting the diagram into your programs.

Get some graph paper (I use paper with half-inch squares). Position the paper with the long side horizontal and draw a grid of half-inch blocks so that you have 16 columns and 12 rows. Draw a heavy line between the second and third row from the bottom. This line is the bottom of the page 1 screen. Starting at the top left, label the first column 15, the second column 30, the third column 45, and so on until the last column is labeled 270. Starting at the top left, label the rows in a similar fashion so that the bottom row is labeled 180. Next you should make copies of this as it is your worksheet for

Program listing 2. This is a listing of the timer program discussed in the text. It works well; give it a try the next time you are playing with a 555 timer chip.

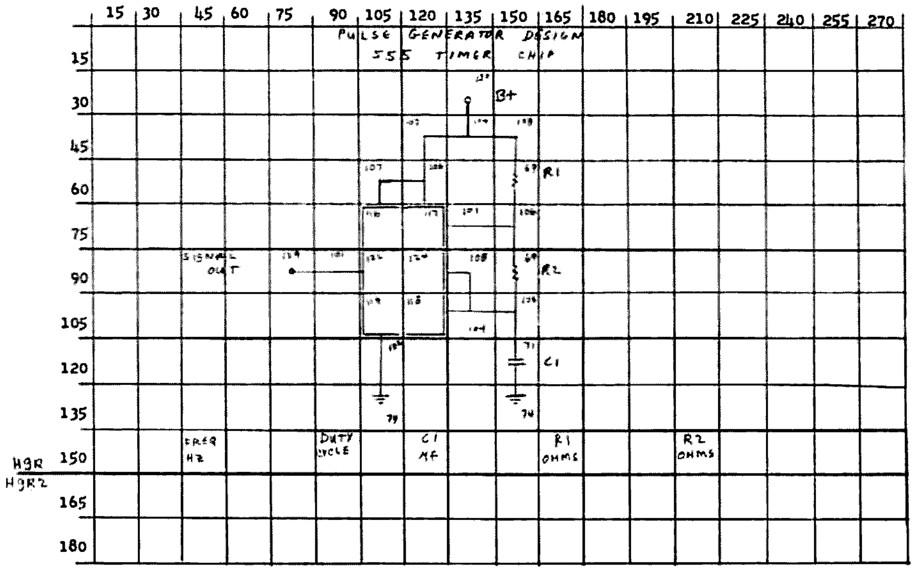

Fig. 3. Example of the worksheet discussed in the text. The diagram is that of the schematic used in the timer program listed with this article.

drawing and inputting schematics. (See Fig. 3.)

As an example of how to correctly use the worksheet, I have included my timer program in Fig. 3 and will step you through the procedure for implementing the schematic in that program. Notice that each shape making up the circuit is centered within a block so that its leads will exit in the middle of a side rather than at a corner. First, draw the diagram on the worksheet using only shapes from the shapefile. Next, label each shape with its corresponding number. Now enter any labels or text desired.

The next step is to enter the worksheet information into your program. In my example program (Program listing 2), the HIRES portion is located beginning on line 4000 and extends to the end of the program. Lines 4500 through 4590 draw the actual shapes. The easiest way to do this is draw all of the shapes on each worksheet row using one program line. This speeds up the programming process considerably when it comes to editing. Sometimes, when a row has only one shape, I will include that shape with the next row (such as line 4510 which draws the shapes for rows 30 and 45).

Lines 4200 through 4275 are a subroutine which makes the printing of text very easy. It takes the string P$ and prints it with normal character spacing beginning at the last values of X and Y. This subroutine will allow you to input only one line of text at a time. Additional

Program listing 3. Here is the EGC draw-and-edit program listing. See text for a description of how it works.

lines may be processed automatically by incrementing Y when the value of X gets to 274. Lines 4280 through 4350 print the header on the diagram using P$ and the line 4200 subroutine. Lines 4600 through to the end are the labels for the schematic and the remainder of the text on the HIRES screen.

The schematic for my timer program is small enough so that I was able to use HIRES page 1 and use the four text lines at the bottom for my calculations. This is a very convenient setup as I can see the diagram at the same time I am calculating values. To get the most out of the four lines below the HIRES screen, I put the column headings directly on the HIRES screen at the bottom. Most of my programs with schematics require that the calculations be displayed on page 1 of text while the schematic is on the full-screen HIRES page 2. In these programs I include a small subroutine which allows me to flip between the schematic and the calculations. This is accomplished by checking each input to the calculations for an ESC. When one is encountered, use the "soft switches" described on pages 12 and 13 of the Apple reference manual to display the desired HIRES page. To return to the calculations, use the same system. Check for the ESC key to be depressed, then use the soft switches to display text page 1. This method will leave your calculations intact while you examine the circuit and you will have to draw the circuit only once as it is preserved unchanged.

Most of the shapes in the shapefile are self-explanatory, but there are a few requiring comments. Shape 70 is a variable resistor. If you connect a lead to the left side, it will appear as a regular potentiometer. Shape 79 can be used for coils, transformers, or chokes. Shapes 84, 85, and 86 are leads to be used with the op amp, shape 83. Using these leads will allow you to connect the op amp to other components using the standard configuration. Shape 88 is a bridge rectifier, while shape 89 can be used for meters and other round items.

Shapes 93 through 99 are for transistors and FETs. To draw a transistor, you must combine four shapes, but they make very nice transistors. I use shapes 116 through 119 to draw ICs.

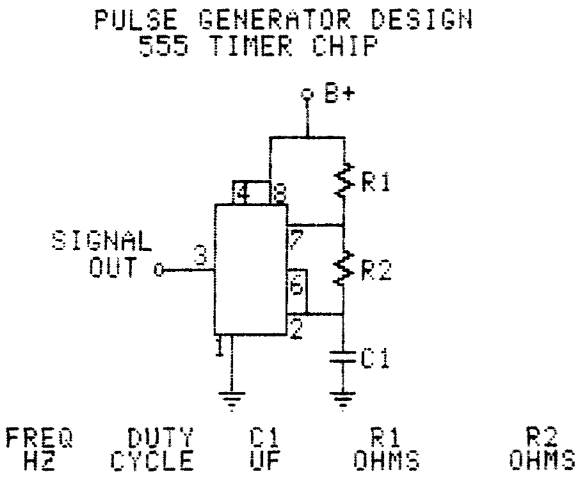

Fig. 4. Actual HIRES screen of the schematic used in the timer program. See Fig. 3 for the worksheet used to develop this schematic.

This allows enough room to label the pins clearly. The remainder of the shapes should be fairly self-explanatory, and if you are not sure about what a shape does, just try drawing it on your computer. If you want to add shapes to your shapefile, you should consult your Apple reference manuals and be familiar with shapetables. To conform to my system, the new shape should be drawn on a 15 × 15 grid and the origin of the shape should lie at the center (coordinates 8,8). Also remember to have all leads exit at the middle of a side. In setting up the shapetable listed here, I used a program from *Micro Magazine*, September, 1980, called "Creating Shape Tables, Improved," by Peter A. Cook.

I have listed the shapefile beginning at $8000. Note the $00 beginning at $810c and extending to $8193. These 00s are necessary for proper operation, and this is the space set aside to address additional shapes which might be added to the end of the table in the future. If you enter this shapetable by hand, you can edit the shapes by remembering that each shape is separated by a hex 00. If you have a problem with, for example, shape #9, find the ninth set of hex 00s in the listing and you will be looking in the correct area. This shapefile is quite lengthy so I will make a copy available on disk. If you send me $12.00, I'll send you a copy of the shapefile and the EGG utility program. In addition, I will include a copy of the timer program and a couple of copies of my worksheet. The timer program and the EGG utility are written in Applesoft BASIC and recorded using DOS 3.3. I hope you get as much utility out of my EGG as I have; it will add a whole new dimension to your programs with a minimum of effort. ■

Trade Secrets of Mobile Installation

Mounting a rig in your car is not as hard as it seems. Find out how the pros do it.

Dave Ingram K4TWJ
Eastwood Village #1201 South
Rte. 11, Box 499
Birmingham AL 35210

Installing presently-popular amateur transceivers in the limited space of today's cars can often prove to be a hair-raising experience. While slide-in mounts and rig-hanging brackets may be readily available for some units, these mounts often place their respective rigs in rather awkward positions. When the rig is removed from the car, the unused mount or bracket may continue to occupy vital interior room and thus further emphasize the need for a more flexible arrangement.

The mounting techniques presented in this article will attempt to alleviate those problems and provide a simple yet effective means of containing the rig in a desired location. Since the majority of mobile installations are usually more involved than merely placing a transceiver in the car, I'll also briefly consider antenna cabling and dc power-cord routing. Amateurs following these general guidelines should be able to progress from a "stock" new car to a complete mobile installation in less than an hour's time (assuming everything needed isn't buried at the bottom of a junkbox!).

Rig Location/ Mounting Ideas

An amateur owning a large automobile with a full-width dash, bench-type seat, and no center console

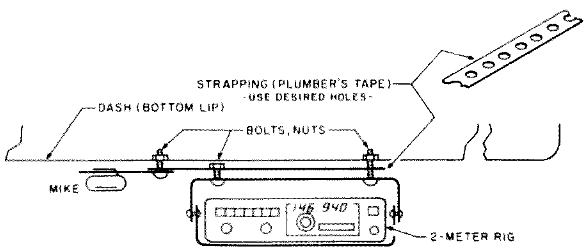

Fig. 1. Method of using strapping to mount a rig under the dash, using existing holes. Screw and nut sandwiched between the dash bottom; strapping should be short and thin for snug mounting and to prevent scratching the rig. The mike holder can be screw-mounted to one of the holes in the strapping.

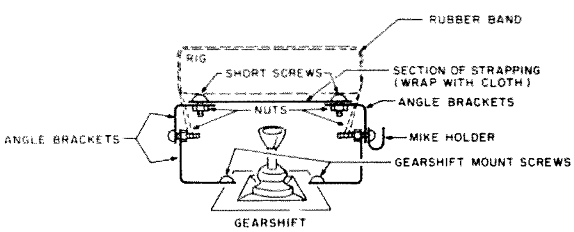

Fig. 2. Method of using hardware-store L-brackets and metal strapping for a universal mount on small autos. Rig's front sits on the covered strap and is held securely by a rubber band. Brackets may be tilted as desired.

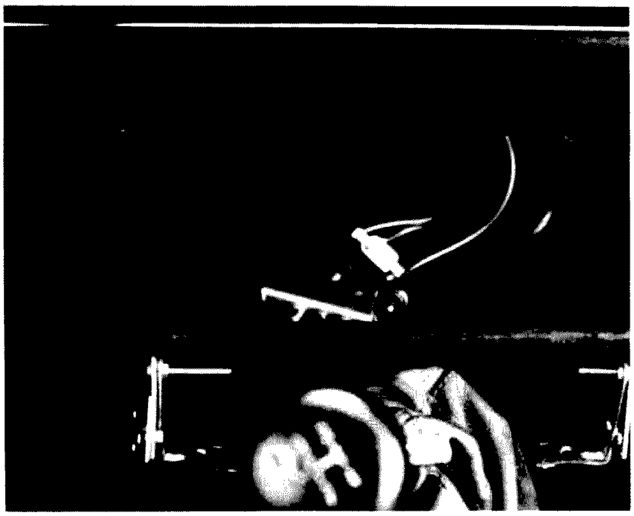

Fig. 3. The home-brew mount. Note the power connectors for various rigs in the background.

Fig. 4. Low-band transceiver is side-slid into position with its front feet catching on the bracket. The rear of the rig is sitting on the transmission hump. The squeezed position assists in securing the rig, eliminating need for a hold-down strap.

Fig. 5. This rig-mounting bracket is ideally suited to rapid installation artists. The unit is merely placed on the mount and secured with a heavy rubber band. Either top or bottom-mounted speakers can be used with this arrangement.

will experience few problems mounting his rig or rigs. If existing holes in the under-dash lip don't align with the rig mounting bracket, a section of metal strapping (plumber's tape) can be used as a "hole relocator." This arrangement is shown in Fig. 1. The rig's rear area can rest lightly on the auto's carpet, if necessary, and a small chock can be used if thick carpeting blocks air flow around heat sinks.

Mounting 2-meter FM-sized transceivers (and possibly small-sized low-band transceivers) in compact autos exhibiting miniscule dash-to-transmission-hump clearance can prove to be difficult. The most logical solutions here involve using home-brew brackets and existing supports for maximum benefit. One example of this technique is shown in Fig. 2. Four L-brackets are bolted together as shown, with heavy metal strapping bolted between the upper L-brackets. The lower L-brackets are secured to the auto's gearshift mounting L-plate via existing screws. These are slightly underneath the floor shift's rubber boot in autos such as the Sunbird, Monza, Skyhawk, etc.; squeezing the boot's bottom will reveal the screws. The upper L-brackets' size and angle of tilt can be varied as desired for proper rig positioning. In order to prevent rig scratches, cover the brackets' upper area with a couple of layers of cloth matching the auto's interior, and sew the cloth tight.

This mount can be used with a variety of rigs, depending on the particular auto's hump-to-dash clearance. A 2-meter rig, for example, can be placed on the mount and secured in place by a rubber band stretched between the long L-bracket screws. (How's that for a quick install/remove caper?) An HF rig such as the Atlas, Kenwood TS-120, etc., can also be side-slid into this bracket by positioning its front feet in front of the covered metal strap while the dash itself secures the rig from its topside (the rig's rear then rests on the transmission hump). Other rigs can also be used with this L-bracket setup merely by securing them with a rubber band when necessary. A small towel the same color as the auto's carpet can be used to cover or camouflage the rig during brief out-of-car stops.

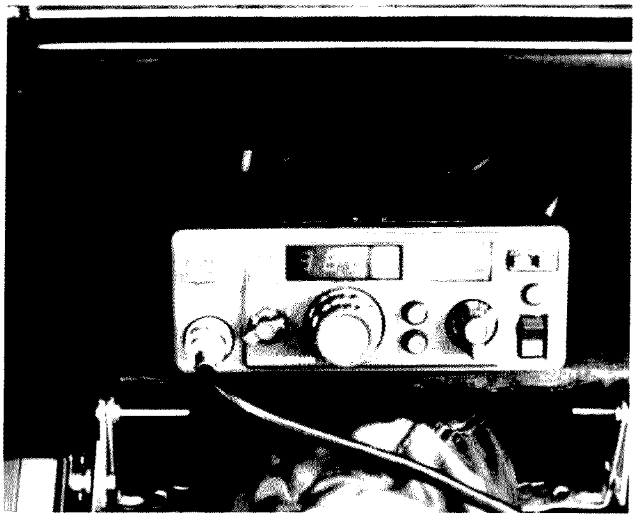

Fig. 6. A second (or third!) rig can be used with the bracket of Fig. 5. If front feet don't secure the rig, use a heavy rubber band. Note the mike mount on the left side of the bracket.

(Be aware, however, that any out-of-view auto is open prey to rip-off artists).

Many small and intermediate-sized autos feature bench-style seats and one-piece dashes which can support 2-meter FM rigs, but may present problems for securely supporting larger HF rigs. An effective mounting idea for these autos involves propping the HF rig between the front seat's edge and the transmission's hump, securing it with a cloth-covered boat tie-down strap as shown in Fig. 7. If connecting cables dig into the carpet or if the rig's heat sink is slightly obstructed, a small piece of wood or indoor/outdoor carpet may be used for chocking. All rig cables and the tie-down strap can merely be pushed under the seat when not in use, providing a perfectly clean-looking interior. Cloth-covered tie-down straps are

available from boating supply or sporting goods stores, with most stores boasting on-the-spot assembly of the tie-down in any desired length. The highest price I have found on tie-downs is $3.00 each.

Fig. 7. Mobile installation of traveling amateur W4CEC consists of an Azden 2-meter rig and Kenwood TS-120. The 120 is merely propped on the auto's seat; its tilt-down front bail secures the unit and eliminates the need for a tie-down strap. The Azden is secured, complete with bracket, by a tie-down strap hooked under the dash. Clever and convenient, and both rigs can be removed in a snap.

Two special-consideration-type mounts which may be applicable to small autos with center consoles involve mounting a mobile rig sideways on either the console or the drive-shaft tunnel right behind the rider's seat. This arrangement is illustrated in Fig. 8. Surprisingly, the front mounting often will support a large low-band rig while the rear mount supports a 2-meter rig.

Routing Cables

Today's tightly-assembled autos can prove quite challenging to cable routing, but a few tricks of the trade can simplify that situation. Antenna transmission line can easily be routed through the auto's trunk area by moving the rear seat on the rider's side and poking part of a stiff, discarded whip antenna through to the trunk. Next, tape the coaxial cable to the end of that whip and pull it into the auto's interior. (Use heavy-duty filament tape and help the cable along for first-try success.) Additional cables, if desired, can then be taped to the initial cable and pulled through in a similar manner. Routing cables on the auto's right (rider) side also is good due to the absence of steering wheel, floor pedals, etc.

The whip-antenna trick is also useful for passing power cords through auto firewall openings. The most logical and convenient opening to use is the expandable grommet through which the speedometer cable passes. Again, poke the whip into the auto's interior, tape the cable to the whip rod's tip and pull it back through the grommet, helping it as necessary.

Finally, make a composite resistance check in the following manner to ensure solid ground connections. Short the antenna's center conductor and shield at the antenna proper, then measure from the power cord's negative lead, through the auto body, through the antenna mount, and back to the center conductor of the PL-259 for less than 1 Ohm's resistance. At this point, you are ready to check alternator/battery voltage with the motor running to ensure that less than 14 volts is delivered . . . and then connect the rig.

Conclusion

The techniques of mounting amateur gear in autos varies with each set of circumstances, yet each installation can be made easier by using ideas tried and proven by others. I hope this collection of thoughts and views will prove helpful in both the installation and operation of your existing or future mobile rigs. ■

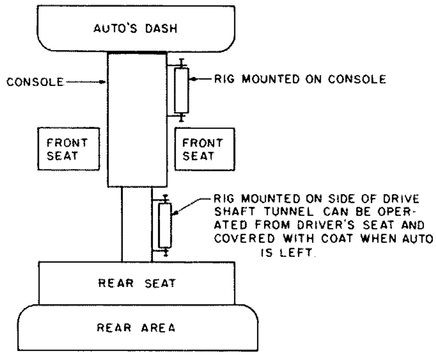

Fig. 8. Two rig-mounting locations for small autos which provide flexibility and a degree of security. Location behind rider's seat is preferred for small 2m FM units.

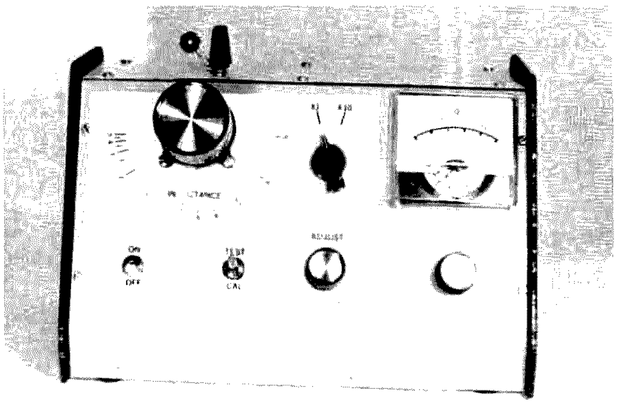
Around and Around and Around

There's got to be a better way to wind your coils to specs. Build the Q-meter and get the exact inductance you need.

Edwin C. Miller N7APE
306 W. Court Street
Weiser ID 83672

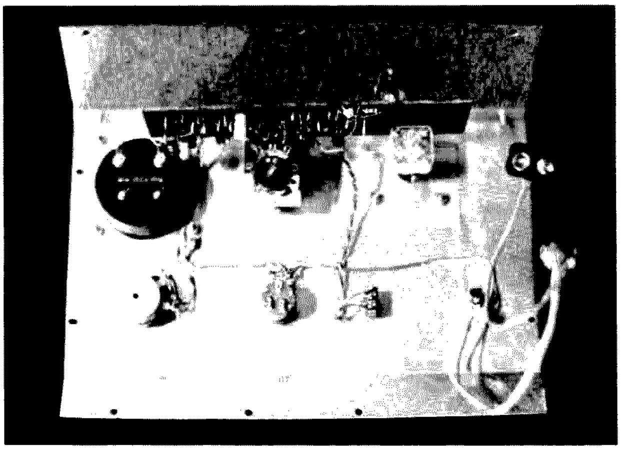


Front view of completed Q-meter.

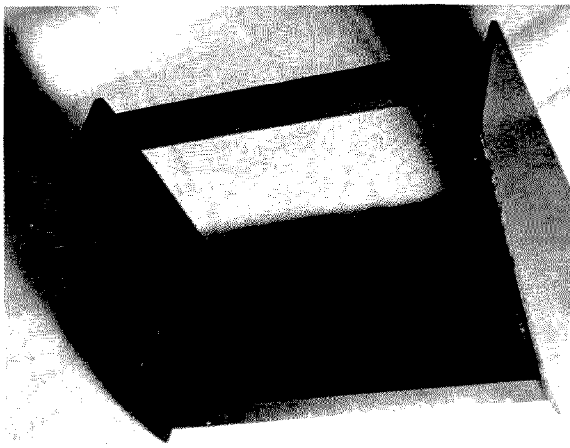
Winding coils for a new project seems to be one of the more frightening aspects of the job. One reason may be the fear that we may not be able to duplicate the author's model. If we have a way to check each coil before it's installed, much of the apprehension is removed. A "Q"-meter will do this by measuring the coil's inductance and Q. The unit pictured is such a Q-meter that will measure inductances from .5 uH to 50 uH and Qs to 200. It's easy to build, easy to operate, and is powered by an internal 9-volt battery or wall-plug power supply.

There are four basic parts to this Q-meter: a dual-frequency rf oscillator, an FET voltmeter, a power supply, and the tank circuit that indicates the inductor of unknown value (L_X).

Fig. 1 is the schematic. A 2N2222 transistor serves as the rf oscillator, followed by an MPF-102 JFET buffer. The range of measurement is controlled by the oscillator frequency and the tank variable capacitor. With the capacitor specified, the range is .5 to 5 uH at a frequency of 20.05 MHz, and 5 to 50 uH at 6.34 MHz. The two toroid coils resonate with C1 and C2 to produce these frequencies, and S1 determines the range in use. The buffer stage provides the neces-



Assembled panel and top plate showing component mounting.



Pine and Masonite™ case for the Q-meter.

sary low impedance excitation for the tank circuit through C8. A 1N270 germanium diode (D1) rectifies the rf output of the buffer and is used to calibrate the meter before taking a measurement. A hot-carrier diode (D2) is placed across the variable capacitor and rectifies the tank circuit current to provide a dc voltage that is proportional to the Q of L_x at resonance. It is this voltage that is measured in the TEST position of S2.

The JFET voltmeter uses two MPF-102 JFETs, zeroed by R15. Full scale on the meter should be 250 microamps or less. The critical components have been selected so that the Q reading will be quite accurate if 100 is used as the calibration reference. The meter I used is calibrated from zero to 250 and is a 200-uA movement. A more sensitive meter will require using a higher resistance setting of R12, but will not affect the unit's accuracy. Qs of 250 or more are seldom required and are difficult to obtain, so there is not much need to have a higher scale.

As for construction, there is really only one critical portion—the mounting of the tank components (C9, C10, and the terminals for L_x). At 50 uH, an inch or two of extra wire will not have much effect on accuracy, but at .5 uH, the leads must be kept as short as possible. This is one reason for the miniature variable capacitor and small unit for C9. The terminals for L_x consist of 4-40 bolts mounted directly to the Formica™ top, using solder lugs to connect to the circuit board components and 4-40 hex nuts fastened by epoxy to small wire nuts for holding the unknown inductor leads. Small 5-way connectors should also work fine. Although I used an import vernier dial mechanism and attached a plastic pointer, a non-reduction knob will work quite well—it's just a little harder to get right on resonance. The shaft of C10 is too short to reach the panel. It can be

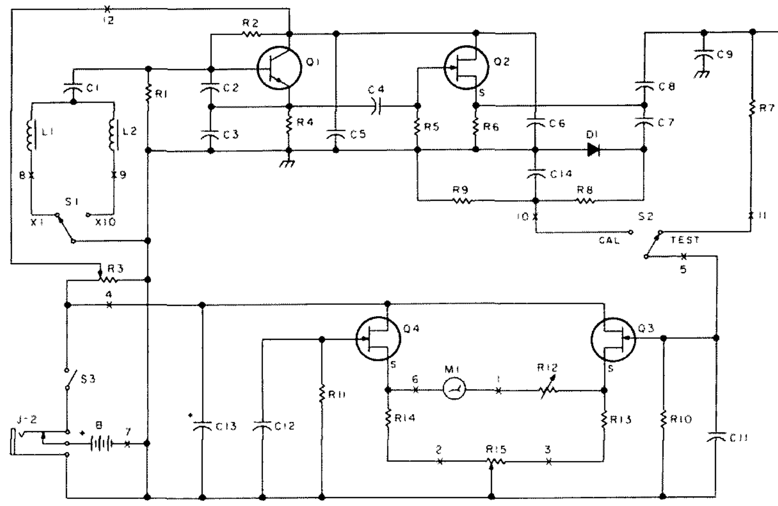


Fig. 1. Circuit schematic.

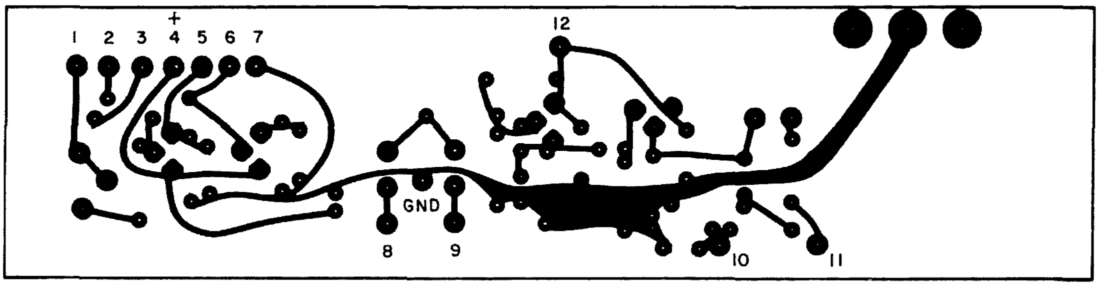

Fig. 2. Circuit board.

Parts List

C1	620-pF ceramic disc
C2, C3	68-pF NPO ceramic
C4	56-pF NPO ceramic
C5, C6, C11, C12	.01 ceramic disc
C7	100-pF ceramic
C8	22-pF NPO ceramic
C9	1500-pF poly
C10	138-pF variable (RS A1-234)
C13	10-uF, 25-V electrolytic
D1	1N270 germanium diode
D2	MBD-101 hot carrier diode
R1	47k, ¼-Watt carbon
R2	100k, ¼-Watt carbon
R3	10k linear pot
R4	1.5k, ¼-Watt carbon
R5, R9	1-meg, ¼-Watt carbon
R6	390-Ohm, ¼-Watt carbon
R7, R10, R11	2.2-meg, ¼-Watt carbon
R8	100k, ¼-Watt carbon
R12	100k trimmer
R13, R14	150-Ohm, ¼-Watt carbon
R15	2k linear standard pot
L1	1.97 uH (21 turns #24 enamel on T-37-2 toroid)
L2	19.7 uH (70 turns #32 enamel on T-37-2 toroid)
S1	SPDT rotary
S2	SPDT mini-toggle
S3	SPST mini-toggle
M1	200-uA meter (see text)
J1	Connectors for L_x (see text)
J2	Mini phone jack (normally-closed circuit)

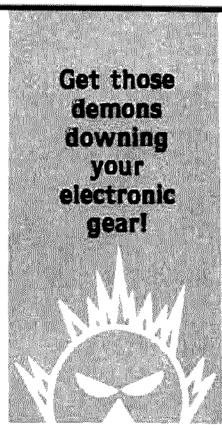
lengthened by attaching a one-quarter-inch round metal spacer with a bolt into the capacitor's threaded shaft. An alternative would be a small flexible coupler and a piece of ¼-inch shaft.

The total current drain is under 15 mA, so a 9-volt battery will last a long time with intermittent use. For ac operation, any rectified and filtered wall-plug supply that is rated at 4.5 to 9 volts fills the bill.

To put the Q-meter to work, set S2 to TEST, turn on the power switch, and adjust the meter to zero reading with R15. Switch S2 to CAL and set the rf level to 100 on the meter by adjusting R3. Connect the coil you want to measure, using the shortest possible leads. Reset S2 to TEST; tune C10 for maximum deflection of the meter. The reading is the approximate Q of the unknown inductor. If you cannot get any upward deflection of the meter, try the other position of S1. If you still cannot get a reading and you are quite sure the unknown inductance falls within the range of the meter, recheck the L_x connections. A good connection is a must for reliable operation of the Q-meter.

A test coil can be made by winding about 15 turns of #24 enamel-covered wire in a T-37-2 or T-37-6 toroid. You should measure it somewhere around 1 uH with a Q of about 100. If you are satisfied with the results, you may want to mark the measured information on a tag and attach it to the inductor. It can be used later to check the performance of the meter if you should question a reading on some unknown coil.

This relatively simple project can take a lot of the fear out of coil-winding, as well as sort out unmarked small inductors and provide the identification you need. ■



Nothing matches the MACC in voltage surge protection and component-by-component on-off control

- compact, attractive desk-top console
- eight clean AC power outlets
- individual and master on-off control
- superior three-stage auto-restore circuit with manual reset circuit breaker
- individually lighted rocker switches

Lightning striking miles away, electric motors running on the same power line, fluorescent lighting and even wind-driven snow static buildup can cause problems with delicate circuits and miniature electronic chips. But the MACC, within nanoseconds, can recognize the current disturbance, then clip it off and dissipate it, while maintaining clean current flow to your system's equipment. The MACC protects all semi-conductor, solid-state circuitry.

The MACC is designed with three 2000-amp surge discharge protection circuits — one between each of the AC input's hot, neutral and ground lines. Other surge devices may use a single 100-amp surge protector between the hot and neutral lines only. Its resettable circuit breaker adds further protection.

MACC gives you control convenience, too. It provides 8 plug-in "U" ground outlets for your components — including one "hot" outlet for a continuously powered application such as your clock. Seven "on/off" rocker switches let you control individual components. And you can turn your entire system on or off with a single master rocker switch.

ALPHA DELTA'S MASTER AC CONTROL CONSOLE PROTECTS AGAINST ALL THESE DAMAGING SURGE PROBLEMS

Problems caused in circuitry by surging and transient voltages:

- Melting of "hot spots" within semi-conductor devices
- Thermal runaway of transistors
- Welding, pitting and metal transfer on switch contacts
- Switch contact corrosion
- Insulation breakdown causing arcing of components
- Shortening of component life

The MACC is tested to IEEE pulse standards and rated at 15A, 125V-AC, 60 Hz, 1875 watts continuous duty total for the console. A label on the unit describes the surge protection limitations.

MACC Specs

Alpha Delta Master AC Control Console

Amperage	15
Volt (AC)	125
Hertz	60
Total Wattage	1875
Size	
MACC	11" x 2-3/4" x 2-3/4"
MACC-4	5-1/2" x 2-3/4" x 2-3/4"
Shipping Weight	4-1/2 lbs. approximately

Alpha Delta Model MACC Systems are designed to reduce the hazards of lightning-induced surges. These devices, however, will not prevent fire or damage caused by a direct stroke to an AC line or a structure. Specifications, availability and price are subject to change without notice.

Warranted against defects in materials or workmanship.

AUSTRALIA

J. E. Joyce VK3YJ
44 Wren Street
Altona 3018
Australia

In most countries, to varying degrees, amateurs are involved in emergency situations. We in Australia have an organization called Wireless Institute Civil Emergency Network, abbreviated to WICEN, that is set up as a community service in times of declared emergency situations. It is used also at several sporting events during the year as practice exercise.

However, in what we in the southern states of Australia called "The Holocaust of Ash Wednesday," practice turned to reality. It was a firestorm that spread from Adelaide in South Australia right through Victoria and up north to New South Wales—a distance of 800 miles. For us it fell, unfortunately, on the biblical Ash Wednesday, February 16th.

The states of the lower part of Australia were ripe for a bushfire. Being realistic, bushfires are a natural phenomenon here, as a lot of our trees and grasses will not germinate until bushfires have heated the seedpods to temperatures that would destroy imported trees and shrubs. The previous two seasons had been hot and dry, and on the morning of the 16th, we had a temperature of over 40° C plus strong winds of over 60 mph at some spots.

We had noticed minor bushfire smoke on the horizon during the working day but were not aware that in a few hours the whole state of Victoria with all its emergency services—and amateur radio in particular—would be put to the greatest test for decades. As you can imagine, with a country that relies largely on telephone lines strung between gum trees and wooden poles across open plains, it did not take long, once the fires got started, to burn down the gum trees and the wooden poles, leaving much of the state of Victoria with a communications problem. Added to this was the fact that most of our emergency services had only two or three crystal-locked channels of communications each.

It soon became clear that WICEN had to be activated to back up the overloaded communications systems of the authorities. Most amateurs had been monitoring the 2-meter repeater in their area and it was not long before literally hundreds of amateurs had volunteered to go mobile or set up base stations in the affected areas. All the 2-meter repeaters were taken over for emergency use in the Melbourne area, giving us a coverage of at least 100 miles all around Melbourne. Also, we had HF set up on 80 and 40 meters for those low spots that VHF could not reach.

By the early hours of Thursday morning, February 17, WICEN was in full swing, had organized amateurs as base-receiving stations, and had dispatched mobile stations with VHF, UHF, and HF capabilities to all the disaster areas.

The sights at some of these spots were horrific, with some of the smaller towns losing 100% of their buildings. More than 2000 dwellings were totally destroyed. The loss of stock went into the thousands, and it was a pathetic sight to see hundreds of dead or dying stock, some of the badly injured ones still wandering around waiting to be shot.

Upon arriving at some of the places we were to operate from in the early stages of the operation, the scenes were not much better, with people wandering around dazed, some of them with their clothes still smoldering. Large holes burned in their coats, dresses, etc., showed how close they had come to being casualties. Even though a lot of them had lost everything they owned, their main worries were whether fathers or some other relations or friends had survived in the next town, or perhaps only 10 miles away.

With the fires still raging and the phones mostly out of operation, it was here that WICEN operators, by now located at all disaster relief centers, could really help. Welfare messages were passed, and the looks of relief on faces when messages came back that relations or friends were alright made a lasting impression on the WICEN operators, some of whom had spent up to two days with no sleep.

Some of the places of operation were a bit hairy, to say the least, as some amateurs decided to stay in the path of the fire to relay messages. While some were set up in plush hotels with cold drinks and hot meals, others were out in the bush with cold sandwiches and hot drinks.

As a rough guide to the intensity of the fires, agricultural pipes buried two feet underground were melted and buckled beyond recognition; land that was previously flat had actually boiled and afterwards was left rough and uneven.

The wind created by the fires reached over 100 mph in some places. One instance we had reported from one of the worst-hit areas along the southern coast of Victoria was that people trying to direct traffic had to wrap arms and legs around the safety rails of a bridge to keep from being blown off.

Another aspect of fires in Australia is that the same eucalyptus oil that gives relief to people all around the world is also released during the heat of the fires. It can form into fireballs that can be up to 50 feet across and can roll along, sometimes far in advance of the main fire front. There was a sad total of 70 lives lost in these fires over a period of 2 days.

The amateur involvement did not end with the fires. Amateurs later were asked to assist in "Operation Clean-Up," when councils from most country and city areas donated men and equipment to help the fire victims remove their debris so they could start to rebuild their houses and lives. As most of these bulldozers, front-end loaders, etc., did not have two-way communications, a control center was set up and approximately 150 amateurs gave their services either at control or out with the vehicles, directing them from one site of destruction to another.

A debriefing was held for all amateurs and some of the emergency services and the result, I feel, will be a greater degree of cooperation between all concerned in any future emergencies. Also, in the media coverage of the fires, there was a fair mention of the involvement of amateur radio, and I think the general public now has a greater understanding of the role that we, as amateurs, can play in community-service ventures.

The Wireless Institute of Australia has displayed proudly on the clubroom wall in Melbourne a plaque of appreciation awarded to them for the part played by amateur radio in "The Holocaust that was Ash Wednesday."

This photo, taken 100 years ago, shows the first electric plant in South America, in Campos City. Equipment came from Cleveland, Ohio, to Campos City, the pioneer in using electric light services in South America.

CW GROUPS

CW operation has had a gradual increase in Brazil the last five years, especially on the low bands. More on forty than on eighty, we can hear a dozen stations daily between 2100 and 0300 GMT, our after-dinner time. The establishment of more than twenty CW groups did this.

Sponsoring at least one beautiful award, CW groups have provided their members with the necessary incitement to be active in CW as much as possible. Their annual contests are successful and they receive more than 95% of the logs from the participants, even when they made only a few QSOs.

Since the beginning of "73 International," we have published, little by little, the rules of some of those CW awards. Now, after six months, we are happy to say that those groups which have had their award rules published have received many more applications for their awards from abroad. And the awards are not so easy, even for us!

AWARDS

Regarding the rules of the CWRJ Award published in our column of May, 1983, please add to the CWRJ members list the following stations: PY1QN, PY1PL, PY1DUB, PY1VKA, PY1VMV, PY1ECL, PY1DWM, PY1TBW, PY1APS, PY1DMX, PY1KX, PY1QQ, PY1URQ, PY1ENW, and PY1VEC. They are all very active stations and will make it easier to work the CWRJ Award.

LETTERS

We want to thank you very, very much for the letters we have received from readers of our monthly column. Besides the kindness and the most flattering terms of the letters, we are happy to know that readers are interested in Brazilian things and events.

One of them, Richard W. Randall K6ARE, collects old telegraph and wireless keys, and he is trying for one from each major part of the world. He wants an old key made in South America. The age does not make any difference, but it should be complete and in working condition. If possible, the key should be marked with the place it was made and the name of the company.

I have forwarded his letter to the CWSA CW group in the city of Santo Andre. Who can help Richard?

WIPA AWARD

Sponsored by the Grupo Praiano de CW (GPCW), the WIPA Award is available to all licensed amateurs for confirmed contacts with 10 (ten) different cities which have international ports (harbors) in at least three continents. No more than two cities for each country. For example: in Brazil, the city of Santos and the city of Rio de Janeiro. Contacts must have been made after January 1, 1983, on any amateur band. Only two-way CW mode with a minimum report of (RST) 338. No QSLs. Send GCR list of stations worked (call,

date, time, band, mode, and report) and 15 IRCs for mailing expenses to GPCW, PO Box 556, 11100 Santos, SP, Brazil.

Endorsements: copper label for additional 5 (five) cities, silver label for additional 15 (fifteen) cities, and gold label for additional 30 (thirty) cities.

de PY1APS

CAMPOS CITY AWARD

In 1883, a hundred years ago, using equipment coming from the Brush Electric Light Company, Cleveland, Ohio, for the first time in South America public electric light service was offered—in Campos, a Brazilian city in Rio de Janeiro State. Celebrating this event, Campos radio amateurs are sponsoring the Campos City Pioneer Award, as follows:

Available to all licensed radio amateurs, the award may be won by forming the sentence "1883-1983—Campos—Cem Anos de Iluminacao a Eletricidade. Pioneira na America do Sul (meaning 1883-1983—Campos—One Hundred Years of Electric Light Service. Pioneer in South America).

Use last letters of callsigns of stations reached to make the words. Contacts with two stations from Rio de Janeiro (PY1) are required, each one to substitute for one of the two dates (1883 and 1983). Contacts with stations from Campos City are valid as special QSLs to substitute for any missing letters.

Any band, any mode QSL is valid, mixed or single as well. Contacts made from January, 1983, on only. Do not send QSLs. Send log certified by amateur radio society or by two radio amateurs, stating name and call, date, QTR, report, band, and full address with zip code. Fee is 10 IRCs, and send request to Comissao Diploma Cent. Luz Elet., PO Box 391, 28100 Campos, Brazil, South America.

Submit the 62 needed QSLs in a column, in log, with the last suffix letters forming the sentence vertically.

PY2AMI BEACON PROJECT

Since April 14, 1982, a ten-Watt beacon has been permanently operating from Americana, in Sao Paulo State, at 28.300 kHz, using this message—VV VV DE PY2AMI PWR 10W ANT GP LAT 22 45 S LONG 47 16 W AMERICANA SAO PAULO. Congratulations and reports are coming from everywhere for this first 10-meter ORP beacon.

The PY2AMI call is the Brazilian hams' league, LABRE, in Americana. It was granted to the three Brazilian radio amateurs who were responsible for the transmitter and the CW identifying call message: PY2VRX Carlos Felipe, PY2FUZ Jose Roberto, and PY2CRI D'Orsay.

Reports have come from all Brazilian states, from as far as SM4KRT (Borlange, Sweden), LU9DDQ (Buenos Aires, Argentina), VE3MBN (Ontario, Canada), DF5FP (Amselwg, Germany), F3HQ (Eaubonne, France); from the USA: WB1DLE, Massachusetts, N8CSR, Virginia, and KA2LEB, New Jersey; from EA8EY (Canarias Islands), GD3FLH/P (Isle of Man), GM3MHG (Ayrshire, Scotland), ZL1ATW (New Zealand), PA3BKS (Netherlands), G5AQO (Romford, England), and many other places.

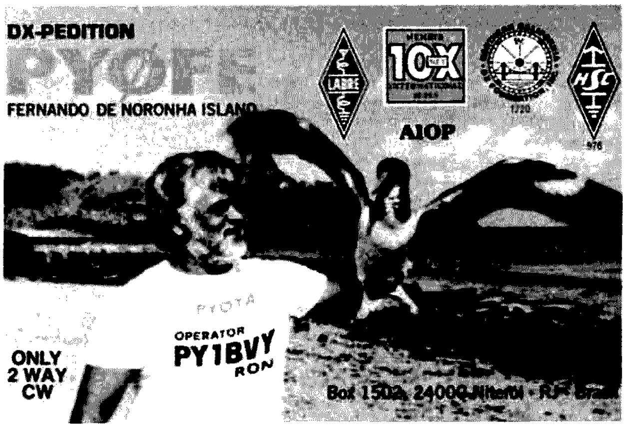
Keep an eye at 28.300 kHz and drop a QSL to PY2AMI Beacon Project, PO Box 31 or PO Box 108, 13470 Americana, Sao Paulo, Brazil, South America. Carlos Felipe, Jose Roberto, and D'Orsay will sure appreciate your report.

ORP IN BRAZIL

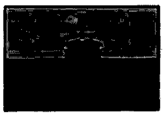
QRP operation in Brazil is getting a push, not only because of all the fun, not only because of new equipment and terrific prices, and not even because of its no-TVI advantages. QRP is growing as an immediate consequence of CW groups spread all over Brazilian territory, and even a QRP group was born from this, bringing to all radio amateurs (and especially to newcomers), love for CW operation. Easy-to-build transceivers and transmitters are a very strong call to the QRP world, especially in the CW mode.

What? Still talking about a no-code license? Why don't you think big? Why don't you try to be a "real" radio amateur and join all the fun?

de PY1CC



PY0FE's QSL. Ron is really fond of CW operations as you can see easily from the number of CW groups he's tied to.



ECUADOR

B. Patricio Recalde S. HC2PP
PO Box 511
Guayaquil
Ecuador

Last July 11, at 0728 hours, there was an aviation crash in which 119 people died. The location was four kilometers from the airport of Cuenca, the third largest city in Ecuador.

By 0745, the SAR (Servicio ala de Rescate), had an emergency net operating on 40 and 2 meters.

With the cooperation of radio amateurs, the SAR, part of the Air Force of Ecuador (FAE), was formed last year.

The area of the accident was easily covered by three repeaters, two from the Cuenca Radio Club and the other one from the Guayaquil Radio Club. The amateurs from Cuenca were at the place of the tragedy within minutes, and the reports were that there was nobody alive. At 0810, Guayaquil sent radio equipment and one amateur, by helicopter. At 0800, there were military people with amateurs from Cuenca covering the place. The repeater that was used was monitored by HC5KA, who was handling all the communication. He assigned different places for emergency handling, hospitals, Red Cross, fire department, police, and military.

At 0915 another helicopter was airborne to Cuenca from Guayaquil, and then, successively, three small planes were airborne to Cuenca. At this time, we all got to know that there were no survivors, and then our task got very sad.

We began, on 40 meters, to call relatives in different parts of the country and to locate people who were supposed to be in that plane but apparently were not.

There was a call through 20 meters to England to tell to some people there of an Englishman who died in the accident.

At midday, the emergency was under control. The SAR had handled the emergency in an extremely organized way. But 119 dead! We hope that this kind of accident doesn't happen again.

CANADA

(Reprinted from the CARF News Service Radio News*, No. 14/83, by permission of the Canadian Amateur Radio Federation, Inc.)*

According to reports from maritime amateurs, the DOC has taken action against a ring of illegal radio operators by seizing equipment and dismantling antennas in New Glasgow, Nova Scotia. Among the equipment seized was amateur gear modified to operate from 6 to 25 MHz. The group operates in and out of the amateur bands, with its own callsigns and QSL cards. Halifax amateurs reported that they were asked by the DOC to inform the Department of related "bootleg" activities. The enforcement action is being taken in cooperation with other countries. The DOC has not given out any details as the matter is still under investigation. Prosecutions will likely follow.

In what may be a spin-off from the recent sale of a Candu nuclear reactor to Rumania, Keith Jones VE3MH has received permission from that government to operate as VE3MH/YO in Bucharest. Keith, who works for External Affairs, was to have been on the 15-, 10-, and 20-meter bands since October 1st. The warm-up in diplomatic relations apparently resulted in this first such authority and also could account for two other firsts, both to Canadians—the issuing of a fishing license to one and permission to pursue his hobby of parachuting to another. It put Keith one up in the diplomatic community as even the US ambassador in Bucharest, who is an amateur, couldn't get the okay to operate there. Incidentally, Keith's good fortune is a one-shot special permission as there is no reciprocal operating arrangement between Canada and Rumania.

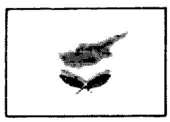
Scores of amateurs were present at the Royal Canadian Corps of Signals reunion and 80th anniversary ceremonies on Labor Day weekend in Kingston, Ontario. More than two thousand signallers, wives, and girlfriends participated in the three days of ceremonies, banquet, and barbeque. About a thousand veterans took part in the impressive march past, making a real good show considering it was forty or more years since they had left the Vimy Barracks training center.

Unfortunately, Canadian amateurs are spectators only in a situation which would affect them directly if the FCC proposal for a no-code license goes through. A militant group calling itself the "American CB Trucking Alliance" is pressuring US legislators for a far more permissive aproach to the code-free ticket than the one proposed by the FCC. The group wants all CB 11-meter operators eligible for amateur status in any new codeless license class. Most of this crew are operating illegally. US amateur organizations are meeting the FCC head-on in this one, with the perennial champion of the American amateur, Senator Barry Goldwater, leading the charge, with the assistance of other legislators.

Thanks to the assistance of the Minister of Communications, Francis Fox, three CARF handbooks are being translated into French, to be published by CARF in 1984. *The Regulations Handbook* is in the process of translation now.

Hopes may not be realized to have the ARRL DXCC list graced with a special prefix for St. Paul and Sable Islands, as they are based on the assumption that they are not under any provincial jurisdiction. They are, however, very much a part of Nova Scotia's territory, according to the federal Privy Council Office.

Regional Notes: Midwest—Norm Waltho VE5AE has taken over the VE5 QSL Bureau in addition to his other activities, including the "CARF Family Hour" on 3770 kHz at 0215 Zulu. Atlantic—Leigh Hawkes VE1ZN will be starting a CARF Regional Net soon. Ontario—Craig Howie VE3HWN, who has been very active in CARF, has resigned his directorship as he has moved to Calgary with a new job.



CYPRUS

Cyprus

NEWS FROM CYPRUS

On the 3rd and 4th of September, we had the National Field Day Contest. In this contest, three club stations took part: the Nicosia Club 5B4NC, the Larnaca Club 5B4LC, and the Paphos Technical School Club 5B4KX. Many amateurs helped in the setting up and operating of the stations, which shows that interest in amateur radio in Cyprus is growing.

All stations have sent me a report on their operations, and I start first with the Nicosia report which was sent to me by OM 5B4IT.

A few days before the start of Field Day, an initial scouting by 5B4IT and John 5B4MC around the capital, Nicosia, resulted in finding a nice hill called Kambia. Early in the morning of Field Day, 5B4NM (Marios), 5B4MB (YL Marianna), 5B4LP (Andreas), and 5B4MF (Spyros) went to the site and installed dipoles for 10m, 15m, 20m, and 40m. They also put up a 4-band vertical antenna. Around noon,

5B4MC and 5B4IT arrived with the rest of the gear, including a Sommerkamp FT-277 and a gasoline generator. Then the antennas were tuned and all was ready for the afternoon. All sat in the shade (temperature 35° C) and had a beer and a snack. 5B4MD (George) arrived in the afternoon bringing the last supplies of food and an IC-720 transceiver.

At 1800 hours, the contest started with MF first to operate. Around 2000, the fire for the barbecue was started, but the transceiver never stopped operating. At about 2330, 5B4BD (Antonis) became quite hungry and so the charcoal fire was started again. Nobody slept that night until very early in the morning when one by one, each in turn had a short nap. Breakfast was served by 5B4MD. During the contest propagation was poor, and a final total of 937 contacts was made. Everybody in the group enjoyed both the barbecue and the contest, but it is rather difficult to decide in which order.

The Larnaca Club activities were reported to me by the main leader of the group, 5B4GJ (Erricos). The installation of the tent and generator was done by 5B4EA, 5B4GJ, and their harmonics. The site was 3½ miles outside Larnaca City, by the seaside. Dipoles for 10m, 15m, 20m, and 40m were installed by 5B4DM and 5B4SP. Main operators for the contest were 5B4DM, 5B4JW, and 5B4SP. At the site, also present and helpful with operation, were 5B4EN, 5B4KY, 5B4FM, and 5B4AH, who repaired the transceiver which was used. Only 160 contacts were made due to poor propagation, and also the station was operated only until midnight Saturday and during the early morning on Sunday. According to Cyprus tradition, everybody enjoyed lots of food and drinks, such as wine, ouzo, beer, and whiskey.

The Paphos group reported to me via 2m that they set up their tent and station a few miles outside Paphos, by the seaside. The station was operated by 5B4JR (Andreas), 5B4JX (Sotos), 5B4MG (Dimitris), 5B4AI (Paul), who is also J28AI, and a group of pupils of the Paphos Technical School club station, 5B4KX. The Paphos group reports that they made around 450 contacts. So the Nicosia Club is the winner for this year's contest.

The Limassol group hopes to take part in the contest next year, and we generally hope that more Cyprus amateurs will be taking part in contests—not only local ones but also international ones.

THE UK SCENE

I have mentioned before the problems of intrusion on the amateur bands by illegal operators. This has usually meant CBers moving up from the crowded 27-MHz band into the bottom of our exclusive 10m band. Recently a new menace has presented itself in the form of cordless telephones.

The UK has for many years had a very restricted and tightly-controlled state monopoly of telecommunications run by British Telecom (formerly The Post Office). BT's obsession with technical excellence and paperwork has long frustrated attempts to introduce modern telecommunications facilities (such as keyphones, call-distribution systems, mobile phones, electronic exchanges, and so on) for business and domestic use.

It is fair to say that BT has heeded the Thatcher government's desire for liberalization and competition with a more aggressive and commercial approach to its marketing. However, commercial pressures have led in the last couple of years to the widespread use of illegal telephone equipment.

Included in this category is the cordless telephone of the type consisting of a base station and remote hand-held or mobile unit. To provide full duplex communication, these crystal-controlled units operate on widely-separated transmit-receive frequencies. Most of the imported units are 1.6-2 MHz and 49.7-49.9 MHz, or 49.6-49.9 MHz and 70-70.5 MHz.

This causes interference to two amateur bands in the UK since, in addition to the International top-band allocation on 160m, we have an allocation at 4 meters (70 MHz).

With an estimated 10,000 illegal units operating in London alone and using powers up to 100-mW FM, the scale of likely interference is readily appreciated. A recent report compiled for the Radio Society of Great Britain by G3TCT has brought a measure of the problem to the attention of BT's Radio Interference Service. (Recent legislation provides for legal operation of cordless phones on 1.632-1.792 MHz and 47.45-47.554 MHz.)

DECLINE OF UK CB?

As predicted by a number of pundits, the growth in the UK CB market has not continued. CB has not and is not likely to replace hi-fi or video as the dominant consumer electronics market.

A recent statement in the House of Commons by Alexander Fletcher, Secretary of State for Trade and Industry, pointed out that although 453,000 CB licenses were issued since legalization in November, 1981, only some 285,000 are still valid. The general impression one gets from the scale (or lack) of CB advertising and the demise of most of the street-corner equipment shops suggests that UK CB is no longer significant.

NOVICE LICENSE?

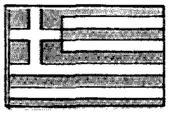
The government has again rejected suggestions that a Novice amateur license be introduced to allow code-free, minimum-technical-knowledge access to the amateur bands. It is felt that nothing should be done which would reduce the high standard of operating and technical proficiency shown to date by the Amateur Service. I doubt that few readers will disagree with that.

* * * * *

The RSGB breaks some new ground with the election of Bob Barrett as its president for 1984. As well as being Welsh and only in his early forties, Bob holds a class-B VHF-only callsign (GW8HEZ). Bob is the first class-B license holder to be elected for this high office.

Anyone contemplating a visit to the UK, or just interested in the latest happenings over here, might like to call the RSGB Headline News Service for some recorded comment. The number to call is 44 707 59312.

On the subject of telephone numbers, reference orbits (and other information) for UoSAT (OSCAR 9) can be heard on 44 483 61202.



GREECE

Manos Darkadakis SV1IW
Box 23051
Athens 11210
Greece

In my previous column, I mentioned the new frequencies now in use by Greek amateurs.

By the time you read this, you probably will have heard some of them working around the new bands. On 160 meters, you may find Charlie SV0AA (ex SV0WT). Charlie is an old-timer coming from the States but living permanently in Greece—for about 20 years now. He is well known among CW operators worldwide and he is really enjoying 160 fun with his brand new Corsair from Ten-Tec and a center-loaded vertical. Of course, Charlie is not the only one down there, but he is probably the only one on CW. (If I find a solution to the antenna problem, I will certainly join him.)

There are also some SVs on 30 meters and there will be more as soon as interest grows.

Starting cars being flagged off at the Parc Ferme. The ham operators are stationed right under the banner in the background.

Finally, for you OSCAR enthusiasts, SV1OE and SV1AB are almost daily in AMSAT's new bird, offering both SSB and CW to the satellite DX chasers.

By the way, if anyone has a problem getting a QSL out of my fellow SV amateurs (including me) or needs a sked on some particular band/mode, I will be more than happy to help.

September and October are contest months, so as I write this many Greek radio amateurs are ready for the big events during these months. In a contest, not only can you upgrade your operating skill and represent your country, but also you can pick up some new ones, and this makes the effort very well rewarded.

So, antennas have been tested and tuned for optimum performance, radios have been checked, and arrangements have been made for the XYL and kids to spend a pleasant weekend at her sister's (or mother's) place away from the shack jungle where the cannibals will scream and yell at the microphone for 48 hours!

HIMALAYAN CAR RALLY

Photos by C. P. Ravindranath

The third Himalayan Car Rally was one of the toughest rallies in the world and therefore was indeed a challenge for the motorists. So was it also for the hams who provided communications for the organizers. They travelled over the most difficult tracks of the rally, along spine-chilling but beautiful mountain roads high up in the Himalayas.

Thirty radio amateurs from different parts of the country converged in New Delhi to take part in this hectic activity from 30th October to 6th November, 1982. While seven were stationed at the Communications Headquarters and six were mobiling on different legs of the rally, 17 were manning nine different base stations along the 4000-km track.

Communications Headquarters was located adjacent to the headquarters of the organizers in the Hotel Maurya Sheraton, New Delhi. It was manned by VU9AID Dasan, VU9BBJ Asu, VU9NKR Naresh, VU9RX Vasani, VU9TN Ram, VU9UK Kap, and VU9YY Rayu in three shifts, with the special call VU9HRY. Changing shifts every four hours, the station was operative on 80m, 40m, 20m, and 2m all the time. Three separate dipoles for the HF bands and a 12-element yagi for VHF, all on top of the 40-meter-high hotel roof, were powered by a TS-830S, Drake TR-7, Icom 720, and a host of VHF rigs.

VU9AIR Viji, VU9FD Dinesh, VU9HSL Homi, VU9KIT Chris, VU9NA Sasi, and VU9PCD Pradeep were manning the mobile stations en route. All of them, except VU9AIR Viji, started from Bombay and came to New Delhi where they branched off in different directions. All of them were operating throughout the rally, providing most valuable support. In fact, the most adventurous, daring, and back-breaking activity of all was that of the mobiling hams.

The base stations were located at Dehradun and Mussorie (VU9LT Ratna, VU9LR Satya, VU9BF Kalia), Nainital

(VU9SU Subi, VU9WC Sesha), Ranikhet (VU9KT Dilip, VU9VPR Vilas), Narkhanda (VU9VMJ Jadeja, VU9VRG Gopal), Manali (VU9MMA Mathew, myself), Simla (VU9SNM Subhandu, VU9XX Patil), Mandi (VU9SRJ Ramu, VU9POP Prakash), and Rai (VU9GSI Gurudev, VU9JSI Jasvinder), all along the route of the rally.

Originally, one more station was planned at Khoksar (10,000-foot altitude), but we had to cancel it since the rally itself went only up to Marhi, a little beyond Manali, due to snow-clad roads.

Most of the base stations were on HF bands. However, some operated both (Manali, Simla) and one VHF only (Narkhanda). The setup at each of the stations was decided on the basis of the survey done earlier by VU9RX Vasant.

VU9MMA and I were assigned to Manali, which was the northern tip of the rally route. At Manali the rally stopped for a night and returned from Marhi during the next day. So Manali was considered an important regrouping control point.

We were staying at the Hotel Beas, named after the snowy river flowing by its side. We had a trap dipole for 80m, 40m, and 20m supplied by VU9RX Vasant, which we put across the river (150 feet wide) at a height of about 80 feet above the water level. The other 40m and 20m combination inverted V, which I had brought along, was put up at the Parc Ferme (where the vehicles were parked for the halt), about 200 meters away from the hotel. The 3-piece, 12-element 2m ZL beam was moved around quite a bit whenever we needed it.

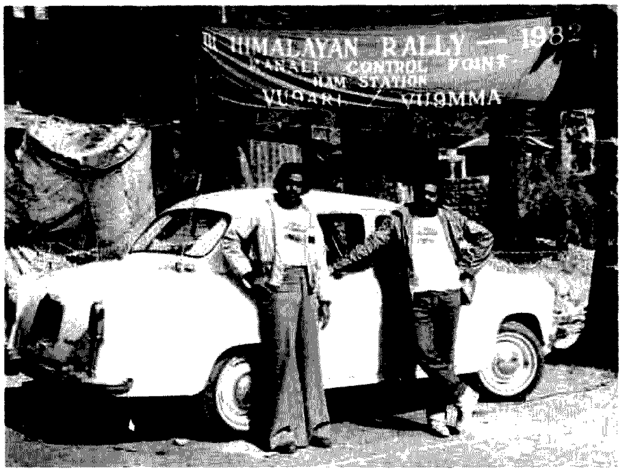
In spite of Manali being a very important control point, we had only one HF rig (Kenwood TS-130S) and one VHF rig (Icom IC-255A) to work with. Both of these were worked on an 80-Ah car battery which was under charge all the time.

The propagation conditions changed so rapidly that we had to keep on changing bands, one after the other, almost every hour. And very often, we had to get the assistance of hams in southern India to relay traffic. But generally 20m stayed good for the day and the other two bands were good during the night. Copy from Marhi on 2m was perfect throughout.

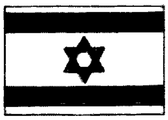
Until the cars started coming in on the night of November 3rd, we were operating from indoors, either relaying for some other rally station or handling traffic for the local regrouping control officials. But we had to stay outdoors almost the entire night once the cars came. And outside, it was really cold at 2° C. For many that may not seem cold, but for us who came in from far south, where the temperature varies only between 26° and 35° C, it was really very, *very* cold. There were many occasions while operating outdoors when we had to stop talking to breathe!

On our way back to New Delhi on November 5th, we also picked up VU9SRJ Ramu and VU9POP Prakash from Mandi, whom we had dropped there on our onward journey. In the prize-distribution ceremony (and later at the Rally Ball), to which all the participating hams were specially invited, the organizers commented on the excellent backup we all had provided for the rally. In fact, in their words, "We only organized the rally; the hams ran it!"

The whole communications network organized by the Federation of Amateur Radio Societies of India (FARSI) was steered by a committee headed by VU9AID (Chief Coordinator) and ably assisted by VU9RX Vasant and VU9TN Ram. In spite of all the difficulties with climate, food, and travel, all of us really enjoyed this activity and are looking forward to something similar again.



VU9MMA Mathew and VU9ARL James standing outdoors where they set up the station



ISRAEL

Ron Gang 4Z4MK
Kibbutz Urim
Negev Mobile Post Office
85530 Israel

In the last edition of this column, I reported on the Israeli VHF scene and mentioned Bruno 4X4DH's pioneering work with the first OSCAR satellites.

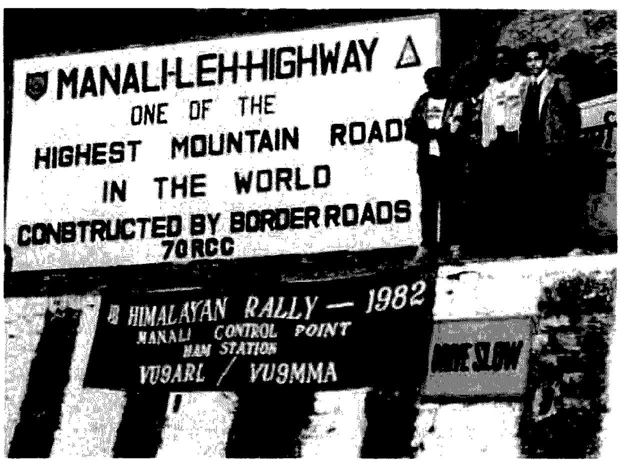
It is with pleasure that I can write that with the successful launching and operation of AMSAT OSCAR 10, Aharon 4Z4AG, Bruno's student from the Tel Aviv Club 4X4HQ in the class of 1966, was following in his footsteps on that historic afternoon of August 6th when the satellite's transponder was turned on. The other Israeli station making contacts through the bird was that of Abe 4X4IX.

Aharon, well known in ham circles here for his high degree of technical proficiency, had his Mode B station already standby on the day of the launch. His gear is largely home brew—the receiving converter, transmitting amplifier, and antennas. The 70-centimeter transmitter is a Kenwood TR-9500; for receiving he uses a crossed yagi, and he transmits on a helical antenna. Aharon wants to add a low-noise amplifier to his receiving setup to aid the weak signals. His elevational antenna rotator is also home constructed.

At the date of writing, 4Z4AG had contacted 30 countries through OSCAR 10, reporting that its apparent range from Israel is from New Zealand in the east to California in the west. California was contacted using at the time only ten Watts of CW, and the station sent him Hebrew New Year's greetings, to Aharon's great surprise! Aharon thinks that contacts with Hawaii may be possible, but only when the satellite is in a very particular position.

The amateur radio study guide, from the Open University's Center for Technological Education, mentioned here a few columns back, has at long last been published and been made available to the public. The book made its debut in August at the joint pavillion of the Israel Amateur Radio Club and the Center for Technological Education at "Youth City" in the Tel Aviv fairgrounds.

Along with a display of the CTE's educational wares—various courses and books in the technological fields—special-events station 4X4CET was operated around the clock. Interested visitors were given explanations and encouraged to sign up for the next courses to be given at 4X4HQ. Special mention must be made of Naomi 4X6DW for her efforts in setting up the station and coercing people to operate it!



VU9MMA Mathew, VU9ARL James, and their friends just outside the hotel on the bank of River Beas.

So, after two thousand years, the first ham study book has been published in the Hebrew language. Although this well-put-together and attractive work is intended only for the grade-C Novice ticket, it is so thorough that it gives a good background for the higher-class grade-B license. The Center, so it is said, has at present no intention of putting out a higher level course. Instead, they are making available a bibliography of their other books which cover the technical topics of the grade-B exam, such that the reader of the Hebrew language will not be left high and dry when he wishes to upgrade.

The IARC Events Committee has been busy making plans, including, in May, a world conference of radio amateurs to be centered around the Israel Independence Day celebrations. Arrangements are to be made with various travel agencies and the Ministry of Communications. When more details are available, they shall be rushed to *73*. In February, there is to be a national hamfest which will include the raffle of equipment and "junk" that was missing at the Annual Assembly. National Field Day is planned for the spring, March 20, 1984.

A new committee has come into being—the Contest Committee. Meeting at the QTH of Mike 4X6DF, they set for themselves the following aims: the creation of an Israeli worldwide contest, updating the rules of the Spring Contest (mentioned in the September, 1983, issue), liaison with the Ministry of Communications and foreign magazines, and the formation of a big guns all-star contest team to operate in the multi-multi class. Good luck in the contest!

On the social front, there have been meetings of both the Old-Timers, with Ozzie 4X4CW at the helm, and the Young-Timers, with Rami 4X6FH coordinating get-togethers. The Jerusalem Club, meeting on the first Thursday evening of each month, extends its invitation to all visiting amateurs. The profusion of visitors from abroad was so great at a previous meeting that the proceedings were conducted in English, under the capable leadership of Ben 4Z4ZA!

I have both good news and bad news for the seekers of the coveted Jerusalem Award. First the good news: Only 8 IRCs will be required instead of 10. Secondly, 4X4JW has informed me of the following changes: Seven contacts with Jerusalem shall be needed instead of five, and three additional contacts must be made with other Israeli stations. QSLs go to 4X6AA (Dr. Milt Gordon, PO Box 4079, Jerusalem, Israel).

To help you out with this difficult award, active Jerusalem amateurs include 4X4s JW, LH, LI, RL, SO, and WP; 4Z4s JS, SM, SW, US, ZA, and ZB; 4X6s AA, BM, CJ, CQ, and GH; G3ZCZ and WB6SZB, both portable 4X. There are probably others, but these are known to me as active on HF. Check out the high end of 20 meters SSB after 2100 GMT.

On the Move with 10 FM!

These modifications for Comtronix and Azden rigs will get you on your feet in a hurry.

F. W. "Andy" Anderson W7AR
8041 31 Avenue N.W.
Seattle WA 98117

Andy and his rig.

What aspect of modern ham radio could cause a 75-year-old "recycled teenager" to tumble back into a medium which devoured his spare time as far back as 1928? The excitement and freshness of FM on ten meters did it, coupled with the fact that you can carry by shoulder strap a totally portable station feeding 14 Watts rf into a 7.9-foot whip.

Owners of transceivers like the Comtronix FM-80 and Azden may benefit from my tinkering—which included adding a 2.5-mH rf choke where the hot mike lead enters the chassis, to kill audio squeal from rf entering the transceiver through the mike cord.

Discarding the whip which came with the Radio Shack CB kit (No. 21-941A), the ceramic cone and sturdy aluminum bracket gave me the necessary and secure antenna support. My FM-80 had two knurled screws on each side of the clamshell case, intended for U-bracket mounting under the dash. I used these screws and holes to fasten two suitably shaped 1/8-inch-thick dural plates to which not only the whip-mounting bracket could be fastened, but also the studs holding each end of

Close-up of the rig.

the Superscope tape-deck shoulder strap. In this way, no drilling of the clamshell was necessary except for the minibox mounting.

I experimented through a succession of whips to settle on a unit 7.9 feet long, consisting of a bottom section of 31 inches of 3/16" flexible aluminum rod, the upper end of which was threaded to fit an appropriate hole in the base of an 8-section telescoping whip, available for $.99 from Etco Electronics in Plattsburgh, New York. (Get on their mailing list; you'll not regret it!) This makes an extremely light, portable whip.

The heavy aluminum right-angle bracket (part of the ceramic cone insulator) was painstakingly rasped into shape and made to swivel through a short arc from a central hole with 10-32 thread screws into the dural plate. This allowed the whip to be vertical whether the FM-80 was shoulder-carried or operated from a card table outdoors.

A Bud CU-2102-B minibox was secured to the clamshell with 4-40 tapping and screws to hold the transmatch network—same as Ten-Tec's 247 unit. I settled for ten turns of No. 22 enamel on a 1/4-inch bakelite rod. The 100-pF (each section) 2-gang capacitor may be hard to come by, although Etco has one with 45 pF per section that will work (No. 151JK, made in England). I am actually using only about 40 pF each section for an excellent 1.1:1 swr into the whip.

I dismantled several Meissner mica compression padders to come up with one 100-pF capacity feeding the whip. It was a most pleasant surprise to find that the Radio Shack Micronta 3-way CB tester (No. 21-526A) of 10-Watt rating would handle our 14 Watts (up against the pin) with no sweat. Unfortunately, the coax fittings extended out the top surface. Identical holes were drilled and reamed out the bottom; fortunately, the PC board inside could be tipped so that its coax outlets were convenient for my use.

An swr reading should always be available while walking with this rig. Two access grommet holes in the minibox permit one to make corrections for minimum swr before starting out. Hold the mike to your face in the same attitude and the swr will remain low. When the rf power meter on the FM-80 falls to mid-scale in transmit, the nicads should not be discharged further; the receiver itself should be turned off. These batteries should never be totally discharged.

I have not regretted using the BP20A-11 nicad battery pack of 2.3-Ah capacity

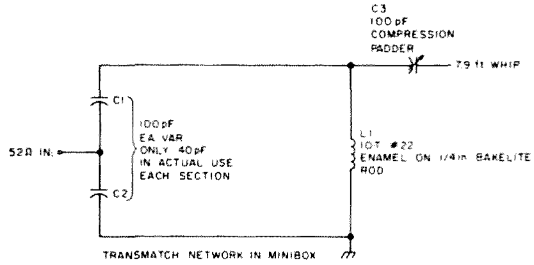

Fig. 1. Transmatch network in the minibox.

(from Alexander Mfg. Co. in Mason City, Iowa) and their 20-11 charger is guaranteed not to overcharge this unit. Fully charged in 10 hours, its 14 volts provides about three hours of operating fun. Silver duct tape secures the battery pack and swr meter case to the clamshell.

In passing, Azden/Comtronix-type transceivers intended for portable use will eventually have to go to LCD frequency/channel readouts since LEDs in daylight are useless.

While testing this unit in my basement workshop several feet below ground level, the whip lying horizontally, N4JB in Germantown, North Carolina, couldn't believe the circumstances for the boffo signal he copied! Operating it on a card table outdoors feeding a Cushcraft Ringo-10 right from the swr meter, the world is your oyster. See you on ten FM! ■

Thank You for Listening

Build this simple speech expander and stop shouting. Your DX friends will thank you and the QSLs will roll in.

A versatile little chip called an electronic attenuator and manufactured under the brand code MC3340P is the heart of this unit. When used ahead of my old war-horse—the Heathkit SB-401 transmitter—it certainly adds a few S units when trying to make a QSO through the QRM.

In Fig. 1, the MC3340 is shown being used as a basic remote volume control. The advantage of this circuit is that the remotely located potentiometer does not need cumbersome shielded leads directly connected to a sensitive mike or other low-level audio input. When pin 2 is held high (up to +6 V dc), the audio will be fully expanded—approximately 0-dB attenuation. If the voltage at pin 2 is brought down to 3.0 V dc, 90-dB attenuation is achieved. The control potentiometer, when varied between 4k and 30k, theoretically achieves the 0-dB-to-90-dB attenuation.

Based upon these premises, the speech expander/clipper came into being.

The input transistor, Q1, is a 2N3819 and, being an FET, serves as an excellent high-impedance buffer for the microphone and the MC3340. Transistor Q2 is a 2N1305 or similar transistor having a fairly good low-leakage coefficient. This transistor serves the purpose of dynamically varying the dc voltage at pin 2 of the MC3340.

The second chip, IC2, is a dual op amp, i.e., an LM358. Half the LM358 is used as an ac complex-non-inverting amplifier. The other half could be used to drive a VU meter or bar-graph display which can be used to monitor the audio output. However, the first half of the LM358 samples, through its pin 3, a portion of the audio output from pin 7 of the MC3340. Based upon the setting of R3, which controls the gain of the LM358, the sampled portion of the audio signal triggers a control voltage to appear at pin 1 of the LM358. This control voltage is rectified by D1 and fed to the base of Q2 which in turn controls the gain of the MC3340. Thus, the whole circuit acts as a sort of agc loop with R2 and R3 setting the attenuation thresholds.

Most of the parts are readily available at your local Radio Shack, except for the MC3340 and possibly the LM358, for which they may have no equivalent. Any op amp could be used for IC2—the only stipulation being that it must be able to work off a single-rail supply. The prototype unit that I built used an LM741, but it required two 9-V batteries to produce the dual-rail supply. I suppose the CA3140, which is said to have a better slew rate than the 741, could have been used with a single-rail supply. However, as far as I know, the MC3340 has no equivalent. Therefore, this IC will have to be obtained from a Motorola dealer.

The printed circuit board is fairly easy to lay out and etch and should be no problem to the regular constructor. In the Heathkit SB-401, the unit can be built inboard if the VU meter/bar-graph display is not included. The unit is more accessible with plenty of scope for expansion if built as an outboard addition, in which case the male and female replicas of the microphone connectors must be obtained.

Setting up the attenuation thresholds can be done accurately and quickly if a scope is available. If a scope is not available, plug the microphone into the input socket and clamp the leads of a pair of headphones between output connector and ground. (Do not plug the output of the unit into the transmitter.) Turn on the crystal calibrator of your receiver and adjust the audio output of the receiver for a high-pitch audio note. If the scope is available, connect it to the output connector of the unit.

Place S1 in the BYPASS position. Set R2 for minimum resistance from ground. Set R3 to minimum resistance. Set R1 to the halfway mark. Place the microphone near the receiver's speaker. If S1 has been connected appropriately, a weak tone should be heard in the headphones and a low audio trace should appear on the scope.

Now apply power to the unit and set S1 to OPERATE. If all has been connected well, you should get a significant increase in audio level at the output. Check the voltage at TP1 with a high-impedance voltmeter, preferably digital. It should

read 2.6 V dc. The voltage at TP3 should be zero or −Ve. This is the unit in full expansion mode.

Increase R3 until the voltage at TP3 goes positive approximately 1 volt. Check the voltage at TP1. It still should be showing +2.6 V dc and the scope should still be showing a healthy trace. A quick flip of S1 from OPERATE to BYPASS and back to OPERATE should show the amount of expansion.

With the voltage probe still at TP1, increase R2 until the meter shows +3 V dc. Now increase R3 until the meter reads +3.6 V dc. A reduction in the audio level at the output will be noticed and the trace on the scope will alter likewise. This is the clipping point.

If the audio source is abruptly increased and held at that level, or a loud long shout is emitted into the microphone, the result will be a sharp rise followed by a steep decline of the output signal to a constant level. This is most noticeable on the scope. The voltage at TP1 should show +4.5 V dc or higher (max. +5.2 V dc). This status is the unit in the attenuation mode.

When this has been achieved, speak at your normal level into the microphone and adjust R2 and R3 alternately until an accentuation of your voice from your normal speech level shows the peak briefly appearing and then being pulled down to the normal level. The aim of the adjustment procedure is to get that time constant between the peak and the pull-down as short as possible.

When this has been achieved, disconnect the headphones, turn off the crystal calibrator or audio source, plug the unit into the transmitter, and tune the transmitter into a dummy load. It will be found that the microphone gain control does not have to be turned up so much before the ALC cuts in. If a scope is used to monitor the transmitted audio signal, check and fine-tune R2 and R3 to suit your voice pattern and distortion threshold.

Get on the air and see how it works. Contact a distant station with the unit in OPERATE mode. Do not mention the unit, but in the course of conversation put it into BYPASS and wait for the reaction. Act accordingly.

I will be pleased to receive comments, enhancements, modifications, etc., concerning the unit and its operation.

In closing, I would like to thank G3YNB (H. Clayton) and VE1AOP (G. Coughlan) for getting me into redesigning the unit and writing this article. ■

Secrets of Nicads

Nicad batteries will save you money. Or will they?

You've been reading for years that nickel-cadmium batteries are the greatest thing since sliced bread for your portable gear. From one viewpoint, this is true, namely, economy. One set of nicads can be recharged many times before they have to be replaced, at a savings to the user every time they are recharged. However, there are some down sides to the use of nicads, some of which are readily apparent (lower terminal voltage, memory, downtime while charging) as well as one which is very important but not widely known: The capacity of a nicad is only about 25% that of a premium primary cell.

As an example, let's take the AA-size cell. The commonly available AA nicad has a capacity of 450–475 milliampere hours (mAh). Gould, GE, and Radio Shack cells fall into this range. A premium alkaline AA cell from Duracell, Eveready, or Ray-O-Vac has a capacity of 1700-1900 mAh or nearly four times the capacity of the nicad. Thus, it would be necessary to recharge the nicad cell four times before you achieve any economy.

But wait. There is more to this story. We all know about the memory associated with nicads. If not fully discharged before recharging, they have a tendency to "remember" the discharge cycle, limiting the life to the remembered discharge. Suppose you use your HT every day to and from work for a total drain of say, 150 mAh. You decide to put the charger on every night so as to have a full charge, right? *Wrong*. Unless you drag those batteries right down to nothing, a constant discharge/recharge of 150 mAh will result in cells with a capacity of about 150 mAh. Thus, you would have to recharge 12 times to obtain the same life as a set of premium AA cells. But that still represents some economy, doesn't it? Sure, if you are satisfied with less return on your investment than you expected.

Let's talk about the lower terminal voltage of nicads. They are 1.2 volts when fully charged. Eight cells (typical arrangement) will give you only a 9.6-volt power supply, vs. 12 volts from eight fresh premium alkaline cells. Some HTs will provide space for 10 cells when using nicads, and some dummy cells to be used with primary batteries, but then your economy is eroded further (10 nicads vs. 8 alkalines).

Now, your 12 recharges to recover your investment becomes 15. Still an economy, sure, but not the one you thought you were getting. And if you cannot use 10 cells in your rig, think about the lower outputs, both audio and rf, when operating at the lower supply voltage.

Another consideration that you should think about is charge retention. Nicad cells will lose 10–12% of their charge per month unused, whereas alkaline cells can lose about 10–15% of

Primary	**Capacity**	**Secondary**	**Capacity**

Table 1. Capacity of various batteries.

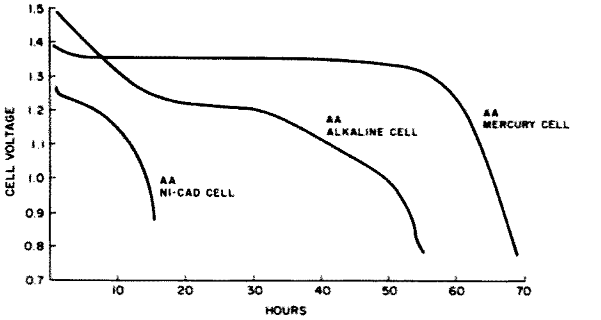

Fig. 1. Cell discharge curves. 25 Ohms continuous discharge.

rated capacity per year through shelf-discharge. Nicads are not the choice of battery to keep around in case of power failure, unless they can be trickle charged. You would be better served to keep a sack full of AA alkaline cells on the shelf for when the power goes off.

Fig. 1 shows the typical discharge curves for both alkaline and nicad cells. The curve for a typical mercury cell is also included for reference. AA mercury cells have a typical capacity of 2500 mAh, but cost nearly as much as nicads, thus are not cost-effective when compared to alkaline cells.

Table 1 is a listing of available primary and secondary cells with the manufacturer's ratings. Note the dramatic differences between cells and capacities.

Please note: I refer to *premium alkaline* cells. The LeClenche or zinc-carbon cell is *not* recommended for communications products for a myriad of reasons, one of which is capacity. Manufacturers of zinc-carbon cells typically publish no data on them because of their widely varying performance.

I am not saying that nicad batteries don't have their place, but in situations where it is important to keep a radio going over the long pull, when you can't recharge (no ac outlets in the woods looking for that lost child), or in foreign countries where your 110-volt charger will not operate, the premium alkaline cell offers many real, substantial advantages that cannot be overcome by nicads. ■

The Edison Effect

American inventor Thomas Edison is remembered for his array of electrical firsts. But lesser known is his invention of the first wireless telegraph.

The contributions that Thomas A. Edison made to the electrical world were many and are fully recognized by today's historians. His genius as a top-notch inventor is well known internationally and he is justly credited to be the most prolific and important pioneer of the electrical age. The duplex and quadruplex telegraphs, the light bulb, the gramophone, the camera, and the movie projector are only a few of his inventions. There were many more, accounting for about 1,300 different patents at the end of his creative life.

But did you know that Edison also experimented with electromagnetic waves several years before Hertz did? invented an inductive railroad telegraph? invented a wireless electrostatic communication system? discovered and applied the thermionic vacuum emission, creating, in effect, the first two-element tube rectifier?

In 1875, while experimenting with sound vibrations produced by a magnetic vibrator and ways to transmit them over wires to distant points, he noticed with curious amazement a peculiar light, or bright oscillating sparks, coming out of the core of the magnet. He had seen this phenomenon before in the telegraph relays and in loose filings between armatures and magnetic cores of telegraph printers, but so far attributed them to induction. These new sparks were somehow more intense and it occurred to him that they were not caused by induction. He wrote in his diary:

"We found that if we touched any part of the vibrator or magnet we got the spark. The larger the body of iron that touched the vibrator, the larger the spark. We now connected a wire to the end of the vibrating rod and we found we could get a spark from it by touching a piece of iron to it ... by connecting to the gas pipe we drew sparks from it in any part of the room ... "

He called this unknown electrical discharge "etheric force" or "etheric current" and conducted several randomly-directed experiments with it. It was not actually a discovery, since Joseph Henry noticed it much earlier, Faraday had speculated upon such a possibility before, and Maxwell had predicted it in 1823. Unaware of it at that time, Edi-

Edison with some original Edison-effect lamps.

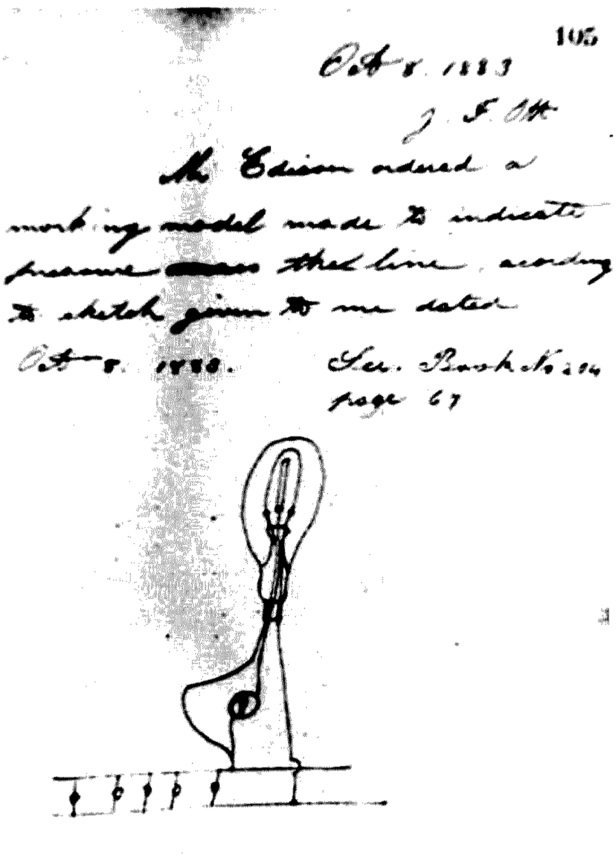
son had been playing with electromagnetic waves.

In order to observe the new force, he constructed a "black box" with two adjustable sharp-pointed carbons and an eyepiece on top. He made public the results of his tests and since Edison was always news, the local papers reproduced his declarations, adding a bit of spice for good measure. Their words were something like this: "Mr. Edison discovered a new electric ray and predicts that someday all telegraphic and cable communications will be carried out without poles or wires."

He demonstrated his black box and etheric forces to a scientific association in New York, which brought about a few congratulations and started a turmoil of opinions—both pro and con. The news traveled as far as Europe, and in England, physicist Sylvanus Thomson declared that all was based upon known electrical principles. Oliver Lodge, distinguished man of science and later a renowned wireless pioneer, discussed the experiments and arrived at the same conclusion. Edison did not pursue his investigations much further, perhaps resentful of being criticized by these known authorities, or maybe for the lack of a practical application for the forces; he continued his inventive career in the direction of "greener" pastures.

In 1880 we find Edison at work with a novel telegraphic system, which he called the "space" or "grasshopper" telegraph. He was assisted in this project by his good friend and colleague Ezra T. Gilliland. The idea was to provide a means of communication to train travelers in the long stretches of the western plains. It made use of a special telegraph line, strung on poles at car height on the opposite side of the regular telegraph line to eliminate the interference from them. The receiver employed an insulated metal plate on top of the car, connected in series with the secondary winding of an induction coil, and a telephone receiver. The circuit continued through the metal wheels and track to ground. The transmitter used a battery, a telegraph key, and a high-frequency buzzer, in series with the primary of the induction coil. A send/receive switch completed the installation.

Close-up of an Edison effect.



Entry in Edison's notebook showing lamp connected as a voltage indicator.

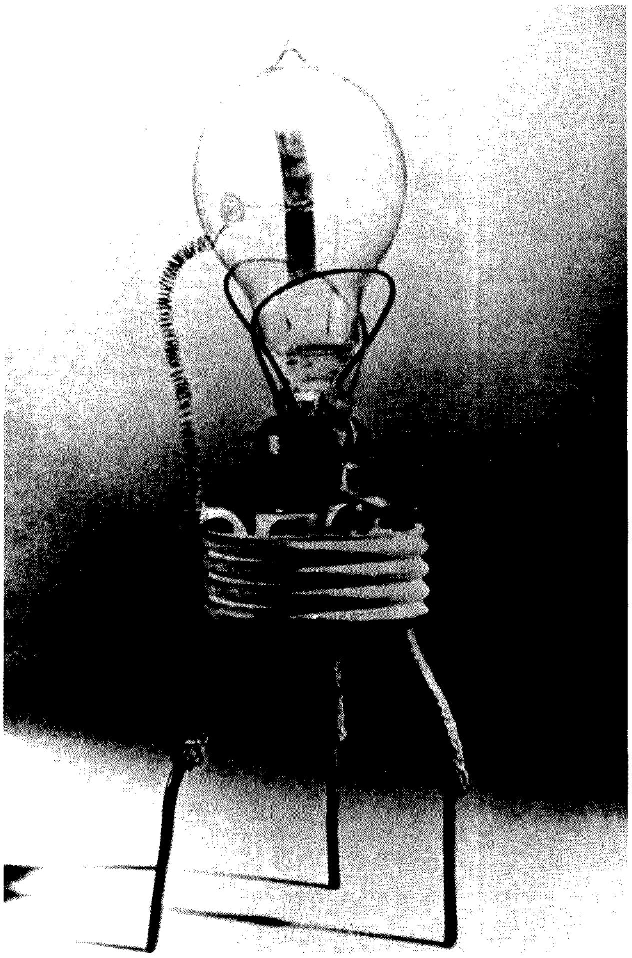
A duplicate set was to be installed at each telegraph office along the railroad line. The first tests were conducted on a small train in Staten Island NY and after a few failures and modifications, it was declared a success. Further experiments on the Lehigh Valley Railroad demonstrated the practicability of the grasshopper telegraph. It was never exploited and, although patented, apparently forgotten.

In 1855 at Menlo Park a wireless telegraphic system was developed by Edison. It used vertical masts of a hundred feet in length with metal plates on top. In his original patent he claimed to be able to communicate with points up to 3 miles distant and suggested that it could be installed on board ships, using their masts for the same purpose. He stated that communications between ships and between ships and shore could be established and collisions prevented during foggy days. As in the case of the grasshopper telegraph, the transmitter discharged an induction coil into the metal plate suspended on top of the mast. This induced a similar electrostatic charge on the plate of the receiving pole and the current thus created caused an audible click on the telephone receiver. It was never used commercially and when Edison was questioned about it, he declared with some air of mystery that, "It has been sold to a wealthy medium who wishes to communicate with the spiritual world."

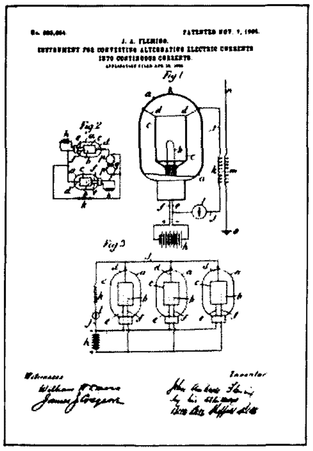
According to records found later, it was discovered that he had sold the patent, which also included the grasshopper telegraph, to the Marconi Company in 1904 (patent no. 465,771).

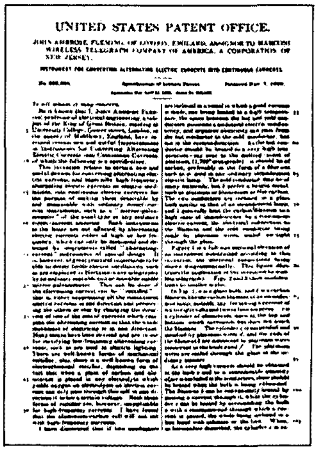
In 1880, while testing incandescent lamps, Edison observed that particles of carbon from the filament were "carried" and deposited on the inside of the glass bulb. He also discovered that after certain periods of operation there was a thin white line, similar to a shadow, parallel to the filament but to one side. The lamps were fed with direct current and it showed that this effect was caused on the side of the filament connected to the positive side. Notes were taken but shelved for future reference since his work on lighting and power plants required his full attention at that time.

Experiments done by other scientists some years before had proven that the air, when in contact with red-hot metals, showed



One of the Edison lamps used by Fleming in early experiments.





UNITED STATES PATENT OFFICE.

Copy of Fleming's US patent for use of the "valve" in ac rectification.

strange properties with regard to electrical charges. It was assumed (and sometimes emphatically affirmed) that electricity could not travel in a vacuum. Edison was aware of all these theories, but he never paid much attention to scientific assurances unless, of course, he could arrive at the same conclusions by experimentation. He was not a theoretician but a practical inventor. The question, "Was or was not the electricity the carrier of these particles of carbon?" was in his mind. He wanted an answer, he had to know and wanted to be sure.

Assuming that he installed another element inside the bulb and connected it to the positive side of the line, would it stop the flow of particles and keep the lamp clean inside? In 1882 he sketched a bulb with the added element, but it was not until the next year that he was able to spare the time to build and test the new lamp.

The second element consisted of a platinum wire suspended between the two filament legs and insulated by the glass. When it was connected to the positive side of the line, he found that a current flow was indicated in a galvanometer connected into that circuit, but when the new element was on the negative side, there was no current indication. He did many other experiments in order to determine the best size, form, and position of the second element and found out that the best shape was a flat metal plate installed between the filaments, without any electrical connection to any of them. The current thus obtained proved to be proportional to the incandescence of the lamp, or candlepower. This lamp was patented by Edison (patent no. 3,070,311) although its commercial use or application was vague at that moment.

What he created was in reality an electronic measuring device—the first one able to demonstrate that electricity, under certain conditions, could and would travel inside a vacuum. The reason why this truth was not fully understood at the beginning was that the nature of electricity was still a mystery, as far as electronic theory was concerned.

The lamp was shown at the 1884 International Electrical Exposition in Philadelphia PA and advertised as an indicator of incandescent voltages. Due to the lack of a better vacuum, the reliability was not of the first order. This time, however, Edison's discovery was received in a more favorable mood by the electrical elite. Visitors were frankly impressed by the tests conducted by Edison in person. The renowned professor Edwin J. Houston declared prophetically that "Edison's invention would become something of great importance in the future . . ." He was right. Sir William Preece, Engineer-in-Chief of the British Post Office, also an induction telegraph pioneer and later Marconi's protector and collaborator, who in the past had questioned some of Edison's electrical conclusions, visited the Exposition and was sincerely moved with the two-element lamp and acquired some of them for further study and evaluation. His conclusions were published in England and a paper about the subject was read at the Royal Society in 1885. He coined the phrase "Edison effect" in recognition of Edison's achievement.

Another well-known scientist, Dr. Ambrose Fleming, recently appointed electrical consultant to the new Edison London Lighting Company, obtained several of the two-element lamps, with the purpose of using them as indicators in generator circuits—without much success.

In 1897 the British physicist, J. J. Thomson, after experimenting with the lamps, concluded that the effect was caused by the emission of "electrons," or negative electricity, which flowed from the hot filament to the cold element or plate connected to a positive potential.

Edison did not pursue

these investigations much further and his discovery lay dormant for several years, that is, until 1904. At that time Dr. Ambrose Fleming—later knighted for his discoveries in the wireless telegraphic field—was employed as technical adviser by the Marconi Wireless Telegraph Co., Ltd., in London. Fleming was searching for a better detector to be used on the receivers manufactured by that company, since the magnetic detectors currently in use lacked sensitivity. He then recalled the tests that years before he had made with the Edison-effect lamps and concluded that they could be easily adapted for that purpose. He dedicated himself to investigating the lamp in scientific detail and to improving its operation, using higher vacuum and changing the plate to a cylinder surrounding the filament. He renamed them "oscillation valves" (this is why, in England, all vacuum tubes are still called valves) and applied for patents in England, Germany, and the United States.

Contrary to his claim, he did not invent the device, he simply used it as a high-frequency oscillation rectifier (it did not oscillate). Nor was he the first one to use it as a rectifier. Years later, as a result of litigations, his US patent was invalidated in favor of Edison's previous patent.

It did not matter very much anyway, since the Fleming valve did not make a great deal of difference as a detector of wireless signals. First, under the Marconi Company monopoly, it was supplied only to be used with their equipment and, second, it was less sensitive than the electrolytic and crystal detectors which appeared in the open market at about the same time.

We cannot deny that Dr. Fleming was a highly skilled and competent man of science who made abundant contributions to the wireless and later radio industry. His experiments with the two-element lamps revealed facts and set standards to be considered later in their manufacture. He drew up operational curves; he used new configurations, types of filaments, and shielding schemes, and was the first one to use them in conjunction with tuned circuits. But what really revolutionized the wireless art and converted it to "radio" (1912) was the addition of a third element or "grid" by Dr. Lee De Forest, which made the bulbs capable of being used as high-frequency detectors, amplifiers, and oscillators.

It has been said that Edison did not make any great scientific discovery, but by his skill, ingenuity, and power of observation, he was able to surpass in practical achievements many scientists with broad academic backgrounds. He was a real pioneer, perhaps the most important and imaginative of them all. He planted many seeds; others continued where he left off and a few collected the fruits. His work may not look like much to today's electronics students, where transistors, ICs, and computerized items dominate the industry, but it was the beginning—without it, radio, TV, and satellite communications would still be many years behind.* ■

In his article "The Magical Audio Filter" (November), Jim Pepper incorrectly states that the notch frequency of Fig. 1 varies directly as R4 and by the square root of C1 and C2. However, his formula indicates that the frequency varies inversely as B4 and inversely as the square root of C1 and C2. Thus, double R4 divides the frequency by two. Also, doubling either C1 or C2 reduces the frequency to .707 its original value.

SOCIAL EVENTS

Listings in this column are provided free of charge on a space-available basis. The following information should be included in every announcement: sponsor, event, date, time, place, city, state, admission charge (if any), features, talk-in frequencies, and the name of whom to contact for further information. Announcements must be received by 73 Magazine by the first of the month, two months prior to the month in which the event takes place. Mail to Editorial Offices, 73 Magazine, Pine St., Peterborough NH 03458.

WEST ALLIS WI
JAN 7

The West Allis Radio Amateur Club will hold its 12th annual Midwinter Swapfest on Saturday, January 7, 1984, beginning at 8:00 am, at the Waukesha County Expo Center Forum (take I-94 to Co. F, then south to FT, then west to Expo). Admission is $2.00 in advance and $3.00 at the door. Tables are $3.00 in advance (reserved until 11:00 am) and $4.00 at the door on a first-come, first-served basis. Delicious food will be available. For tickets or more information, send SASE to WARAC, PO Box 1072, Milwaukee WI 53201.

SOUTH BEND IN
JAN 8

A hamfest swap & shop will be held on Sunday, January 8, 1984, at Century Center, downtown on US 33 Oneway North between the St. Joseph Bank Building and the river, South Bend IN. Tables are $3.00 each in a carpeted half-acre room. The Industrial History Museum is in the same building. Four-lane highways lead to the door from all directions. Talk-in on .52/.52, .99/.39, .93/.33, .78/.18, .69/.09, 145.43, and 145.29. For more information, contact Wayne Werts K9IXU, 1889 Riverside Drive, South Bend IN 46616, or phone (219)-233-5307.

SARASOTA FL
JAN 14-15

The Sarasota Amateur Radio Association will hold its 5th annual Sarasota Hamfest on Saturday and Sunday, January 14-15, 1984, at the Exhibition Hall, 801 N. Tamiami Trail (US 41), Sarasota FL. The hours on Saturday are from 8:30 am to 4:30 pm and on Sunday, from 8:30 am to 3:00 pm. Donations, good for both days, are $3.00 in advance and $4.00 at the door. The swap-table donation is $12.00 for both days and includes the door donation. No one-day tables will be available and advance registrations are requested. Talk-in on 146.91/.13 primary and 146.73/.13 secondary. For advance tickets, booths, and tables, contact Dave Johnson, Jr. W4CCR, 2619 Forest Lane, Sarasota FL 33581, or call (813)-924-2525, or write Sarasota Hamfest, PO Box 3182, Sarasota FL 33578.

RICHMOND VA
JAN 15

The Richmond Amateur Telecommunications Society will hold its Frostfest '84 Winter Amateur Radio and Computer Show on Sunday, January 15, 1984, from 8:00 am to 4:00 pm, at the Virginia State Fairgrounds, Richmond VA. All events will be indoors and general admission is $4.00. Flea-market spaces are $3.00 and tables are available for $3.50. KX4Y will give Novice examinations. Doors will be open for unloading and setups beginning Saturday noon and a security guard will be on duty all night. Talk-in on 146.28/.88 and 146.34/.94. For more information, contact Bill Scruggs N4DDM at (804)-272-8206, or write Richmond Frostfest, PO Box 1070, Richmond VA 23208.

YONKERS NY
JAN 22

The Yonkers Amateur Radio Club will sponsor the Yonkers Electronics Auction on Sunday, January 22, 1984, from 9:00 am to 3:00 pm, at Lempko Hall, 556 Yonkers Avenue, Yonkers NY. Admission for buyers and sellers is $3.00 each; children under 8 will be admitted free. New and used equipment will be auctioned and can be inspected from 9:00 am to 10:00 am. There will be plenty of seats and parking and the auction will start at 10:00 am sharp. Unlimited free coffee will be available all day. The club will charge a 10% commission on the first $100 and 5% on the remainder on successful sales only. Talk-in on 146.265T/146.865R and .52 direct. For more information, write YARC, 53 Hay-

ward Street, Yonkers NY 10704, or phone (914)-969-1053.

TRAVERSE CITY MI
FEB 11

The Cherryland Amateur Radio Club will hold its 10th annual swap and shop on February 11, 1984, from 8:00 am to 1:00 pm, at the Immaculate Conception School Gym, 2 blocks south and 1 block west of the intersection of M-37 and M-22, Traverse City MI. Registration will be at the door. Talk-in on 146.25/.85. For more information, call Jerry Cermak K8YVU at (616)-947-4848.

MANSFIELD OH
FEB 12

The Mansfield Midwinter Hamfest/Auction will be held on Sunday, February 12, 1984, beginning at 8:00 am, at the Richland County Fairgrounds, Mansfield OH. Tickets are $2.00 in advance and $3.00 at the door. Tables are $5.00 in advance and $6.00 at the door. Half tables are available. Talk-in on 146.34/.94. For additional information or advance tickets and tables, send an SASE to Dean Wrasse KB8MG, 1094 Beal Road, Mansfield OH 44905, or phone (419)-589-2415.

GLASGOW KY
FEB 25

The annual Glasgow Swapfest will be held on Saturday, February 25, 1984, beginning at 8:00 am Central time, at the Glasgow Flea Market Building, 2 miles south of Glasgow, just off highway 31E. Admission is $2.00 per person. There is no additional charge for exhibitors. The first table per exhibitor will be free, and extra tables will be available for $3.00 each. There will be a large heated building, free parking, free coffee, and a large flea market. Talk-in on 146.34/.94 or 147.63/.03. For further information, write Bernie Schwitzgebel WA4JZO, 121 Adairland Court, Glasgow KY 42141.

FRIDLEY MN
FEB 25

The Robbinsdale Amateur Radio Club will hold its 3rd annual Midwinter Madness Hobby Electronics Show on Saturday, February 25, 1984, from 9:00 am to 3:00 pm, at Totino-Grace High School, 1350 Gardena Avenue NE, Fridley MN (a Minneapolis suburb). Admission is $3.00 in advance and $4.00 at the door. There will be manufacturers and dealers of ham, computer, satellite, and R/C gear, as well as seminars and a flea market. Talk-in on 146.52 simplex or the 147.60/.00 repeater (K0LTC). For more information, contact Robbinsdale ARC, PO Box 22613, Robbinsdale MN 55422, or call Bob at (612)-533-7354.

AKRON OH
FEB 28

The Cuyahoga Falls ARC will hold its 30th annual electronic equipment auction and hamfest on Sunday, February 26, 1984, from 8:00 am to 4:00 pm, at North High School, Akron OH. There is easy access from the Tallmadge Avenue off-ramp of North Expressway (Rte. 8). Tickets are $2.50 in advance and $3.00 at the door. Some tables are available for $2.00 or sellers may bring their own; advance reservations are advised. Talk-in on .87/.27. For more details or reservations (please include an SASE), write CFARC, PO Box 6, Cuyahoga Falls OH 44222. Table reservations may also be made by calling Bill Sovinsky K8JSL at (216)-923-3830 and will be held until 9:00 am.

HAM HELP

We are happy to provide Ham Help listings free, on a space-available basis. We are not happy when we have to take time from other duties to decipher cryptic notes scrawled illegibly on dog-eared postcards and odd-sized scraps of paper. Please type or print your request (neatly!), double spaced, on an 8½" x 11" sheet of paper and use upper- and lowercase letters where appropriate. Also, please make a "1" look like a "1," not an "l," which could be an "el" or an "eye." and so on. Hard as it may be to believe, we are not familiar with every piece of equipment manufactured on Earth for the last 50 years! Thanks for your cooperation.

I need a schematic and manual for Lafayette FET multimeter #99-50833. I will pay copying costs.

Keith Heryford
PO Box F
Cedarville CA 96104

I would like to hear from anyone who has successfully interfaced a Commodore VIC-1525 printer to a Hal CT-2100 communications terminal either to the ASCII printer or RS-232C serial output of the Hal terminal.

Karl Thurber W8FX
317 Poplar Drive
Millbrook AL 36054

Our club station (VE2CLL) needs schematics and service manuals for the Hallicrafters HT-45 linear and P-45 power supply.

Harold Carmichael VE2ELN
257 St. Leon St.
Quebec City
Quebec G1K 1B8
Canada

I need an up-to-date tube-checking list for a B&K Dyna-Quik Model 500 tube tester. I have the list that is attached to the top of the case but I need a more modern list. The manufacturer says that it is out of print. Drop me a line letting me know what you have.

Gene V. Mock W4RHD
Rt. 9, Box 64-5
Fayetteville AR 72701

I need any and all technical information and manuals on the Central Electronics Model 100V transmitter. I also am interested in salvage units for parts. I will pay all expenses.

W. Van Lennep
PO Box 211
Pepperell MA 01463
(617)-433-6031

I need a copy of the tech manual/schematic of the Tektronix 535A oscilloscope. I will copy and return, or quote price for a good copy.

Hank Dean N8DOE
408 Brisbane Ave.
Westerville OH 43081

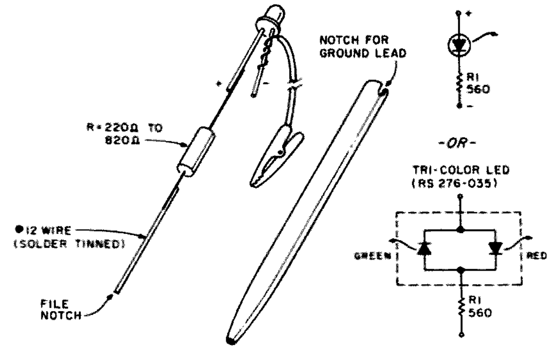
I would like to hear from anyone who has successfully changed the early Yaesu 101 6JS6 finals to 6146s.

R. F. Bricker K4CSV
PO Box 295
Fort White FL 32038

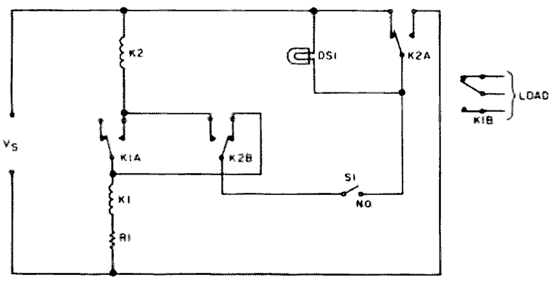
CIRCUITS

Do you have a technique, modification, or easy-to-duplicate circuit that your fellow readers might be interested in? If so, send us a concise description of it (under two pages, double-spaced) and include a clear diagram or schematic if needed.

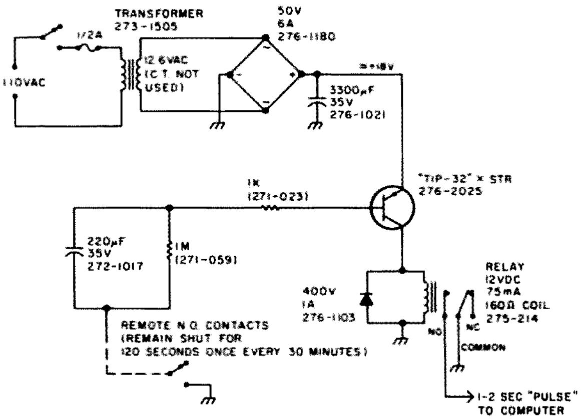
In exchange for these technical gems, 73 offers you the choice of a book from the Radio Bookshop, *to be sent upon publication. Submit your idea (and book choice) to: Circuits, Editorial Offices,* 73 Magazine, *Peterborough NH 03458. Submissions not selected for publication will be returned if an SASE is enclosed.*



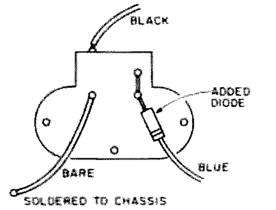
WORLD'S CHEAPEST IC TEST PROBE: The wire and resistor assembly should be about 4 inches long; work it into a ball-point pen case and glue the LED to the top. With a 560-Ohm resistor, this probe will handle up to 16 V.—Jim Hyde WB4TYL, Waycross GA.



RELAY FLIP-FLOP: Here is a way to make two inexpensive DPDT relays act like an R-S flip-flop. One press of push-button switch S1 sets it; a second press resets it. Indicator DS1 shows when the circuit is set. Use contacts K1B to control the load. The two relays must have the same coil-voltage rating, which must be equal to one-half of the supply voltage, Vs. Choose R1 to reduce holding current if desired.—Terry Simonds WB4FXD, Edgartown MA.

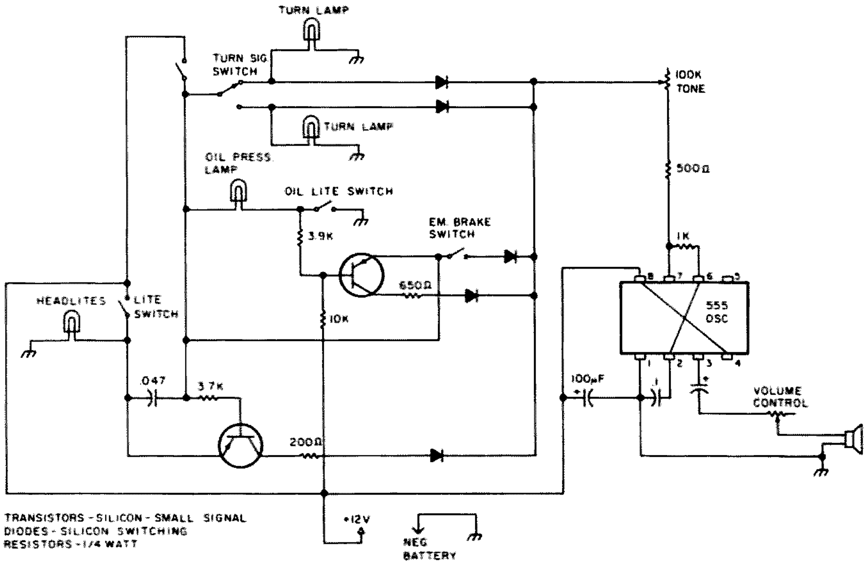


REMOTE-SWITCH TIME LIMITER: This circuit will produce a 1-2 second pulse when the remote switch contacts are closed for any length of time. When the remote switch closes, the 220-uF capacitor charges through the base-emitter junction of the transistor. The 1k resistor limits the current flow. As the capacitor charges, the current drops off until the transistor stops conducting. The on/off cycling pulls the relay in and then drops it out again. The 1-meg resistor discharges the capacitor when the remote contacts open again.—Jeffrey Blackmon W2YI, Beavercreek OH.



ENLARGED VIEW OF *EXT BACK UP* SOCKET AS SEEN FROM INSIDE CHASSIS

MEMORY SAVER FOR THE KENWOOD TR-7800: The Kenwood has nicad batteries to keep the memory intact when you unplug the rig. However, if you leave the power switch on when the rig is unplugged, the batteries will also try to power the rig—resulting in a very short memory life. To keep this from happening, first locate the blue wire connected to the "EXT BACKUP" socket. Remove this wire from the socket and insert a small diode between the end of the wire and the terminal to which it was formerly connected. The cathode end should be hooked up to the wire. Any small diode will do, provided it has no significant reverse current at 20 volts and as little forward resistance as possible.—H. F. Viney VE3AZX, Nepean, Ontario, Canada.



AUTOMOBILE EARLY-WARNING SYSTEM: Hook this up to your car and you will never leave your lights on again. The circuit also provides an audible turn-signal indicator, as well as warns you when your emergency brake is on. Another connection to the oil-pressure light will tell you when the pressure is low.—Keith Barrigar W7KQD, Lebanon OR.

FUN!

John Edwards KI2U
PO Box 73
Middle Village NY 11379

REPEATERS

This month's column is dedicated to the memory of WR2APG, a fine machine that died of neglect because it operated on 220 MHz instead of 2 meters. Funny, at the time I thought a repeater that specialized in RTTY, SSTV, and FAX would be successful.

ELEMENT 1—MULTIPLE CHOICE

1) What is a station master?
  1) A brand of repeater antenna
  2) Slang for a repeater control operator
  3) The name of Motorola's repeater line
  4) A type of phone patch

2) In most ham applications, Motorola's HT-220 operates on:
  1) 50 MHz
  2) 145 MHz
  3) 220 MHz
  4) 440 MHz

3) The Private Line subaudible tone system was invented by:
  1) General Electric
  2) RCA
  3) Motorola
  4) Kenwood

4) In which year did the amateur 6-meter band open?
  1) 1968
  2) 1919
  3) 1923
  4) 1945

5) Who invented FM?
  1) Colonel Perkins
  2) Major Armstrong
  3) Captain Andrews
  4) General Stupidity

ELEMENT 2—MATCHING

Match the past and present 2-meter transceivers with their manufacturers.

Column A	Column B
1) Carfone	A) Icom
2) Brimstone 144	B) KLM
3) Marker-Luxury (ML-2)	C) Swan
	D) Azden
4) Voice Commander III	E) Motorola
	F) Yaesu
5) HR-2A	G) Santec
6) Multi 11	H) General Electric
7) FM-DX	I) Tempo
8) HW-2036	J) Kenwood
9) IC-2AT	K) RCA
10) Metrum II	L) Satan Electronics
11) PCS-4500	
12) TM-201A	M) Heathkit
13) 144uP	N) Clegg
14) GTX-202	O) VHF Engineering
15) FM-2X	P) Drake
16) VHF-1	Q) Midland
17) TRX-144	R) FM Laboratories
18) 1402 SM	S) Genave
19) FT-221	T) Wilson
20) 13-510A	U) Regency

ELEMENT 3—SCRAMBLED WORDS

Unscramble these examples of repeater terminology:

RMMEJA	PUSR
TCHAPTOAU	PLUDXE
PERTREEA	TILSP
LENNCHA	QUELCHS
FOFEST	PIMXSLE

THE ANSWERS

Element 1:

1—1 Made by Phelps-Dodge and very popular.
2—2 Doesn't make much sense, does it?
3—3 Ever notice how many "subaudible" tones really aren't?
4—4 Hmmm. Just a couple of years before TV.
5—2 Major Edwin H. Armstrong, who later killed himself when the boys at the radio networks tried to cheat him out of his royalties.

Element 2:

1-K, 2-L, 3-P, 4-H, 5-U, 6-B, 7-N, 8-M, 9-A, 10-E, 11-D, 12-J, 13-G, 14-S, 15-C, 16-I, 17-O, 18-T, 19-F, 20-Q.

Element 3:

(Reading from left to right) JAMMER, SPUR, AUTOPATCH, DUPLEX, REPEATER, SPLIT, CHANNEL, SQUELCH, OFFSET, SIMPLEX.

SCORING

Element 1:
Six points for each correct answer.
Element 2:
One and one-half points per match.
Element 3:
Three points for each word unscrambled.

How well do you repeat?

1-20 points—Have never ventured beyond 14 MHz
21-40 points—Think that 2-meter radiation is harmful
41-60 points—Use 2 meters when the CB is broken
61-80 points—Take your HT along on dates
81 + points—Hopelessly addicted

AUTHOR'S CORNER

In these last few lines of this month's column I would like to respond to a point raised by Mark Regan of Reynoldsburg, Ohio. In a letter appearing in the August, 1983, "Letters" column, Mr. Regan claims that my comments in response to a "FUN!" poll question on religious nets proves that I wish "to deny the right of free speech to those who like to talk about ideas of a religious nature."

Not true, Mr. Regan. I certainly have no objection to bible discussions or any other sort of on-air religious activity that conforms to FCC rules. If my comment gave an anti-free-speech impression, as Mr. Regan asserts, I'm sorry. To set the matter straight, I believe in free speech for all.

RTTY LOOP

Marc I. Leavey, M.D. WA3AJR
6 Jenny Lane
Pikesville MD 21208

Happy New Year! I don't know how long I have been waiting for this year to finally arrive. I guess it has been ever since I read the book—George Orwell's, that is. But this year seems no more frightening than last, even though the technology for some of Mr. Orwell's more frightening machinery does exist. Hopefully, however, we will use this technology for good, progressive communication.

We do have a touch of "newspeak," however. Ever hear of a CBBS? How about an ABBS, Tariboard, PMS, or other such cryptic phrase? To the computer buff, these bulletin-board systems (BBS) represent the "Citizens Band" (if you will forgive the expression) of computing. They offer a source of bulletins, a pipeline for programs, and a kind of public soapbox and maildrop that is available for the cost of a phone call. It shouldn't surprise you, then, that we hams have our own form of BBS on the air—usually called a RTTY mailbox system.

Made possible by any of a number of microcomputers, these versatile fusions of hardware and software create a kind of, well, let's call it a repeater, which can be called up, accessed, and used much as our computer buff's BBS can. But ours is on the radio, not the telephone!

I know that you all are interested in these systems, with a representative letter this month coming from Bob Wallace W9STA/2, in New York City. Bob writes, "Do you have any information regarding the RTTY mailboxes such as frequency, location, and how these things are accessed?"

Well, Art Santella K1VKO passes along the following information about one such system, the WA1GOO mailbox, in Rowayton, Connecticut. Art tells me that the system is on 146.580 MHz, twenty-four hours a day, idling at 60 wpm. A user accessing the machine can switch it to 100-wpm Murray or 110-baud ASCII. The machine covers a large area of Long Island and Connecticut, being located on the coastline of Long Island Sound. Operating simplex, with a Station Master antenna, Art tells me that plans are in the mill to raise the antenna to 100 feet, using a hardline feed, and a linear may be added to boost the output even more. Further down the line, a twenty-meter mailbox may be added, with a link to the VHF machine. This would give a super way to reach in and out of the Long Island area for local and DX stations.

A look at the directory on line recently shows about thirty files, including listings of computer nets, an RBBS directory, Miami weather frequencies, a W1AW schedule, various ARRL and other bulletins, several articles on RTTY and computers, and other items of interest. Even recent DX stations worked are listed, with times and frequencies, to aid other operators in their search for the rare country.

The system uses the Super-RATT™ software that we mentioned here a few months back. Some of the commands available include the ability to save or read messages on the system disk, scan recent news or weather bulletins, look at the user file, set mode to Murray code at 45 baud (60 wpm), 74 baud, 110 baud, or ASCII at 110 baud, even the ability to look at four analog-to-digital converters. I don't know what you would use that for!

If you are interested in this system, Art would be happy to send you a full list of commands and such. Just send a business-size SASE to Art Santella K1VKO, 43 Seaview Avenue, East Norwalk CT 06855, and ask for the information on the WA1GOO mailbox. Be sure to tell him you saw it in "RTTY Loop."

A look at the mailbox on my front curb produces this letter from Roy D. Thomas KA4VVJ. Roy would like to find a source for in-depth information on several of the microprocessor chips around. He relates having information on the 6800 (a fine chip!) but wants to learn more about the 8080, Z-80, 6502, and others. He also wants to know where you can buy any of these chips.

Well Roy, let's cover that last question first. Any good computer center or parts house should stock those CPU chips mentioned above, along with the support chips needed to build a functioning system. I would caution, however, that it takes a fair piece more than a chip and a power supply to make a computer. So, before you go out and buy a chip for ten bucks or so, it would do you well to read quite a bit and decide on just what you want to accomplish.

There is a raft of books out there, ranging from highly technical masterpieces of obfuscation to primers that spend hundreds of pages to teach a few elementary facts. The best bet is to read a few of the computer magazines which cover all bases, such as *Microcomputing*, and look at back issues, which should be in any reasonably sized library, to get a grasp on the hardware involved. In the ads in these magazines you will find a great number of books on microprocessors, and many of these books will be reviewed in the magazines as well. Look them over; I am sure you will find enough information to keep you busy for some time to come.

Above all, please realize that, with few exceptions, it makes little difference which microprocessor chip is ultimately used. How well and flexibly the software is written, how well the system, once configured, will do the task at hand, and what the upward compatibility is (will it become obsolete next year?) are all valid considerations.

A thank you to you all, the readers of "RTTY Loop," is sent along by way of Barry Travis N4FNZ. Barry, you may recall, needed a hard-to-find CRT for his oscilloscope. Well you all came through, and Barry is watching dancing green lines once again.

A new request comes from Henry Kirchmer KF4UW. Henry is looking for help in putting a Yaesu FT-107 on RTTY. He also would like to find a RTTY interface for the Timex/Sinclair 1000. I did not find any T/S-1000 interfaces in my review last month, Henry. But I am sure that any reader with information would be glad to drop you a note at 30 Patrick Lane, Rockledge FL 32955. Send me a copy, too, folks—thanks.

Another ham looking for help is Tom Childers WA5ZVZ. Tom has purchased a Teletype® Model 35 and plans to use it as a printer for his TRS-80C®. He is looking for help in connecting the loop supply of the teleprinter to his computer. Well, Tom, I have zip in the way of information on the Model 35; I am sure that at least one of our readers does, however, maybe even having hooked up the thing as you want to. If

so, I am sure that you will receive a note at 7189 Westbranch, Olive Branch MS 38654, very soon. If I hear anything here, I'll let you know.

In case any hams in the southern California area have never heard of SCATS (the Southern Counties Amateur Teleprinter Society), and I find that hard to believe, the club operates a two-meter repeater on 146.10/146.70 MHz, located in the north San Fernando Valley, and another repeater on 223.12/224.72 MHz on the Palo Verdes hills. These are Murray RTTY repeaters, open to all. The current president of the club is Sid Heyman WB6FFW. Interested amateurs are invited to drop a note to the editor of SCATTER, the society's newsletter, Hugh Washburn WA6IEX, 5772 Garden Grove Blvd., Sp 415, Westminister CA 92683, for more information.

I would like to take a moment to address a rather select group of readers. Any of you who are using 6800 or 6809 systems under the Smoke Signal DOS68 or DOS69 systems are invited to drop me a line with your name, address, and whatever system details you care to offer. I am looking to get a sense of how big the DOS68/DOS69 group is compared with the FLEX bunch, so that we can see some more of our system's stuff in print. Thanks.

As I have said before, I always enjoy hearing about your experiences with the newer RTTY equipment. This month, let me present one man's experiences. Ronald Kenneady N2DWN writes: "I have been reading 'RTTY Loop' for quite some time now and with the advent of computers, interfaces, printers, and solid-state rigs, I have finally decided to plunge in.

"And when I plunge in I *plunge in*! I've acquired a Kenwood TS130S, a Kantronics Interface, and a VIC-20 computer, along with the VIC dataset, disk drive, and dot-matrix printer. Right out of the box everything worked, except the interface.

"But, not to worry, the folks at Kantronics are great people and Mr. Travis Brann stayed on the telephone with me quite some time trying to figure out why every time I plugged in the computer-to-interface cord the Kenwood went into transmit mode. He finally decided that it must be a defective cable and said that he would send me a new cable.

"Not wanting to wait for the UPS truck, I pulled the cap off the game port end of the connector and began to experiment. The wire-to-pin scheme that Travis Brann had given me said that I should be looking at the brown wire to pin 1, the red wire to pin 2, white to pin 3, green to pin 6, and black to pin 8. Not so and it's not Kantronics' fault! It's the connector itself. Pins 1, 2, and 3 (on the top side) are correct, however, on the bottom, it's a different story. The numbering order has been reversed. Therefore, by placing the green wire in the connector slot marked for pin 8 and the black in the slot for pin 6, all systems become a GO! The black wire in this cable is a double wire attached to shield, and therefore, somewhere along the line, to ground. Grounding pin 8 will activate the PTT circuit in the Kenwood and jump to transmit mode. If other hams are having problems of this nature they would do well to check the wiring to the pin in the game port.

"If you decide to use the Kantronics Interface, be careful with the operating voltage and current. If the input is not at least 12 volts at 1.5 Amps, it just won't work. If the interface can't pull enough current from the source, the entire bar graph and LED tuning light will light up and signals will not pass in either direction. Another hint for operation troubleshooting: All power must be on in order to operate. The monitor, computer, interface, transceiver, and printer (if attached) must all have power on in order to operate. Turn one of them off and the whole system will go down. According to Travis Brann it's a built-in feature."

Well, I really appreciate these impressions of the Kantronics unit, and I am sure that those readers considering putting a computer on the air do as well. I will try to cover more of the material you ask about in the coming months. Please remember, if you would like a personal reply to a letter, enclose an SASE. Thanks. So long for now—stay tuned for next month's "RTTY Loop."

LETTERS

WINNER!

In my opinion, your recent introduction of the "73 International" column has set your publication apart from all the others.

The use of correspondents "in country" makes the contents believable. The use of full-color national flags in the headings is a stroke of genius.

It seems to me that beyond the real service that this column provides to worldwide amateurs, it provides an insight to the correspondents' countries to the non-amateurs who may come across it. The Lord knows the world needs all the help it can get! Hope springs eternal that before long you will have correspondents in TA-, CN-, 4S-, 5R-, and perhaps even SP- and (dare I wish?) U-lands.

Finally, it is obvious that the inputs from some of the non-English-speaking correspondents have been *transliterated*, rather than *translated*. The difference is best illustrated by the line from the song: "Throw Mama from the train a kiss" (trans*literation*). The German when trans*lated* would be: "Throw a kiss to Mama from the train." To the thinking person, I believe this enhances the credence of the correspondents. Please don't edit them, except possibly for length.

Wayne, you have another winner!

Thomas L. Bowers III WD4CQY
Eustis FL

OFF-BASE COLUMN?

I am not given to writing letters to the editor, but after reading a column in the August issue of *73*, I am moved to put in my two cents worth. The column I am referring to was part of "*73* International" and was written by Roy Waite W9PQN concerning his views on amateur radio in Japan . . . and other non-related items.

Mr. Waite's comments made for interesting reading. Unfortunately, his statements were somewhat incomplete, incorrect, and outdated. Some were not even relevant to amateur radio.

There is a general statement that foreigners living in Japan often make that applies: Nothing in Japan is easy. It is a bureaucratic, red-tape, paperwork nightmare. It also makes for full employment! Mr. Waite attempted to tie Japanese procedures, rules, and regulations to the American way of doing business. That is like comparing apples to oranges. We have an outstanding country, but in my opinion, we have too liberal rules and regulations covering a wide range of rights accorded to visiting foreigners, both the legal and illegal type. But Japan is the subject here, not America.

First, it is not easy for a foreigner to obtain a license and permission to operate an amateur-radio station in Japan, but it can be done. The number doing so is quite large, surprisingly so. However, for the short-term tourist, it is almost impossible. Anyone having a valid amateur license issued by another country can apply for permission to operate on the correct form obtained from the Telecommunications Commission. The next, and often most difficult, step is finding a radio club that will allow you to use their club callsign. Only one individual at a time can use the club callsign. The other way for a foreigner to get on the air is to take the written exam in Japanese. Do that and you get your license and callsign like any other amateur. The last time I checked, the American exam was not given in Japanese—only English—so anyone who desires a regular American license must know our language.

In Japan, there are four classes of license: first class, second class, telegraphy, and telephony. First and second class can operate 100 Watts. The strict government inspection that Mr. Waite referred to plus the $100 charge are things of the past. JARL has been given the authority to inspect and approve 100-Watt (and for first class, up to 500-Watt) stations. The modern equipment used by most amateurs makes the inspection routine.

Much has been made by Mr. Waite and others of the large numbers of Japanese who hold the lowest-class license. They attempt to equate it to CB and a lack of technical expertise. Actually, this is not the case. The level of technical know-how among average Japanese amateurs is higher than that of the average American Novice. What is more important, technical ability and knowledge or the ability to copy CW at 12 words per minute (9 wpm for the second class, which is about equal to our General class)? In technical skills and knowledge, the holders of the lowest-level license in Japan are *not* Novices.

I also disagree with the statement that in Japan amateur radio is merely an extension of the Citizens Band, including its numerous abuses, bad manners, overcrowding, and lack of what amateur radio is all about. What is amateur radio all about anyway? It is a hobby. It is fun. It is communicating with others who enjoy the same thing. There is no requirement to do research or experiment or build homebrew equipment. The general consensus of opinion is that the more people involved with amateur radio (or any other hobby), the better off it is. More people involved means band crowding. It also means an increased likelihood of more experimenters and developers, more domestic equipment, a larger market, and a fresh infusion of "new blood" to prevent stagnation. I've heard my share of pileups and bad manners from English-speaking operators. One additional point needs to be remembered (and recognized): The holder of the license, even the telephony class, must clearly demonstrate technical knowledge . . . something that the stateside CB operator does not have to do. As a matter of fact, Japan has a new "sport band" in the 900-MHz range that requires no license. Putting CB up there makes more sense than in the upper HF range where ours is.

One small but important (to the few involved) aspect of amateur radio in Japan that was not covered by Mr. Waite is the KA callsign. Under an agreement between the governments of Japan and the US, amateurs who are stationed with the US military in Japan and who reside on a US military installation can be issued a special license and a KA callsign. The callsign consists of the KA prefix, a number corresponding to the part of the country where the radio is located, and by a two-letter suffix. The interesting part is that the operating privileges accorded the amateur are the same for the holder of the Novice-class US license as they are for the holder of the Extra-class ticket. In addition, they are expanded over what is authorized in the US. For example, KA stations are granted permission to operate voice from 14.000 to 14.350 and from 21.000 to 21.450. Therefore, the holders of the KA call can legally talk with foreign stations on frequencies well outside of those normally authorized. Even a Novice, something Mr. Waite seems to think is not worth much, can talk to his heart's content with any station outside of Japan on frequencies even a US Extra ticket holder cannot use. I'm sure that must rub some "real hams" the wrong way! The two noteworthy limitations to the KA callsign are: (1) the station must be fixed-base, no mobile operations allowed (and, of course, the station must be on a US facility), and (2) no contact with Japanese stations and no third party ops are allowed.

Unfortunately, even though the KA callsigns are often listed in the callsign directory, many amateurs are not familiar with them and (1) think we are stateside or (2) don't realize that we can legally operate outside of the normal limits followed by US hams stateside.

One aspect of Mr. Waite's column that I objected to the most was the voicing of his opinions of the policies of the Japanese government. Japan is not America. His comments are best directed toward his congressman. I don't necessarily agree with many of the official or unofficial policies practiced by the Japanese government or the population at large. However, amateur radio is supposed to transcend politics. Describing the living place of the average Japanese as a "rabbit hutch" or "hovel" has no place in your magazine nor do discussions of his opinion of their attempts to protect Japanese domestic production. I have lived in Japan for the past six years and do not agree with his assessment of the living conditions of the local population . . . but my opinion really should not show up in print in an amateur-radio magazine any more than his should. We want to improve international relations and increase goodwill between hams, not torpedo it.

I hate to say it, but the July issue of that unnameable magazine, on page 60, gave a better summation of the Japanese license than did Mr. Waite. No politics or opinions, just the correct facts.

Thank you for your time.

Cdr. William W. Radican N7CAD/KA2WR
San Francisco CA

I wouldn't want to say that I am more qualified to comment on amateur radio (or

anything else in Japan) than Cdr. Radican after his six years in Japan, but I would think that my 20+ years in Japan, having associated with Japanese hams of all classes as well as foreign hams, might give me a slight edge.

Cdr. Radican begins his essay by stating that my statements were incorrect and outdated. No way! In rechecking the column in question, I find no misstatement of fact of any kind, nor is the information outdated. My friends in the JARL (including President Hara), Ministry of Posts and Telecommunications, and CQ Ham Radio wouldn't let me down. The only fact that has changed since the column appeared (which Cdr. Radican attempts but fails to explain correctly) occurred after 73 went to press. This was the change in the rule which eliminates station inspection for stations of 100 Watts or less (previously 10 Watts or less). And this was brought about only because the American side would not sign a reciprocal agreement that required a station to be inspected prior to issuance of a license. The JARL successfully negotiated that point with the very stubborn Ministry of Posts. It has now become more probable that a reciprocal agreement will be signed, but the Japanese side still wants to charge 7,000 yen per application (equivalent to about $28). This is not exactly reciprocity, or course, because as far as I know, most (if not all) of the major nations make no charge at all, or only a nominal charge at most. But maybe we can live with that. I am not sure the US will agree, though.

Cdr. Radican states that the JARL has been given permission to inspect first-class stations up to 500 Watts. Not true. The JARL has been given authority to waive inspections for any stations of 100 Watts or less (output power). Incidentally, inspections are not necessarily as routine as Cdr. Radican would have us believe. It depends on the inspector, the weather, if he likes the way you comb your hair, etc. Several of my Japanese friends have told me some hair-raising tales about these inspections. And you have to wait as long as six months for the inspectors to come before you can operate. A short-term visitor to Japan wouldn't even be here that long!

Cdr. Radican also states that "anyone having a valid amateur-radio license issued by another country can apply for permission to operate..." Wrong! Only amateurs from America, Germany, Finland, and Ireland can do that.

Cdr. Radican states that all a foreigner has to do is to take the written Japanese exam, and if he passes it, he will get a license and callsign like everyone else. Wrong again! He will get only an operator's permit. The station and operator's license are separate in Japan. He still needs a friendly Japanese who is willing to lend a club callsign to him. But no callsign will be assigned to the foreigner. The club callsign is owned by the Japanese, and the Japanese is in charge. The foreigner only becomes a member of that particular club. Under Japanese law, only Japanese citizens can have a callsign. Four non-Japanese have taken the Japanese test and passed, but they still had to search for a club to operate from.

Cdr. Radican disagrees with the statement that in Japan amateur radio is an extension of the Citizens Band. OK, he can disagree if he likes. But that doesn't change anything. He ought to listen to 2 meters or 15 meters some night or weekend. Maybe he would enjoy the sex tapes played on the main calling channel, deliberate repeater blocking, another "ham" telling all who will listen that he is going to masturbate on the air as he goes through all the sounds, the jeers and mocking when two English speakers want to have a QSO, guitar playing, singing, etc. Does Cdr. Radican have his head buried in the sand?

Cdr. Radican refers to the Japanese Denwakyu (whom I properly called "Novice" operators, in English). There is no doubt that the Novice operators in Japan have in the long run added new numbers to the ham population, but perhaps Cdr. Radican does not know that 42% of these new operators fail to renew their station licenses upon expiration. Of those that do renew, upon the second expiration, ony 25% renew. After that, the rate continues downward. It is a case of diminishing returns. We have just a lot of people "passing through" the amateur gates and never returning after they tire of screaming and shouting and carrying on. The reason? No incentive. One can remain in the depths of the Novice world forever if he or she so chooses. Too easy to get in in the first place. Remember that anything acquired too easily is usually not cherished for long. Incidentally, many people think the large number of hams here has some real meaning, but actually, callsigns are never reissued; counting callsigns is futile, since many operators are counted who have long ago dropped out. No one knows for sure what the real number is.

Technical skills superior to the US Novice? Yes, the questions do seem on a higher level, but remember that they are multiple choice. Memory courses are run for these budding hams the year around.

I think Cdr. Radican is correct in his statement about the new 900-MHz sport band. It is a good idea. But I am not planning to cover it, as it is outside the realm of ham radio.

Now about the US military KA stations. I covered this in the October issue of 73. Cdr. Radican seems to think that Japan and America have an agreement permitting these stations to operate. Quite the contrary. The JARL and Ministry of Posts have made it known to Japanese hams that KA stations are not hams at all and have prohibited all Japanese hams from contacting them, subject to penalties. The agreement that seems to be confusing Cdr. Radican is the Status of Forces Agreement that allows the US military to establish military communications. It is for that reason that Japan considers KA stations to be military rather than ham stations. It is not a kind Japanese government that is permitting the American KA stations full-band operation, even for US Novices. Quite the contrary.

Cdr. Radican thinks that ham radio should transcend politics. No, not when it comes to reciprocity, unfortunately. This is the real world.

Cdr. Radican states that "Nothing in Japan is easy. It is a bureaucratic, red-tape, paperwork nightmare. It also makes for full employment!" So, from that statement, I gather that Cdr. Radican would have the US imitate Japan in this regard: more red-tape and paperwork nightmares, and we will have full employment. How simple life could be, indeed! It isn't possible that some of that red tape and bureaucracy is keeping American products out of Japan, is it?

Cdr. Radican reminds me that "Japan is not America." Yes, I've noticed.

Cdr. Radican mostly objects to the voicing of my opinions of the policies of the Japanese government. Why is that? Are we to be afraid of the truth in these matters? Are my comments irrelevant to amateur radio? They certainly are not. Mr. Nakasone, the Prime Minister of Japan, does not deny me my right to criticize the government. I have written two times to Mr. Nakasone and received replies from him both times. (He answers all of his mail.) I am a member of Japanese society here, pay my taxes (heavily!), and obey the laws. Of course, I complain, and I shall continue to do so. I praise many things here, too.

My comments about Japanese life, etc., are known as "perspective sketching," and it's useful to set things in proper perspective in order to understand why things are like they are. We must not hide from the truth. I will continue to tell the truth as long as I have the strength to do so.

Cdr. Radican tells us about the various classes of Japanese licenses, etc., but we know all of that already. I hope Cdr. Radican will read the September and October issues of 73 for a fuller understanding.

Those of my Japanese friends who have read my columns so far have congratulated me on "telling the full story," as they put it. They are looking forward to a reciprocal agreement with the US as much as I am.

I enjoyed reading Cdr. Radican's letter. I just wish he would get his facts straight and put a little more trust in me. Any column I submit to 73 has been checked and double-checked carefully before submission. Items relating to law were confirmed by one of the 12 Japanese (English-speaking) attorney colleagues in my office. Additionally, these columns have been read by a Japanese and an American ham for "reaction" before submission to 73. I feel I owe that much to the readers of 73 and to Mr. Green. I am not infallible, of course, but in rereading the columns I have submitted to 73 thus far, I find no errors. The columns stand. Cdr. Radican has struck out.

As for that "unnameable" magazine, all I can say is that my mother stopped dishing up pablum when I was one year old. Thereafter, I haven't cared much for it.

I am sorry Cdr. Radican didn't like my August column in 73. (Surely he won't care much for my September and October columns either.) Many people did like the columns, however, judging by my mail so far. Even my Japanese in-laws and my Japanese nephew (a budding ham) enjoyed the columns. Cdr. Radican's letter is the only negative voice I have heard.

I hope Cdr. Radican will continue reading 73 even though he doesn't find my writing to his liking. There is a large selection of fine features in 73 every month, and I think he will find many interesting articles among them, perhaps more suited to his taste.—Roy E. Waite W9PQN, Tokyo, Japan.

ELECTRONIC LUNCH

If you go to a fast-service diner, order a *radio* for lunch. Short-order cooks call poached eggs on toast *Adam and Eve on a Raft*, sometimes served with *red lead* (ketchup).

A *radio* is a tuna-fish sandwich on toast. Does anyone know why?

Carl S. Zelich AA4MI
Merritt Island FL

RELOCATED BEACON

Thank you for publishing the information on my ten-meter beacon. Unfortunately, due to the lead time for publication, the information was published after I moved. The KA1YE/B beacon has been moved to the Rochester NY area in western New York. It is about 10 miles south of the city at 43° 02' N, 77° 41' W, in grid square FN 13 of the Maidenhead grid locator system. The power is still 4 Watts, and the antenna is a dipole. The beacon is on 24 hours a day on 28.286 MHz CW.

R. I. P., OSBORNE 1

I can still remember a QSO I had in April of 1981. There used to be a group of local hams that chewed the rag on 15 meters all night long. As usual, we were talking about computers.

The latest issue of *Byte* had just come out which, second only to receiving one's issue of *Kilobaud* (now *Microcomputing*), was the most interesting event in a computer hacker's life. (Hackers tend to lead dull lives.) In the editorial section, there was mention of a new computer: the Osborne 1. I commented to the guys in the net: "Did you see the new computer from Osborne? It certainly is an interesting idea!"

"Bob, I can't believe you fell for that," commented Marc WB2JUF. "That thing is nothing more than an April Fool's joke!" Everyone on frequency had a good laugh, and I conceded to Marc that I had been taken. After taking a close look at the picture of the Osborne 1, it looked as if it were a paste-up. And the silly things *Byte* said about it! Who in their right mind would want to put a computer under an airline seat?

After a few days passed and the *Wall Street Journal* carried a story on the unit, it became apparent that it was Marc, not me, who had been fooled. By now everyone knows the Osborne story. For a while they were extremely successful. The design which could have been taken for an April Fool's joke became a popular style of computer: the "transportable computer."

Unfortunately, Osborne didn't last. They announced their bankruptcy in late 1983. Competition became fierce, and mistakes were made and not corrected until it was too late. The death of Osborne also marked the end of another phenomenon: the "garage" computer. Now, with the big guns making personal computers, multimillion-dollar ad campaigns, and consumers looking for brand names when they go computer shopping, it will be next to impossible for an individual to start his or her own computer business. The shake-out has begun.

WAKE UP, IT'S 1984

We finally made it to Orwell's infamous year. Will technology help us or ruin us? As computer hobbyists, we all have encountered anti-computer remarks and no doubt have been offended by them. How many times have you been told by a shop clerk that the computer "won't let" her do something. Or perhaps you experienced a delay at the

Fig. 1. DTMF frequencies in Hz. Xs indicate tones for the digits and characters on the left

bank because "the computer was down." It's no wonder that some people seem to be against new technology. Amateur radio seems to be no different. I have received all sorts of strange comments from hams who object to the "strange noises" they hear coming from my station over two meters. Usually the objection is that the simplex frequency I am on (144.44) is for voice communications only, established by a gentlemen's agreement. To their comments, I can only respond that I am not a gentleman!

But by and large, hams are realizing that, in order to keep up with the world, a knowledge of computers is essential. In fact, computers are discussed over ham radio almost as much as the weather. I hope this trend continues.

One of the new things that computers have allowed is packet repeaters. Interest in this mode is gaining. It is nice to be able to use our spectrum more efficiently. Combined with mailbox facilities, a packet repeater is an excellent mode of communication. In the St. Louis area, packet radio is thriving. Pete Eaton WB9FLW, president of St. Louis Area Packet Radio, reports that "packet radio is growing rapidly . . . in the Midwest, as well as the rest of the country." His club publishes an informative newsletter, *SLAPR Protocol*. For more information about the club and the newsletter, write to: *SLAPR Protocol*, St. Louis Area Packet Radio Club, 1309 Gloucester Dr., Edwardsville IL 62025.

ATARI DTMF

Atari home computers incorporate a built-in sound synthesizer. With commands from Basic, it is possible to make a wide range of musical notes and weird noises. As the tones are specified with an 8-bit (0–255) quantity, resolution is limited. For applications which require an accurate tone, a higher resolution is required. Atari realized that there might be a need for accurate tones and provided a way of creating them.

Atari sound is generated with a custom chip known as POKEY. Normally, one controls sound production from Basic using SOUND commands of the form SOUND a,b,c,d where a is the voice (1–4), b is the pitch (0–255), c is the distortion parameter, and d is the amplitude (0–15). The POKEY chip, however, serves other functions and has other capabilities which are not directly accessible with Basic statements. These functions can be used from Basic with the help of some POKE commands.

The program in listing 1 will generate the tones for DTMF signaling. Program logic is as follows: lines 1–4 serve to initialize the POKEY chip. All sound generation in the program is done with POKE statements, not SOUND statements. Lines 10 through 130 read in a pair of tone frequencies. From these numbers, a value is calculated which corresponds to a 16-bit integer. These numbers are split into two segments; since a byte can only hold 8 bits, 2 bytes are needed to hold the 16-bit number. The statement in line 200 tells the POKEY chip to link the sound generators in pairs: 0/1 and 2/3. Each pair becomes 1 voice that is controlled by a 16-bit (0–65535) number instead of an 8-bit (0–255) number. In addition, this POKE also makes the POKEY switch to a higher clock frequency, thus providing even more accuracy. The tones are actually switched on by lines 250 and 260. After a short delay provided by the FOR/NEXT in line 270, the tones are switched off at line 290. Line 300 starts the process all over again.

To enter the tone data, the frequencies must be placed on data statements. For example, if you wanted to have the computer "dial" the code *911, add the following data statements:

1500 DATA 941,1209
1510 DATA 770,1477
1520 DATA 697,1209
1530 DATA 697,1209

Those numbers are, of course, the tone frequencies used in the DTMF code (see Fig. 1 for the complete code).

This program can be used to create any tone that you may need. Accuracy is certainly good enough for any amateur-radio purpose. Simply put the tone frequencies you want generated on data statements. To generate single tones, eliminate the following lines: 50, 60, 70, 120, 130, 230, 240, and 260. Change line 10 to "READ A" and line 290 to "POKE 53763,224" And, of course, create your data statements accordingly. It should be possible to generate accurate RTTY and SSTV tones with the Atari—perhaps even to take a graphics screen and convert it into the proper SSTV tones. (Basic would be too slow for this; assembly language would be needed.)

For those of you who want to experiment with Atari sound, memory locations 53761, 53763, 53765, and 53767 will be of interest to you; they are the audio-channel control registers. The most-significant three bits determine the distortion parameter, the next bit is the "forced-output" bit, and the least-significant three bits are the volume-level bits. When the forced-output bit is set to a one, the output is controlled directly with the volume bit; the speaker can be set to any one of 16 positions. Using this bit, custom waveforms can be created.

Frequency is determined with locations 53760, 53762, 53764, and 53766. The value in these registers controls the frequency of the corresponding audio generator. When two voices are linked together, the locations are taken in pairs with the higher address taking the most-significant portion of the 16-bit number.

The way to coordinate tone generation is with location 53768. For our purposes, we would be concerned with bits 6, 5, 4, and 3. When bit 6 is set to 1, channel 1 is clocked with a 1.79-MHz frequency; bit 5 does the same for channel 3. Setting bit 4 high will join channels 2 and 1; bit 3 joins channels 4 and 3. These addresses were used to produce the tones for the DTMF routine. As you see, the Atari will allow for some elaborate tone generation.

I certainly appreciate all the mail I have been receiving. So far, I have received a few interesting proposals for an amateur-radio graphics standard—I would like to hear from some more of you on this matter!

HAM HELP

I am converting a Teaberry Ranger T model 4012 CB rig for use on 10 meters. Can anyone supply a schematic or service manual?

Reprinted from the Federal Register

Amendment of the Commission's Rules To Allow the Use of Volunteers To Prepare and Administer Operator Examinations in the Amateur Radio Service

AGENCY: Federal Communications Commission.

ACTION: Final rule.

SUMMARY: This document amends FCC Rules to permit the use of Volunteers to prepare and administer amateur radio operator examinations. These amendments are necessary in order to maintain a viable examination program for amateur radio operators in light of FCC budgetary constraints. With a volunteer examination program, applicants will have more opportunities available to them to obtain amateur radio operator licenses.

EFFECTIVE DATE: December 1, 1983.

PART 0—[AMENDED]

1. The Table of Contents for Part 0 is amended as follows:

(a) A new § 0.484 entitled "Amateur radio operator examinations." is added.

(b) The Heading of § 0.485 is revised to read: "Commercial radio operator examinations."

* * * * *

2. A new § 0.484 is added to read:

§ 0.484 Amateur radio operator examinations.

Generally, examinations for amateur radio operator licenses shall be administered at locations and times specified by volunteer examiners. (See § 97.28(a)). When the FCC conducts examinations for amateur radio operator licenses, they shall take place at locations and times designated by the FCC.

3. Section 0.485 is revised to read:

§ 0.485 Commercial radio operator examinations.

Written examinations and International Morse code telegraphy examinations for commercial radio operator licenses are conducted at prescribed intervals or by appointment at locations specified in the Commission's current examination schedule, copies of which are available from any Commission field office or from the FCC, Public Service Division, Field Operations Bureau, FCC, Washington, D.C. 20554.

PART 1—[AMENDED]

4. The Table of Contents for Part 1 is amended as follows: the heading of § 1.925 is revised to read "Application for special temporary authorization, temporary permit or temporary operating authority."

5. Paragraph (a) of § 1.912 is revised to read:

§ 1.912 Where applications are to be filed.

(a) Applications for any class of new or upgraded amateur operator license shall be submitted to the examiners prior to the examination. (See § 97.28.) The examiners are required to submit the applications of persons passing their respective examinations to the Commission (for Novice Class operator licenses) or to the Volunteer-Examiner Coordinator (for all other amateur operator licenses). All other applications for amateur radio licenses shall be submitted to the Federal Communications Commission, Gettysburg, Pennsylvania 17325. Only one copy of the application is required.

* * * * *

6. The heading and paragraph (e) of § 1.925 are revised to read:

§ 1.925 Application for special temporary authorization, temporary permit or temporary operating authority.

* * * * *

(e) Upon successful completion of an Amateur Radio Service operator examination, an applicant already licensed in the Amateur Radio Service may operate his/her amateur radio station pending issuance of his/her permanent amateur station and operator licenses by the Commission for a period of 90 days or until issuance of the permanent operator and station licenses, whichever comes first, consistent with the rights and privileges of the higher operating class for which the applicant has passed the appropriate examination element(s), provided that the applicant retains the certificate(s) issued by the examiners for successful completion of the examination element(s) at the station location, and provided that the applicant uses an identifier code provided by a VEC as a suffix to his/her present call sign.

* * * * *

7. Section 1.934 is revised to read:

§ 1.934 Procedure with respect to amateur radio operator license.

Each candidate for an amateur radio license which requires the applicant to pass one or more examination elements must present the examiner(s) with a properly completed FCC Form 610 prior to the examination. Upon completion of the examination, the examiner(s) will immediately grade the test papers. If the applicant is successful, the examiner(s) will forward the candidate's application to: (a) the Commission's Gettysburg, Pennsylvania facility for an application for a Novice Class operator license, or (b) a Volunteer-Examiner Coordinator (VEC) for all other classes of operator licenses. The examiners will then issue a certificate for successful completion of an amateur radio operator examination. A VEC will forward the application to the Commission's Gettysburg, Pennsylvania facility.

PART 97—[AMENDED]

8. The Table of Contents for Part 97 is amended as follows:

(a) A new § 97.26 entitled "Examination procedure." is added.

(b) The heading of § 97.27 is revised to read "Examination preparation."

(c) The heading of § 97.28 is revised to read "Examination administration."

(d) A new § 97.29 entitled "Examination grading." is added.

(e) The heading of § 97.31 is revised to read "Volunteer examiner requirements."

(f) Section 97.32 and its heading are removed.

(g) The heading of § 97.33 is revised to read "Volunteer examiner conduct."

(h) A new § 97.35 entitled "Temporary operating authority." is added.

(i) A new Subpart I is added, as follows:

Subpart I—Volunteer-Examiner Coordinators

General

§ 97.501 Purpose.
§ 97.503 Definitions.
§ 97.505 Applicability of rules.
§ 97.507 VEC Qualifications.
§ 97.509 Conflicts of interest.

Volunteer-Examiner Coordinator Functions

§ 97.511 Agreement required
§ 97.513 Scheduling of examinations.
§ 97.515 Coordinating volunteer examiners.
§ 97.517 Written examinations.
§ 97.519 Examination procedures.
§ 97.521 Evaluation of questions.
§ 97.523 Identification of applicants passing examinations.

Authority: Secs. 4(i) and 303 of the Communications Act of 1934, as amended, 47 USC 154(i) and 303.

9. Section 97.11 is revised to read:

§ 97.11 Application for operator license.

(a) An application (FCC Form 610) for a new operator license, including an application for change in operating privileges, which will require an examination shall be submitted in accordance with the provisions of § 97.28.

(b) An application (FCC Form 610) for renewal and/or modification of license when no change in operating privileges is involved shall be submitted to the Commission's office at Gettysburg, Pennsylvania 17325.

10. Paragraph (b) of § 97.25 is revised to read as follows:

§ 97.25 Examination credit.

* * * * *

(b) A certificate of successful completion of an examination will be issued to applicants who successfully complete an examination element. Upon presentation of this certificate for telegraphy examination elements 1(A), 1(B) or 1(C), examiners shall give the applicant for an amateur radio operator license examination credit for the code speed associated with the previously completed element. For purposes of examination credit, this certificate is valid for a period of one year from the date of its issuance.

* * * * *

11. A new § 97.26 is added to read:

§ 97.26 Examination procedure.

(a) Each examination for an amateur radio operator license shall be administered at a location and a time specified by the examiner(s). Public announcement before examinations shall be made for elements 1(B), 1(C), 3, 4(A) and 4(B).

(b) The examiner(s) must be present and observing the candidate throughout the entire examination.

(c) The examiner(s) will be responsible for the proper conduct and necessary supervision during each examination.

(d) Each candidate for an amateur radio license, which requires the applicant to pass one or more examination elements, must present the examiner(s) with a properly completed FCC Form 610 on or before the registration deadline date for those examination sessions for which registration is required; otherwise, applicants shall submit FCC Form 610 at the examination session before the start of the examination(s). In cases where a registration deadline is required, it shall be specified by the VEC that issues the examination papers to the examiner.

(e) The candidate shall comply with the instructions given by the examiner(s). The examiner(s) must immediately terminate the examination upon failure of the candidate to comply with the examiner(s)' instructions.

(f) At the completion of the examination, the candidate shall return all test papers to the examiner(s).

(g) A candidate whose physical disabilities require special procedures to allow participation in examination sessions shall attach a statement to his/her application. For examinations other than Novice Class the statement shall be retained in the files of the VEC that issues the test papers. The statement for Novice Class examinations shall be retained by the examiner for one year. The statement shall include:

(1) A physician's certification indicating the nature of the disability; and

(2) the name(s) of the person(s) taking and transcribing the applicant's dictation of test questions and answers, if such a procedure is necessary.

(h) An applicant who fails an examination element required for an amateur radio operator license shall not apply to be examined for the same or higher examination element within thirty days of the date the examination element was failed.

12. Section 97.27 is revised to read:

§ 97.27 Examination preparation.

(a) Element 1(A) shall be prepared by the examiner. The preparer must hold an Amateur Extra, Advanced, or General Class operator license. The test shall be such as to prove the applicant's ability to transmit correctly by hand key and to receive correctly by ear texts in the international Morse code at a rate of not less than five (5) words per minute. (Special procedures may be employed in cases of physical disability. See § 97.26(g).) The applicant is responsible for knowing, and may be tested on, the twenty-six letters of the alphabet, the numerals 0-9, the period, the comma, the question mark, AR, SK, BT and DN. (See § 97.29(c).)

(b) Elements 1(B) and 1(C) shall be prepared by the examiners or be obtained by the examiners from the VEC. The preparer must hold an Amateur Extra Class license. The test shall be such as to prove the applicant's ability to transmit correctly by hand key and to receive correctly by ear texts in the international Morse code at not less than the prescribed speed. (Special procedures may be employed in cases of physical disability. See § 97.26(g).) The applicant is responsible for knowing, and may be tested on, the twenty-six letters of the alphabet, the numerals 0-9, the period, the comma, the question mark, $\overline{AR}$, $\overline{SK}$, $\overline{BT}$ and $\overline{DN}$. (See § 97.29(c).)

(c) Element 2 shall be designed by the examiner from PR Bulletin 1035A (latest date of issue), entitled *Questions for the Element 2 Amateur Radio Operator License Examination.*

(d) Elements 3, 4(A) and 4(B) will be designed by the FCC. The FCC will select questions for each test from the appropriate list of questions approved by the Commission (either PR Bulletin 1035 B, C, or D, latest date of issue). The FCC will provide each VEC with current examination designs. The VEC is required to hold current examination designs in confidence.

(e) PR Bulletins 1035 A, B, and C and D will be composed of questions originated by the FCC and questions submitted by amateur radio operators in accordance with the instructions in the Bulletin. Amateur radio operators holding Amateur Extra Class licenses may submit questions for any written examination element. Amateur radio operators holding Advanced Class licenses may only submit questions for Element 2 and 3. Amateur radio operators holding General Class or Technician Class licenses may only submit questions for Element 2.

13. Section 97.28 is revised to read:

§ 97.28 Examination administration.

(a) Unless otherwise prescribed by the Commission, each examination for an amateur radio operator license (except the Novice Class operator license) shall be administered by three accredited volunteer examiners. The examiners must hold Amateur Extra Class operator licenses, unless: (1) They are administering telegraphy element 1(A), in which case they may hold Amateur Extra Class, advanced Class or General Class radio operator licenses, or (2) they are administering written examination *elements 2 or 3, in which case they may*

hold Amateur Extra Class or Advanced Class radio operator licenses.

(b) Unless otherwise prescribed by the Commission, each examination for the Novice Class operator license shall be administered by one volunteer examiner. The examiner does not have to be accredited. The volunteer examiner must hold a current General, Advanced or Amateur Extra Class operator license issued by the Commission.

(c) Upon completion of an examination element, the examiner(s) shall immediately grade the test papers.

(d) When the candidate does not score a passing grade on an examination element, the examiner(s) shall so inform the candidate by providing the percentage of questions answered correctly, and by returning the application (see § 97.26) to the candidate. For examinations other than Novice Class examinations, the test papers, including answer sheets, shall be returned to the VEC that issued them. For Novice Class examinations, the test papers, including answer sheets, must be retained as part of the volunteer examiner's station records for one year from the date the examination is administered.

(e) When the candidate scores a passing grade on an examination element, the examiners (except for examinations for the Novice Class operator license) must issue a certificate of successful completion of the examination. This certificate must bear the VEC-issued examination identifier code (see § 97.523). This certificate is required for already-licensed applicants operating with privileges of an amateur operator class higher than that of their permanent amateur operator license (See §§ 1.925(e) and 97.84). Within one year this certificate may also be used for examination credit for elements 1(A), 1(B) or 1(C) (See § 97.25).

(f) When the candidate scores a passing grade on all examination elements required for the operator license class sought (see § 97.23), the examiners shall certify to the following information on the candidate's application form (see § 97.26):

(1) Examiners' names, addresses and amateur radio station call signs;

(2) Examiners' qualifications to administer the examination (see § 97.31); *and*

(3) Examiners' signed statements that the applicant has passed the required examination elements.

(g) Within ten days of the administration of a successful examination for the Novice Class operator license, the examiner shall submit the candidate's application to: Federal Communications Commission, Gettysburg, Pennsylvania 17325.

(h) Within ten days of the administration of a successful examination for the Technician, General, Advanced or Amateur Extra Class operator license, the examiners shall submit the successful candidates' applications and all test papers to the VEC that originally issued that test.

(i) The FCC reserves the right, without qualification, to:

(1) administer examinations itself; *or*

(2) readminister examinations itself or under the supervision of an examiner designated by the FCC, to any person who obtained an operator license through the volunteer examination process.

14. A new § 97.29 is added to read:

§ 97.29 Examination grading.

(a) Each examination element shall be graded separately by the examiners.

(b) An applicant passes a written examination if he/she answers at least 74 percent of the questions correctly.

(c) An applicant passes a code element examination if he/she proves his/her ability to transmit correctly by hand key (straight key, or, if supplied by the applicant, any other type of hand operated key such as a semi-automatic or electronic key, but not a keyboard keyer) and to receive correctly by ear texts in the international Morse code at not less than the prescribed speed for one continuous minute during a five-minute test period. Each five characters shall be counted as one word. Each punctuation mark and numeral shall be counted as two characters.

15. Section 97.31 is revised to read:

§ 97.31 Volunteer examiner requirements.

(a) Each volunteer examiner administering an examination for an amateur radio operator license must:

(1) Be at least 18 years of age; *and*

(2) Not be related to the candidate.

(b) Any person who owns a significant interest in, or is an employee of, any company or other entity which is engaged in the manufacture or distribution of equipment used in connection with amateur radio transmissions, or in the preparation or distribution of any publication used in preparation for obtaining amateur station operator licenses, is ineligible to be a volunteer examiner for purposes of administering an amateur radio operator examination. However, an employee who can demonstrate that he/she does not normally communicate with that part of an entity engaged in such manufacture or publishing is eligible to be a volunteer examiner.

(c) Each volunteer examiner shall be uncompensated for his/her services.

(d) Each volunteer administering an examination for the Technician, General, Advanced or Amateur Extra Class operator license must be accredited by the Volunteer-Examiner Coordinator (see Subpart I).

(e) The FCC will not accept the services of any person seeking to be a volunteer examiner if that person's amateur radio station license or amateur radio station operator's license has ever been revoked or suspended.

16. Section 97.33 is revised to read:

§ 97.33 Volunteer examiner conduct.

A volunteer examiner who has given or certified examinations fraudulently or for monetary or other consideration is subject to revocation of his/her amateur radio station license and suspension of his/her amateur radio operator license.

17. A new § 97.35 is added to read:

§ 97.35 Temporary operating authority.

Upon successful completion of an Amateur Radio Service operator examination, an applicant already licensed in the Amateur Radio Service may operate his/her amateur radio station pending issuance of his/her permanent amateur station and operator licenses by the Commission for a period of 90 days or until issuance of the permanent operator and station licenses, whichever comes first, consistent with the rights and privileges of the higher operating class for which the applicant has passed the appropriate examination(s), provided that the applicant retains the certificate(s) issued by the examiners for successful completion of the examination(s) at the station location, and provided that the applicant uses an identifier code provided by a VEC as a suffix to his/her present call sign.

18. Paragraph (f) of § 97.84 is revised to read:

§ 97.84 Station identification.

* * * * *

(f) When operating under the temporary operating authority permitted by § 1.925(e) with privileges which exceed the privileges of the licensee's permanent operator license, the station must be identified in the following manner:

(1) On radiotelephony, by the transmission of the station call sign, followed by the word "temporary," followed by the identifier code(s) shown on the certificate(s) for successful completion of an amateur radio operator examination.

(2) On radiotelegraphy, by the transmission of the station call sign, followed by the fraction bar DN, followed by the identifier code(s) shown on the certificate(s) for successful completion of an amateur radio operator examination.

* * * * *

19. A new Subpart I is added to Part 97 to read as follows:

* * * * *

Subpart I—Volunteer-Examiner Coordinators

General

§ 97.501 Purpose.

The rules in this subpart are designed to provide for the establishment of volunteer-examiner coordinators to coordinate the efforts of volunteer examiners in preparing and administering examinations for amateur radio operator licenses.

§ 97.503 Definitions.

For the purpose of this subpart, the following definitions are applicable:

(a) *Volunteer-examiner coordinator* (VEC). An entity which has entered into an agreement with the Federal Communications Commission to coordinate the efforts of volunteer examiners in preparing and administering examinations for amateur radio operator licenses.

(b) *Volunteer examiner*. An amateur radio operator who prepares or administers examinations to applicants for amateur radio operator licenses (see § 97.30).

§ 97.505 Applicability of rules.

These rules apply to each entity that serves as a volunteer examiner coordinator.

§ 97.507 VEC Qualifications.

In order to be a VEC, an organization must:

(a) Be organized at least partially for the purpose of furthering amateur radio;

(b) Be at least regional in scope, serving one or more of the following regions:

(1) Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island and Vermont;

(2) New Jersey and New York;

(3) Delaware, the District of Columbia, Maryland and Pennsylvania;

(4) Alabama, Florida, Georgia, Kentucky, North Carolina, South Carolina, Tennessee and Virginia;

(5) Arkansas, Louisiana, Mississippi, New Mexico, Oklahoma and Texas;

(6) California;

(7) Arizona, Idaho, Montana, Nevada, Oregon, Utah, Washington and Wyoming;

(8) Michigan, Ohio and West Virginia;

(9) Illinois, Indiana and Wisconsin;

(10) Colorado, Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota and South Dakota;

(11) Alaska;

(12) Caribbean Insular areas: Commonwealth of Puerto Rico, United States Virgin Islands (50 islets and cays) and Navassa Island; and

(13) Pacific Insular areas: Hawaii, American Samoa (seven islands), Baker Island, Commonwealth of Northern Mariana Islands, Guam Island, Howland Island, Jarvis Island, Johnston Island (Islets East, Johnston, North and Sand), Kingman Reef, Midway Island (Islets Eastern and Sand), Palmyra Island (more than 50 islets) and Wake Island (Islets Peale, Wake and Wilkes).

(c) Be capable of acting as a VEC in one or more of the regions listed in paragraph (b);

(d) Agree to coordinate all amateur radio operator examination elements for all amateur radio operator license classes;

(e) Agree not to accept any compensation from any source for its services as a VEC; *and*

(f) Agree to assure that for any examination every candidate qualified under these rules is registered without regard to race, sex, religion, national origin or membership (or lack thereof) in any amateur radio organization.

§ 97.509 Conflicts of interest.

An entity engaged in the manufacture or distribution of equipment used in connection with amateur radio transmissions, or in the preparation or distribution of any publication used in preparation for obtaining amateur radio station operator licenses may be a VEC only upon a persuasive showing to the Commission that preventive measures have been taken to preclude any possible conflict of interest.

Volunteer-Examiner Coordinator Functions

§ 97.511 Agreement required.

No entity may serve as a VEC until that entity has entered into a written agreement with the Federal Communications Commission to do so. The VEC must abide by the terms of that agreement.

§ 97.513 Scheduling of examinations.

A VEC will coordinate the dates and times for scheduling examinations (see § 97.26) throughout the areas where communications are regulated by the Federal Communications Commission. A VEC may also coordinate the scheduling of testing opportunities at other places. A VEC shall notify the Engineer-in-Charge of the Field Operations Bureau (FOB) District Office having jurisdiction over the area where an examination is to be held of the time, place and registration requirements for any examination. If no FOB District Office has jurisdiction over the area where an examination is to be held, a VEC shall notify the Chief of the Public Service Division of FOB in Washington, D.C., instead. In either case, this notification must be made at least 30 days in advance of the registration deadline.

§ 97.515 Coordinating volunteer examiners.

A VEC will accredit amateur radio operators, licensed by the Federal Communications Commission, as volunteer examiners (see § 97.30). A VEC will seek to recruit a broad representation of amateur radio operators to be volunteer examiners. A VEC may not discriminate in accrediting volunteer examiners on the basis of race, sex, religion or national origin. A VEC may not refuse to accredit a volunteer on the basis of membership (or lack thereof) in an amateur radio organization. A VEC must not accredit an amateur radio operator volunteering to be an examiner if:

(a) The volunteer examiner does not meet minimum statutory qualifications or minimum qualifications as prescribed by the rules;

(b) The FCC refuses to accept the voluntary and uncompensated services of the volunteer examiner;

(c) The VEC determines that the volunteer is not competent to perform the function for which he/she volunteered; *or*

(d) The VEC determines that questions of the volunteer's integrity or honesty could compromise the examination(s).

§ 97.517 Written examinations.

A VEC will assemble, print and distribute written examinations designed by the FCC (see § 97.27(d)).

§ 97.519 Examination procedures.

At the completion of each examination, a VEC will collect the candidates' application forms, answer sheets and test results from the volunteer examiners (see § 97.28(h)). A VEC will:

(a) Make a record of the date and place of the test; the names of the

volunteer examiners and their qualifications; the names of the candidates; the test results; and, related information.

(b) Screen the application for completeness and authenticity.

(c) Forward the application within ten days of the date of the most recent examination to: Federal Communications Commission, Licensing Division, Private Radio Bureau, Gettysburg, Pennsylvania 17325.

(d) Make available to any authorized FCC representative any requested examination records.

§ 97.521 Evaluation of questions.

A VEC will be expected to evaluate the clarity and accuracy of examination questions on the basis of experience, and to bring ambiguous or inaccurate questions to the attention of the Commission, with a recommendation on whether to revise the question or to delete the question from the Commission's list of examination questions.

§ 97.523 Identification of applicants passing examinations.

A VEC must establish a unique identifier code for each testing session. This code must be a slant (/) followed by two letters from one of the following letter groups: WA through WZ, KA through KZ, NA through NZ, or AA through AL. The identifier code must be shown on the certificate for successful completion of an examination. The identifier code(s) applicable must be appended as a suffix to the licensee's call sign when the licensee operates under temporary authority granted to amateur radio operators who have passed the appropriate examination(s) for a higher class (see §§ 1.925(e) and 97.84(f)).

Use of Volunteers To Prepare and Administer Operator Examinations in the Amateur Radio Service; Correction.

AGENCY: Federal Communication Commission.

ACTION: Final rule; correction

SUMMARY: This document corrects an FCC Rule regarding Volunteer-Examiner Coordinators (VEC's) in the Amateur Radio Service. This correction is necessary in order to clarify that VEC's will not be required to coordinate amateur radio operator examinations for the Novice Class.

FOR FURTHER INFORMATION CONTACT: John J. Borkowski, Private Radio Bureau, Washington, D.C. 20554 (202) 632-4964.

Erratum

In the matter of amendment of parts 0, 1 and 97 of the commission's rules to allow the use of volunteers to prepare and administer operator examinations in the Amateur Radio Service; PR Docket No. 83-27, Rm-4229.

Released: October 12, 1983.

1. On September 29, 1983, the Commission released a *Report and Order*, FCC 83-433, in the above captioned proceeding. In the *Report and Order*, the Commission amended Parts 0, 1 and 97 of its Rules to allow the use of volunteers to prepare and administer operator examinations in the Amateur Radio Service.

2. At paragraph 9 of the *Report and Order*, the Commission indicated that it was adopting new rules to apply above the Novice Class, while retaining rules recently adopted in another proceeding for the Novice Class. *See Report and Order*, PR Docket No. 82-727, 48 FR 32586 (July 18, 1983). However, paragraph (d) of newly added Section 97.507 of the Rules in the Appendix would appear to require Volunteer-Examiner Coordinators (VEC's) to coordinate examinations for all classes, including the Novice Class. This was not intended.

3. Accordingly, paragraph (d) of Section 97.507 of the Rules in the Appendix is corrected to read as follows:

§ 97.507 VEC Qualifications.

* * * * *

(d) Agree to coordinate all amateur radio operator examination elements for all amateur radio operator license classes except Novice Class;

* * * * *

Federal Communications Commission.
William J. Tricarico,
Secretary.

Amendment of the Rules To Authorize Ten Year License Terms in the Amateur Radio Service

AGENCY: Federal Communications Commission.

ACTION: Final rule.

SUMMARY: The Commission is amending Part 97 of its Rules to authorize ten year operator and station license terms and two year grace period for renewal of expired operator and station licenses in the Amateur Radio Service. The Communications Amendment Act of 1982 authorized license terms not to exceed ten years in the Amateur Radio Service. This change is necessary in order to eliminate a burden on Commission resources and a paperwork burden upon the public.

DATES: Effective December 15, 1983.

PART 97—[AMENDED]

1. Section 97.13(d) is revised to read as follows:

§ 97.13 Renewal or modification of operator license.

* * * * *

(d) If a license is allowed to expire, application for renewal may be made during a grace period of two years after the expiration date. During this grace period, an expired license is not valid. A license renewed during the grace period will be dated currently and will not be backdated to the date of its expiration. Application for renewal shall be submitted on FCC Form 610 and shall be accompanied by the applicant's expired license or a photocopy thereof.

2. Section 97.47(b) is revised to read as follows:

§ 97.47 Renewal and/or modification of amateur station license.

* * * * *

(b) If a license is allowed to expire, application for renewal may be made during a grace period of two years after the expiration date. During this grace period, an expired license is not valid. A license renewal during the grace period will be dated currently and will not be backdated to the date of its expiration. An application for an individual station license shall be submitted on FCC Form 610. An application for an amateur club or military recreation station license shall be submitted on FCC Form 610-B. In every case the application shall be accompanied by the applicant's expired license or a photocopy thereof.

3. Section 97.59 (a) and (b) are revised to read as follows:

§ 97.59 License term.

(a) Amateur operator licenses are normally valid for a period of ten years from the date of issuance of a new, modified or renewed license.

(b) Amateur station licenses are normally valid for a period of ten years from the date of issuance of a new, modified or renewed license. All amateur station licenses, regardless of when issued, will expire on the same date as the licensee's amateur operator license.

DX AWARDS FROM CZECHOSLOVAKIA

If you've never seen the beautiful DX awards available to licensed amateurs from the Central Radio Club of Czechoslovakia, then you're in for a real treat. It has been my pleasure this past month to have received the full details of their entire awards program and they are described in the paragraphs to follow.

S6S Award

The S6S Award is afforded those amateurs who have had a QSO since January 1, 1950, with at least one station located in each of the six continents as defined by the IARU. Awards will recognize those contacts on CW, phone, and RTTY, either allband or single-band achievements. Mixed-mode contacts are recognized.

P75P Award

This award is for having worked at least 75 ITU zones as defined by the ITU Geneva Conference of 1959. All contacts must have been made since January 1, 1960, and awards are available in three levels of achievement: 1st class—70 zones, 2nd class—60 zones, and 3rd class—50 zones. Zones may be determined in accordance with a special map made available by the Central Radio Club for a cost of 3 IRCs. Also, it is important to note that all contacts must be made with fixed stations only.

ZMT Award

To qualify for the ZMT Award, applicants must have confirmed contact since April 26, 1949, with at least one station located in each of the following 39 areas: OK1, OK2, OK3, HA, LZ, UA1, UA2, UA3, UA4, UA6, UA9, UA0, UB, UC, UD, UF, UG, UH, UI, UJ, UL, UM, UN, UO, UP, UQ, UR, DM (3 different regions determined by the last letter of the callsign), SP (3 different districts), YO (3 different districts), YU (3 different districts).

ZMT 24 Award

For those interested in pursuing the ultimate in DX endurance, the ZMT 24 Award is just for you. The requirements are exactly the same as for the basic ZMT Award detailed above, with the exception that all contacts must be made within a 24-hour period. Sound impossible? Absolutely not, but don't be discouraged if it takes you several attempts using the stopwatch!

100 OK Award

Check your QSL cards. If you can find a total of 100 OK stations, then you will qualify for the 100 OK Award. All contacts, however, must have been made on or after January 1, 1954. Endorsement stickers are available for every additional 100 stations confirmed, up to a total of 500. Stations may be worked any band, any mode.

OK SSB Award

This award requires the applicant to have two-way SSB contact with different Czechoslovak stations totaling 25 points, without a date limitation. 1 point will be scored for each QSO on the 28-, 21-, or 14-MHz bands and 2 points for each QSO on the 7- or 3.5-MHz bands. There are no mode restrictions.

As an added tip to those wishing to pursue these very respectable awards, this editor recommends that you keep a close eye on the "Contests" column in *73* magazine and consider making a few contacts during the annual OK DX Contest. Dates and times will be announced at least a month in advance of the scheduled event. The Awards Manager of the CRC also mentions that QSOs made during the contest will not require QSL confirmations. There is one stipulation, however: Application must be submitted along with your logbook entry for the OK DX Contest.

All the certificates are issued free of charge for members of clubs or associations which accept this rule reciprocally. The fee for all others is 10 IRCs for the P75P Award and 5 IRCs for all the other awards offered by the Central Radio Club of Czechoslovakia. General certification rules apply by which contacts may be verified by two amateurs of a local club, a club official, or a notary public.

Applications shall include details for each contact, i.e., callsign, GMT, date, frequency, mode, RS(T), and any additional information required for the award. Send to Central Radio Club, Awards Manager, PO Box 69, 113-27 Praha 1, Czechoslovakia.

Slovensko Award

The DX Club of Radio Amateurs of Slovakia offers this award to all licensed amateurs who can show proof of contact with stations in the different districts (OKR) of Slovakia (OK3, OL8, OL9, OL0; districts listed below) after January 1, 1946.

Stations in countries which have a common border with Slovakia must contact 35 districts, 20 districts are required of stations in other European countries, and 10 districts are required for stations outside the European continent.

There are no band or mode restrictions. Applications with a GCR list and award fee of 5 IRCs may be sent to: Central Radio Club, PO Box 69, 113-27 Praha 1, Czechoslovakia.

Districts which qualify are: Banska, Dystrica, Bardejov, Bratislava, Bratislava-Vidiek, Cadca, Dolny Kubin, Dunajska Streda, Galanta, Hmenne,

Komarno, Kosice, Kosice-Vidiek, Levice, Liptovsky, Mikulas, Lucenec, Martin, Michalovce, Nitra, Nove, Zamky, Poprad, Povazska Bystrica, Presov, Prievidza, Rimavska Sobota, Roznava, Senica, Spisska Nova Ves, Stara Lubovna, Svidnik, Topolcany, Trebisov, Trencin, Trnava, Velky Krtis, Vranov, Zvolen, Ziar nad Hronom, and Zilina.

TEN-TEN INTERNATIONAL NET AWARDS

For those of us who frequent the ten-meter band, a minute doesn't elapse that you don't hear reference being made to the Ten-Ten International fraternity.

The 10-10 organization was formed in 1962 by a group of amateurs in southern California. To this date, better than 27,000 amateurs have joined their ranks. The unique awards program for this international group was founded and managed for years by Frank Orcutt W4JO, who is now a silent key.

To qualify for membership in Ten-Ten International and to move up on their awards ladder of achievement, you first must make contact with ten individual Ten-Ten members on the ten-meter band. From each QSO, you must obtain the station's call, 10-10 number, name, and exact QTH. Once this has been achieved, you may submit your list along with your check for US$4.00 (includes fee for the quarterly 10-10 publication) to one of the following area or district vice presidents: Earle W1NC, Larry WA2SUH, Jim WA3RBQ, Clint K4EKX, Grace K5MRU, Dick W6ANK, Ron WB7ADO, Del W9BPU, John N0ADJ, Mac ZL3RK (New Zealand), Art VK2BXN (Australia), August DK5UG (Europe), Jim K6PJO (DX at large).

Your application is checked against the 10-10 net roster, and if found correct, you will be issued your very own 10-10 number and Black Cat Certificate.

Once you obtain your 10-10 number, you may begin work toward various "bar" awards. The bar awards are issued in multiples of 100 individual 10-10 contacts. To apply for any bar award, you must not duplicate contacts previously claimed. In each case, submit only 100 contacts per application—no more. Each must show the callsign of the station worked, the 10-10 number, name, and exact QTH.

Award applications must show contacts in 10-10 number sequence. Applications received in any other order will be returned. There is no award fee for "bars"; however, an SASE sent along with your application is appreciated. Send to: Bill Risher WB6OMH, 10542 Lock Avon Drive, Whittier CA 90606.

This same process is repeated for the 200, 300, and 400 bar awards. Where it will end, nobody knows, for the most numbers collected to date is by Grace K5MRU, who now has 8200 confirmed.

When you reach the 500 bar, serial numbers are then assigned to each bar issued thereafter. Once the applicant reaches 1000, he or she reaches the first step in which award plaques are issued. Plaques are issued also for 2500, 5000, and 7500 contacts.

10-10 WAS Award

This award requires an applicant to make at least one contact in each state with another member of Ten-Ten International. QSL cards and sufficient postage for their safe return are to be sent with your application to WB6OMH. This award is issued only for contacts made after January 1, 1973, on any authorized mode on the ten-meter band.

The VP Certificate

To qualify for this award, a net member must have earned his or her "500 bar," at which time a VP number and certificate were assigned. The idea for the VP certificate issued here is to work at least 100 other net members who have achieved their 500 bar and who have been issued a VP serial number. To be valid, all contacts must be made between 28.500 and 28.550 MHz or above 29 MHz, with the contact lasting at least 5 minutes. As with all 10-10 awards, application must indicate the 10-10 number, callsign, name, frequency, and exact QTH. Also, a definite requirement is to list the station's VP serial number.

All contacts must be made on or after October 15, 1979, to qualify. Send your application to: Grace Dunlap K5MRU, Box 445, La Feria TX 78559.

To the best of our knowledge there is no award fee.

Lucky 13 Award

The Lucky 13 Award is to prove that your station is capable of working the entire 10-meter band. This is not a frequency-measuring test and it is not necessary to stay exactly on the prescribed frequencies. The idea here is to make contact with 13 different VP members on each 100-kHz segment of the band: 28.500, 28.600, 28.700, 28.800, 28.900, 29.000, 29.100, 29.200, 29.300, 29.400, 29.500, 29.600, and 29.690 (29.700 is the band edge, so be careful). Any mode or mixed mode is permissible. As with all awards, you must log the callsign, the VP number, the first name, the QTH, and in this case, the date and time of each contact claimed. It is not necessary to send QSLs, but you should have your list verified and mailed to: Rich Richardson QB6FQD, 960 E. Cottonwood Avenue, Littleton CO 80121.

FEARL AWARDS

I received award information from a personal friend of mine, Glenn KA8GW (WB7SPD), who used to reside here on Whidbey Island and is stationed with the US Navy in Masawa, Japan. Glenn urges those seeking the awards being offered by the Far East Auxiliary Radio League (FEARL) to be careful to only count contacts with KA stations in Japan and not to include those in the continental United States.

Glenn mentioned a couple of nets which may assist those wishing to meet the award requirements in a minimum of time. 14.284 MHz is the golden frequency on Sundays at 0200Z and Wednesdays at 1200Z.

All FEARL awards are available for $1.00 or 7 IRCs, which must be sent with your application to: Far East Auxiliary Radio League, Attention: Awards Manager, c/o Sam Fleming KA2SF, GARH-ID-GS-M NCS Japan, APO San Francisco CA 96343.

Worked Fifteen KA Stations

To qualify for the WFTKAS Award, applicants must work a minimum of at least 15 KA stations located in Japan or Okinawa. Stateside KA stations do not count. There are no mode or band restrictions nor are there any date limitations. General certification rules apply, with proper logbook data.

KA Rag-Chewers Club

This award certifies that the applicant has presented evidence of having had a rag chew with a KA station in the Orient for a period of not less than thirty minutes. There are no band, mode, or date limitations. To apply, merely give general logbook data including the time your QSO began and ended. GCR apply.

Rag-Chewer Supreme

Should you be longwinded and were fortunate enough to enjoy an hour-long QSO with a KA station in the Orient, then the Rag-Chewer Supreme award is designed especially for you. To apply, merely provide logbook data and the appropriate award fee of $1.00 or 7 IRCs. GCR apply.

KA Roundtable Award

To qualify for this award, the applicant must establish and maintain two-way amateur-radio communication with at least two KA stations in the Orient on the same frequency at the same time for a minimum of thirty minutes. There are no special band or mode endorsements. Date is not a factor. GCR apply.

Shortwave Listener Award

For the shortwave listeners, FEARL presents this award for having heard and rendered a signal report to the operators of at least two KA stations in the Orient. Applicants merely send general logbook data and the appropriate award fee when applying.

UTICA NY

The Utica Amateur Radio Club will operate special-event station K2IQ, commemorating its 50th anniversary, from 1700Z February 11 to 2200Z February 12, on SSB, 25 kHz from the upper edge of the 40-, 20-, and 15-meter bands, and 25 kHz from the upper edge of the 40-meter Novice band. QSL with SASE and contact number for an attractive certificate to: K2IQ, PO Box 71, Utica NY 13503.

SNOWFLAKE MADNESS

The Michigan Technological University Amateur Radio Club and the Copper Country Radio Amateur Association announce a radio celebration of their Winter Carnival festivities in the northernmost part of Michigan's upper peninsula.

Tech's Winter Carnival is probably the most spectacular winter festival in America with snow sculptures, ice hockey, dogsled racing, skiing, and other festive events.

In association with the Copper Country Chamber of Commerce, we are issuing a certificate to all amateurs who make contact with any participating ham in the Copper Country between 0000 February 2 and 0000 February 8, 1984.

Only one contact is required to get a certificate. Frequencies are 3.630, 7.090, and 14.095, RTTY; 3.705, 7.085, 14.085, 21.085, and 28.185, CW; and 3.930, 7.285, 14.305, 21.385, and 28.685, phone. On CW listen for CQ Winter Carnival.

Send your QSL along with three 20¢ stamps (for postage and handling) to: Howard Junkin N8FHF, 106 W. South Avenue, Houghton MI 49931.

HOSARC SPECIAL-EVENT STATIONS

The Hall of Science Amateur Radio Club will issue a commemorative certificate to anyone working a HOSARC club station on January 15 from 1400 to 2300 UTC, in conjunction with HOSARC's 11th anniversary. Stations using the call WB2JSM will operate CW in the first 25 kHz of the Novice bands of 40, 15, and 10 meters. Stations using the call WB2ZZO will operate SSB in the first 25 kHz of the General phone bands of 40, 20, 15, and 10 meters. QSL with a large SASE (40¢ or 1 IRC) to HOSARC, PO Box 131, Jamaica NY 11415, or to WB2YXB, club QSL manager.

PUNXSUTAWNEY PA

The Punxsutawney, Pennsylvania, Amateur Radio Club will commemorate Groundhog Day on Sunday, January 29, 1984, from 10 am to 5 pm on 7.230 and 14.290. For a certificate send an SASE to Clif WB3GAD, RD #6 Box 211, Punxsutawney PA 15767.

HAPPY NEW YEAR

The start of a new year brings reflection and anticipation: reflection on the events of the past twelve months and anticipation for the coming year. It is a time to think back on coveted successes and missed opportunities, a time to consider what you will be doing over the next year.

1983 was a good year for DX. Not a great one; the sunspot numbers continued to fall, shortening band openings and weakening signals. But 1983 also saw some excellent DX from many corners of the globe.

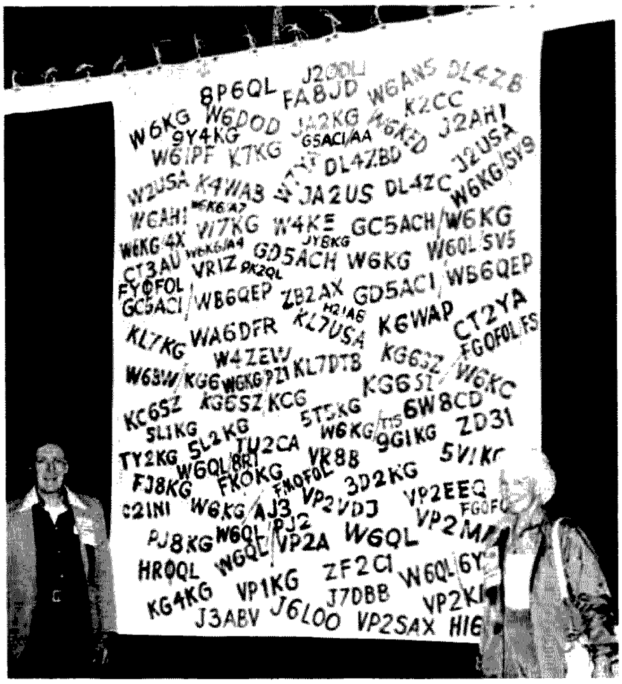
Among the DX highlights were not one but *two* DXpeditions to inhospitable Heard Island, the disaster in the Spratly Islands, a highly successful assault on Malpelo, increasing activity from China, and dozens of other amateur operations.

What do we see ahead for 1984? Radio propagation will continue to decline. The sunspot numbers are already well below their peak levels of the late '70s and early '80s, and they will fall still further this year. This regular pattern of worsening propagation is familiar to DXers of more than 10 years standing. The old-timers will remember the slow days of the mid-'70s when sporadic E and trans-equatorial propagation provided what little DX excitement there was, and DXing hours were spent fighting the static on the lower frequencies and calling long CQs on apparently dead bands.

1984 probably will not be the bottom of the current sunspot cycle. The 1986-8 period is a more likely candidate for that dubious honor. However, the sun can be fickle, and it can decrease activity dramatically or flare up and provide some good DXing. But the overall trend in 1984 will be down.

Those DXers bitten by the DX bug in the past few years, however, will be hard pressed. The tremendous increase in the number of amateurs worldwide and especially the number of DXers, since the last sunspot minimum, is unprecedented. Many thousands of amateurs turned on to DX at a time when 10 Watts into a wet noodle could be heard around the world. The amateur radio equipment of today is significantly advanced over that of ten years ago, facilitating such communications.

Jim Smith VK9NS plans a 1984 DXpedition to Kermadec Island, north of New Zealand. Jim led the Heard Island DX Association trip to Heard last year. (Photo via The DXers Magazine*)*



Lloyd W6KG and Iris W6QL Colvin swing through South America on the 1983-4 Yasme trip. (Photo via The DXers Magazine*)*

The effects of these factors of declining sunspots and large numbers of avid DXers can be seen already. When a DX station comes on the band, a pileup often begins even if the station is not particularly rare. The large number of DXer mice chasing the increasingly elusive DX cheese makes it very difficult for foreign stations to have satisfying contacts. This trend will only worsen.

For the many thousands of amateurs who have started chasing DX since 1978, 1984 will be a year of decision. Should I upgrade my station to remain competitive in the increasingly-difficult DX world? Should I try to tough it out with my present equipment, meekly accepting diminishing results? Or should I forget about DX for a few years and turn to satellite operation or stamp collecting?

The hard-core DXer will rise to the challenge, improving his station and operating techniques to ensure DX success. And the DXer will have considerable assistance in this task. Again in 1984, as in the past years, a number of hard-working and dedicated amateurs will be traveling to choice DX locations around the world to hand out contacts to the "Deserving DXers."

THE DX ADVENTURE

Some of the most rewarding aspects of DXing are the wonderful people who devote so much of their own time and money to sponsor, organize, and operate on DXpeditions to the rarer amateur spots in the world. Without the dedication and persistence of these amateurs, the DX world would be dull indeed. And a fine example of this respected breed is Jack Binder KB7NW.

An avid traveler, Jack had moved to Australia in 1969 with his English wife, Jude. A few years later, the Binder family, including two young sons, set sail in their home-built *Banyandah* (which is Aboriginal for "Home on the Water"). And that's what the yacht was to the family of four: their only home. For eight years the family cruised the Pacific, covering more than 60,000 miles. Jack and Jude took turns teaching their boys using materials from a cooperative stateside school. The parents supplemented the traditional curriculum with extra lessons in marine biology, botany, and geography, based on their travels.

The Binders kept their expenses to the minimum (there was no need of clothes on the boat or uninhabited islands, for example), but they did need a source of cash for foodstuffs, supplies, and repairs. Sometimes Jack worked on land for a short time, but in 1978 he turned to charter trips for income. And one of his early charters was a DXpedition to Mellish Reef, off Australia.

Jack's next DXpedition would be enough to turn most hams away from this pastime: Jack's yacht was fired upon as it approached Amboyna Cay, in the Spratly Islands, in 1979. The Binders escaped without being hit, unlike the Germans in the more recent attempt. Several members of that DXpedition figured Brunei VS5 was exciting enough, but Jack and two other hams returned to the Spratlys, setting up and operating on Barc Canada Reef. Since then, Jack's wanderlust and DX spirit have led him to Palmyra, Kingman, Tokelau, and back to Mellish Reef.

The Binders called a temporary halt to their odyssey in 1982 and placed their sons in a regular school for the first time in their lives. Meanwhile, Jack earned some much-needed funds by piloting a charter vessel around the Great Barrier Reef. "It's an unalterable fact of life that it costs money to live, no matter how idyllic the life-style or how basic and down-to-earth one lives," Jack explains.

Jack makes it very clear that this land-based existence is not permanent. "My one and only true love will always be *expeditions*. There is something about them that's hard to put down in words. Something about conceiving the idea, then putting it into action, following it through in every tiny detail until the speck of land shows on the horizon and the operators get down to business. It's out and out adventure, but with a purpose."

Now, 1984, the Four Js (Jack, Jude, Jerome, and Jason) are on the open ocean again. The planned itinerary includes the Solomon Islands (H44), the Philippines (DU), Singapore (9V), and the Seychelles (S7) on the way to the western Indian Ocean. The DX targets there are Mayotte (FH), Glorioso (FR), and Juan de Nova (FR), in late spring or early summer.

A host of other DXpeditions are scheduled for early 1984. A group of Venezuelan amateurs intend to land on tiny Aves Island in the Caribbean. Aves (YV0), about 125 miles southwest of Montserrat, is so low to the water that high waves and tides preclude landing for much of the year. Also on tap for the coming year is another trip to Clipperton Island (FO) by a collection of Tahitian and stateside hams. And Jim Smith VK9NS (see photo) of Heard-Island fame is putting together a scientific and amateur operation on Kermadec Island (ZL/K). Closer to home, the Colvins are on the move again, and a couple of Puerto Rican amateurs are shooting for Desecheo (KP4/D)—see details, below.

YASME SAILS AGAIN

Once again, Lloyd and Iris Colvin, W6KG and W6QL (see photo), are DXpeditioning, this year concentrating on South America where contacts may be plentiful but QSLs rare. The Colvins are sailing under the auspices of the Yasme Foundation, the nonprofit group which has been sponsoring DXpeditions for many years. The name, Yasme, comes from the yacht of that name on which Danny Weil sailed for many DXpeditions twenty years ago.

The Colvins customarily set up a substantial station in each country where they operate, including beam antennas and amplifiers. They thus present a consistent signal and are quite easy to work. Also, the Colvins stay at each location for several weeks, working 5-10,000 QSOs, which gives DXers with very modest stations ample opportunity for a contact. And the Yasme Foundation QSL system is excellent.

Look for the Colvins (with portable calls or calls ending in KG or QL) toward the low ends of the bands, especially the lower frequencies. Send QSLs to Yasme Foundation, Box 2025, Castro Valley CA 94546.

DESECHEO

Two amateurs from Puerto Rico plan a DXpedition to tiny Desecheo Island in the Caribbean this month. Jose Maldonado WP4ATF and Rodolfo HI3RST/KP4 are aiming for the first week in January for

Desecheo from the air. Two Puerto Rican amateurs hope to activate KP4/D this month. (WP4ATF photo)

their three-day operation. They will use their own callsigns with the designator /D. They solicit contributions and QSLs via Box 449, Palmer PR 00721.

Desecheo was one of the last DXCC "countries" admitted under the "separate administration" rule which has since been eliminated. The island is a wildlife refuge only a few miles west of Puerto Rico. Its refuge status was the reason for its separate-country designation by the ARRL, but this same status also restricts travel to the island. The Fish and Wildlife people don't want dozens of hams swarming over their island, littering with beer cans and coax cable bits. Consequently, only a few amateur DXpeditions have operated from the island, starting with Bob Dennison WØDX.

The well-run International DX Foundation DXpedition to Descheo two years ago cleaned up most of the demand for KP4/D, but then, the definition of a rare country is "the one you don't have," regardless of how easy it is to work. Hopefully, the operators will spend some time on the lower frequencies to take advantage of the good propagation from that part of the world and to meet the increasing demands for 40-, 80-, and 160-meter DX contacts.

KEEPING INFORMED

There is a major difference between working a DXpedition versus contacting a resident of the country. In the latter case, the timing probably is not very important. If you don't work him this time, you might tomorrow, or next week, or next year. But you don't get a second chance with many DXpeditions. How long do you think it will be before hams return to Heard Island?

DXpeditions give DXers a great shot at the DX contact, and in many cases provide the *only* way for radio contacts. After all, many of these DXCC "countries" are totally uninhabited. Many are uninhabitable over the long term, and only the limited stay of a DXpedition provides DXers with a shot at them.

So the DXpedition will *not* be there next week, or next year. It may be years before that particular "country" again attracts a DXpedition. Thus the DXer cannot afford to miss the contacts offered by the DXpeditioners. If you hibernated through the Heard Island activity last year, you probably won't get another shot at it for many years.

Real DXers understand that keeping informed on a timely basis is an essential part of successful DXing, especially as the sunspots decline and the pileups increase on the few remaining DX stations.

The chief way of keeping abreast of the DX world is through the radio; active amateurs who talk to and listen to their fellow DXers will know who is on now, who is supposed to be coming on, and where. There is no substitute for activity. But there are aids which make DXing more effective and enjoyable.

You local radio club can be an excellent source of DX information. Keeping in touch with other DXers in your area is like having extra pairs of ears. You can be keeping an eye on 20 meters while a fellow DXer across town is watching 40. A quick call over VHF FM keeps both hams informed.

Many areas of the country have taken this a step further by organizing DX clubs. The larger DX clubs sponsor repeaters dedicated to DX and DXers. Now with dozens of ears out, little DX slips by. A DX station can tell when his presence is broadcast over a DX repeater easily. He first works one station in an area, say San Francisco. Then, a couple of minutes later, another DXer from the same region calls. Then stations from all over the Bay area are in the pileup!

Of course, the flow of information must go both ways. The DXer should share his success with the other members of the club and not simply take advantage of the hard work of others. And the DX club probably has many other tasks which need help: meetings, newsletters, repeater maintenance, etc. So one way you can continue your DX success is to join and support your local radio club.

Other useful sources of DX information are the DX bulletins. DX columns in the major amateur radio magazines (such as this one) have lead times too long for the kind of timely information needed in the DX world. You need to know what is on *now*, and for that a weekly DX news sheet can be well worth the money.

So to help you keep up-to-date in the DX world in 1984, the two major weekly DX bulletins are offering a free subscription to a couple of lucky readers of this column. Send your QSL card (and maybe a photo of you and your shack) to VP2ML, Box 4881, Santa Rosa CA 95402 by January 31, 1984. I'll pull a couple of cards out of my hat and present the lucky winners with a one-year subscription to *The DX Bulletin* or *QRX DX*.

If you can't wait and you aren't lucky enough to have your card pulled out of the hat, you can subscribe directly. Send $28.00 for a one-year subscription to *QRX DX*, Box 4072, Richardson TX 75080, or to *The DX Bulletin*, Box 873, Vernon CT 06066.

REVIEW

THE HEATHKIT SS-9000

From the time about two years ago that I had the opportunity to try out a prototype of the SS-9000, I have looked forward with anticipation to seeing it on the market. While the unit has many features attractive to the SSB operator, it should have special appeal to the computer-oriented operator who likes to jump from band to band and frequency to frequency in search of a good QSO or rare DX. The CW operator can take advantage of two extremely effective narrow filters in addition to the above-mentioned computer capabilities.

A floppy disk that demonstrates some of the capabilities of the unit's controller is shipped with it. The disk utilizes interaction between the computer, the operator, and the SS-9000 during the demonstration. The program that controls the unit during operation is within the unit itself, in the controller circuit, however. As a consequence, only a terminal is required, and any computer used must be reconfigured as a terminal if it is to be used to control the SS-9000. I used a Heathkit H-89 computer to run the demo disk and then had to go into the cabinet to change a jumper cable to use it as a terminal. In effect, I was dedicating the computer to use with the SS-9000 alone. My guess is that anyone who wants to control his unit with a keyboard will opt for some inexpensive terminal rather than restricting the use of his home computer to transceiver control.

Terminal Functions

The unit is programmed to remember and display both the frequencies last shown on the two frequency displays and the one stored in memory on each band. If I inadvertently bandswitch to one of these bands, the displays (and terminal printout) will return to the appropriate band limit and the stored frequencies will be lost. In order to be used, the frequencies must be retrieved by the terminal.

The terminal also controls and indicates the frequency within each band to which the receiver and transmitter have been toggled. Two push-buttons centered under the middle of the two frequency displays do this switching in the manual mode. The indicators for toggling on the unit are red LEDs for transmit and green LEDs for the receive frequencies. The displayed and remembered frequencies for each band can be established by either terminal or manual control at any time.

Some other functions the terminal can control and indicate are:

- Passband shift in 100-Hz steps—as many as 600 Hz down and 400 Hz up
- Bandswitching
- Scan rate
- Transmit/Receive
- Mode: LSB, USB, CW wide, CW medium (400 Hz), CW narrow (200 Hz), and RTTY (400 Hz)

During operation on any given band, the operator has the ability to preset all of these functions in anticipation of operating on another band.

Shared Functions: PLL Tuning

The phase-locked-loop tuning is deadly accurate to the 100-Hz steps by which it changes. No supplementary frequency standard is necessary. PLL with 100-Hz resolution introduces a problem in bringing two or more transceivers to the identical frequency. I can be as much as 50 Hz off while attempting to zero beat another signal with the SS-9000. The other station with stepless tuning might have to make up the difference. The SS-9000 CW operator might become a little frustrated with this dependence on the other operator if he is a purist. Fifty- or ten-Hertz resolution would lessen the problem of frequency matching, but for most operators the higher resolution is probably unnecessary.

Scan Rate

PLL tuning makes it practicable for the manufacturer to offer tuning up or down the band at almost any desired rate. This rate can be determined for the SS-9000 by the setting of four DIP switches. Since access is gained to these switches by removing the cover of the unit (nine screws), I probably won't change them often. On the other hand, if I'm operating with the terminal, I need only to punch S = 1 (to 16) to vary the manual scan rate through its whole range.

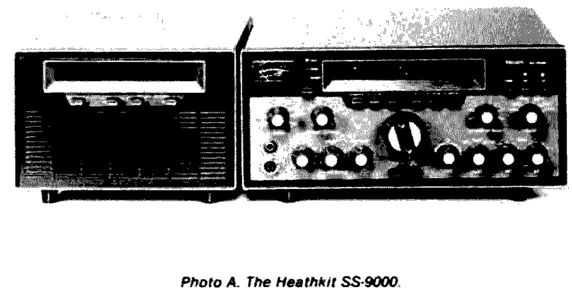


Photo A. The Heathkit SS-9000.

Memories

The practicality of the memories comes out when I'm looking for a QSO on whatever band is open. I'll flip the rig on to hear immediately a sector of a band that I have last used. Nothing new there, but I have also two other segments of the band that I can check out with two punches of a button. This happens without my losing the first frequency in the process. I can tune up or down from any of the three spots if I hear nothing interesting. If I hear a station in QSO that I might like to talk with when he finishes, I commit his frequency to memory—not my memory but the memory of the SS-9000—and resume searching for a CQ or someone finishing a QSO. If I don't find either, I can check back on the QSO with a punch of a button, and if it's still underway, resume searching with another punch.

If somehow I hear a second hot prospect for a later QSO, I can leave the one display on that second station and toggle the receiver over to the other display to continue searching. Then if I want to take a quick listen for activity on the other band, the three selections are preserved in memory.

Bandswitching

On the SS-9000, changing bands with the front-panel bandswitch can be made to activate an antenna switch for each selection. There is a plug on the back that will connect the unit directly to the Heathkit antenna switching relay. This function can, of course, be adapted to other antenna switches.

Bandswitching by computer or terminal control is another capability of this unit. A motor switches bands as well as antennas if this is desired.

On this unit, the bandswitch hung up at times when I attempted to rotate it counterclockwise manually. This could have damaged the switch if I had strong-armed it. This is because the teeth that engage during computer-controlled bandswitching are not quite separated adequately on this particular motor assembly. I expect that a call or a letter to the company could bring a new assembly in the mail. Since the assembly is located in a housing that

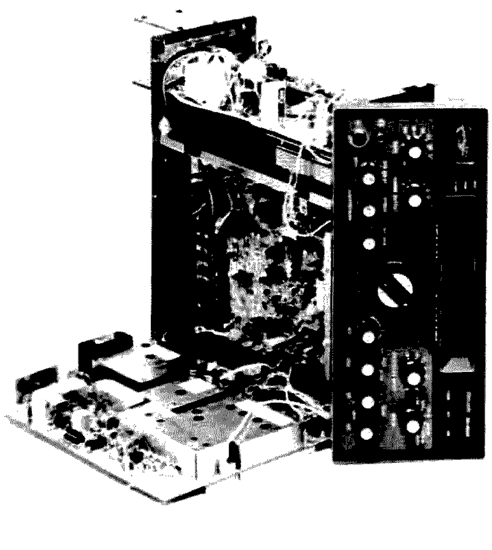

Photo B. Bottom view of the SS-9000.

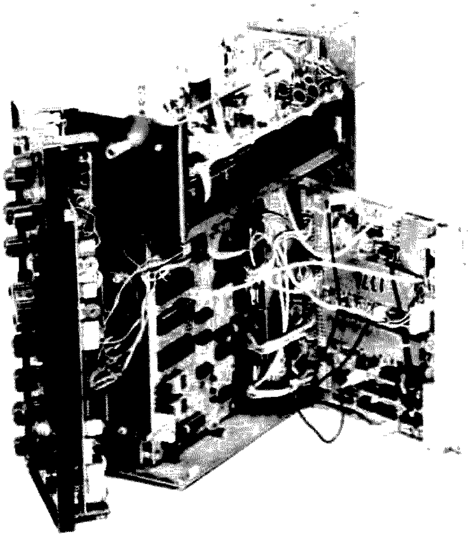

Photo C. Top view of the SS-9000.

extends from the back of the unit behind the bandswitch shaft, it would not be difficult for me to replace.

Receiving

True to the numbers given in the manual, the bandpass filter and CW filters are extremely effective. The effectiveness of the SSB bandpass filter can be demonstrated easily with a turn of the bandpass shift switch during reception with a strong interfering signal parked close by. All I sacrifice for this filtering are some of the lows of the received operator's voice, or some of the highs. Being able to drop a strong unwanted signal off the side of the bandpass plateau can result in a significant increase in intelligibility of the wanted signal.

CW Operation

Using the CW narrow filter, I can drop a strong intefering signal 100 Hz or more away down to a level at which I can copy a desired signal through it. This means, too, that the strong signal is far enough down the filter passband skirt that the agc is not triggered to the point that the weak signal doesn't get amplified adequately. In fact, the filtering is such that I am able to copy CW with the comfort of agc leveling of the desired signal almost without exception since the CW filtering renders harmless the signal-killing effect of the agc from strong stations. Another nice feature of the narrower filters is the lack of ringing I experienced. This is an especial advantage while copying high-speed CW. The SS-9000's filtering is the cleanest I have heard in this regard.

Since I'm not a musician and don't have perfect pitch, I have the same problem with the SS-9000 that I have with any other transceiver. I can't tell by ear when I have the desired signal at the offset frequency of 800 Hz. It's easy to tell by peaking the signal with the S-meter with the narrow CW filter switched in if there is no interference and/or fading. It's almost impossible otherwise to tune the transmitter exactly to the frequency of the received station without an outside reference tone.

Being able to tune as closely as possible to another signal with one's own transmitter is important. It minimizes the amount of band space taken up, it's easier for others to break in, one doesn't have to retune for each signal in a round robin, and it minimizes leap-frogging. I attempt to minimize my contribution to the problem by using a cheap audio frequency standard: a musician's pitch pipe. I tune the note of the desired signal to F-sharp, 800 Hz. Then my signal and at least one other are on the same frequency.

Transmitter

Front-panel controls in addition to the shared transceiver controls of band and frequency are: power output, VOX delay, speech compression, and microphone gain. Power output can be read directly from the multi-function meter as the power control is varied. These are all that are needed to control SSB transmissions from contact to contact. Speech compression, if desired, is switched on and turned up until compression indicated on the meter on voice peaks gives the same excursion of the needle as depressing the tune button while the meter is switched to read power. That's probably the most complicated maneuver necessary to learn to be able to take full advantage of the SSB feature of this unit. Microphone gain also is turned up on voice peaks until the meter, switched to ALC indication, shows some ALC action.

VOX delay, compression, and microphone gain may need to be varied from operator to operator, justifying the location of the controls on the front panel. Three other controls will need to be set, but not adjusted as frequently as the front-panel controls. These are: CW sidetone level, anti-trip, and VOX gain. Adjustment of these is made through the right side panel.

Power Supply

The companion power supply to the SS-9000 will operate with inputs in the 120- and 240-V-ac ranges to provide 13.8 V dc with sophisticated regulation and protection. It has high-temperature protection from heat, sink sensing, surge-current protection, and short protection. Tripping the last of the three will require resetting the on-off switch. The first two react by reducing power-supply output to safe levels until the condition reverses itself. The power-amplifier transistors of the SS-9000 are provided protection from excess current flow by these power-supply circuits as well as by power-output-controlling circuitry that is heat-sink temperature dependent, and by high vswr cutback circuitry.

The power-supply cabinet contains the speaker for the unit and two clocks, each settable by its own two front-panel buttons. The clocks will operate with either 12- or 24-hour format. The readouts are green vacuum flourescent tubes, as are the frequency displays on the SS-9000.

Summary

Setting the SS-9000 up for operation on SSB and CW was as straightforward as could be. I did not make use of the RTTY mode, but RTTY sending and receiving should be optimally simple also. A 400-Hz RTTY filter position is provided in the mode switch as well as the usual LSB.

The several controls that must be dealt with in order to operate SSB are easily set using the owner's manual. Front-panel-control changes, such as power output, VOX delay, compression, and microphone gain are extremely simple with the multi-function metering provided at the touch of a button.

Operating the SS-9000 with an amplifier is easily arranged. After stringing a phono-plugged cable for the relay and the ALC voltage, I just punched the tune button and screwdriver-adjusted the ALC level in the back panel to limit the amplifier current properly by limiting drive power.

I had to get used to operating CW without QSK, coming from a rig that has a carrier-operated relay (COR). It was good discipline for me to attempt to keep my transmissions short. Rumor has it that it was felt the frequency synthesizer loops might be too unstable while using the COR in this unit with high-speed CW. As you can tell from the advertisements, only very recently have manufacturers developed confidence enough in their designs to offer full break-in operation with PLL tuning, Heathkit included.

Conclusion

I very much enjoyed indulging in fantasies about how I could take advantage of the unique features of this rig. One idea most appealing was to buy some cheap high-lying property in my local telephone-calling area or within UHF range and set up the SS-9000 right in the middle of a huge antenna farm. A terminal with modem could control the unit, and I could operate from any convenient room in the house.

The capability of terminal control rather than computer and software control appeals to me. I'm eager to develop applications for personal computers in my life, but I'm not enthusiastic about dedicating a PC to a single use. If the feature of terminal control and the concept of a quality-built, sensitive, selective, adaptable transceiver appeal to you, give the SS-9000 serious consideration.

WHAT DO *YOU* THINK?

Have you recently purchased a new product that has been reviewed in *73*? If you have, write and tell us what *you* think about it. *73* will publish your comments so you can share them with other hams, as part of our continuing effort to bring you the best in new product information and reviews. Send your thoughts to Review Editor, *73: Amateur Radio's Technical Journal*, Peterborough NH 03458.

A BOOK ON AMTOR: WHAT, WHY, AND HOW

AMTOR means *AM*ateur *T*eletype *O*ver *R*adio and provides almost error-free

transmission and reception of messages. A form of RTTY that uses a seven-bit (Moore) code, TOR has been in use by both land-based and sea-based stations for several years but has been adopted by amateurs only recently.

The International Telegraphic Union Report CCIR 476-2 (1978) formed the basis for the 1983 FCC approval of AMTOR, and provides a set of operating standards and procedures.

And now, because of the relative newness of AMTOR to the amateur-radio fraternity and because some of the introductory articles that appeared in amateur magazines have been missed by amateurs who may be interested in trying out this new mode of communication, Phil Anderson W0XI has put out a neat, soft-cover publication called *Introduction to and the Operation of AMTOR.*

The table of contents lists a preface and introduction and chapters entitled Why AMTOR, Basic Equipment, Basic Operating Procedures, An Operating Example: AMTORSOFT (Copyright 1983 by Kantronics, Inc.), and Theory of Operation, AMTOR; there also is an appendix which includes chapters on a "Brief History of AMTOR," a table of the AMTOR code, and references.

The author uses cartoons in an early chapter to relate the reader to the idea of AMTOR, showing how interference can be minimized through repetition of the message and how an acknowledgement of message received is an important element of the system.

The booklet describes how essentially error-free comunication can result in spite of fading, interference, and the use of low power by either or both stations in a two-way circuit. It shows the reader what equipment is required, basic operating procedures, where to find and how to tune AMTOR, how to establish contact, how to send and receive messages, and provides dozens of other vital pieces of information that one will want to know when beginning. Retail price of this 37-page booklet is $3.50.

THE J. C. LABS ACTION MONITOR

The first thing you'll ask yourself—as I did—is, "Why hasn't someone done that before?"

The Action Monitor is one of those devices that is simple, neat, and effective... besides which it is *needed*! Let me give you an example.

How many of you have a scanner or monitor that has to be left unattended much of the day (or night)? There may be something that comes over the monitor that you want to know, or even have to know... yet you can't be there.

How about a DX station that you have been waiting for on a spot frequency, but you have to go to work and may never know whether it ever showed up?

If you've ever worried about not getting that vital message, or capturing that signal that you wanted, the Action Monitor by J. C. Labs is for you. Here's how it works.

The Action Monitor is actually a VOX unit that operates a built-in switch to turn on a tape recorder or other recording device. You attach the speaker output of your receiver or scanner to the input terminals of the Action Monitor by a pair of wires. These can be audio wire, zip cord, or even a shielded pair, although it isn't necessary to go to shielded wire unless you want to.

Next, you attach one of the output leads of the Action Monitor to the tape recorder's push-to-talk input jack by means of the mating plug already furnished; and finally, you attach the other output lead to the tape recorder's microphone input jack by means of the mating plug also furnished. Now you are ready to record.

There is an ON-OFF switch on the Action Monitor. In the OFF position, the Action Monitor is not functional and your scanner or receiver functions normally—that is, without recording anything. Now comes the good part: You turn the switch to ON and you set the tape recorder to the RECORD position. Then tune in a signal on the receiver and watch what happens. As soon as the signal is received, the Action Monitor automatically turns the tape recorder on, and it records the received signal.

In case you wonder about it turning off too soon and missing a reply, Jim Casamassa of J. C. Labs has that all figured out: He provides a two-second delay in the Action Monitor so that it doesn't shut the recorder off immediately. Thus, if there is another signal following the first one by a short delav it also is picked up. Neat, huh?

Okay, how well does it work, you'd like to know? *It works just great!* My thing, for instance, is monitoring the aircraft bands. I like to listen to the commercial airliners call in to the Boston Air Traffic Control Center, so I merely hook up my aircraft monitor receiver to my tape recorder through the Action Monitor, and let it record while I am away from home.

In case you wonder why I do that, let me say that it's not mere curiosity. I happen to be a pilot who uses radio communications in my aircraft. Aircraft radio procedure is short, terse, clipped, and *fast.* It takes a bit of getting used to, and you have to mentally gear up to understand it ...particularly when you receive instructions to make a complicated approach. I find that the only way for me to be able to understand these rapid-fire contacts is to practice, practice, and practice listening, and the Action Monitor is the perfect way to do it simply and painlessly. I can get a tape full of information over a period of a day's time, so that when I get home in the evening, I can listen to the tape and hear what has happened while away. Best of all, I can replay the tape again and again to get that important practice.

Your use of the Action Monitor may be somewhat different than mine, of course, but that doesn't mean it will be less useful. A friend of mine listens to those "secret" frequencies where nothing happens for hours—even days—at a time. Then, suddenly, there is a burst of information. The Action Monitor is there, ready as always, to catch and record the transmission. Clandestine-radio monitors will find the Action Monitor to be absolutely necessary for their purposes—it is a valuable tool that saves time and money.

Speaking of which, you ought to know that the Action Monitor costs only $39.95 (plus $2.00 shipping and handling)—an extremely affordable price, in this writer's opinion, for something that is as useful and simple as this device. As I said in the beginning, why hasn't it been done before?

Oh, yes, one more thing: The Action Monitor comes complete with 9-V battery for powering the VOX circuit. While the battery seems to last forever, it is possible to use an ac adapter to furnish the necessary direct current. J. C. Labs furnishes one that is suitable for use with the Action Monitor for $8.95, as an optional accessory, plus a $1.00 shipping and handling charge.

For more information, contact *J. C. Labs, PO Box 183, Wales WI 53183; (414)-547-7987.* Reader Service number 482.

Photo B. Top view of the discone.

A NEW DISCONE ANTENNA FOR AMATEUR SERVICE

For the past twenty years, the discone antenna has been a very popular item among military communicators, and until recently, the only source for such antennas was the military surplus business. But things are changing, and in the last few months, TET (Taniguchi-Engineering-Traders, Yokohama, Japan) has introduced a discone antenna for amateur use.

The useful frequency range of the antenna is an impresssive 50 to 480 Megahertz continuous. That's one of the biggest payoffs of a discone: about an octave worth of bandwidth. TET claims that the swr anyplace in the useful frequency range is less than 1.5:1. Let me tell you, I tested the antenna at 146 MHz, 220 MHz and 450 MHz, and the worst swr obtained was 1.3:1—a very impressive performance.

The gain of the antenna is given at 3 dBi, and in a quick comparison between a quarter-wave vertical whip and the discone, the discone came out ahead by 2.8 dB. Considering that the measurement was relatively crude (even though it was done in an anechoic chamber), I probably would go along with the specifications given by TET.

Maximum power limit on this jewel is 500 Watts. The most impressive part of the antenna is the way it was built. The metal used is high-quality aluminum and the hardware used is all stainless steel. Assembly of the antenna took me about one hour (that includes two long-distance telephone interruptions) after figuring out the conversion from metric to inches (my tape measure is in inches). Mechanically, the antenna is about as strong as a mule, yet the unit only weighs 6.5 pounds.

The longest element, part of a radial, is 2200 mm (86.6"). This seven-foot radial is needed for 50-MHz operation. Photo B shows the top of the discone, and Photo C shows the insulator between the driven elements and the reflectors. It is made of a very hard and durable plastic, solid, and about 2 inches in diameter.

The antenna can be mounted on top of an HF monobander or tribander. It has about the same performance as a Ringo Ranger but much wider frequency operating range. This antenna will work very well

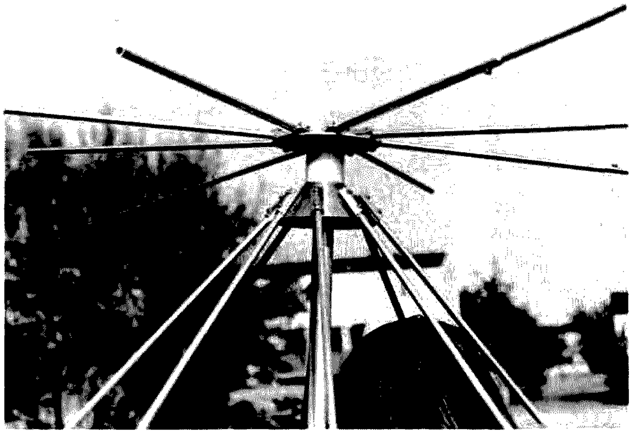

Photo C. The two discs of the discone, top (radiator) and bottom (ground-plane reflector).

on 2 meters, 220 MHz, and 450 MHz; it is vertically polarized, which makes it compatible with repeaters and FM simplex operation.

The angle of radiation is relatively low, at approximately 15° from the horizontal plane. Fig. 1 shows the angle of radiation relative to a quarter-wave vertical antenna. The GDX-2 is made with a metal coupling that mounts on the top of the SO-239 connector to protect such a connector from the weather.

For those of you willing to take the plunge, the antenna is now available from US TET distributors. (I bought this one from Sultronics, Inc., Xenia, Ohio.) The antenna was bought by DARA (Dayton Amateur Radio Association) for evaluation purposes; it was given as a door prize at one of the association meetings.

We paid the standard price of $79.95 for the antenna. Considering the wide bandwidth, the rugged construction, and its performance, the price is very good. The alternative would be to build three antennas and three feedlines plus connectors.

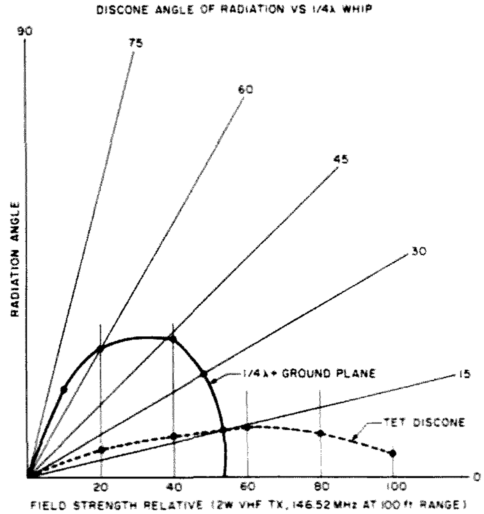

Fig. 1. Angle of radiation relative to a quarter-wave vertical.

The discone comes ahead financially after making the tradeoff.

NEW PRODUCTS

AEA RTTY SOFTWARE

AEA has released several new RTTY software packages for the Commodore machines. The MBAText is an advanced Morse, Baudot, and RTTY package for the VIC-20 or C-64, and includes a keyboard overlay for easy operation. The program includes RTTY and ASCII speed-estimate mode, as well as automatic speed tracking and lock-on capabilities. Dedicated function keys, message buffers, and hardcopy and magnetic media storage all make for easy, full-capability operation.

The AEA Micropatch™ is a low-cost Morse, Baudot, and ASCII software/hardware interface package. The Micropatch incorporates the MBAText software ROM, and adds dual-channel mark and space Chebyshev active filters. Automatic threshold correction makes for good copy when one tone is obliterated by QRM or selective fading. Several shifts are switch-selectable, and the triple-LED indicator creates an easy-tuning environment.

AEA has also produced two AMTOR products, the AMTORText™ and the MicroAMTOR Patch™. AMTORText will allow the Commodore 64 to be used as an AMTOR terminal with all the features. The menu-driven program makes it easy to run, and comes complete with SELCALL, ARQ, and break-in operation capabilities.

Combine the AMTORText program with high-quality hardware, and you get MicroAMTOR Patch. Four-pole active filters, automatic PTT, and an EXAR 2206 sine generator make this interface capable of copying through severe QRM.

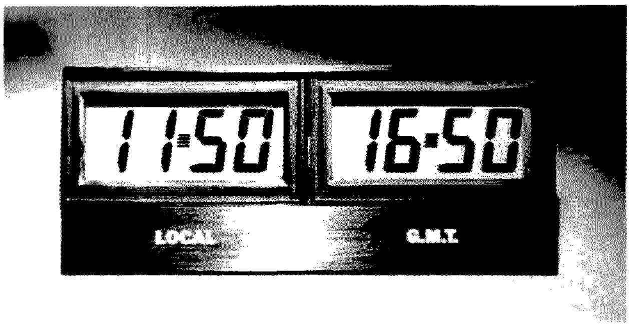
For more information, contact *Advanced Electronic Applications, Inc., PO Box C-2160, Lynnwood WA 98036; (206)-775-7373.*

BHC'S NEW BHC—THE BIG HAM CLOCK

BHC, Inc., has just introduced their Big Ham Clock, the latest of large liquid-crystal-display clocks in small packages. The clock has two large (5/8" tall) LCD modules, one for local time (12- or 24-hour type) and one for GMT. Each clock module can be programmed for your desired combination of: month/day, hours/minutes, seconds, and set to WWV (hack).

Each of the big modules will run one to three years on the replaceable battery. Both modules are mounted in a black anodized desk-top frame.

The Big Ham Clock is available from amateur radio dealers and distributors, or may be ordered directly from *BHC, Inc., 1716 Woodhead, Houston TX 77019.* Reader Service number 477.



BHC's Big Ham Clock.

NEMAL'S SATELLITE CONTROL CABLE

Nemal Electronics International, Inc., has just introduced a new type of combination cable designed for the satellite television industry. As a supplier of cable, connectors, and SMATV products to the satellite television market for over seven years, Nemal has responded to a need for an all-purpose cable for TVRO installations.

Consisting of nine individual conductors plus a 96% copper-shielded RG59/U coaxial line, the Nemal SCC (Satellite Control Cable) provides for all the requirements of most TVRO equipment in one direct burial cable. On the nine conductors, there are five #22-gauge standard copper, two 22-gauge shielded with a third drain wire, and two #18-gauge wires. All wires are color coded to industry standards for easy identification.

Nemal SCC is available in 500- and 1000-foot rolls, as well as by the foot. For additional information, please contact *Nemal Electronics International, Inc., 12240 N.E. 14th Avenue, North Miami FL 33161; (305)-893-3924.* Reader Service number 478.

INFORMATION PACKETS BY H. STEWART DESIGNS

H. Stewart Designs recently announced the availability of its design-information packet for a unique indoor antenna called the DX Hidden Asset Loop Antenna. This antenna is intended for use by apartment and condo dwellers, and others who are frustrated by antenna space restrictions. An antenna made from the information supplied has a vertically-polarized omnidirectional radiation pattern ideal for working mobiles and for DXing.

Intended for mounting in an attic or crawl space (and outdoors, too, if you should be lucky enough to have roof space available) a DX Hidden Asset Loop Antenna built for the ten-meter band would be only 40 inches tall and 55 inches in diameter. It is electrically balanced, independent of ground, and does not require radials or a ground connection.

Constructed from wire and other simple, readily-available materials, the DXHA looks like two four-foot halos arranged in a horizontal plane, mounted one above the other and separated by a little over three feet. The two loops are joined by two vertical wires spaced a few inches apart, and the coax feedline attaches to the center of one of the wires. Radiation is mainly from the verticals and, possibly, the antenna could be thought of as top-and-bottom-loaded radiators, although that has not been suggested by the literature.

If made from aluminum tubing and supported by some PVC pipe, it would appear as if the antenna could be self-supporting and well suited to outdoor mounting. H. Stewart Designs gives the construction for a wire-and-wood antenna but suggests that other possibilities exist. The informa-

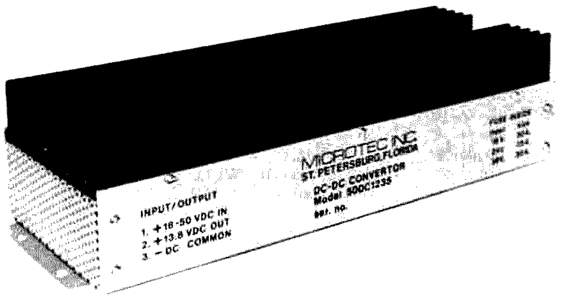
tion package contains drawings, tables of dimensions, diagrams, and assembly/tuning instructions for several popular high-frequency amateur bands from two through fifteen meters.

We at *73* will be putting together a ten-meter version for evaluation and will report results in the Product Review section within a few months. Meanwhile, for further information, contact *H. Stewart Designs, PO Box 643, Oregon City OR 97045.* Reader Service number 481.

GUIDE TO RTTY FREQUENCIES

Interest in monitoring RTTY signals in the shortwave spectrum has caught the fancy of thousands of hams and SWLs. Receiving RTTY signals has been greatly simplified through the use of computer technology and stable HF receiving equipment. In keeping pace with this explosive growth, the second edition of the *Guide to RTTY Frequencies* has double the amount of information and number of pages as the 1980 first edition.

Compiled and edited by O. P. Ferrell, the *Guide to RTTY Frequencies* details the frequency, callsign, location, power, speed, and shift, plus schedules of over 5000 RTTY stations and frequencies in use. The book is conveniently divided into two separate lists: the first by frequency, the second a reverse list by callsign. Included in the lists are military, weather, aeronautical, embassy, press, traffic, and coastal RTTY stations and nets. This is the most comprehensive listing of RTTY stations ever published.



Microtec's dc-dc converter.

The introductory text provides an overview of the techniques of RTTY reception with short articles on Russian Cyrillic, Hellschreiber, test signals, and an explanation of how to use the station lists. RTTY newscasts are given special consideration in the *Guide*. For the first time in print, the *Guide to RTTY Frequencies* gives definitive schedules, details on beam headings, "silent days," special shift patterns, etc. The author gives some advice on buying equipment just to copy RTTY newscasts, pointing out that the number of RTTY newscasts that can be monitored in North America has been steadily decreasing although activity in all other services is expanding.

For more information, contact *Gilfer Associates, Inc., 52 Park Avenue, PO Box 239, Park Ridge NJ 07656; (201)-391-7887.* Reader Service number 476.

A 25-W AMPLIFIER FOR TWO METERS

Ham Industries, Inc., which recently expanded its product line, has announced the availability of its first ham product, the PA-25, a very compact 25-Watt amplifier for the 2-meter band.

Weighing 8 ounces, the PA-25 can be attached to a hand-held or mounted to a car dashboard with the accessory mounts included. It will boost output power up to 6 times for a hand-held transceiver. An adapter cord allows plugging into a cigarette lighter, or a separate power supply can be used.

To order, or to obtain further information, contact *Ham Industries, Inc., Inspection Products Division, 835 Highland Rd., Macedonia OH 44056, (212)-467-4256.* Reader Service number 479.

THE MICROTEC 50DC1235 DC-DC CONVERTER

Magnum Distributors, Inc., has introduced another power-conversion product, the model 50DC1235, designed and manufactured by Microtec, Inc.

The model 50DC1235 is a commercial-grade, high-efficiency, high-current, continuous-duty, dc-dc converter. Specifications: 18-50-V-dc input, 13.8-V-dc output at 30 A. Continuous, 35 A intermittent (35 A continuous with forced air cooling); regulation: line 0.1% temp. 0.5%; output ripple and noise: less than 5 mV rms at max. load; efficiency: 83-90% input and output protection; size: 13.5" x 3.25" x 4.5"; weight: 5 lbs.; construction: all non-ferrous, 1 year warranty. Complete specifications upon request.

For additional information and pricing, contact *Magnum Distributors, Inc., 1000 S. Dixie Hy. W. #3, Pompano Beach FL 33060; (305)-785-2002.* Reader Service number 480.

CONTESTS

Robert Baker WB2GFE
15 Windsor Dr.
Atco NJ 08004

3RD ANNUAL 40-METER WORLD SSB CHAMPIONSHIP 0000Z to 2400Z January 7, 1984

SPONSORED BY:

73: Amateur Radio's Technical Journal.

MISCELLANEOUS RULES:

Work as many stations as possible on 40-meter phone during the specified times of allowable operation. The same station may be worked *once*. Crossmode contacts will not count. Single-operator stations may operate a total of 16 hours. All multi-operator stations may operate the entire 24-hour period. Off periods must be noted in your log(s) and on your summary sheet. Off periods are *no less than 30 minutes each.*

OPERATOR CLASSES:

(A) Single operator, single transmitter, phone only. (B) Multi-operator, single transmitter, phone only.

EXCHANGE:

Stations within the continental 48 United States and Canada transmit an RS report and state, province, or territory. All other stations, including Alaska and Hawaii, transmit RS report and DX country.

POINTS:

5 QSO points for contacts with W/VE stations located within the continental 48 United States and Canada. All other contacts score 10 points each. List points for each contact on your log sheet(s).

MULTIPLIERS:

1 multiplier point is earned for each US state, 48 maximum (a District of Columbia contact may be substituted for a Maryland multiplier), each Canadian province or territory (13 maximum), and DX country (excluding the continental US and Canada).

FINAL SCORE:

Total QSO points times total multiplier points equals *claimed score.*

CONTEST ENTRIES:

Each entry must include a contest log, a dupe sheet, a contest summary, and multiplier checklist. We recommend that contestants send for a copy of the contest forms. Send an SASE to the contest address listed below.

CONTEST DEADLINE:

Each entry must be postmarked no later than February 12, 1984.

DISQUALIFICATIONS:

Omission of any required entry form, operating in excess of legal power, manipulating of contest scores or times to achieve a score advantage, or failure to omit duplicate contacts which would reduce the overall score more than 2% are all grounds for immediate disqualification. Decisions of the contest committee are final.

AWARDS:

Contest awards will be issued in each operator class in each of the continental 48 United States, Canadian provinces and territories, and each DX country represented. A minimum of 100 QSOs must be worked to be eligible for contest awards.

CONTEST ADDRESS:

To obtain entry forms or to submit an entry, contact: 40-Meter Contest, Dennis Younker NE6I, 43261 Sixth Street East, Lancaster CA 93535.

THE TSRAC BNT

NEWSLETTER OF THE MONTH

"The A. R. *club* publication that *tries* to be different." That's the self-proclaimed motto of The Triple States Radio Amateur Club's *TSRAC BNT*, this month's contest winner. How are they different from most other newsletters?

Well, sure, they have news about club members and news about hamfests and special events. News about past and future happenings. "The Trading Post" classifieds. Some paid advertising. News (and a coupon) about a new Novice class. FCC and ARRL news. Articles (September issue) such as "Simulated Disaster Turns into the Real Thing" and "Helping the FCC at Midnight!" News about the newsletter itself—editorial and subscription info. Letters to the Editor. News "From the Editor's Desk" for readers. Some photos of hams in action. ARES news. A League membership application. More news.

Get the picture? News, news, news—crammed into this 24-page single-spaced issue. Editor Ralph McDonough K8AN's club doesn't get this award for news, though. They get it for taking the time and an awful lot of space to congratulate and recognize club members for their personal and club efforts. They *try* to be different by doing this and we feel that they more than succeed.

Our congratulations go out to Ralph, his helpers (however unsung), and *TSRAC* for a job very well done.

To enter your club's newsletter in *73*'s Newsletter of the Month Contest, send it to *73*, Pine Street, Peterborough NH 03458, Attn: Newsletter of the Month.

3RD ANNUAL 75-METER WORLD SSB CHAMPIONSHIP 0000Z to 2400Z January 8, 1984

SPONSORED BY:

73: Amateur Radio's Technical Journal.

MISCELLANEOUS RULES:

Work as many stations as possible on 75-meter phone during the specified times of allowable operation. The same station may be worked *once*. Crossmode contacts will not count. Single-operator stations may operate a total of 16 hours. All multi-operator stations may operate the entire 24-hour period. Off periods must be noted in your log(s) and on your summary sheet. Off periods are *no less than 30 minutes each.*

OPERATOR CLASSES:

(A) Single operator, single transmitter, phone only. (B) Multi-operator, single transmitter, phone only.

EXCHANGE:

Stations within the continental 48 United States and Canada transmit an RS report and state, province, or territory. All other stations, including Alaska and Hawaii, transmit RS report and DX country.

POINTS:

5 QSO points for contacts with W/VE stations located within the continental 48 United States and Canada. All other contacts score 10 points each. List points for each contact on your log sheet(s).

MULTIPLIERS:

1 multiplier point is earned for each US state, 48 maximum (a District of Columbia contact may be substituted for a Maryland multiplier), each Canadian province or territory (13 maximum), and DX country (excluding the continental US and Canada).

FINAL SCORE:

Total QSO points times total multiplier points equals *claimed score*.

CONTEST ENTRIES:

Each entry must include a contest log, a dupe sheet, a contest summary, and multiplier checklist. We recommend that contestants send for a copy of the contest forms. Send an SASE to the contest address listed below.

CONTEST DEADLINE:

Each entry must be postmarked no later than February 12, 1984.

DISQUALIFICATIONS:

Omission of any required entry form, operating in excess of legal power, manipulating of contest scores or times to achieve a score advantage, or failure to omit duplicate contacts which would reduce the overall score more than 2% are all grounds for immediate disqualification. Decisions of the contest committee are final.

AWARDS:

Contest awards will be issued in each operator class in each of the continental 48 United States, Canadian provinces and territories, and each DX country represented. A minimum of 100 QSOs must be worked to be eligible for contest awards.

CONTEST ADDRESS:

To obtain entry forms or to submit an entry, contact: 75-Meter Contest, Jose A. Castillo N4BAA, 1832 Highland Drive, Amelia Island FL 32034.

Aug 24-27	A5 North American UHF FSTV-DX Contest
Sep 22-23	Late Summer QRP CW Activity Weekend

RATS NEST AND CROOKED STICK IV
2100Z January 8 to 0100Z January 9

This antenna experimenter's contest sprint is sponsored by the Issaquah Amateur Radio Club. A Rats Nest and Crooked Stick antenna is 100 feet maximum of single-conductor wire (solid or stranded), any configuration. Feedline will not have to count as part of the 100 feet unless it is coaxial cable. Antenna height is limited to *20 feet* at the center of high current, i.e., center of dipole, center of quad, base of 1/4-wave vertical. Transmitter power shall be 250 Watts or less (dc input).

FREQUENCIES:

CW—21.060 to 21.200 MHz.
SSB—21.350 to 21.450 MHz.

EXCHANGE:

Name, location (QTH), type of antenna, IARC member—yes or no.

SCORING:

CW contact—21.060 to 21.099 MHz, 5 points; CW contact—21.100 to 21.200 MHz, 10 points; SSB contact—21.350 to 21.450 MHz, 2 points.

A station may be contacted once on SSB and once on CW. Each dupe the contest committee finds is penalized by a loss of 10 points.

Bonus points awarded as follows: each new state worked, 3 points; worked all seventh-call-area states (8), 50 points; worked all states (50) 75 points; each new call area worked, 5 points; worked all ten US call areas, 35 points; 7 or more CW contacts, 25 points; 15 or more CW contacts, 75 points; each DX contact (KH6, KL7, VE, XE, JA, etc.), 5 points.

CATEGORIES:

1. Non-IARC member using a Rats Nest and Crooked Stick antenna. 2. IARC member using a Rats Nest and Crooked Stick antenna. 3. IARC member using a conventional base-station antenna. 4. A station making contact with three IARC members during contest.

AWARDS:

In each of the above categories 1, 2, and 3: A. High overall score. B. High CW score (without bonus). C. High SSB score (without bonus). D. High Novice/Technician score. E. Participant (1 hour or more operation).

In category 4: "Rat Catcher" certificate.

ENTRIES:

By February 1, 1984, submit summary sheet-points per mode, bonus points earned, total points earned, name, call, address, complete description of antenna and equipment used, license class. Log sheet—time, call, frequency, mode, exchange.

For Rat Catcher entries, submit log sheet showing three contacts with Issaquah Amateur Radio Club members during contest.

All correspondence must include an SASE sent to: Issaquah Amateur Radio Club, Bob Farnworth KB7NV, 6822 131st Ave. S.E., Bellevue WA 98006. All decisions of the contest committee will be final.

RESULTS

1983 ARIZONA QSO PARTY

Arizona Stations

Call	QTH	Score
*K6LL	Yuma County	75,468
*KB7KZ	Pima County	16,965

Non-Arizona Stations

Call	QTH	Score
*W5PWG	Texas	200
W5WG	Louisiana	170

* Certificate winner

5TH ANNUAL 160-METER WORLD SSB CHAMPIONSHIP
0000Z January 14, 1984 to 2400Z January 15, 1984

SPONSORED BY:

73: Amateur Radio's Technical Journal.

OBJECT:

To work as many stations as possible on 160-meter phone in a maximum of 32 hours allowable contest time. Multi-operator stations may operate the entire 48-hour contest period. Stations may be worked only once.

ENTRY CATEGORIES:

(A) Single operator, single transmitter, phone only. (B) Multi-operator, single transmitter, phone only.

EXCHANGE:

Stations within the continental US and Canada transmit RS report and state or province/territory. All others transmit RS report and DX country.

POINTS:

5 QSO points for contact with W/VE stations contacted within the continental 48 United States and Canada. All other contacts earn 10 points each.

MULTIPLIERS:

1 multiplier point will be earned for each of the continental United States. 48 maximum (a District of Columbia contact may be substituted for a Maryland multiplier), each of the Canadian provinces/territories (13 maximum), and each DX country outside the continental 48 United States and Canada.

FINAL SCORE:

Total QSO points times total multiplier points equals *claimed score*.

CONTEST ENTRIES:

Each entry must include log sheets, dupe sheet for 100 or more contacts, a contest summary, and a multiplier check sheet.

ENTRY DEADLINE:

All entries must be postmarked no later than February 19, 1984.

DX WINDOW:

Stations are expected to observe the DX window from 1.825-1.830 MHz as mutually agreed by top-band operators. Stations in the US and Canada are asked not to transmit in this 5-kHz segment of the band. During the contest, all W/VE stations are requested to utilize only those frequencies from 1.808-1.825 and 1.830-1.900 MHz.

DISQUALIFICATIONS:

Disqualification may result if a contestant omits any required entry form, operates in excess of legal power authorized for his/her given area, manipulates operating times to achieve a score advantage, or fails to omit duplicate contacts which reduce the overall score more than 2%. Decisions of the contest committee are final.

AWARDS:

Contest awards will be issued in each entry category in each of the continental United States, each Canadian province/territory, and each DX country. A minimum of 100 QSOs must be worked to qualify.

CONTEST ADDRESS:

To obtain information or entry forms (enclose an SASE) or to submit a contest entry, contact: 160-Meter Contest, Harry Arsenault K1PLR, 603 Powell Avenue, Erie PA 16505.

HUNTING LIONS IN THE AIR CONTEST

Starts: 1200 GMT January 14
Ends: 1200 GMT January 15

The contest is sponsored by Lions Clubs International and coordinated by Lions Club Rio de Janeiro Arpoador, Brazil. Participation in the contest is open to all duly licensed radio operators, Lion and non-Lion. There are two modes: phone and CW. Participation in both modes is allowed but points are counted separately. All amateur stations participating must operate within their licensing regulation. Separate categories will exist for single operators and radio clubs/societies. Multi-operators may participate as long as they do not operate simultaneously with the same callsign. However, each callsign used must be listed on the log.

Use all bands, 80, 40, 20, 15, and 10 meters. Only one QSO with the same station on each band may be counted. Remember that phone and CW are counted separately!

EXCHANGE:

RS(T) and sequential QSO number. When a contact is made with any Lion, Leo, or Lioness, the name of the club contacted should be clearly identified.

SCORING:

QSOs within the same continent count 1 point while those between different continents count 3 points. Score 10 extra bonus points for each QSO with a member of a Lion, Lioness, or Leo Club from a different country or 5 points within the same country. Score 20 bonus points for a QSO with a member of the Lions Club Rio de Janeiro Arpoador. Contacts between Brazilian stations and members of the Arpoador club will count only 5 extra points. Contacts between members of the Arpoador club will not count any bonus points.

AWARDS:

For single-operator entries, Lions Clubs International will present trophies for first, second, and third places on both modes. Fourth through tenth places will receive plaques. In addition, each participant sending a log with a minimum of 5 contacts will receive a special certificate. The contest committee will also select and reward the most active Lions Club participating in the contest.

ENTRIES:

Keep a separate log for each mode. Each participant will note in the log the callsign and information exchanged. Confirmation of contacts will be made by comparing the logs of the participants. Participants should send their logs by airmail no later than Feb. 5 to: Contest Committee, Hunting Lions in the Air, Lions Club of Rio de Janeiro Arpoador, Rua Sao Francisco Xavier #246, Apt. 407, 22550 Rio de Janeiro, RJ, Brazil.

A5 WAS SSTV CONTEST

Starts: 1800 EDT January 20
Ends: 1800 EDT January 22

This is the 3rd annual contest sponsored by *A5 ATV Magazine*. The object is to work as many different US states as possible on the video mode. All contacts must be in video form with a minimum of callsign and RSV signal reports sent and received. Count 10 points per SSTV QSO regardless of location, with 100 points awarded for each new state. Contacts with Alaska or Hawaii on SSTV count 500 points. Top scorer will receive a free 3-year subscription to *A5 ATV Magazine* with 1-year subscriptions going to District leaders. All entrants will receive a special gold specialized-communications certificate suitable for framing. Logs must be sent to: Contest Manager, *A5 ATV Magazine*, PO Box H, Lowden IA 52255. Indicate state and score on the front of the envelope. Logs and photos sent will be returned at the close of the contest judging period. Results should be published in the March or April, 1984, issue of *A5 ATV Magazine*.

NORTH DAKOTA QSO PARTY

0000 to 0800 and 1600 to 2400 GMT January 21
0800 to 1600 GMT January 22

Sponsored again by the Red River Radio Amateurs of Fargo ND. Work stations once per band and mode.

EXCHANGE:

RS(T) and state, province, country, or North Dakota county.

FREQUENCIES:

Phone—1835, 3905, 7280, 14295, 21380, 28580.
CW—1810, 3540, 7035, 14035, 21035, 28035.
Novice—3725, 7125, 21125, 28125.

SCORING:

Phone contacts count 10 points, CW 20 points, and RTTY 50 points. North Dakota stations count an additional 100-point bonus for working five Novices. North Dakota stations multiply score by total of states, provinces, and countries worked. Others multiply by the number of North Dakota counties worked (max 53).

ENTRIES & AWARDS:

Certificates to state, province, and country winners. Plaque to North Dakota winner and highest scorer outside North Dakota. Mail logs by February 28th to: Mike Beaton KDØA, 2267 Flickertail Dr., Fargo ND 58103. Include a large SASE for results.

CQ WORLDWIDE 160-METER CONTEST-CW

Starts: 2200 GMT January 27
Ends: 1600 GMT January 29

Operating classes include both single and multi-operator (maximum of 5 ops per station).

EXCHANGE:

RST plus QTH, and state for USA, province for Canadian.

SCORING:

Contacts with stations within own country are 2 points, other countries but same continent are 5 points, other continents are 10 points. KH6 and KL7 are considered countries.

Multipliers are each US state, VE province, and DX country. USA and Canada are *not* country multipliers. However, there are three VE1 provinces: New Brunswick, Nova Scotia, and Prince Edward Island. Final score is total QSO points times the sum of the multipliers. Maritime-mobile scoring will be determined by the location.

AWARDS:

Certificates to the top scorers in each class in each US state, VE province, and DX country. Special plaques are also being awarded for top USA, Europe, and world scores.

PENALTIES:

Three additional contacts will be deleted from the score for each duplicate, false, or unverifiable contact removed from the log. A second multiplier will also be removed for each one lost by this action.

Violation of the rules and regulations pertaining to amateur radio in the country of the contestant or the rules of the contest, unsportsmanlike conduct, or taking credit for excessive duplicate contacts or multipliers will be deemed sufficient cause for disqualification. Disqualified stations or operators may be barred from competing in CQ contests for a period of up to three years.

ENTRIES:

Sample log and summary sheets may be obtained from CQ by sending a large SASE with sufficient postage to cover your request. It is not necessary to use the official form, you can use your own. Logs should have 40 contacts per page and show time in GMT, numbers sent and received, and separate columns for QSO points and multipliers. Indicate the multiplier only the first time it is worked.

Include a summary sheet with your entry showing the scoring and other essential information, and a signed declaration that all rules and regulations have been observed. Mailing deadline for CW entries is Feb 28. Logs can be sent directly to the 160 Contest Director, Don McClenon N4IN, 3075 Florida Avenue, Melbourne FL 32901, USA. Alternatively, they can be sent to *CQ* 160-Meter Contest, 76 North Broadway, Hicksville NY 11801, USA. Please indicate "CW" on the envelope!

MICHIGAN YL QSO PARTY

Starts: 1800 GMT January 28
Ends: 1800 GMT January 29

Sponsored by The Auto State Young Ladies (TASYLs). No crossband, net, or repeater QSOs are allowed. Each station can be contacted only once.

EXCHANGE:

RS(T), QTH, and TASYL number (for members).

SCORING:

Score one point per QSO and multiply by 2 if on CW. Multiply again by 2 if TASYL member. Multiply QSO points by number of different ARRL sections and DX countries worked.

ENTRIES:

Send logs to TASYL President Carol Hall WD8DQG, 4651 Cardinal Dr., Mt. Pleasant MI 48858. Entries must be received by February 25th.

The TASYL Certificate may also be earned during the QSO Party for working TASYL members. Charter members 1 thru 50 count 2 points while all other members count 1 point. Michigan stations need 15 points while others only need 10 points. To apply for the award, send a signed and dated log showing the date and time of contacts, callsigns, frequencies, RST, and TASYL numbers. Certification giving date and QTH must be on the original application and signed by one of the following: 2 licensed amateurs, General-class or higher (non-family), one official of a recognized club, or a notary public. Include $1 to cover mailing costs, etc., and submit applications to Carol Hall WD8DQG, 4651 Cardinal Drive, Mt. Pleasant MI 48858.

3RD ANNUAL RTTY WORLD CHAMPIONSHIP

0000Z to 2400Z
February 25, 1984

SPONSORED BY:

73: Amateur Radio's Technical Journal and *The RTTY Journal*

OPERATOR CLASSES

(A) Single operator, single transmitter. (B) Multi-operator, single transmitter.

ENTRY CATEGORIES

(A) Single band. (B) Allband, 10-80 meters.

EXCHANGE

Stations within the 48 continental United States and Canada must transmit RST and state or province/territory. All others must transmit RST and consecutive contact number.

MISCELLANEOUS RULES

The same station may be worked once on each band. Crossmode contacts do not count. Single-operator stations may work 16 hours maximum, while multi-operator stations may operate the entire 24-hour period. Off times are *no less* than 30 minutes each and must be noted in your log(s).

QSO POINTS

5 QSO points for contacts with W/VE stations located within the continental United States and Canada. 10 QSO points for all other contacts.

MULTIPLIER POINTS

1 multiplier point is awarded for each of the 48 continental United States (a District of Columbia contact may be substituted for a Maryland multiplier). Canadian provinces/territories, and DX countries worked on each band (excluding US and Canada).

FINAL POINTS

Total QSO points times total multipliers equals *claimed score*.

CONTEST ENTRIES

Entries must include a *separate* log for each band, a dupe sheet, a summary sheet, a multiplier checklist, and a list of equipment used. Contestants are asked to send an SASE to the contest address for official forms.

ENTRY DEADLINE

All entries must be postmarked no later than April 15, 1984.

DISQUALIFICATIONS

Omission of the required entry forms, operating in excess of legal power, manipulating scores or times to achieve a score advantage, or failure to omit duplicate contacts which would reduce the overall score more than 2% are all grounds for immediate disqualification. Decisions of the contest committee are final.

AWARDS

Contest awards will be issued in each entry category and operator class in each of the US call districts and Canadian provinces/territories, as well as in each DX country represented. Other awards may be issued at the discretion of the awards committee. A minimum of 25 QSOs must be worked to be eligible for awards.

CONTEST ADDRESS

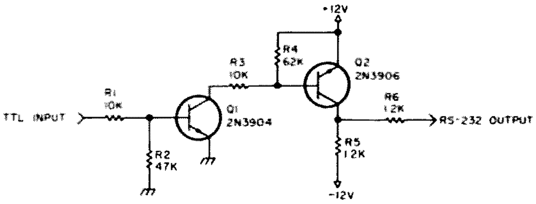
RTTY World Championship, c/o *The RTTY Journal*, PO Box RY, Cardiff CA 92007.

CIRCUITS

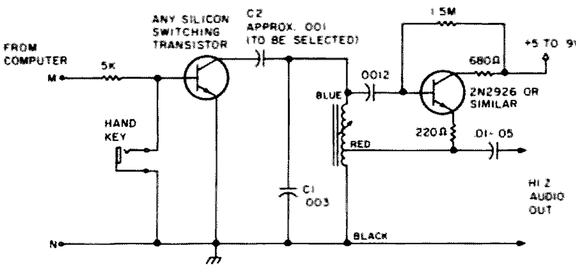
Do you have a technique, modification, or easy-to-duplicate circuit that your fellow readers might be interested in? If so, send us a concise description of it (under two pages, double-spaced) and include a clear diagram or schematic it needed.

In exchange tor these technical gems, 73 offers you the choice of a book from the Radio Bookshop, *to be sent upon publication. Submit your idea (and book choice) to: Circuits, Editorial Offices, 73* Magazine, *Peterborough NH 03458. Submissions not selected for publication will be returned if an SASE is enclosed.*

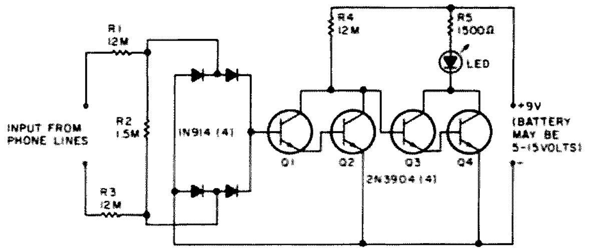
STOP THAT ICOM BUZZ: If your IC-45A has been buzzing through the speaker or has been commanding itself to start or stop scanning, here is a simple fix. The regulator (IC-2) on the main board is the power supply for the whole radio. If it is not securely attached to the heat sink and if the board on which it sits is not firmly attached to the framework, the regulator filter will not function correctly. This will allow a buzz into the 8-V supply and will false the CPU into thinking that there was a command. Buzz may also occur in the audio. By tightening the four screws holding IC-2 to the heat sink, the filter will be allowed to work again. Some of the screws have a tendency to loosen, so a periodic check of them is in order.—Rick Bates WA6NHC, Petaluma CA.



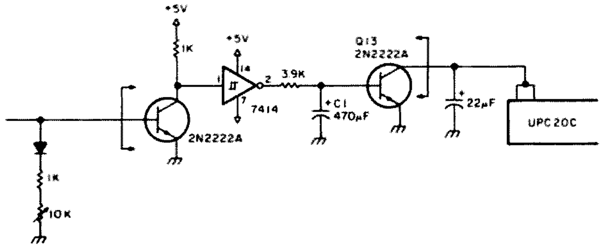
SIMPLE TRANSISTOR TTL-TO-RS232 INTERFACE: This circuit can be used for driving an RS232 printer or RTTY interface from your computer or digital circuit. Transistor Q2 is the ± 12-V switch, which is driven by Q1. When the TTL input is low (mark condition), Q1 is turned off, which allows Q2 to be turned off. The RS232 output rests at − 12 volts (mark condition). When the TTL input is logic high (5 V), Q1 turns on and drives the base of Q2, turning it on. The RS232 output will then go to approximately + 12 V (space condition). Resistor R6 maintains a current limit in the event of an RS232 output short circuit. If the output were shorted without R6 in the circuit, the switch transistor Q2 would quickly burn out. The total cost of this simple interface is 32 cents.—Scott M. Freeberg WA9WFA, Ft. Atkinson WI.



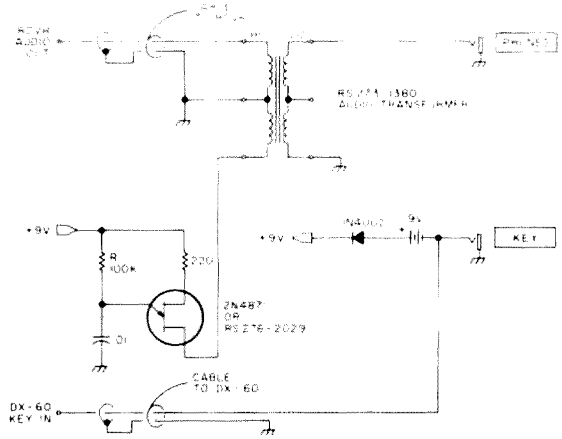
RTTY OSCILLATOR FROM ORGAN PARTS: Using a tapped coil from the tone generator in a Conn organ, this circuit will generate the necessary 1275 and 1445 tones for RTTY. The coil I used (no. 57013) produced F sharp in the sixth octave; it should be available from a Conn organ repairman. Other coils may be used instead, but you must change the value of C2 to get the correct frequency. The circuit itself is a standard Hartley oscillator, and the coil adjustment is a standard 6-32 nut. Be sure to finish tuning in the tightening mode to ensure mechanical stability.—Wm. Bruce Cameron WA4UZM, Temple Terrace FL.



TELEPHONE OFF-HOOK INDICATOR: How many times have you started to dial a phone number only to find that the line was already in use? This visual indicator will signal when another person is dialing or talking on an extension and also provides a visual ring indicator. The LED flickers when the phone is ringing or being dialed. It glows steadily when the phone is off the hook. R1 and R2 isolate the system from the phone lines. They form a voltage divider with R3. The divider output feeds switch Q1-Q2. The switch senses less than 2 uA which the system draws from the phone line. That small current drops about three volts across R2 which keeps Q2 turned on. That keeps the second switch, Q3-Q4, and the LED turned off. But when the phone is taken off the hook, the line voltage falls, Q1-Q2 turns off, and Q3-Q4 turns on and lights the LED. Voltage changes caused by ringing and dialing also affect the switching, causing the LED to flicker.—Evert Fruitman W7RXV, Phoenix AZ.



FAST-ATTACK SQUELCH: This circuit was designed to provide a high-performance squelch for a nearby repeater which uses an IC-22A as a receiver. The Schmitt trigger provides a little hysteresis where it takes more signal energy to open the squelch than it takes to close it. Replace Q13 with a 2N222A in a TO-18 package, and leave the base lead out of the circuit board so that a wire can be attached to it later. C1 must be greater than 100 uF to eliminate popping noise around the squelch threshold, but the other parts values are not critical.—Robert C. Lee WB0UBL, North Liberty IA.



CW SIDETONE FOR THE DX-60: Here's a simple circuit which will work with any receiver and create a sidetone when you are keying the DX-60. Transformer T1 is an audio transformer. The unijunction transistor used as an oscillator may be any type; a 2N4871 or RS 276-2029 are good choices. Battery drain is practically nil, so a power switch is not needed, and you can change the pitch of the sidetone by changing the value of R.—Terry Simonds WB4FXD, Edgartown MA.

W2NSD/1 NEVER SAY DIE

editorial by Wayne Green

from page 6

nology, I'll let you know what's going on. In computers, the big push is for lap micros—the size of a ream of paper, but a lot lighter. This editorial is being written on a Tandy 100 lap computer.

The first system on the market along this line was the Sony Typecorder. But after almost a two-year lead on the field, Sony dropped the ball. An old CB manufacturing firm in Japan went the next step, producing the Tandy 100. This came out last spring, made by Kyocera.

Oddly enough, I described this computer in rather good detail when I gave a talk at the Atlanta Hamfestival in 1976. Later that year, I went over the idea with K. Mishi, the editor of *I/O* magazine in Japan. He, I am told, worked with Kyocera on its development. My part has probably been forgotten by now, but then, I'm used to that. It was my idea for splitting channels onto videotape which brought the first breakthrough by Ampex back in 1948. I'm sure that my idea has been long forgotten, but it was the one thing they needed to get started with videotape. At the time, I was working as a television engineer for WPIX in New York. I attended a TV seminar and talked with the engineers at Ampex. They explained that they were only able to get part of the needed bandwidth on tape, so I suggested heterodyning the frequencies down to where they could be put on tape and then putting the frequencies back together again later. They tried it and soon after we had 2" videotape from Ampex. No one even said thanks.

The lap computer is going to be a very big business, with opportunities for small firms to develop accessories and software for them—thousands of firms. But the next step is one which should be duck soup for hams—getting rid of the umbilical cord so these small computers can access a nearby computer system and use its storage, disks, and so on.

The next step, as I have written before, is a communications system which will allow all the desktop and lap computers to almost instantly communicate with each other. Something along the line of our repeater systems, which would receive messages, check them for errors and roger them, then pass them along to the addressee, complete with a return roger of the message receipt, is so obvious that it will have to happen.

In a few years, any of us who want to will be able to communicate with anyone anywhere from anywhere. It won't make any difference if I am walking along the street, shopping in Singapore, or in New Hampshire on a ski slope—I'll be able to type or talk a message and have it delivered in a second or two anywhere to anyone.

This is going to change business beyond recognition. It is going to have a profound effect on education. We can't even imagine what it will do for personal relationships. Oh, busy people will have to have filters built into the system. When my business was small I was available by phone at any time of the day or night. Today I'd be driven crazy with stockbrokers wanting to help me with my "portfolio" and investment counselors wanting to help me with my estate—not to mention people with investment ideas for my money and so on.

This communications demand is going to call for hundreds of thousands or even millions of technicians, engineers, and scientists to develop, manufacture, sell, install, operate, and service the systems it will take to do all this. It's mind-boggling in concept. We'll be using fiber optics, lasers, microwaves, satellites, and anything else we can invent to speed things up and make them less expensive. Amateurs are in a beautiful spot to get in on this bonanza. We can develop the communications system to do these things on our ham bands and then get started with small businesses, taking advantage of what we've developed. Or, we can bicker over the Morse code, get into pileups fighting for DX, and jam nets. I'm not sure these activities are any more beneficial to the world—or to amateur radio—than sitting back with two six packs of 807s and watching football on television.

The potential is there. My magazines can help you take advantage of that potential. Indeed, it is as a direct result of the pressures at Dayton, where hundreds of hams pleaded for a good Commodore magazine, that we've launched *RUN*. The first issue is due out in December and it looks as if it will sell well over 100,000 copies right off the bat.

I have a bunch more magazines in various stages of getting started just in case you don't smoke and are interested in getting involved in high-tech publishing. Some are in computers, some aren't.

Speaking of new magazines, while in Munich for the huge systems show (24 big buildings full of computer exhibits), we had a launching party for *PC Welt*, a German version of our sister magazine, *PC World*. Then on to Tokyo for the Data Show and the launching of a PC magazine there. A day later in Singapore, at a third computer show, it was *Computerworld Asia* getting started. And finally, after flying around the world and covering 32,000 miles in ten days, Comdex in Amsterdam and the launching of ***MicroInfo***, a Dutch micro magazine—another associated publication of ours. Whew, what a trip!

With sunspots diminishing for several more years, DX is going to be harder to work and our higher bands are going to be of less interest. This seems like the ideal time for us to get cracking on new technologies—to experiment with new modes of communications and pioneer them.

Will we see automatic identification of rigs this year? It's certainly within our current level of technology to do this, complete with a reader on every receiver which will instantly read out the call of the received station—or even search for a desired station prefix.

With the development of packet communications, we may start having automatic message handling. We could have done that thirty years ago when I first started working with digital communications on the ham bands, but our national organization has done little to encourage such changes—and much to discourage them.

I'll be continuing to get on 20m as much as I can—and 2m from the various cities I visit. Sure, I'll be at Dayton this year. I don't know which other hamfests I'll make as yet. I've gotten to a lot of shows in the last year—consumer electronics shows in Tokyo, Seoul, Taipei, Hong Kong, and Vegas—computer shows in Anaheim, Tokyo, Taipei, Singapore, Munich, Amsterdam, Atlanta, Boston, New York, and so on. This year I'll be hitting more hamfests—hope to see you.

INTERNATIONAL CORRESPONDENTS

First, I'd like to thank the hundreds of readers who have called or written to say that this feature is a favorite. We have 52 countries with correspondents and need more. I'll do what I can to find 'em as I travel, but you can help, too, by mentioning it over the air to some of the more interesting DX operators you get to know.

Some of the columnists have a tough job getting the information through—such as from Poland, for example. We really appreciate the job they're doing.

We have a truly international hobby and this column helps to bring us all together. We're interested in news of expeditions, special operations, certificates, how visitors can get permission to operate, how easy or difficult it is to get a license for locals, and so on.

With its international column, *73* has become the first international ham magazine.

PRICE INCREASE

With a substantial increase in the international distribution of *73*—increased by 35,000 copies—we've had to increase the cover price from $2.495 to $2.50 so as not to drive foreign newsstands right out of their minds. We had enough trouble in America—worth every minute of it, by the way.

Speaking of DX, have you chosen a DX operator to send a subscription to?

BARTER 'N' BUY

73 CLASSIFIED ADVERTISING

RATES

Individual (non-commercial) .... 15¢ per word
Commercial .... 50¢ per word

Prepayment by check or money order is required with your ad. No discounts or commissions are available. Please make your payment to *73*. Rates for multiple insertions are available on request.

ADVERTISING COPY

Advertising must pertain to amateur radio products or services. No special layouts or positions are possible. All advertising copy must be submitted typewritten (double-spaced) and must include full name and address. Copy limited to 100 words, maximum. Count only words in text. Address, free.

73 cannot verify advertising claims and cannot be held responsible for claims made by the advertiser. Liability will be limited to making any necessary correction in the next available issue. *73* reserves the right to reject any copy deemed unsuitable.

DEADLINES

Copy must be received in Peterborough by the 5th of the second month preceding the cover date. If copy is received after the deadline, it will be scheduled to run the following month, unless specifically prohibited by the advertiser.

MATERIALS

Send to Advertising Department, *73*, Elm Street, Peterborough NH 03458.

WYOMING-UTAH RANCH LAND. 10 acres, $60 down, $60/month. FREE information, maps, photographs. Trade equity for ham gear, home computer, test equipment, etc. Owner—Mike Gauthier K6ICS, 9550-B—Gallatin Rd., Downey CA 90240. BNB001

QSL MANAGER ALBUM™. Beautiful leather-grained vinyl ring binder for displaying 240 of your prized QSL cards. 30-day guarantee. $18.95 ppd or send stamp for flyer. Walter Beaton WD8DVX, 3780 Cecilia Ave., Cleveland OH 44109. BNB009

MOBILE IGNITION SHIELDING. Free literature. Estes Engineering, 930 Marine Drive, Port Angeles WA 98362. BNB006

DEALERS IN SURPLUS test instruments, microwave equipment, and components. WANTED: late test equipment (H.P., TEK, G.R., Narda, etc.), waveguide diagonal coax components. Immediate needs: H.P. K382A, R382A, S382C, 432A; G.R. 874- and 900-series coax items. Request want list. LECTRONICS, 1423 Ferry Avenue, Camden NJ 08104. Telephone (609)-541-4200. BNB015

WANTED: Early telegraph instruments for my collection. Keys, sounders, call boxes, registers, meters, and related items including pre-1910 paper. Larry Nutting WD6DTC, 5957 Yerba Buena, Santa Rosa CA 95405. BNB018

COLOR COMPUTER owners—call (212)-441-2807 for FREE color computer hardware and software catalog or write to Spectrum Projects, 93-15 86 Drive, Woodhaven NY 11421. BNB023

FOURTH ANNUAL Ohio State Convention and Flea Market: Join in the even bigger "Cincinnati ARRL '84," February 25 and 26. Activities for hams and electronics enthusiasts: forums, meetings, vendors, Wouff Hong, women's activities, banquet, hospitality suite, more. Sure cure for "cabin fever." Hospitality suite Friday and Saturday nights. The $5 convention registration includes all convention awards. Flea market is $4/space for two days—ham and electronics items, only. Write: Cincinnati ARRL '84, POB 11300, Cincinnati OH 45211 or telephone (513)-825-8234. Vendor and exhibitor inquiries invited. BNB024

KENWOOD 7625 2-meter transceiver, synthesized/memory, 25 Watts, $135. Kenwood TS-130V, $75. Turner Plus Two amplified mike, $35. D-104 amplified mike, $35; unamplified, $25. Vista IV 4-Amp unregulated 12-volt power supply, $16. Earl W. Long KAØMOE, Box 955, Joplin MO 64802-0955. No telephone calls please. BNB025

FREE SAMPLE—send stamp. Buy/sell radio, computer equipment in "Electronic Exchange," Box 486E, Forest Lake MN 55025. BNB026

CABLE, CONNECTORS, Fittings, 50 & 75 Ohms. Bought storage room full new ham/cable TV hardware. Send SASE & $.50 for big list. Pete WB3BQO, 329 Little Ave., Ridgway PA 15853. BNB027

DXERS—DX headings centered on YOUR QTH. $3.00 pp. KENTRONICS, PO Box 586, Vernon AL 35592. BNB028

AZDEN SERVICE MANUALS, PCS 3000 and PCS 300—$5.00 each; PCS 4000—$9.00. N.P.S., 1138 Boxwood, Jenkintown PA 19046. BNB029

WANTED: Cash paid for used SPEED RADAR EQUIPMENT. Write or call: Brian R. Esterman, PO Box 8141, Northfield IL 60093; (312)-251-8901. BNB030

MILITARY RADIO GEAR turns me on—I particularly crave more German, Japanese WW2 gear, UK sets, type #18, 21, 22, 48, Canadian RCAF AR-6, other non-US items. Also US types GRC-109, PRC-1 through 5, RAX, RBD, RBM, TRC-2, 10, others through 1950s, except post-1945 FM/VHF. I collect/restore/operate this vintage gear, so please dig out those dusty green and black boxes, accessories, manuals, etc. Tnx! Hugh Miller KA7LXY, 11206-1 NE, Seattle WA 98125. BNB031

RTTY FDM DEMODULATORS. FDM RTTY exists on satellites, FM SCA broadcast subcarriers (e.g., Commodity News Service), and HF radio. Four solid-state synthesized models, NSA surplus, new-used, $50 to $350. Call/write for brochure. Electrovalue Industrial, Inc., Box 376-WF, Morris Plains NJ 07950; (201)-267-1117. BNB032

PALOMAR ELECTRONICS CORPORATION EQUIPMENT REPAIR—2 techs, factory-trained, FCC-licensed, experienced, professional. Also available—Palomar equipment service manual—covers over 30 models. Communications Service, PO Box 3262, Escondido CA 92025. BNB033

ATLAS RADIO REPAIR—Specializing in the 180-210x-215x. Factory-trained, fast, experienced, reasonable. Payne Communications, PO Box 977, Vista CA 92083. BNB034

RTTY FOR THE TI99/4a. Mini-memory required. Mark and space tones are internally generated in send mode. TU is needed for receive only. $17.95. Mark Schmidt, 4661 Lark Dr., Beale AFB CA 95903. BNB035

PSST! HEY, wanna make professional-quality printed circuit boards? One or more in only 60 minutes. Simple, inexpensive, new system. Free 1984 catalog. PINCOR, 530 Palace, Aurora IL 60506; (312)-896-0015. BNB036

73 INTERNATIONAL

from page 80

1914 km on 1296 MHz and 1663 km on 10 GHz!

Last summer that worldwide-known GHz DXer bettered a fantastic world record of 1166 km on 10 GHz from Sagunto, Spain, to Italy. On July 2nd, Nicola joined IØSC and IØKBL in Ceuta. With them was Bernardo EA5RK. Nicola's car hauled a trailer with gear for 144 MHz, HF, and the GHz transceivers.

They met many hams from Ceuta, EA9LT, EA9GH, EA9KF, EA9LV, and EA9GH, who gave their assistance, providing permission to install the setup and the antennas on the Ceuta lighthouse, 400 feet above sea level.

● July 4—Nicola starts with two QSOs on 144 MHz MS, contacting I4BXN and F6FHI.

● July 5—There is an E-sporadic aperture: Nicola contacts on 144 MHz several YUs and Is with signals far in excess of S9. These are the first EA9-YU QSOs in history. At 1507Z, a contact is established on 1296 MHz with I8TUS/8. The QRB is 1914 km, a world record.

● July 6—At 1052, an ES contact with 9H1CG, a new one on 144 between EA9 and 9H. Then dozens of ES contacts with Italy and Yugoslavia. The signals are terrific: The S-meter is pinning up to full scale. At 1804, another new one with G4IJE; then, at 1845, GI4TAP (first QSO EA9-GI); at 1847, EI2CA, and at 1917, GW8FKB (two new ones with EA9).

● July 7—A one-hour opening on 1296 and many QSOs with Sicily. IØHOC/IT9 displays in Ceuta a signal of S9+20. Giuseppe has gone portable from Rome to Sicily just to try the contact!

Then the magic moments: At 1600, the contact is established with fair signals with IWØBCU/IT9, France, with a QRB of 1621 km! After seven minutes, again the record with IØNLK/IT9. The entire Roma Microwave Gang was in Sicily to attend the IØSNY enterprise.

Three hours after the record is filed, a new contact with IØNLK/IE9, Isle of Ustica, brings the record to 1663 km, almost 500 km more than the 1982 record from Sagunto to Rome. The day is not ended, as IWØBHN is contacted on 10 GHz: 1603 km, not a record but great DX!

● 9 and 10 July—The team is now in Morocco and gets several new contacts from that country on 144 and 432 MHz. But the most interesting QSO is the contact with IØHOC/IT9 on 1296: two hours of conversation with steady signals of S9+40 dB, full scale! Nicola then tries FM: S9+40 again!

Too many bureaucratic difficulties in Morocco, so IØSNY and his friends leave for Perugia, the nice, historical, small city where he lives, in central Italy.

Boys, let's see what he will do next summer!

ing modes: Frequencies: HF, VHF, UHF, microwaves above 3 GHz. Modes: SSB, CW, mixed, RTTY.

To obtain the award, the amateurs/SWLs must work/hear Italian islands to obtain the following score: DX—10 points; EU—20 points; Italy—40 points.

Contacts are valid starting from January 1, 1970.

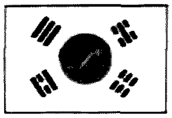
Points must be calculated following the list (see box). Different islands of the same archipelago can be contacted, and the points achieved added up. The same island of the same archipelago can be worked on different bands and modes, i.e., five different contacts with the same island but on five different bands count 5 × points assigned to that island.

Honor Roll—This endorsement is achieved with a minimum of 60 points.

5BIIA—To obtain this award, 10 contacts must be made with islands or groups of islands on 5 HF bands.

The IIA must be requested from the ARI Award Manager, Via Scarlatti 31, 20124 Milano, Italy. It is not necessary to send QSL cards; a list log-formed is sufficient. The QSL cards must be in the possession of the applicant and should be sent if requested by the Award Manager.

Fee: Any application must be sent with US $8.00 or 30 IRCs.



KOREA

J. Michael Wengert HL9KT
c/o ABC News
CPO Box 2961
Seoul
Korea

Amateur radio operators in Korea were surprised recently to receive letters from the "Korean Radio Operators Association," a group of professional radio operators, requesting them to mail fees to the organization and to make their stations available for inspection. Apparently, the Korean Ministry of Communications (MOC), which is responsible for issuance of all commercial and amateur radio licenses and for inspection of all classes of radio transmitting stations, has decided that the annual inspection required for all amateur stations for license renewal will be conducted by the professional organization and not by KARL (Korean Amateur Radio League). KARL had all but announced that they would soon be taking over inspection of amateur stations from the MOC. The reason for turning over the inspection responsibility to an outside organization was given as the "excessive workload" imposed by the growing number of new ham stations in Korea.

This decision from the MOC was yet another blow to KARL, which already was smarting from suspicion and criticism from its members following a procurement scandal. Early this year, a general-affairs director of KARL was relieved of his official duties when it was learned that his position was used to gain exclusive import rights for Japanese-made transceivers for a certain Korean import company whose president was a close friend of the KARL president, National Assemblyman Lee Min Sup. Lee was not directly implicated in the matter, but the incident has yet to be resolved to the satisfaction of KARL members as Lee repeatedly overruled attempts by individual members to bring up the matter for discussion at the KARL annual meeting last April.

Other matters for which KARL is under attack by its members include high fees charged for membership compared to that of other countries. Membership in the League is compulsory for all amateur radio operators in Korea and annual dues must be paid up in advance (US$30) before the KARL president's seal may be applied to applications for annual renewal of the station licenses. The annual inspection fee comes to another $22 (average). This, coupled with high customs duty and local taxes, makes amateur radio in Korea a pastime for rich people.

Attempts by KARL to get mobile/portable operation reinstated have failed. A League source, who prefers to remain anonymous, blames Korea's security agencies for blocking the approval.

Although the total number of amateurs in Korea is on the increase, the number of active hams, especially on the HF bands, is not increasing proportionately. Korea has a Radiotelephone Class license (no-code Novice) which permits phone operation on 80, 40, 15, and 10 meters plus VHF and is relatively easy to get. As a result, many Koreans soon lose interest, sell their rigs, and buy microcomputers, a phenomenon observed in neighboring Japan which also has a box-top, no-code license.

HL9 operation by United Nations Command-affiliated personnel continues, but attempts to get on the new Phase III bird are thwarted by the unavailability of 430 MHz. More on the HL9s and the American Radio Club in Korea next month. 73 from the Land of the Morning Calm.

What is a developing country—in amateur radio?

This question is under consideration by a committee of the Region I Division Conference of The International Amateur Radio Union. When this question has been decided, they will study a proposal "To establish a means of funding, and guidelines for effective operation for the Promotion of Amateur Radio in the Developing Countries."

Here is another quote: ". . . for example, in Liberia there are 67 licensed amateurs of which 26 are members of the Liberian Radio Amateur Association (LRAA). Of the 67, only 10 are indigenous Liberians."

Here in Monrovia, we have just finished a course in amateur radio. Out of a hundred and twenty students who registered for the course, twenty-six came in to sit for the examination. Of these, four passed the General test and four passed the Novice test.

We are a developing country. There is no lack of interest, and the data given above is enough evidence of that. The data given above might also be an indication of the handicaps under which we and the students must work. It takes a lot of courage for a high school student or an adult to study amateur radio without a textbook or a code oscillator.

We are very much encouraged by the fact that the Region I Conference is aware of our problems and is actively engaged in an effort to solve them. They propose to set up a resource center that will make available all kinds of instructional materials. They will stock printed materials that are either donated or that are obtainable free of charge and will appropriate an ongoing fund to purchase instructional materials and to pay shipping charges. They are even exploring the possibility of providing instructors if they are not otherwise available.

This is an ambitious idea but it can work, and if it is handled in the manner in which amateurs traditionally handle their undertakings, it will indeed do what it is supposed to do. It will succeed.

One can only guess what is happening in other developing countries, but here in Liberia there is real promise of progress. We have, at the present time, five places, all of them school locations run by missionaries, where there is one (in some cases more) dedicated person ready to conduct classes in amateur radio even under existing conditions. If we can apply to the Region I committee, or to anyone else for that matter, for essential teaching materials, it would increase very much the effectiveness of our work.

MEXICO'S NATIONAL EMERGENCY NETWORK

One of the many activities that has been developed over the years here in Mexico, as in many countries, is the cooperation among many ham radio operators during catastrophes, natural disasters, and airplane accidents, as well as work on problems with mobiles (auto and maritime). In 1943, a communications net known by the name of The Emergency Chain of Ham Radio Operators of the Southeast was established in order to provide auxiliary services along the coast of the Gulf of Mexico, principally in the State of Veracruz. It was formally accepted in 1949 due to the aid of many national hams.

Later on, in 1960, a group of ham operators who were members of the Mexican Radio Experimenters League undertook the labor of forming a nationwide emergency network that would also be tied in with emergency networks in other countries. Frequencies were then established (see box for current frequencies being used). This National Emergency Network was fully organized finally by 1963. One of today's most leading authorities or representatives of the network is Pablo A. Mooser XE1SR who serves as president of the Mexican Radio Experimenters League at the present.

Organizational Structure

In order for this National Emergency Network to function well, it is obvious that an administrative staff is very necessary (see box). This is composed of its director and six additional positions in order to coordinate things fully. Under this administrative staff, the country is divided into eight different regions or zones, each with its own Regional Coordinator. Within each region or zone there are various states, each with its own State Coordinator. These coordinators have in mind the development of special programs for members of the net so as to be able to function efficiently under most emergency situations. (This is very similar to emergency networks in other countries.) The structure may be of use to some of you who plan on organizing an emergency network in your own country where ham activities are starting to boom.

Certificates Available from the Network

Mexico's National Emergency Network

encourages new membership and more cooperation by means of authorizing three different certificates yearly. This is done by calculating individual attendance figures during each year. First, one has to be a member of the net. This organized transmission takes place daily at 2100 GMT on 3.690 MHz and on the 2nd and 4th Sundays of each month at 1000 GMT on 7.060 MHz. (The frequency chart shows frequencies to use when disaster strikes; they are used frequently for get-togethers.)

1) The first certificate is available for having attended 50 sessions with the net during the year (once a week).

2) The second certificate is available for having attended 150 times during the year (three times a week).

3) The third and last certificate is available for having been on frequency and reported your call 300 times during one year (six times a week).

The National Emergency Network can and has already presented different members with special certificates upon having participated in and resulting in outstanding performances during emergencies, catastrophes, or in special situations requiring aid.

You are possibly asking yourself: "How can I be a member?"

Membership

In order to become a member, you must have attended at least 24 sessions of the net during a year (at least once every two weeks). This certificate is valid for one year and is renewable upon attending another 24 sessions as mentioned above.

As was mentioned, many activities are planned by the National Emergency Net each year, and here I could mention that the different radio clubs throughout the country work in harmony with the net and also plan special events such as DXpeditions and other activities for the advancement of ham technology.

Special Note to Regional and State Coordinators in Mexico

Upon planning your future activities, I would appreciate it very much if you would send me an outline of such events and other pertinent information that may be of interest to *73* readers! Gracias!

The Netherlands

FIFTEENTH DNAT

From the 26th to the 28th of August of this year, the DNAT was held. The DNAT means Deutsch-Niederlandische Amateurfunktage (the German-Dutch Amateur Radio Days).

These days are organized by two Dutch amateur radio unions and one German, namely the VERON, the VRZA, and the DARC.

This annual Dutch-German meeting was held this year for the 15th time, in the beautiful city of Bad Bentheim, which is located near Almelo (The Netherlands), just a few kilometers over the Dutch border in Germany. Every year the Dutch and German hams and their families come from miles around to meet one another in Bentheim.

This year also the DNAT was a great success and hundreds of hams were present. Also yours truly was there with his YL to see what was on the program this year.

The flea market at Bad Bentheim.

My first pleasure was to fill up the tank of my car with much cheaper German gas. The difference is about thirty cents a liter! My second pleasure was to find a good camping spot near Bentheim. The thought of taking a hotel during these days you can forget, because all the hotels are fully booked. Anyway, I was glad that I took my tent along because we had extremely high temperatures for our kind of climate and for this time of the year.

We arrived at Bentheim on Friday evening, and because I was a bit tired of my work and I have to drive from the west side of my country to the east side, we had a few drinks and went to sleep.

The next morning my YL, friends, and I checked in at the DNAT office, located in the DARC (German Amateur Radio Club) building. We paid our registration fee and received badges with the DNAT sign. By paying the fee, entrance to all activities was free. We even had free entrance to the Bentheimer Casino and we could visit the Amateur Radio Museum. We also drove out of town and went to the castle of Bentheim. Afterwards we had a look at the flea market; you never know what bargains might be found.

So we took a very close look at all the stands. The place was so crowded that I and my friends kept in contact via our HTs—otherwise we would have lost each other. Since we all came in one car, the thought of losing one other was not a pleasant idea!

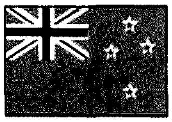
There was much to see, from pieces of junk to complete HF lines with reasonable pricetags. I bought some spare tubes for some receivers; the price of one tube was one mark. What can you buy for one mark these days?

After the flea market full of "sonderangebot," as the Germans call it, we had a look in the large school building where a number of German dealers had their stands. All the big names in ham equipment were present, and often these dealers had special DNAT prices. We bought some antenna stuff.

In the evening we went to a large hamfest in the garden of the castle of Bentheim, where we could dance to the music of a combo. On Sunday morning we packed up our things and went home again. It all was a great success, and I promised myself and my YL that we'll be there again next year.

NEW RULE

A new rule in Dutch amateur radio license conditions requires that all hams make a complete inventory of all the transmitters they own. This list has to be in the station's logbook and must include serial numbers, date of selling or purchase, type of equipment, power output, and name and address from whom the rig was bought and to whom the rig was sold. So, in the future, all Dutch hams will need an accountant to keep papers in order. (Hi).



NEW ZEALAND

Des Chapman ZL2VR
459 Kennedy Road
Napier
New Zealand

This month I shall explain about the birth of the Amateur Radio Emergency Corps of the New Zealand Association of Radio Transmitters.

THE 1931 EARTHQUAKE

"There can be, at this time, no more topical or important subject than the calamitous earthquake that has almost razed to the ground the towns of Napier and Hastings. The day of February 3rd, 1931, will remain for long a day of grief and consternation for the country as a whole, even as for years the date '79 A.D.' was significant for the annihilation of the cities of Herculaneum and Pompeii by Vesuvius."

So went the editorial from *Break-In* for the month of February, 1931. It goes on to extol the feats of two local Hawkes Bay amateur radio enthusiasts from Napier and Hastings who were able to transmit messages to the outside world of the tragedy of that day. ZL2GE (George Tyler) and ZL2BE (Jim Mills) provided the only communications links with places outside the earthquake-affected area in those early few hours after the first shocks at 10:50 that morning.

There were some other radio stations on board ships in the harbor which were able to call for help, too, but the amateur stations were operating from the centers of the two stricken cities. Both stations were battery operated and had contact with other amateur stations. Early in the emergency, the New Zealand Post and Telegraph Department requisitioned the amateur stations at Napier and Hastings as well as an amateur station in Wellington so that there were communications links available for emergency traffic in the first 24 hours after the calamity and until the telegraph and telephone lines were repaired and normal communications were restored.

THE RADIO EMERGENCY CORPS

That very briefly indicates the happenings of the 1931 February day when the earthquake struck. As a direct result of the success of the earthquake amateur radio communications network, the New Zealand Association of Radio Transmitters formed the Radio Emergency Corps in March, 1932.

Previously, about 1930, as a result of suggestions at a Headquarters meeting, a form of communications network was set up under the name of the Guard System and introduced in March, 1931. Guard stations were rostered two nights each week to operate a traffic net between HQ and the Branches of NZART. Rosters were published in *Break-In* and the NZART *Journal*, and the Guard System operated from 6:30 pm to 10:00 pm, Monday to Friday, and 6:00 pm to 11:00 pm, Saturday and Sunday.

It was intended that in times of an emergency, all Guard Stations would stand by for the Control Guard Station in the District affected by the emergency and handle any traffic as required. This Guard System gave the members practice in handling messages on the air and established a link between HQ and the Branches. The system was most successful, and many messages were transmitted and received every week on a scheduled basis. However, in due course, the New Zealand Post and Telegraph Department, the regulatory body in New Zealand, decided this message service was contrary to the radio regulations governing the amateur service here (no third-party traffic allowed), so NZART discontinued the Guard System.

About the same time as the Guard System was being formulated, a Christchurch group of amateurs under Norm Laugeson ZL3AS assisted by Hugh Simpson ZL3CF, Jack Elliott ZL3CC, and Les Hurrell ZL3BG had set up a group in that area able to go into action in an emergency at short notice should the necessity arise. But because the Christchurch group was part of the Radio Society of Christchurch and the Third District Transmitters Association, the two clubs catering to the local budding radio enthusiasts of the 30s, they were not part of the NZART message-handling system, although most of the group were members of the NZART. The Third District RTA in due course merged with the NZART to form the Christchurch Branch.

With the termination of the Guard System, Norm Laugeson, then a Vice-President of NZART, put forward a proposal to HQ for an emergency radio communications scheme, and in February, 1932, the proposal was adopted by the Executive of NZART, and amateur stations were asked to form themselves into local Sections of the Radio Emergency Corps, each self-contained but affiliated to the national body of emergency stations at Headquarters. Thus, the Radio Emergency Corps was formed.

The response from amateurs throughout the country was tremendous. A constitution was produced, and by March, 1932, nine Sections had been formed and a National REC Field Day was held to test the emergency network; 27 amateur stations and approximately 50 operators participated in that first successful Field Day.

The Field Day organization consisted of at least three stations, a Guard Relay Station (Base Station today), a Zone Station (Field Headquarters today), and an Outpost Station (or stations)—the same title today. Stations were to organize and ex-

change messages during the exercise, up and down the network. The Guard Relay Stations handled the messages between each District and distributed the messages for their own District to the Zone Stations, which retransmitted them to the Outpost Stations. Zone and Outpost Stations were operated at a portable location, on battery power.

The pace of the organization of the Radio Emergency Corps continued to quicken, and in June, 1932, negotiations were completed with the New Zealand Post and Telegraph Department for the allocation of special callsigns and wavelengths for the Emergency Service to use during practices and emergencies. As this step had finally cemented the setting up of the REC of NZART, Headquarters, through an editorial in *Break-In*, paid tribute to the untiring efforts of Norn Laugeson ZL3AS and Wally Ashbridge ZL2GP of Wellington, in formulating and founding the REC. Headquarters expressed the gratitude of all ZL amateur operators and the community at large for all the work these two men, and others closely associated with them, had done to set up an organization that was to become well known in the future.

Wally Ashbridge, a professional communications man in the New Zealand Army and the officer in charge of the Guard System, was appointed the first Commanding Officer of the REC. The collaboration between Wally Ashbridge and Norm Laugeson, professionally a detective in the NZ Police, is obvious today when one observes that there is very little difference between the basic organization of the present day emergency network systems and that which they formulated over 50 years ago. Truly a great tribute to the organizational abilities of these two men and their assistants.

The honor of the first operation went to the Christchurch group which went into action in January, 1932, in response to a request from Wally Ashbridge to provide some radio communications for search parties at an alpine tragedy in the Southern Alps. They made ready a group of four Christchurch amateurs, complete with transmitters, receivers, and suitable rations for one week in the field, within one hour of the request being received. They were to set up a communications net between the search parties in the Alps and the Telegraph office at Bealy, the headquarters for the search, some 15 miles distant. Although the missing trampers' bodies were found before the team was able to set up the communications net, it ably demonstrated the way REC was going to work in emergencies.

In July, 1932, the new REC held another Field Day with the newly allotted callsigns and wavelengths. In all, 11 Sections operated with the "E" calls very similar to those we use today, but only two-letter ones for obvious reasons. The present three-letter callsigns were introduced in the early 50s. At this 1932 Field Day, the frequencies used were between 100 and 105 meters, and these were found to be useful but not successful in some areas. The Field Day was a great success, and Wally Ashbridge declared that all Sections were fit to operate on emergency duties any time the need should arise. All Sections agreed that the exercise had been a successful one, but some felt that a frequency change could improve the communications between some of the Basic Stations.

By February, 1933, a new constitution and organization plan was approved by Headquarters and duly circulated to all members. The 1933 format and organization is still basically the same as given in our modernized AREC Manual in use today.

Over the years, the AREC has participated in many searches and rescues, severe floodings on both North and South Islands, air crashes, earthquakes, land subsidances, and marine searches. The Amateur Radio Emergency Corps of today is still the same as our founders intended—to provide emergency communications during times of national calamity or tragedy, and to provide readily organized mobile transmitting and receiving stations, equipment, and operators to function at short notice should they be required—except that the equipment we use today has changed drastically from that used in former times.

Today, when Search and Rescue Headquarters requires it, we are able to put teams into operation with portable and base stations to assist with all manner of emergency and rescue operations, whether it be in the city, the bush, mountainous terrain, or at sea.

In contrast with the 1932 Field Day statistics mentioned previously, and 51 years later, the 1983 Field Day statistics were: 59 Sections operated 266 Field Day stations, manned by 491 operators, on 80, 40, and 2 meters, and sent and received over 12,000 messages during the 6-hour period of the exercise.

AWARDS

Last month I made mention of a special award to commemorate the 100th birthday of Hastings City. Here are details.

The City of Hastings Centennial Award is open to all amateurs worldwide on all bands and all modes, the period of the award will be from 0001 hours GMT, February 1, 1984, until 2400 hours GMT, February 29, 1984 (*one month only*). Applicants for the award must complete two-way contacts with Hastings stations or members of the Hastings Branch number 13 of NZART as follows: overseas stations—3 contacts, any band, any mode; ZL stations—5 contacts, any band, any mode.

No QSL cards are required; just send a detailed list of the contacts, verified by another amateur operator, to the Awards Manager, PO Box 609, Hastings, New Zealand, with US$2.00 or IRC equivalent, to receive the handsome colored certificate.

Hastings is a city of about 50,000 population situated in the province of Hawkes Bay on the east coast of New Zealand's North Island. The area is favored with a good climate and is surrounded by some of the most fertile land in the country. Hastings is the center of a great and expanding food- and meat-processing industry and one of the most prolific fruit- and grape-growing districts in New Zealand; it justly earns the name, "The Fruit Bowl of New Zealand."

Hastings was constituted a town district in 1833, and in 1886 achieved borough status. The earthquake of 1931, followed by raging fires, caused great loss of life and reduced the town to ruins. The manner in which the city was rebuilt is a tribute to the citizens of that day. In 1956, the borough was proclaimed a city. The motto on the City Arms signifies the harmony between city and countryside.

So to all certificate hunters and readers of *73*, best of luck with this special award. Remember, it is available only for contacts during the month of February, 1984.

By my calculations, this column should be appearing in the January issue of *73*, so I take this opportunity of wishing all readers belated Christmas greetings and the very best of luck for the coming year. For those of you in the northern hemisphere, you are in the depth of your winter season at this festive time while we, down under, are enjoying mid-summer temperatures and our summer holidays, as well as the festive season.

In New Zealand, most large manufacturing businesses curtail their operations at Christmas time, closing from about December 23rd until around January 15th, except for maintenance staff, so we here all have our summer holidays at that time. The schools close for their summer vacation about December 15th and do not resume until February 1st, the equivalent of the US/Canadian July/August school holiday closing.

I hope everyone had a Happy Christmas and a joyous New Year and that Father Christmas brought you something worthwhile for the shack this year!

PAPUA NEW GUINEA

Siegi Freymadl P29NSF
PO Box 165
Rabaul
Papua New Guinea

Lae is the capital of the Morobe Province, one of the twenty provinces of Papua New Guinea. The Morobe Province is located in the northeastern part of New Guinea. Lae, the administrative center of the province and also the industrial metropolis of the entire country, is situated on the Huon Gulf. It is the gateway to the Markham Valley. The population of Lae is approximately 65,000. In Lae we have the country's foremost technological institution, the Papua New Guinea University of Technology, commonly known as Unitech.

The amateur population of Lae is seven, four of whom are on the staff of Unitech (three in the Electrical Engineering Department). P29BR, P29LC, P29MC, and P29NL are Unitech staff. Husband and wife team P29JH and P29NWJ, John and Betty, are with the P and T Training College and are active from Lae. George P29NCB makes up the seventh member of Lae's amateur population; all are expatriates.

Unitech attracts students from all provinces of Papua New Guinea—indeed, from a number of South Pacific countries. What better forum for promoting and advertising amateur radio and thus increasing the number of PNG nationals who are amateurs? In November, 1982, P29BR, P29LC, P29MC, and P29NL put their heads together and decided to offer radio amateur classes to interested students. To publicize amateur radio, a lunch-time demonstration was organized with P29BR bringing his rig along and demonstrating it. The exercise also was written up in the campus newspaper, the *Reporter*. The response was tremendous, and more than 100 students enrolled for amateur radio classes. Thus the Unitech Amateur Radio Club (UARC) was formed and it has the callsign P29HT. The club is affiliated with the Papua New Guinea Amateur Radio Society.

P29BR, P29LC, P29MC, and P29NL give freely of their spare time and provide three hours of tuition per week in CW, theory, and regulations. Practical projects, such as building Morse-code oscillators, are included. P29BR records CW tapes for the weekly classes and on one occasion he decided to take the prepared tapes home. The following morning Bill discovered that his house had been burgled during the night but that the only things missing were the plastic bag containing the tapes, a pair of jeans, and a packet of cheese. A very selective thief, and one who will be bewildered by the strange sounds on the tapes!

The turnover of young hopefuls in the amateur radio classes is large; not many have the staying power, but generally 20 students attend and it is hoped that a number of those will attempt the Novice examinations the next time they are given.

Last year, Bill P29BR went on a visit to the United States and while there approached the ARRL regarding the possibility of donations of equipment and/or publications to help the students at the Unitech Amateur Radio Club; the oral response was positive. Bill also visited the Asia Foundation, and the Area Director for the Pacific Islands there offered assistance with postage expenses for sending material. An official reply was subsequently received from the ARRL which expresses unwillingness to deal directly with the Unitech Amateur Radio Club and appeared willing to have donations handled only through the Papua New Guinea Amateur Radio Society. There can be no questioning the ability of the staff and their supervision at the Unitech Amateur Radio Club. There also cannot be any doubt that future PNG amateurs are more likely to come from Unitech than anywhere else in the country. Why then this reluctance on the part of the ARRL to deal with UARC directly?

It is hoped that several of the students will be successful in the next Novice exams and that a number of PNG nationals will be on the air after that. Another consideration is the application fee which has to be paid six weeks prior to the exam. In the event of any students finding the fee beyond their means, the UARC is willing to come to the rescue out of club funds. We wish the UARC every success in their undertaking!

On July 14, 1983, the Post and Telecommunication Corporation in PNG sent out letters to all amateur radio station licensees introducing the new frequencies available as from that date. Full-call operators have the authorization to operate on all the new frequency bands. Limited amateur radio stations are permitted to operate on all new frequency bands above 30 MHz, and for Novice amateur radio stations there is no change in operating frequencies.

POLISH ETHER CARRIES SOUND AGAIN

On January 1, 1983, martial law in Poland was suspended. Polish hams expected to begin their usual activity. But no gain without pain. Renewing licenses was faced with official difficulties, and the commencement of reissuing them did not take place in January as it had been announced.

At the beginning of 1983, letters of application—printed forms submitted by petitioners to District Verification Boards—were still being brought up to date. At the end of January, 1250 applications were confirmed, and on April 1 over 1700. The Presidium of PRAA (Polish Radio Amateurs Association) was informed that

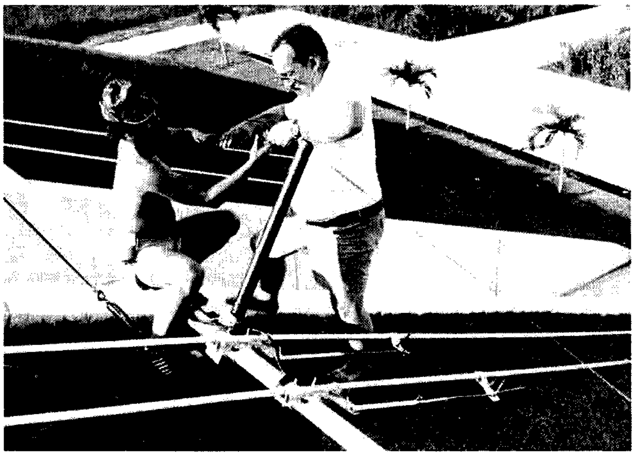
licenses of club radio stations would be handed over to them in April and those of individual radio stations at the turn of the second and third quarters of this year. Better late than never.

Negotiations with authorities brought changes of these provisions. For the sake of the annual international competition, the SP DX Contest, it was promised that licenses would be delivered in March, 1983. And really, 460 individual and 70 club licenses were given. Well, it's a long lane that has no turning. Poles are in the ether again.

A problem is how well this process will continue. At the sixth PRAA director's meeting last April, the president of the association urged patience and calm but encouraged hams to continue to press for more action, through regular channels. He predicted that radio amateur activity would reach a normal level in a few months.

The president has also expressed regret at the new limitations placed on Polish hams and for the State Radio Surveillance.

It was hoped that by the end of 1983, the action of bringing licenses up to date would have been completed. How many Polish hams will be able to use their calls in 1984 when the National Congress of PRAA takes place, nobody knows. But some of them are presently in the ether, so enter upon a conversation with them!



Jean HS1ANV/ON8JA (left) and Hans HS1BG secure the supporting truss on the 20/15-meter (full-size) beam. Note the gamma match, using aluminum piping, plastic hose, and an inner core of copper tubing for the driven elements.

SVALBARD EXPEDITION

A Swedish group of four made a second expedition in the summer of 1983 to the Svalbard Islands in the Arctic Ocean. The group members do this entirely of personal interest on their own vacation time. Two members of the group were ham operators, Kjell SM2AZH and Sigvard SM2EJE.

The purpose of this expedition was to study the flora and fossils. Svalbard has an interesting history and has a geological structure of scientific importance. From the ham-radio point of view, the first trip in 1982 was no success. The radio equipment got damaged by water during transportation between islands in high winds.

The islands of Svalbard (prefix JW) belong to Norway. They are about 1,100 kilometers (700 miles) from the North Pole. The summer temperature reaches refrigerator level. The islands have no permanent residents, but boats stop there when the harbors are free of ice. Svalbard has been the base for many Arctic expeditions. The Norwegians began mining coal there in the 1890s.

Kjell and Sigvard were active from Svalbard using their home calls /JW between July 20 and August 4, 1983. In case you were lucky enough to work them, use their *Callbook* addresses for the QSL.

The equipment for the expedition was sent in advance on a ship for coal transportation. The group itself flew out of Tromsoe (Norway) to their base in Longyearbyen on Svalbard. The radio equipment consisted of a Kenwood TS-120V, the low-power version of this well-known transceiver, and a Heathkit HW-8 for backup. For power, they used two batteries rated at 60 Ah which they charged by a gasoline generator. The antennas for 7 and 14 MHz were verticals, and a dipole was used for 3.5 MHz.

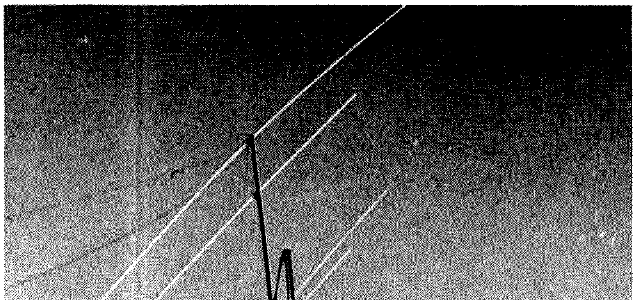
The propagation that far north is very poor on the low bands during the summer season. This is due to two months of daylight and sunshine 24 hours a day. They managed to contact northern Norway and northern Sweden on 40 meters, however, although 20 meters was the best band. A few good openings towards the US and South America stirred up some pileups. Anyway, hamming was not the main purpose for this expedition, so the QSO rate was low. Because of the frequent change of location and transport between islands in a rubber boat, operating time was limited. But wherever hams go and for whatever reason, they surely bring ham radio with them. Kjell and Sigvard and the two other members of this expedition must have had a unique vacation to remember!

NRAU MEETING IN STOCKHOLM

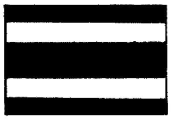
The Nordic Radio Amateur Union was formed in 1935 with the purpose of working for common Nordic interests for the radio amateurs. Through the NRAU there is a valuable dialogue between the leagues in the Nordic countries. Meetings are held annually. The next one is taking place in Stockholm on January 14-15, 1984. The NRAU runs a very low-budget operation, and to make it possible for representatives from distant Iceland (TF) and Faroe Islands (OY) to attend, the other larger leagues try to sponsor them.

Contributions from the Nordic Council, an organization founded in 1952 by the Nordic parliaments for improvement for Nordic cooperation, have been applied for. Unfortunately, no financial support has been received in previous years. Let us hope that they are more obliging this time.

One major subject for discussion at the NRAU meeting is the common Nordic license. This has been worked on for years, but still only regular reciprocal rules apply. Crossing borders between Nordic countries does not require a passport, and you have to be observant even to see the customs house, but still do not even bring the 2-meter hand-held over the border unless you have a valid guest license. Hopefully, this situation will be solved eventually so that it will be as easy to operate from different Nordic countries as it is between the USA and Canada.



The antenna is nearly ready for the HS0HS Seanet-contest operation.



THAILAND

Tony Waltham HS1AMH
c/o Bangkok Post
U Chuliang Building
Bangkok 10500
Thailand

Most countries have their national radio society, and in Thailand the "magic" acronym is RAST, standing for the Radio Amateur Society of Thailand, which has been representing amateur radio activity in Thailand since its founding in November, 1963.

In addition to holding regular club meetings on the first Sunday of each month, to which all visiting radio amateurs are heartily welcomed, it has organized many other activities and has represented Thailand in the field of amateur radio on numerous occasions.

Highlights have been the Southeast Asia Network conventions in 1977 and again last year. Also, club representatives have endeavored to attend every major international conference on amateur radio, such as the World Administrative Radio Conference held in Geneva, IARU regional meetings such as the Manila conference in April, 1982, and the World Communications Year conference in Tokyo in September, and the World Amateur Radio International Conference.

Club meetings regularly vote on routine IARU motions, and full international representation is maintained through the club secretary. The address for all correspondence (as well as for the QSL bureau) is PO Box 2008, GPO, Bangkok 10501, Thailand.

A most encouraging aspect of amateur radio in Thailand has been the recent upsurge in interest among Thais in the hobby and its related aspects. Up until 1971, which coincided with the American presence in Vietnam, the society regulated membership to a maximum of 50. This was largely so that it could be in a posi-

tion to control the activities of what was at that time a hobby mostly pursued by American servicemen based temporarily in Thailand. But with the gradual withdrawal of American forces, the complexion of the club began to change. More Thais joined, and now the society has about 600 registered members, of which 90 percent are Thai—a far cry from the late 1960s when the hobby had caught the imagination of few Thais.

This upsurge can be attributed to several factors, not the least being enthusiasm shown by the Post and Telegraph Department and personally by the department's director-general, Police Major-General Suchart P. Sakhol, who addressed one very-well-attended RAST meeting in 1981.

It would also be appropriate to credit the society's former president, the late Brigadier-General Kamchai Chotikul HS1WR, for his lifelong dedication to the hobby. He also did much to popularize amateur radio and to increase club membership. All club members, as well as his many friends in amateur radio circles, were deeply saddened at his death in June, 1982.

The society has, of course, continued on its course of promoting the hobby and doing its best to popularize amateur radio and its self-educational aspect in this era of rapid technological advances, especially in the field of communications. As an example of this, the club has embarked on a course of teaching computer applications in amateur radio, since the integration of microcomputing and amateur radio is inevitable and they are compatible.

The society also has conducted other educational courses, including Morse code, and especially in teaching the electronic principles and operating procedures required for the Thai equivalent of a Technician's license for two-meter operation.

The Thai PTT has shown great enthusiasm for amateur radio, especially in the light of constraints relating to national security apparently imposed from outside the Communications Ministry. The department has also shown cooperation in authorizing special-event stations on the HF amateur bands for such occasions as major contests and for the Southeast Asia Network Convention in November, 1982.

RAST was thus able to operate an HF station for the Seanet contest in August this year as well as to take part in the All Asia DX Contest (CW section) that same month. Arrangements also were made for the CQ WW phone and CW contests in October and November.

In operating these contests, the club was most grateful to the Asian Institute of Technology on the outskirts of Bangkok which has endorsed our applications to operate on campus and which kindly offered the use of its premises for these club events. In this way, experienced amateur radio operators have been able to demonstrate several aspects of the hobby to those without firsthand experience.

For example, for both contests, club members constructed their own full-sized yagi beam antennas for the 10-, 15,- and 20-meter bands using entirely locally-available aluminum piping and other hardware. The antennas were up and in the air and getting 5 and 9 plus reports all within the space of two afternoons of work by a team of five hams: HS1AHT, who supervised the project, and HS1ALP, HS1BG, HS1ANV, and HS1AMH (yours truly).

The club also issues a much-coveted award, the Siam Award. This is granted to amateur radio stations and SWLs who have submitted evidence (endorsed log extracts) of contacts with Thai amateur radio stations in at least six of the nine call areas as well as the HSØ prefix which signifies a special-event operation. Alternatively, evidence of contacts with 10 different HS stations also qualifies for the award. Applicants should enclose US$5.00 or the equivalent in IRCs to cover the return postage of the award.

The situation regarding operating on HF on a routine basis has not changed since my September, 1983, column, but those who are looking for Zone 26 or Thailand on 10, 15, 20, 40, or 80 meters should listen for a pileup for the call HSØHS, the special-event station, during a major contest.

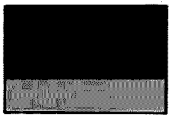
Qualified for license Class	Test for technical knowledge	Test for operating knowledge	Test on regulations	Morse Code send and receive (wpm)
B	75	65	65	12
A	65	65	65	6
C	50	65	65	N/A
Upgrade from A to B	75	–	–	12
Upgrade from C to A	65	–	–	6
Upgrade from C to B	75	–	–	12

Table 1. Percent-correct and wpm scores needed to qualify for licenses, by class and subjects.

Class	Number	PC of Total	PC Increase 1982-1983
B	26,944	56.1	5.1
C	20,254	42.2	1.6(!)
A	822	1.7	37.0
Total	48,020		4.0

Note: The A license has been in existence for only 2 years, and the major reason for the low increase in class C licenses has been due to license holders upgrading to higher license classes. Also note a bad sign: The *total* increase of 4 percent was down over the previous year's increase of 6.6 percent.

Table 2. Distribution of total number of licenses, by class, and percent increases.



WEST GERMANY

Mitchell B. Wolfson DJØQN
Furtweg 18d
D-8044 Lohhof
Federal Republic of Germany

With the hullabaloo concerning the FCC proposal for a code-free license, I felt that it would be appropriate to illustrate how such a license has been approached here in Germany. Before going into the code-free license specifically, let's get a general overview into the German licensing structure first.

There are only three license classes in Germany, A, B, and C. The B license is your all-purpose ticket, giving you full privileges on all bands with a maximum peak power of 750 Watts on 80 meters through 1.2 GHz, and with reduced power on 160 meters, the WARC bands, and the UHF bands 2.3 GHz and above.

The A license is similar to the present Technician-class license in the States, with full VHF/UHF privileges, and with CW from 3520-3600 and 21090-21150, plus full 10-meter phone privileges. Maximum peak power is 150 Watts for bands up to 1.2 GHz. This class of license can be recognized by callsigns beginning with DH.

The third class of license is the class C, the code-free license. This class of license carries all VHF/UHF privileges from 2 meters and up, with a maximum peak power of 75 Watts.

As for the exam itself, the biggest surprise is that there is actually only one exam for all three license classes! The difference between the three license classes lies in the score received on the exam, combined with the code speed tested. It is quite possible for an applicant for a class C license to pass the exam with a score qualifying him for a B license, with only the CW exam lacking. Judging by the number of technically-inclined individuals with class C licenses, I would assume that this situation occurs quite often.

Table 1 illustrates the four parts of the German amateur-radio examination along with the score (in percent) needed to qualify the applicant for a specific license class. Note that the class C license requires the applicant to score only 50 percent on the technical portion, which certainly makes this license class relatively easy to obtain.

Now come the big questions: What is the split between the three license classes and what is the impact of the class C license?

As of January 1, 1983, there were 48,020 licensed amateurs in the Federal Republic of Germany. The split and increase over January 1, 1982, is shown in Table 2.

Now for a bit of editorializing: I have to admit that I accepted the concept of a code-free license with trepidation. Having operated in the USA for nine years before moving to Germany six years ago, I could not bring myself to accept that the class C operators were anything more than a bunch of lids.

Having now had time to let it sink in, plus having been active in club activities, I have come to think otherwise. When I look around at my fellow club members, I see that a number of truly invaluable people are class C holders. There's the club newsletter editor, the member teaching a Basic course, others interested in building equipment for the club station, etc. Many of the other members are ex-C licensees, such as our club president and the one before him. In looking outside our little group, I also see class C licensees active in repeater groups, writing technical articles for amateur magazines, etc.

When you go up to one of the present or previous class C license holders and ask specifically if they would have bothered to have learned CW to get their licenses, the answer could be a "yes," or "no," or a "maybe," but in general they feel that it would have been an unnecessary hindrance. It really is too difficult to speculate on this point, but I'd hate to think about losing many invaluable fellow amateurs just due to the Morse code.

As for the lids on 2 meters with a California-size amateur population with very few repeaters to operate on, the incidence of turkeys is amazingly low when put into perspective. Remembering what it was like in California makes me appreciate the true professionalism many German class C holders exhibit.

Will it work in the States? In my opinion, only you can make it work. If you will accept a code-free licensee as one of your own and try to understand that he or she may be able to contribute to your club in some way, you will find that the Morse code does not really make one a better person. Quite the contrary, many of the young people now interested in computers or electronics would make great amateurs. Do you really want to have to force them all to learn the code? In Germany, we don't and it works!

DEALER DIRECTORY

Culver City CA

Jun's Electronics, 3919 Sepulveda Blvd., Culver City CA 90230, 390-8003. Trades 463-1886 San Diego, 827-5732 (Reno NV)

Fontana CA

Complete lines ICOM, DenTron, Ten-Tec, Mirage, Cubic, Lunar, over 4000 electronic products for hobbyist, technician, experimenter. Also CB radio, landmobile **Fontana Electronics, 8628 Sierra Ave., Fontana CA 92335, 822-7710.**

San Jose CA

Bay area's newest amateur radio store. New & used amateur radio sales & service. We feature Kenwood, ICOM, Azden, Yaesu, Ten-Tec, Santec & many more **Shaver Radio, Inc., 1378 So. Bascom Ave., San Jose CA 95128, 998-1103.**

New Castle DE

Factory Authorized Dealer! Yaesu, ICOM, Ten-Tec, KDK, Azden, AEA, Kantronics, Santec. Full line of accessories. No sales tax in Delaware. One mile off I-95. **Delaware Amateur Supply, 71 Meadow Road, New Castle DE 19720, 328-7728.**

Bloomington IL

Rohn Towers—Wholesale direct to users. 23% to 34% discount from dealer price. All products available. Write or call for price list. Also we are wholesale distributors for Antenna Specialists, Regency, and Hy-Gain. **Hill Radio, 2503 G.E. Road, PO Box 1405, Bloomington IL 61701-0887, 663-2141.**

Boise ID

Rocky Mountain area's newest ham dealer. Call RJM first for AEA, Azden, KDK, Ten-Tec, Butternut, Cushcraft, and more! **RJM Electronics, 4204 Overland, Boise ID 83705, 343-4018.**

Preston ID

Ross WB7BYZ has the largest stock of amateur gear in the Intermountain West and the best prices. Call me for all your ham needs. **Ross Distributing, 78 So. State, Preston ID 83263, 852-0830.**

Littleton MA

The reliable ham store serving NE. Full line of ICOM & Kenwood. Yaesu HTs, Drake, Daiwa, B&W accessories. Curtis & Trac keyers. Larsen, Hustler, Telex Hy-Gain products. Mirage amps., Astron P.S., Alpha Delta protectors, ARRL & Kantronics instruction aids. Whistler radar detectors. Full line of coax fittings. **TEL—COM Electronic Communications, 675 Great Rd. (Rt. 119), Littleton MA 01460, 486-3400/3040.**

Ann Arbor MI

See us for products like Ten-Tec, R. L. Drake, Dentron and many more. Open Monday through Saturday, 0830 to 1730. WB8VGR, WB8UXO, WD8OKN, and W8RP behind the counter. **Purchase Radio Supply, 327 E. Hoover Ave., Ann Arbor MI 48104, 668-8696.**

Livonia MI

Complete photovoltaic systems. Amateur radio, repeater, satellite, and computer applications! Call Paul WD8AHO. **Encon Photovoltaics, 27600 Schoolcraft Road, Livonia MI 48150, 523-1850.**

Hudson NH

Look!—hams, SWLs, and experimenters: parts, books, gear, antennas, towers. Call for quotes. **Polcari's ELECTRONICS CENTER, 61 Lowell Road (Route 3A), Hudson NH 03051, 883-5005.**

Albany, New York UPSTATE NEW YORK

Kenwood, ICOM, Ten-Tec, Belden, Cushcraft, Larsen, Hustler, ARRL, Hy-Gain, B&W, MFJ, Mirage. New and used equipment. Serving the amateur community since 1942. **Adirondack Electronics, Inc., 1991 Central Avenue, Albany NY 12205, 456-0203** (one mile west of Northway exit 2W)

Columbus OH

The biggest and best ham store in the Midwest featuring Kenwood and other quality products with working displays. We sell only the best. Authorized Kenwood service. **Universal Amateur Radio, Inc., 1280 Aida Dr., Reynoldsburg (Columbus) OH 43068, 966-4267.**

Stigler OK

TI99/4-4A Basic, Extended Basic, Assembly Language Programs. CW Transceive, CW Practice, DX, 1010, WAS, SSTV, Hamkid's Programs. **AC5D Computer Programs, Box 368, Stigler OK 74462, 967-2034.**

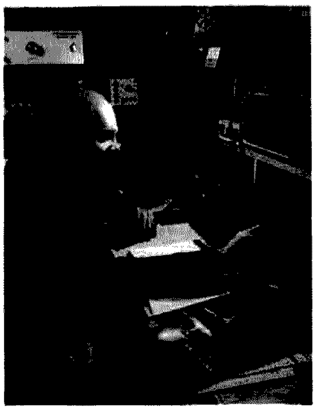
NEVER SAY DIE

editorial by Wayne Green



EGO

Yes, when you write to Wayne Green, I get your letters. Usually I answer, too, much to the surprise of a lot of hams. There is some sort of weird concept that because someone is rich and famous, he is no longer reachable.

Ha! There's that Wayne Green ego again—rich and famous, indeed! Well, golly, I *am* rich in some ways—and though I've worked a lot harder than most people to get this way, many begrudge it. I've been writing for how many years now telling you how to get rich? I wrote a booklet on the subject twenty years ago. And fame? Well, I'm well known in a couple of esoteric circles, if that qualifies. Wayne Green is not yet a household term.

Several letters of interest arrived in the last few days. One chap advised me that he was canceling his subscription because my ego is too big and three thanked me for egging them on to become entrepreneurs and making them rich. Well, I don't know what to do about my ego except ask you to live with it and enjoy it the way I do. Without my ego prodding me, I'm not sure where a lot of things would be.

It's a funny thing about "rich." Sure, I have millions to spend just about any way I want, so what am I doing with all of that loot? Well, for the most part, I am using it to help people with ideas bring them to fruit and to make some of my own ideas work. A plane? Nope, I tried that almost 30 years ago, back in '57, and got it out of my system. A big house, right? Tried that in '69 and didn't like it. No, I have a small room over my office which is all I need for the few hours I waste sleeping each day. I've been putting in hundred-hour weeks for years and enjoying it.

A few weeks ago, I attended an evening class in the art of conversation here in Peterborough. Each of us was asked to explain why we'd come to the class. My rationalization was that I really didn't know how to cope with cocktail parties. What in the hell can one possibly talk about when meeting someone for the first time in a noisy room where the meeting will be for only a few minutes? As I explained, I realized that I had exactly outlined one of the big problems with amateur radio—we meet new people under noisy conditions and are expected to provide some entertainment.

I was assured by everyone else in the class that my prob-

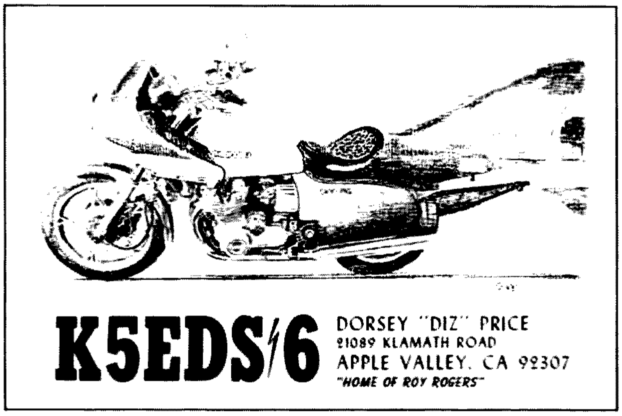
HELP WANTED

73 is currently seeking a TECHNICAL/INTERNATIONAL EDITOR. The position requires excellent written and oral communications skills, as well as a General-class or higher ticket. Experience with microcomputers would be a help. Responsibilities include participating in manuscript review, organizing and implementing special projects, and supervising our staff of foreign correspondents.

We offer a competitive salary and benefits package and excellent, informal working conditions. As you may know, Peterborough is located 75 miles from Boston in the beautiful Monadnock region of New Hampshire—a state with no sales or income tax.

Of course, we are an equal opportunity employer. If you are a non-smoker interested in this position, please forward your resume and salary requirements to: Jack Burnett, Executive Editor, *73: Amateur Radio's Technical Journal*, Peterborough NH 03458.



QSL OF THE MONTH

We don't know what a "Sky-Pig" is, either, but it sure makes you take a look at Diz Price's card.

To enter your QSL, put it in an envelope along with your choice of a book from *73*'s Radio Bookshop and mail it to *73*, Pine Street, Peterborough NH 03458, Attn: QSL of the Month. Entries not in envelopes or without a book choice will not be accepted.

Niceville FL 32578

This Antenna Is Too Good To Be True

It's cheap. It works well on all bands. And it radiates a super signal.

Completed antenna mounted in tree.

Would you like to have an antenna that is capable of working all the HF bands, or any combination of the HF bands including the new WARC bands, with excellent results, at a fraction of the cost of any of the commercially-available multi-band antennas now on the market? Would you also like to have an antenna with an extremely low noise factor? I'm about to describe an antenna that is just what you've been looking for.

This antenna is a combination of the old reliable Zepp with the addition of a balanced, shielded feeder system which has been described in various articles in past years.

This antenna has been in use at this QTH as well as other locations for over two years and has yielded many fine DX contacts and many good reports stateside.

To determine the comparable merit of this antenna, I erected separate dipoles cut for the center of each band and fed with a single coaxial cable. Then I connected all antennas so they could be switched rapidly to determine the comparable signal strength of each as compared to the Zepp antenna.

In addition to the favorable signal strength comparisons, I also found that the noise level on the Zepp antenna was as much as 5 S-units lower than the noise on the cut-to-frequency dipole with single coax feed. I noticed this particularly on

Desired Bands of Operation	Length of Each Side of Antenna From Center to Each End
160–10 meters	108 feet
80–10 meters	54 feet
40–10 meters	27 feet
30–10 meters	18.7 feet
20–10 meters	13.5 feet
17–10 meters	10.4 feet
15–10 meters	9 feet
12–10 meters	7.8 feet

Table 1.

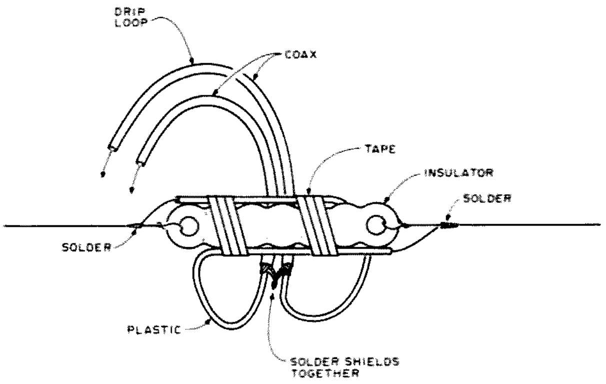

Fig 1. Method of supporting coax cables.

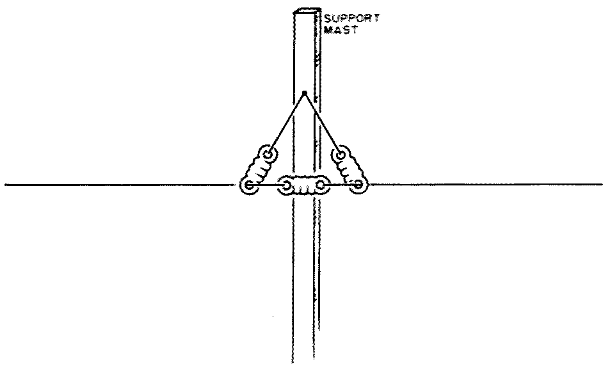

Fig. 2. Method of supporting antenna at center.

the model of this antenna which was erected inside the attic of the house in close proximity to the ac wiring of the building, where the noise level dropped from an S-7 on the regular dipole to an S-2 on the Zepp antenna.

To erect this antenna, you simply figure the length of each side of the flat-top from the center to one end by using the figures shown in Table 1.

This antenna can be cut for operation an any combination of the HF ham bands, including the WARC bands which have not yet been released. For example, if your space is limited, you could put an antenna in the attic of the house, as I did at one location where I had an attic length of only about 30 feet, by figuring the antenna for operation on the bands from 30 through 10 meters, resulting in a length each side of center of 18.67 feet. Then I ran the wire in a Z configuration through the attic to compress it into the available space.

I have used various configurations on this antenna, such as the halo and the inverted vee, and all give good results. If you can get the wire running in a fairly straight line, though, your radiation pattern will be more predictable.

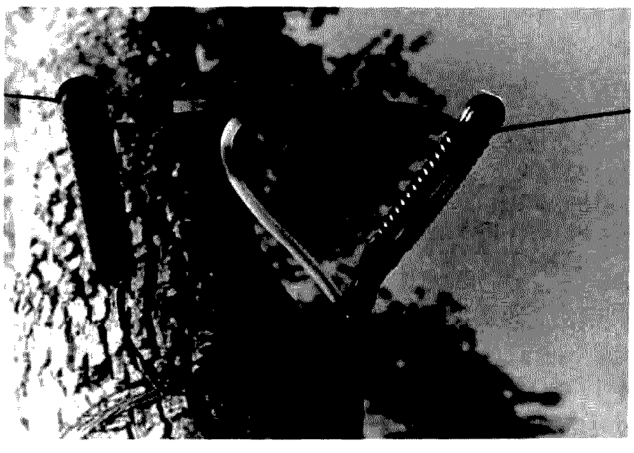
The flat-top portion is designed so that it is non-resonant on all bands of operation, thereby avoiding any extremely high or extremely low impedance points at the feedpoint. It is designed to be resonant between the one-quarter, half, three-quarter, and full-wave points on each band, thereby presenting an impedance to the antenna tuner which is well within range of the tuner on each band and will not cause any loading problems. An antenna tuner is required which has a built-in balun or you must use a 4-to-1 balun at the bottom end of the line if you don't have one built in the tuner itself.

The feedline is made of two runs of RG-8/U cable for powers up to 2 kW PEP, or for low-power operation under 100 Watts output, RG-58/U cable may be used. The lower loss of the larger cable is to be desired, however, even if low power is used.

At the top end of the feedline, you connect the shields of the two coax cables together but *do not* connect them to anything else. Then at the bottom end of the line, the shields are tied together and connected to the ground connection in the shack and to the frame of the tuner.

The inner conductors of the coax cables are tied to each leg of the antenna wire at the top of the line, and at the bottom end of the line they are connected to each of the balanced-output terminals of the antenna tuner.

The feedline can be run anywhere—underground, through metal or vinyl conduit, or in the open. The advantage of this arrangement, however, is that unlike the old open-wire feedline previously used on Zepp antennas, it does not have to be kept clear of surrounding objects and is not affected by anything it lies against.



Center support and coaxial connections.

There is only one precaution that must be observed, and that is to cut both runs of the cable exactly the same length. They do not have to be run together, however, as the shield on the cables provides exact electrical separation of the inner conductors even if the two cables are widely separated.

As to the length of the feedline, I found that best results were observed with line lengths of a little more than one-quarter wavelength at the lowest frequency of operation (or anything longer than that). Try to avoid making the feedline resonant at any particular frequency you are operating on, particularly the quarter-wave points, or you may have a bit of trouble tuning on this band. Optimum length seemed to be about 55 feet for 80-through-10-meter operation.

As for the mechanical construction, it is a good idea to use a long insulator, the same type used on the ends of the antenna, at the center of the antenna. Then slip the end of another insulator of the same type over the wire on either side of the center insulator, coming off at right angles to the wire and tying the support wire to these two side insulators so that equal pull is achieved on either side of the center insulator. Then

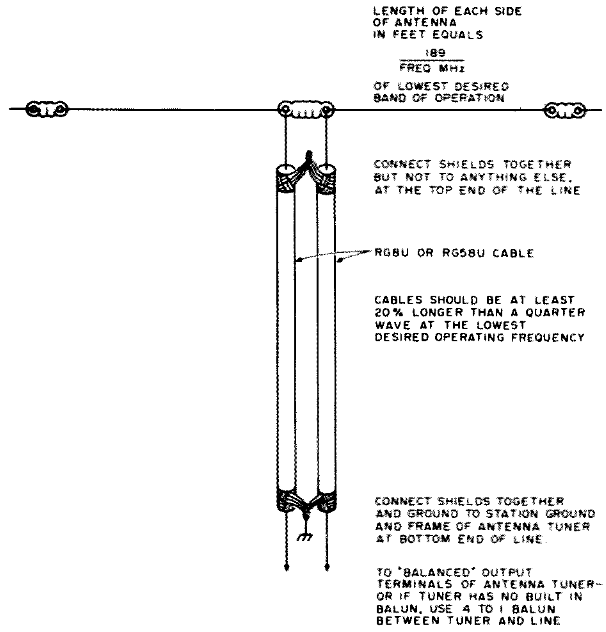


Fig. 3. Allband trapless antenna for HF.

at the point where you need to support the two coax cables, just strip off about 2 feet of the braid, leaving the plastic inner insulation, and bend this part along the center insulator on each side and tape securely to the insulator. This will make a very solid support for the coax cables and will prevent wind damage.

It is also a good idea to bring the coax up the support mast a little higher than the antenna wire and bend it over in a loop and down about a foot or so to prevent the water from leaking into and running down the inside of the shield on the cables.

To separate the braid from the inner conductor on the coax, strip the outside plastic covering off about two feet from the end, then take the end of the shield and push it down, compressing it so that it becomes larger in diameter. Then take an awl or the tip of a small screwdriver and carefully spread the strands of the braid apart, opening up a hole in one side of the braid. At this point, bend the coax in a U shape and pull the plastic insulated center conductor out through the hole in the side of the braid, U-end first. This will eliminate the need for making a solder connection directly next to the plastic where it might create a weak spot.

I have used this antenna in various situations cut for all different combinations of bands and have had excellent results with all of them. I have also made up a portable version of this antenna using stranded insulated wire such as zip-cord and RG-58/U cables which I use in conjunction with a small antenna tuner for operation on 20 through 10 meters. This one is only 13.5 feet long either side of center with two runs of coax 20 feet long. It is ideal for stringing up in a motel room or apartment by supporting it with nylon fishing line. Just keep the antenna out a foot or so from the wall and support it by anything you can find to tie it to. Try it. You'll like it! ■

Construct the Minuteman Timer

As faithful as a grandfather clock, this timer tells when to ID—and when not to.

Gary L. Fait KA8QBQ
302 E. Lexington St.
Davison MI 48423

"But why do you need another ID timer?" my wife asked when she saw me trying to sneak yet another Radio Shack bag to the workbench.

The question was no surprise because my very first electronics project had been an ID timer described in one of the ham magazines. It had worked perfectly, and I remembered well how I had shown it to her and carefully explained why I had added a single LED to the circuit for a visual signal.

The answer to her question, however, was that this timer is even better but it is still simple. Using a seven-segment LED, the timer steps off the minutes beginning with zero.

Many ID timers provide only an audio and/or visual signal when eight or nine minutes have passed. Using this type of timer, the radio operator never knows how much time has elapsed until the signal sounds. I found myself identifying too often because I was never sure when the 10-minute mark would come.

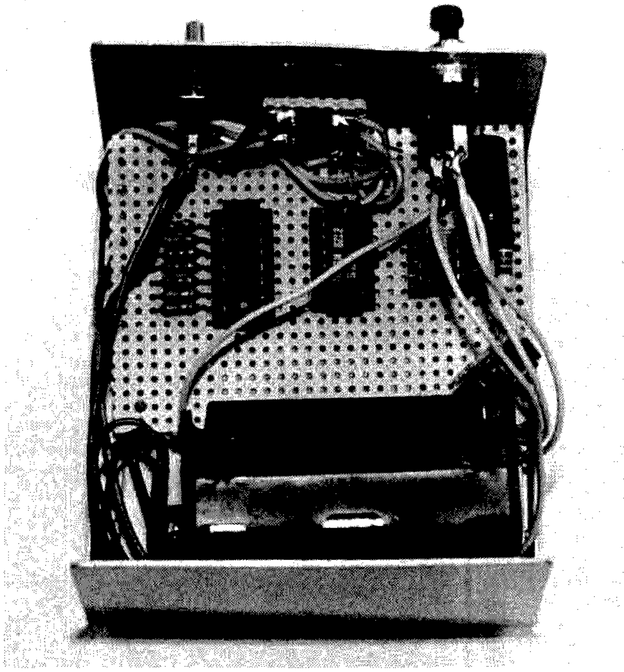

Photo A. Interior view of the timer.

Photo B. Front panel and cabinet for the ID timer.

To solve the problem, I began with a basic timing circuit using three ICs plus the seven-segment LED. I added two push-button switches, one to restart the timer after identifying and one to reset the numeral on the LED.

The 555 timer is controlled by R1, a 1-meg pot. The circuit can be set to time anything from seconds to hours. In this case, obviously, it is adjusted to provide one timing pulse per minute.

Opening S2, a normally-closed momentary-contact switch, causes the resetting pins on the 7490 to go high. This resets the LED to the numeral nine. S3, a normally-open momentary-contact switch, is then closed. This shorts R1, causing the 555 to pulse, beginning a new timing period and by the way causing the LED to pulse to zero.

After turning on the timer, operation is as simple as one-two. Simply push S2, then S3, to begin at zero. If you identify before the 10 minutes have completely elasped, simply give it the one-two again and the timer is back to zero and counting a full minute.

All parts for the LED ID timer are readily available from Radio Shack. Many parts are probably in any well-stocked junk box, but even if purchased new, the timer will cost less than $10. It can be housed in any suitable enclosure. I used a small, steel-topped cabinet because I wanted to impress my wife, but the extra expense of the cabinet is not necessary.

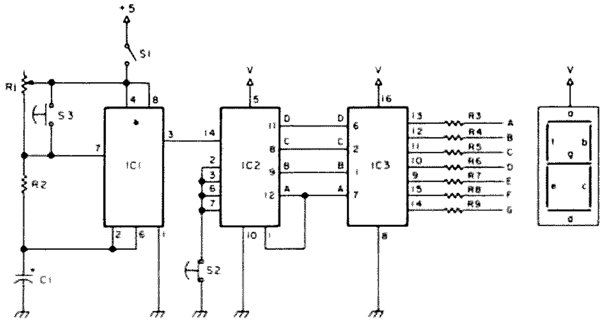

Fig. 1. The LED ID timer schematic.

Parts List

C1	100 uF
IC1	555 timer
IC2	7490
IC3	7447
R1	1 megohm pot
R2	1k
R3-R9	330 Ohm
S1	SPST toggle
S2	normally-closed momentary
S3	normally-open momentary
LED	7-segment common anode

The circuit is extremely simple and is an ideal project for the beginner, but one note of caution is in order. I suggest the use of IC sockets for mounting the three ICs and the LED, instead of soldering them directly to the circuit board. The entire project can be assembled before the ICs are installed, reducing the risk of damaging them in the process. The sockets also allow easy replacement for troubleshooting.

My LED ID timer now sits beside my rig, faithfully ticking off the minutes and saving a lot of unnecessary callsign transmissions. Now, if I could just get my wife to stop borrowing the thing to time her daily exercises. . . ■

The Secret of Remote Control

Inside those miniature planes lie some sophisticated circuits.

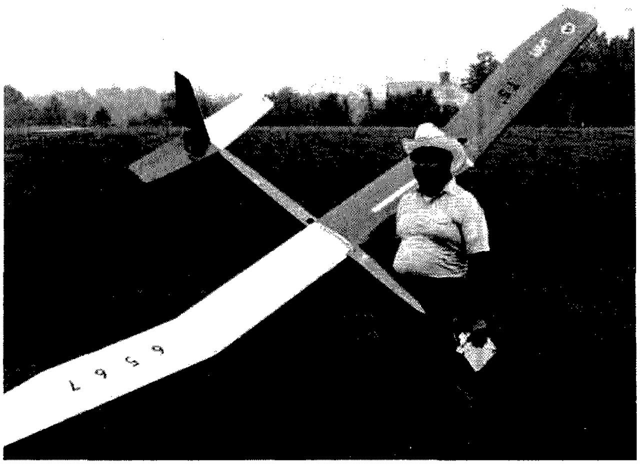
The Field House falls quiet as the pilot winds up the rubber-band motor of his scale model of the Porterfield Collegiate. The plane, which is made of lightweight balsa and covered with tissue paper, is held against the pull of the motor by a helper. Then, with the controls checked, the pilot gently tosses the plane toward the far end of the basketball court and steers the plane as it climbs. The pilot guides the Porterfield around the ceiling lights and basketball backboards until the motor winds down and the plane lands on the floor.

The pilot, a member of the State College, Pennsylvania, Radio Control Club, is an amateur who reworked his Heathkit® radio to reduce its size and weight to fit inside the small Porterfield. By removing the receiver case and using hearing-aid batteries and special small servos, he was able to make a flying machine small enough to fly well inside the confines of an indoor basketball court.

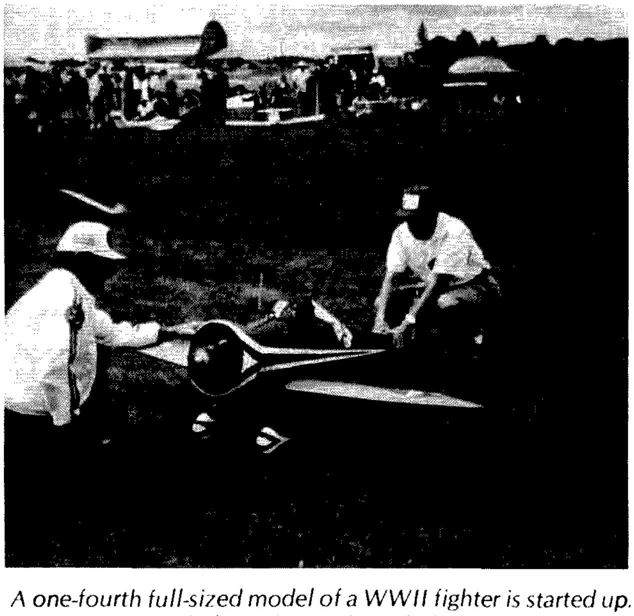
At the other end of the spectrum is the PennFli, an original design of a radio control (R/C) pilot from Indiana, Pennsylvania. The aircraft has a fourteen-foot wingspan and weighs over five pounds. In the warm air of summer, this plane can climb to heights of more than a quarter mile and fly over an hour without landing. It uses warm air up-drafts to stay aloft without a motor and its flight time is limited by the size of the batteries on board.

The Porterfield and the PennFli, for all their differences in size and weight, share a common guidance-system principle. It's called serial digital data transmission and it links the pilot's hands to the steering controls of the aircraft he's flying.

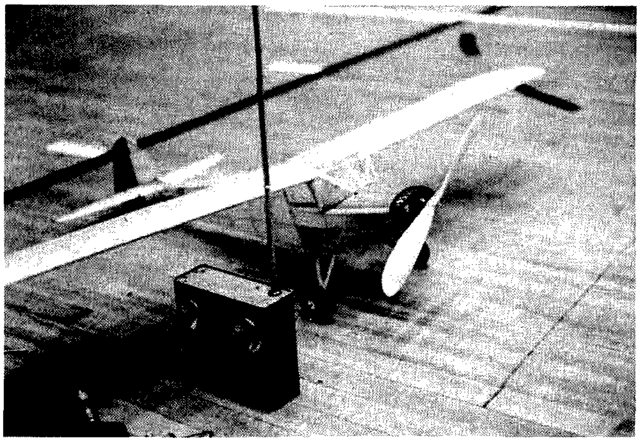
In Fig. 1, the scope trace shows that a timing or clock pulse initializes the sequence by turning on the decoder chain in the aircraft receiver. The next pulse in the series is a data pulse of between one and two milliseconds duration, the width of which is controlled by a joystick on the transmitter. The length of the pulse determines what position the servo arm will take. A pushrod connected between the arm and a control surface, in this case the rudder, links the servo to its workload. The receiver detects the transmitter's signal, decodes the serial data, and routes the proper pulse to each servo. In the servo, the pulse is compared to another from the onboard circuits, a function of where the servo arm is positioned. The error dif-



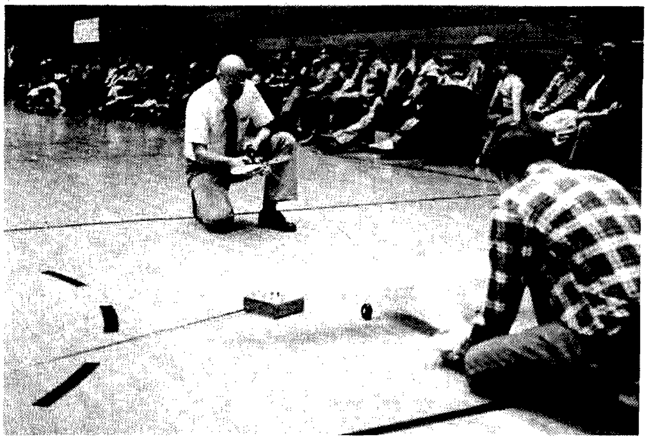
The PennFli, an unlimited class sailplane of fourteen-foot wingspan, weighs about five pounds. Made of balsa and plywood, the plane is covered with a plastic film which shrinks and sticks to the wood when heated with a common clothes iron. Controls are rudder, elevator, spoiler (airbrakes), and releasable tow hook.



A one-fourth full-sized model of a WWII fighter is started up. Constructed of balsa, plywood, and thin aluminum and covered with fabric, the plane uses a chain-saw engine and two-cycle mix fuel for power. A four-channel R/C rig controls ailerons, rudder, elevator, and engine speed.



The tiny Porterfield at rest. The model is made from a $5.00 free-flight kit of thin balsa strips covered with lightweight tissue paper and lightly sprayed with model paint.



A one-inch-per-foot scale model of a Porterfield Collegiate is powered up. A small hand drill and hook are used to wind up the large rubber band to full power.

ference of the two pulses is translated into action through a small dc motor similar to those used as automatic film-winders in cameras. Through a gear train, the motor moves the output arm and also a variable resistor which sets the length of the onboard pulse. When the error ratio of the two pulses is zero, the servo output arm and control surface to which it is connected are in the position called for by the pilot and transmitter. The pulse rate is fast enough so that the net effect is smooth movement of the controls and realistic maneuvering of the plane.

Were all this taking place on the ground where conditions were constant, R/C control would be a fairly simple system. By installing half the control system in an aircraft which at launch is mere inches from the transmitter, then flying the plane so high and far that it looks like a dot in the sky, using simply a length of hookup wire for an antenna, a very special receiver is needed to maintain constant control. As the radio is amplitude-modulated, static or other electrical noise could blank or change the length of one or more data pulses causing steering problems and possibly a crash. A 500-milliwatt rf signal from the transmitter is hot enough to provide solid contact out to over a mile depending on the altitude of the aircraft. The receiver is usually triple-tuned at its antenna circuit for adjacent channel rejection while a double-stage agc circuit holds the signal from the single-conversion i-f strip constant no matter how much rf is picked up by the antenna.

All this is performed by a receiver board about the size of a pack of book matches. The decoder board is the same small size and is wired to take power and audio signal output from the receiver. The long clock pulse sets the time sequence for the decoder and helps it to disregard stray noise which does not occur in the proper or expected time frame. The clock also tells the decoder which of the following data pulses are to be routed to the individual servos. The clock does not leave the decoder board while all the following data pulses are fed to their respective servos.

Most systems today are powered by nickel-cadmium rechargeable batteries in both the transmitter and the airborne unit. Airborne battery voltage is normally 4.8 volts from four 500-mAh AA-size batteries wired in series. The transmitter uses 9.6 volts from eight batteries of the same size and rating as the airborne pack. For aircraft which are ¼-size scale models of full-size planes and have six or eight controls under R/C command, D-cell-size nicad batteries are needed to handle the high net current draw. The added weight of the big pack is also helpful in balancing the model for stable flight.

While most R/C systems are factory built, Heathkit and Ace R/C, Inc., both offer full lines of radios in kit form. As mentioned earlier, the small size and high parts density of the receiver and servos make the building

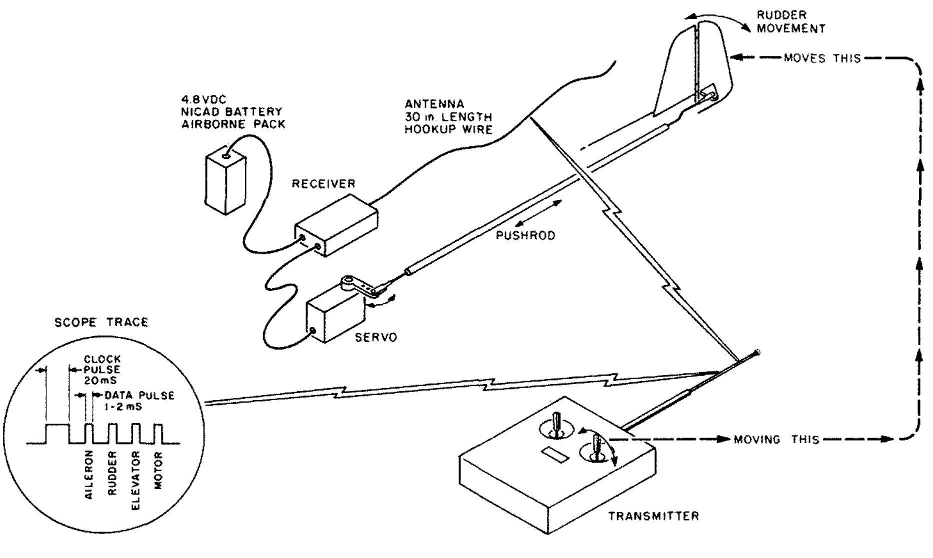


Fig. 1.

task somewhat more critical than wiring an HW-101. While it does call for some high-grade construction skills, most any amateur with some bench time will have no trouble assembling kits from either of these vendors. Both offer operating frequencies in the six-meter band where few interfering signals exist and where there is no crowding, as up in the 72-MHz CB band. While there is no mode restriction for R/C in the amateur bands, only Kraft Systems, Inc., offers an FM-type R/C rig; it is only available factory built. In high rf noise applications such as R/C model helicopters, an FM radio with its higher immunity to static would be a good choice. In most other types of models, the AM type of modulation is very reliable.

Equally as important as the system's electrical specifications is its ability to take physical punishment and be reliable. Whether the aircraft has a large or small engine, each will vibrate the R/C to some degree. If components on the receiver or servo circuit boards aren't mounted close to the board and well soldered, vibration will get them sooner or later. Even gliders, which have no engine, are battered in the landing zone as they have only thin rubber skids on the bottom of the fuselage. The quality of workmanship is very important in R/C rig construction, since almost any circuit failure would cause the plane to crash.

Once an R/C system is built, it can be modified to "fly" many different types of models. Miniature replicas of ocean-going sailboats can be raced in a pond or swimming pool using specially waterproofed gear. Even submarines which have the ability to submerge are available as R/C model kits. The hottest Formula and Indy-type race cars are built from kits and raced using two-channel radios and either electric motors or glow-type model engines. New military tank models have come out which will climb obstacles, go forward, reverse, go left and right, and swing the turret cannon. Helicopters fly in scale fashion in competition by carrying cargo or flying in formation or firing small solid-fuel rockets at targets.

By far the most popular are the scale models of World War II military aircraft. With the reliable radios available today, anyone can pilot the model of his favorite plane and enjoy the thrill of flying the old war birds.

Adapting the radio system to function in any of these models will allow the amateur to use the same rig in several models. In some cases, extra receivers and servos are built for installation in models and operated from a common transmitter so that two or more planes can be flown without having to field-change radios from one model to another.

Since there are few of us who can afford to own a Mustang fighter or a B-29 Superfort, a model of these planes is more practical. From biplanes to the space shuttle, R/C radios allow us to build and fly the most exotic flying machines safely and reliably. Imagination is the only limiting factor in choosing which model to operate, and amateur skills at the workbench make the radios as inexpensive as they are reliable. ■

Calculate Your FT-101

Here's how to treat your trusty FT-101 to a truly automatic digital display and get a frequency counter in the same box—at the flick of a switch.

D. N. Ellis VK8DE
57 Memorial Avenue
Alice Springs, N.T. 5750
Australia

The FT-101 series of HF transceivers has been one of the most popular in amateur radio history. One lingering criticism of the models through the "E" series, however, was the lack of a true calculating digital display. While Yaesu did offer the YO-601 digital display, it counted only the vfo and required operator adjustment for correct frequency display with any band or mode changes.

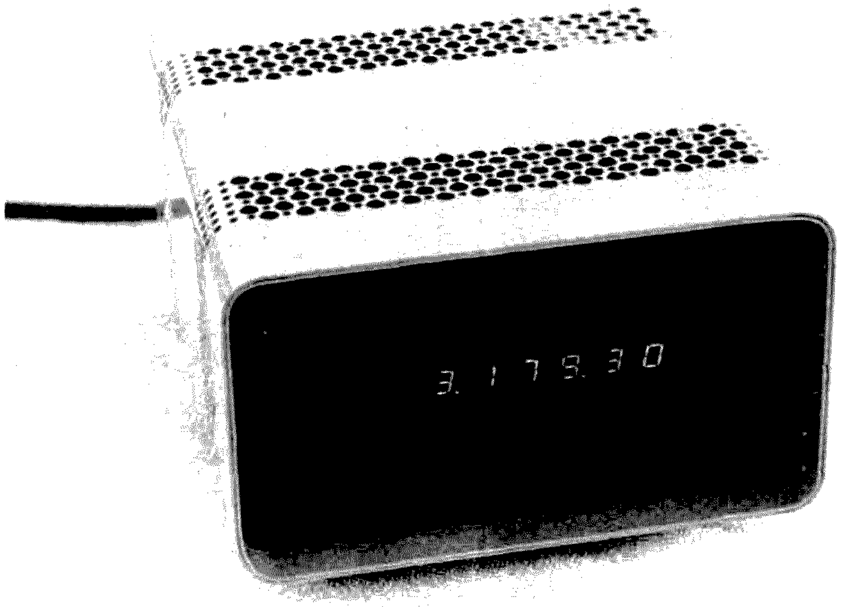

Photo A. Front view. Note that many ventilation holes were drilled oversize for more effective convection cooling of the internally-mounted LM323K voltage regulator and heat sink (photo by R. Campbell).

The "VK8DE Calculating FT-101 Display" is a "hands-off" calculating counter giving true zero-beat frequency readout on all modes and bands. It is inexpensive and straightforward to build and requires only a simple passive interface to the FT-101. It can also serve as a 50-MHz bench frequency counter, and also sports a switchable calibration output signal. The implementation used is LSTTL (Low-power Schottky), available worldwide at low cost. An accurate, automatic digital display is a necessity on the crowded bands, and this project is a convenient and economical upgrade for FT-101 owners.

The counter performs the following frequency calculation formula according to the FT-101 oscillator mixing scheme: F = bfo + LO − vfo, where F = the displayed frequency, bfo = mode-switched Beat Frequency Oscillator (LSB, USB, and

CW/AM), LO = bandswitched Local Oscillator (1 crystal per band), and vfo = dial-tuned Variable Frequency Oscillator.

General Description

Reference to the block diagram of Fig. 1 will be helpful for a general description. The three oscillator signals are routed from the FT-101 external vfo octal socket (J13) on three previously unused pins through coax to the display box.

Isolation amplifiers buffer the signals and then perform a TTL level conversion for the digital processing. A crystal-referenced oscillator feeding a decade divider chain provides necessary timing for the control section. The control section directs up-down counters to follow the frequency determination formula and finally to store and display the information in 7-LED numerical displays. The FAST/SLOW switch offers the operator a choice between 80- or 800-ms-display updates with 100- and 10-Hz resolution, respectively.

The FT-101/external switch allows the unit to function as a normal frequency counter using the LO jack as the input source. The bfo-detect circuit is used to provide a preset substitute value in the absence of bfo signal, such as in AM receive mode. This feature also gives zero-beat CW frequency when the FT-101 mode switch is moved from CW to AM. The "normal" CW presentation is offset low by 800 Hz if tuned properly, which happens to be the difference between the FT-101's USB oscillator of 3.1785 MHz (used in CW receive) and the CW/AM oscillator of 3.1793 MHz (used in CW/AM transmit). A regulated +5-volt source supplies the necessary power for the counter, displays, and isolation amplifiers.

Circuit Details

References to the timing diagram (Fig. 2), and the four sections of the schematic (Figs. 3, 4, 5, and 6) will be made in this section. Fig. 3 shows the raw analog bfo, LO, and vfo cables routed to the BNC jacks J1, 2, and 3, respectively. With the exception of a single input resistor change in the bfo isolation amplifier, the three buffer-converters are identical. One description will, therefore, serve for the three circuits.

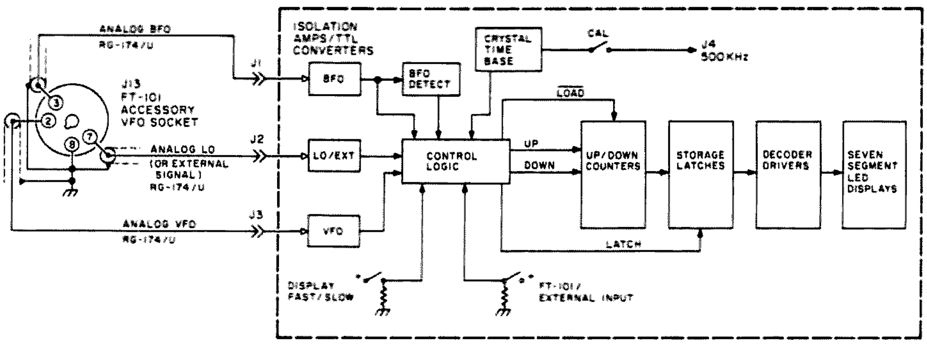

Fig. 1. Block diagram.

Because of the JFET input and the 1-megohm bias resistors, each of these amplifier's input impedance is essentially the value of the input resistor. For high sensitivity it is 1000 Ohms for the LO and vfo, and 10,000 Ohms for the bfo. These impedances do not appreciably load the oscillator signals with 1-meter connecting lengths of RG-174/U coax from the FT-101.

The JFET then feeds an NPN driver which emitter-couples via a large value capacitor to a linearly-biased 74LS04. The IC wired in this manner, as a dc-coupled multistaged amplifier, produces a TTL level (HIGH $\geqslant$ 2.7 V, LOW < .8 V) pulse output from the sinusoidal input. This cheap but utilitarian dc 50-MHz analog-to-TTL amplifier has been used so often by so many that it must nearly be "public domain."

Fig. 4 shows the bfo, LO, and vfo TTL signals as inputs to the timing and control section. In order to guarantee the successful use of low-cost LSTTL, the signals are each prescaled (divided) by a factor of 2. This forces the maximum LO input of 35.52 MHz (used in the 29.5–30-MHz band of the FT-101) to a value of 17.76 MHz after passing through U8, a 74S74 flip-flop.

The guaranteed specification of 30 MHz for a 74LS74 flip-flop, or for that matter, the 74LS192 up/down counters, is thereby never tested. The penalty for prescaling by two is a corresponding extension of the counting time by the same factor.

The control-section activity is directed by a four-state counter made up of U18, a 74LS74. Besides creating a specific counting interval for the bfo, LO, and vfo, the state counter provides a fourth interval to display the resultant frequency calculation and then prepare the machine for another cycle. The timing diagram of Fig. 2 shows the succession of these states and the ensuing events. The state names of 00, 10, 11, and 01 are derived from the successive logical conditions of U18 pins 5 and 9, called Q_A and Q_B. The 1-MHz crystal oscillator of U6 is divided down to provide a continuous stream of state clock pulses as shown in Fig. 2.

Three state clock pulses cause the machine to count up the bfo, count up the LO, and count down the vfo, or add, add, and subtract, in accordance with the F=bfo +LO−vfo equation. The fourth state, called 01, causes a LATCH command to store the frequency value

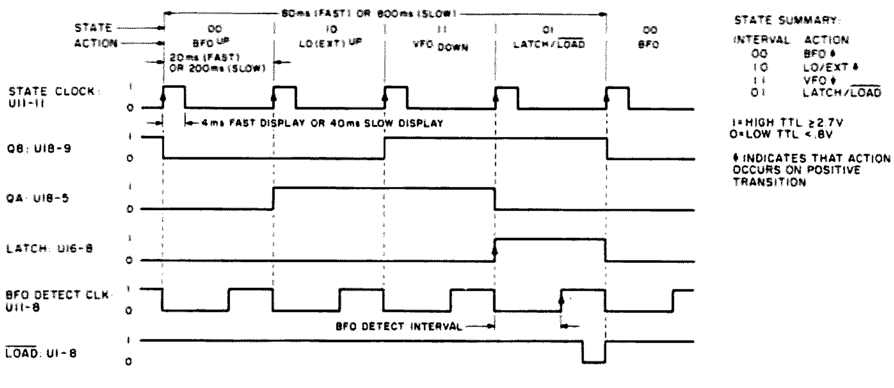

Fig. 2. Timing diagram.

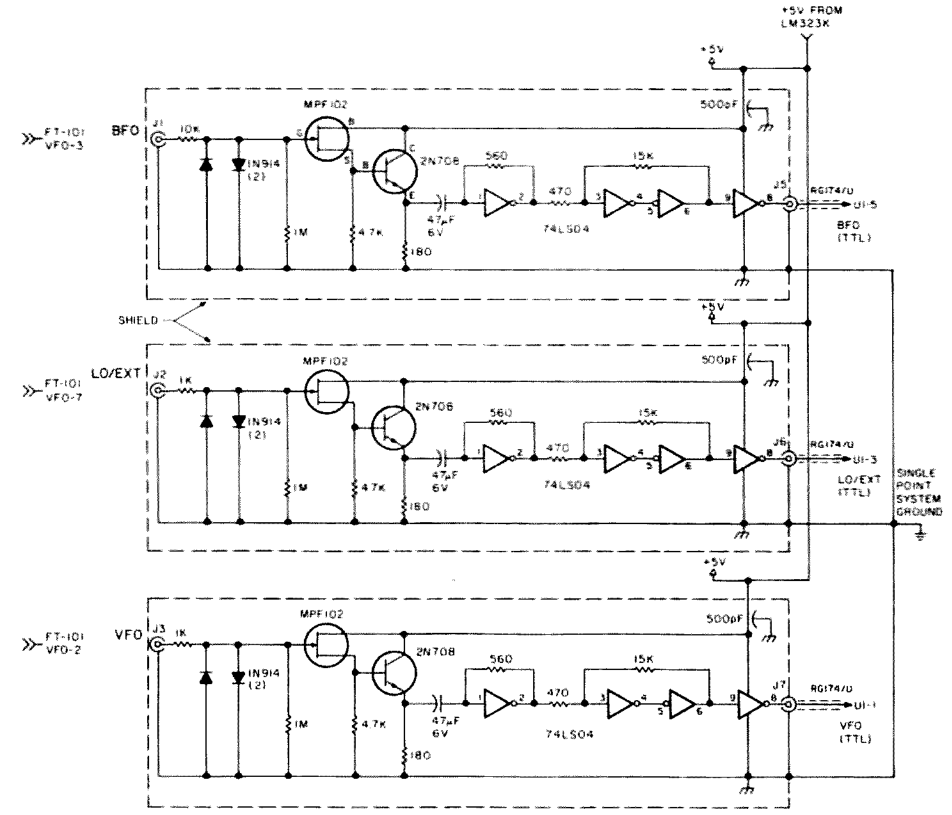

Fig. 3. Isolation amplifiers/TTL converters.

for display viewing and a $\overline{\text{LOAD}}$ pulse to prepare the 74LS192 up/down counters for the next display cycle. A bfo-detect interval is also defined that will determine whether the counter chips are to be loaded with zero or whether, in the absence of a bfo signal, the preset value of 031793 (the CW/AM oscillator frequency) is substituted for the bfo.

The two UP clock signals (bfo and LO) are multiplexed by U15, a 74LS158. The Q_A (U18-5) line selects the bfo when Q_A is a logical 0 (less than .8 volts), and the LO signal when it's a logical 1 (at least 2.7 volts). During the vfo (11) and Latch/Load (01) states, U15 is disabled, producing a solid logical 1 output. The vfo flip-flop, U9, is similarly disabled during the bfo, LO, and Latch/Load states. This action was necessary to properly condition the 74LS192 counters for up/down counting. Thus, for UP counting of the bfo and LO, the DOWN line is disabled, and during DOWN counting, the UP line is disabled.

The occurrence of the 01 state produces the LATCH command at U16-8, which stores the counter bits into 74LS175 quad flip-flops. U17 is the bfo detector, and if bfo activity was present during the bfo-detect interval, U17-8 will go to a logical 1, disabling U3. The disabled outputs of U3 will be all zeros and will be jammed into the 74LS192 counters (U22 through U28) when the $\overline{\text{LOAD}}$ pulse occurs later in the 01 interval. U17 is enabled only during the Latch interval (01 state) and, because of U10, only when the machine is in the FT-101 display mode. The extra U16 gates are used as a delay to ensure U3 output stability during activity of the $\overline{\text{LOAD}}$ signal.

The presence of two display times, together with the bfo-detection concept, was responsible for the inclusion of U3 and its strangely-named outputs. Table 1 shows how U3 (when wired as shown in the schematic) will (when no bfo signal has been detected) inject into the seven 74LS192 counters the value 0031793 when in the FAST mode (80-ms display update), and 0317930 when in the SLOW mode (800-ms update).

Fig. 4 shows the 74LS192s, the 74LS175 storage flip-flops, the 74LS247 decoder-drivers, current-limiting resistors, and common-anode right-hand decimal-point displays. The direct-drive approach was chosen to minimize the chance of display-driver RFI, which often is an unwanted result of the more efficient method of display-digit multiplexing.

Two decimal points are lit for each display mode: one to distinguish megahertz from kilohertz and one to separate kilohertz from Hertz. The FAST position illuminates decimal points on digits 5 and 2 while the SLOW setting drives digits 6 and 3. The decimal point switching and driving derive from a gate of U1 and an open collector-inverter, U2. The seven digits plus the four decimal points require 53 180-Ohm, ¼-W resistors. The displays are 8mm red 5082-7731 units, but any common-anode right-hand decimal-point displays will work.

Fig. 6 shows the power supply. An LM323K in a 15-Watt heat sink is ample for the maximum 2.1-Ampere current requirement. About 1.5 Amps is used by

		Fast/Slow* BCD Input

***Preset value: Fast: 0031793; Slow: 0317930. Above inputs are active when no bfo signal is present and counter is in FT-101 display mode. All counter-preset inputs are zero when in EXTERNAL mode, or when a bfo signal is present in FT-101 mode.**

Table 1. Preset counter bit values.

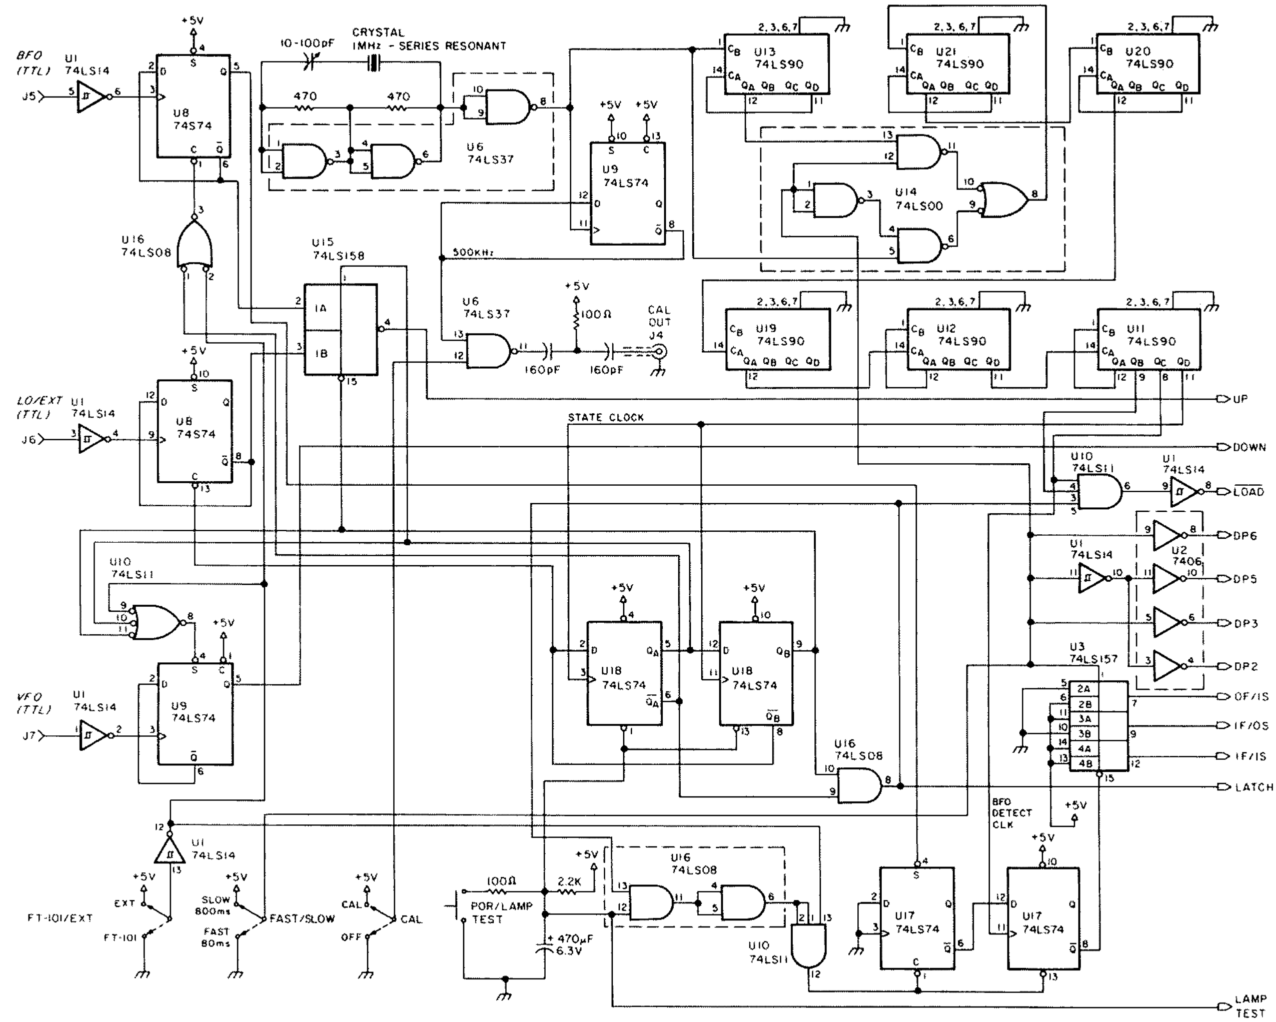

Fig. 4. Timing and control schematic.

the display during a lamp test, when all digits show eights. A 15-V center-tapped, 3-Amp transformer in a full-wave configuration was used. The ac primary is double-pole switched and fused for safety. A single-point ground system was employed to minimize the chances of ground loops.

The time base for the project is conventionally implemented from a 1-MHz TTL crystal oscillator (U6) and a cascaded string of 74LS90 decade dividers. U14 is wired as a 1-of-2 selector to change the frequency of final divider U11's outputs by a factor of 10 for the FAST/SLOW display presentation. An unused portion of U9 divides the 1-MHz oscillator signal by 2, then a remaining U6 gate buffers it and feeds a CRC differentiation network. When the CAL switch is activated, a 500-kHz harmonically rich signal is routed to the J4 output jack. This easily allows band-edge checks and frequency station-standard checks against WWV, JJY, CHU, etc.

Photo B. Rear view. Shown are the FT-101 inputs, the 500-kHz CAL output, and the operating controls. For frequency counter use, the toggle switch is set to EXT and the signal of interest connected to the LO/EXT input (photo by R. Campbell).

Construction and Checkout

The project was built in stages. The FT-101 interface was wired first. Many thanks to KH6BK (March, 1977, *QST*) for this simple but effective method of accessing the three FT-101 oscillator signals.

FT-101 interface instructions: The objective is to capacitively couple the bfo, LO, and vfo via small sections of RG-174/U coax routed through the underside of the chassis to the vfo accessory socket (J13) at pins 3, 7, and 2, respectively.

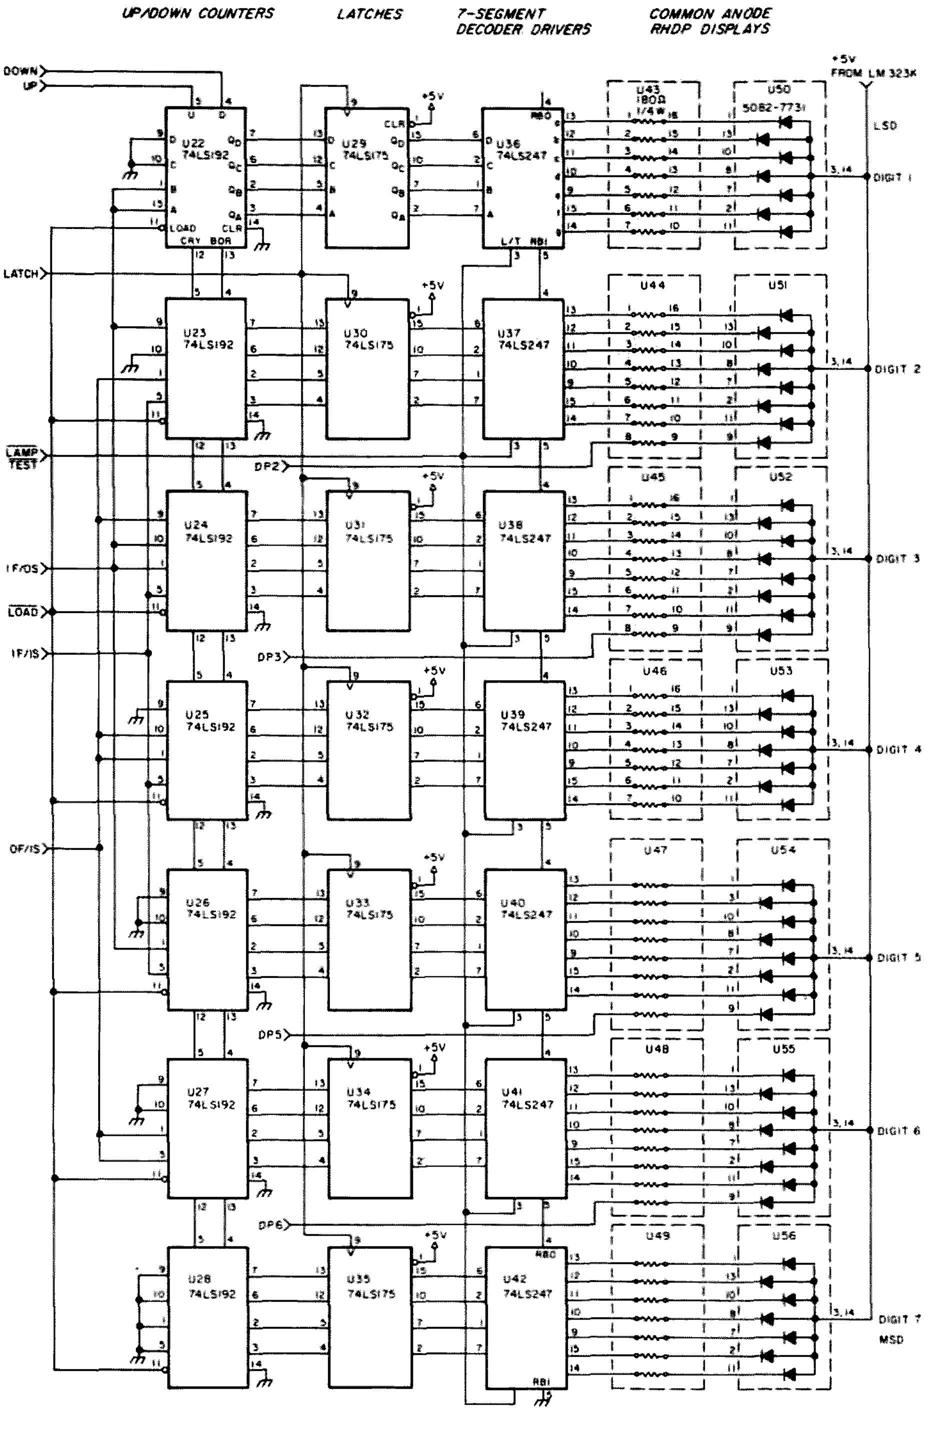

Fig. 5. Up/down counters and display schematic.

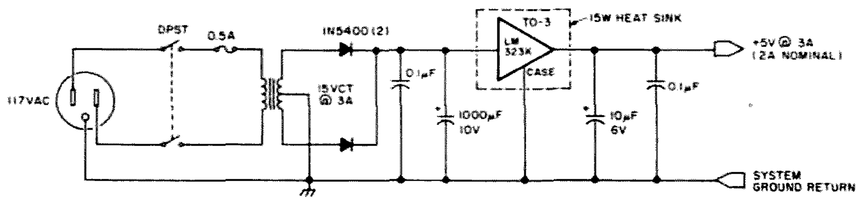

Fig. 6. Power supply.

The shields will be soldered to J13, pin 8. Dress and tin the leads for neatness.

(1)Bfo: Prepare a suitable length of coax and solder the inner conductor to one side of a .01-μF capacitor. Solder the other end of the capacitor to pin 6 of PB 1184A connector. Solder the shield to pin 7 (gnd). Route the cable to the octal vfo socket and solder the inner conductor to pin 3. Solder the shield to pin 8.

(2) LO: Prepare a length of coax and solder the inner conductor of one end directly to pin 15 of the PC connector for PB 1181A. Solder the shield to pin 18 (gnd). After routing the cable back to the vfo socket, solder the inner conductor to pin 7 and the shield to pin 8.

(3) Vfo: Prepare a length of coaxial cable. Solder the inner conductor to one end of a .01-μF capacitor. Solder the other end of the capacitor to pin 11 of the PC connector for PB 1180A (mixer). Solder the shield to pin 10. Route the cable to the vfo socket, soldering the inner conductor to pin 2 and the shield to pin 8.

(4) Remove PB 1181A. Solder a .01-μF capacitor between test point TP and pin 15. Replace PB 1181A.

The interface cable from the FT-101 to the VK8DE Calculating FT-101 Display consists of an octal plug, three equal sections of RG-174/U coax up to 1m in length, and three plugs. The plugs used in the prototype were BNC, but RCA shielded phono plugs would work. Prepare the plug ends of the cables, check for shorts, then solder the inner conductors to octal plug pins 2, 3, and 7. Label the cable to pin 2 "VFO," the pin 3 cable "BFO," and the pin 7 cable "LO," and solder the three shields to pin 8.

Plugging and unplugging the cabled octal plug at the external vfo socket will probably shift the receiver frequency a few Hertz. This is normal and merely re-

Parts List

FT-101 Interface
- 3 .01-μF disc capacitors
- 3 45-cm pieces RG-174/U

Interface Cable
- 1 Octal plug
- 3 1m sections RG-174/U
- 3 RG-174 BNC plugs

Isolation Amplifiers
- 3 Metal boxes[1]
- 3 5 x 2.5 cm fiberglass perfboard
- 3 BNC chassis jacks
- 2 1kΩ resistors
- 1 10kΩ resistor
- 3 1 M resistors
- 3 4.7kΩ resistors
- 3 180Ω resistors
- 3 560Ω resistors
- 3 470Ω resistors
- 3 15kΩ resistors
- 6 1N914 diodes
- 3 MPF102 JFETs
- 3 2N708 NPN
- 3 47-μF, 6-V capacitors
- 3 74LS04
- 3 14-pin solder-tail IC sockets
- 3 RCA phono jacks

Counter Board
- 1 1-MHz series-resonant crystal
- 1 10-100-pF (nominal) ceramic trimmer cap
- 12 .1-μF disc ceramic caps
- 3 RCA shielded phono plugs
- 3 15 cm RG-174/U
- 1 2.2k, ¼-W resistor
- 53 180Ω, ¼-W resistors
- 2 100Ω, ¼-W resistors
- 2 470Ω, ¼-W resistors
- 2 160-pF caps
- 1 20 cm x 12 cm glass epoxy board[2]
- 31 16-pin DIP wire-wrap sockets
- 23 14-pin DIP wire-wrap sockets
- 8 16-pin DIP component carriers (headers)
- 1 74LS37
- 1 74LS157
- 1 74LS158
- 1 7406
- 1 74LS14
- 1 74S74
- 1 74LS11
- 1 74LS08
- 3 74LS74
- 6 74LS90
- 7 74LS192
- 7 74LS175
- 7 74LS247
- 7 5082-7731 red CA displays
- 1500 cm wire-wrap wire

Power Supply
- 1 15 V CT @ 3 A transformer
- 2 1N5400 diodes
- 1 .5-Amp fuse
- 1 fuse holder
- 1 DPST switch
- 1 1000-μF @ 25-V capacitor
- 1 10-μF @ 6-V capacitor
- 1 15-Watt TO-3 heat sink
- 1 LM323K 5-volt, 3-A regulator
- 2 .1-μF @ 50-V disc capacitors
- 1 3-wire ac cord

Chassis
- 1 LMB CO-4A cabinet
- 1 9 cm x 2 cm red display bezel
- 3 SPDT toggle switches
- 1 rubber grommet for power cord
- 1 SPDT momentary switch[3]
- 1 100Ω, ¼-W resistor

Misc.
- 4 3-cm metal standoffs
- 4 2-cm metal standoffs
- 4 1.5-cm metal standoffs
- Screws, washers, bolts, wires, hand tools, solder, etc.

1. About 7.5 cm x 4.5 cm x 2 cm, similar to Bud 2100.
2. 2.54mm-spaced hole-drilled, similar to Vector 84P44WE.
3. Lamp test/power-on-reset.

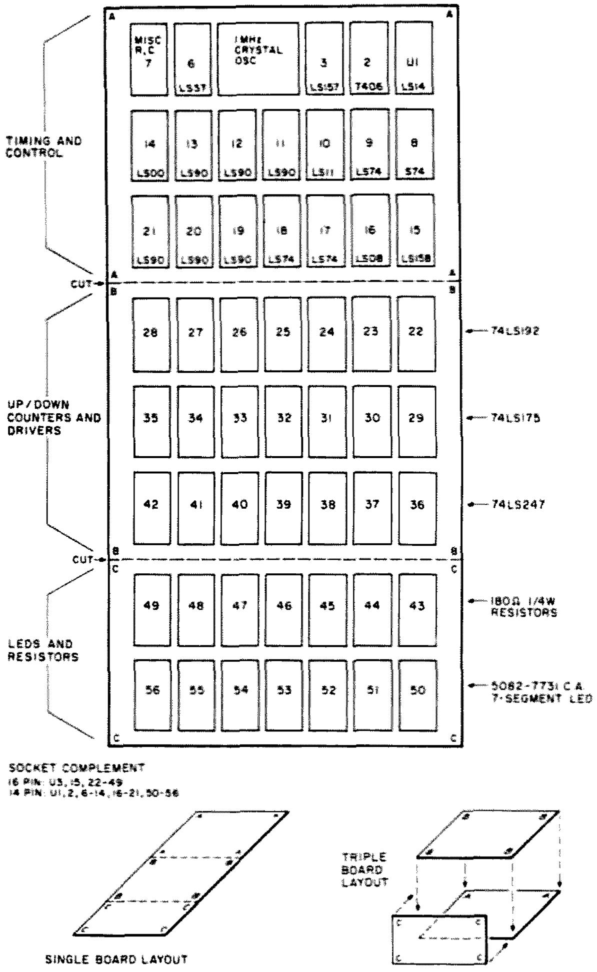

Fig. 7. Board options (component side).

flects the small change in oscillator loading.

The next step suggested is the construction of the three isolation amplifiers. Compact layout, either by printed-circuit etching or point-to-point wiring, is called for. A reasonable example layout for the amplifier from WA2FPT can be found in the September, 1982, *73*, on page 44. The three amplifiers were mounted in small metal boxes for shielding, with BNC inputs (J1, 2, and 3) and RCA phono-output jacks (J5, 6, and 7). RCA phono connectors could be used instead of BNC jacks to save a couple of dollars. The boxes were positioned at the rear of the cabinet so that J1, J2, and J3 would protrude into the enclosed compartments.

The board layout shown in Fig. 7 allows a choice of packaging. Using the single-board approach minimizes interconnections between pieces but requires a larger cabinet and right-angle sockets for the display LEDs. Cutting the larger board into three smaller sections, as shown by dotted lines, allows for a more compact chassis but more board-to-board wires. The prototype employed the three-board approach, mainly for aesthetics. Either way will work. Liberal use of .1-μF bypass capacitors is recommended—about one to every four ICs.

After the isolation amplifiers are built and working, the power supply should be built to allow checkout of the succeeding sections. Then the 1-MHz oscillator and decade divider chain can readily be wired. This prototype used wire-wrapping on a 2.54mm drilled fiberglass board (similar to the Vector 84P44WE), but it is not required. Years of home-brewing, however, point to a higher success rate with wire-wrapping despite the extra cost. Point-to-point construction would be somewhat cheaper and will definitely work but would probably require a larger layout. The choice is yours.

Power and ground wires to all ICs should be wired next. Use of a TTL data book is helpful, remembering that the wiring side is a mirror image of the component side.

The control section was wrapped next, and the timing diagram of Fig. 2 should

be referenced for verification. Access to a dual-trace-triggered sweep oscilloscope would be extremely helpful if substantial troubleshooting is anticipated (or necessary!). The last section connected is circuitry from Fig. 5, consisting of the 74LS192 up/down counters, 74LS175 latches, 74LS247 decoder drivers, the 180-Ohm resistors, and the displays. The front of the prototype contains only the display bezel to emphasize the "hands-off" design concept. The FAST/SLOW switch is a long "bat handle" type on the upper-rear center panel that is easily accessed by a finger flick. For even easier access, it could as readily mount on the front, centered beneath the display.

Operational checks are made by watching the display as the FT-101 is tuned. Upon the application of power, the display will briefly flash all 8s. When displaying frequency, the last digit will be plus or minus a digit, and will change at either the 80-ms fast rate, or every 800 ms, the slow rate. The 80-ms (12.5 Hz) updates will track any tuning rate generated by human hands. Moving the FT-101/EXT switch to the EXT position with the unit cabled to the FT-101 will display the particular LO crystal-oscillator frequency.

The bfo-detect circuit is checked by noting the difference in frequency as the FT-101 is switched from CW to AM. The AM position should read about 800 Hz higher than the CW display. When the CAL signal is input into the LO/EXT jack (J2) and the EXT switch activated, the counter should read exactly .500.00 in the SLOW position, and .500.00 in the FAST position. A short wire inserted into the CAL jack (J4) and placed near the FT-101 antenna input will couple the CAL signal into the FT-101, allowing bandedge checks. The 1-MHz oscillator can be trimmed against WWV in this manner.

Although any suitable-sized, well-ventilated metal cabinet could be used to house the display counter, those in the LMB CO series of two-tone gray cabinets are particularly appealing. The prototype is housed in the CO-4A model (20 × 18 × 10cm) which required careful, dense packaging. This line of cabinetry has a convenient sub-chassis that allows all the ac wiring to lie under the sub-chassis plate. A source for LMB cabinets is Tri-Tek,Inc., 7808 N. 27th Ave., Phoenix AZ 85021.

The VK8DE Calculating FT-101 Display can be built from all-new purchased parts for about US$100. A little scavenging can reduce that figure substantially, however. Areas of cost reduction are cabinetry and point-to-point wiring to avoid wire-wrap construction.

The project was conceived, designed, and built sporadically over a two-year period, allowing for some circuit refinement, and, admittedly, for economical parts acquisition. An "as-built" parts list appears in the box. My only regret is that it was not built sooner.

A display counter such as this one is well worth the effort for the home-brewing FT-101 owner. Variations on the conventional design themes used are quite feasible and are to be encouraged for the adventurous experimenter.

As the one and two "kilobuck" price barriers are regularly burst by new HF transceivers, investing a modest sum and a little work to modernize the venerable FT-101 seems a rather attractive alternative.

Happy digitizing!■

Strictly for FM Deviates

Ever wonder how the modulation is on your FM rig? Try this simple deviation meter and find out.

Rudolf E. Six KA8OBL
30725 Tennessee
Roseville MI 48066

Unlike AM-SSB, FM modulation monitoring on most rigs simply is not available. It's unusual to see audio-modulated transmitters without some indicator to monitor modulation. The opposite is true of FM transceivers. The only indication that your talk power is too high is distortion at the receiving end.

The FM deviation meter I built can be used for monitoring modulation, frequency offset between transmitters, etc. Its most attractive features pay off when, in conjunction with an audio-frequency generator, the transmitter is bench-checked for equal deviation on both sides of the carrier, maximum deviation, and audio distortion.

Amateur FM uses narrowband FM, ±5 kHz maximum deviation from the carrier. The instrument can measure ±10 kHz deviation at 146.52 MHz, the common direct 2-meter frequency. An audio output with 750-μsec de-emphasis is available for scope monitoring. Most parts are available from Radio Shack, coils and variable cap were purchased from Radio Kit, and the crystal from Sentry Manufacturing.

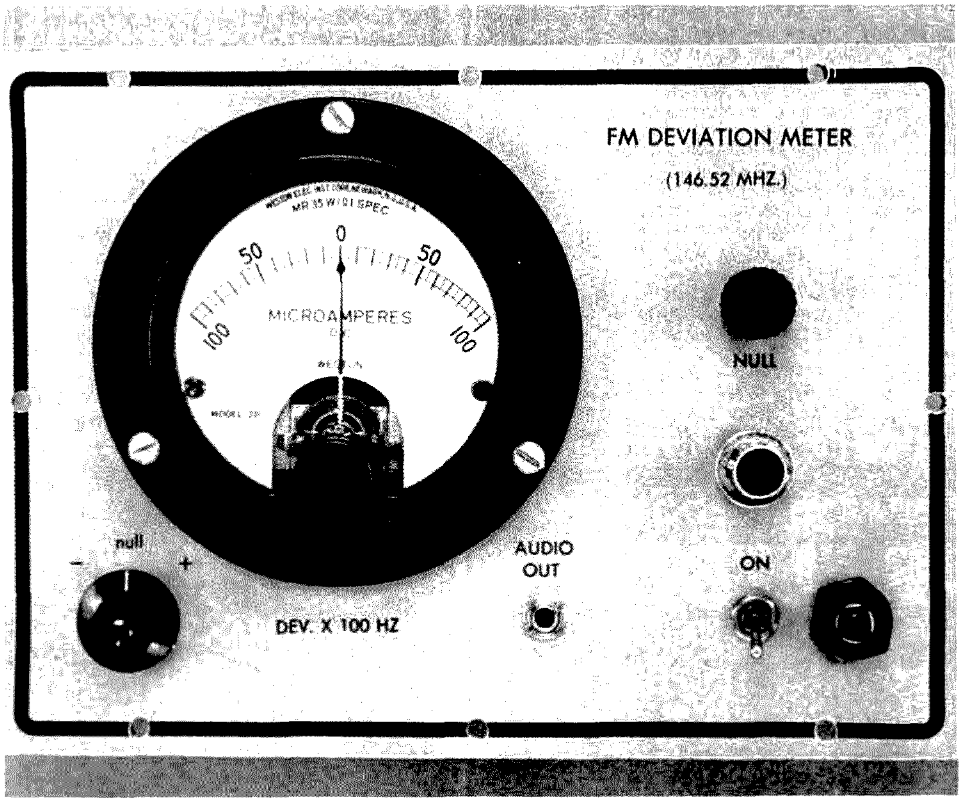

Photo A. Two-meter FM deviation meter.

The heart of the deviation meter is a 565 PLL FM demodulator listed as having a high linearity of demodulated output (0.2%). Calibration proved this out, better than 1% at the meter. The circuit uses the heterodyne method. A crystal-controlled local oscillator beats with the incoming signal and the resulting lower frequency FM is demodulated by the phase-locked loop. After filtering, a peak detector displays the maximum positive or negative frequency excursion of the incoming signal.

How It Works

The internal frequency generator starts with FET local oscillator Q2 at 14.655 MHz. The ouput tank circuit is tuned to the 5th harmonic; it drives doubler circuit Q1. The output is thus 146.55 MHz. The incoming signal with a carrier of 146.52 MHz and the local oscillator are lightly coupled into the mixing diode, D1, resulting in a beat frequency of 30 kHz. This signal has the modulation of the incoming signal. To minimize capacitive loading of the diode, the signal first goes through high-frequency choke L5 and

then low-pass filter L6-C24. Amplifier Q3 boosts the signal approximately 10 times.

The 565 PLL has a voltage-controlled oscillator center-tuned to 30 kHz with C16-R13-R14. Basically, the incoming signal is compared with this oscillator and a dc voltage is generated which is directly proportional to the frequency of the input signal. As the input frequency shifts, it is this output signal which causes the vco to shift its frequency to match that of the input. The peak voltage occurs at peak frequency deviation.

This demodulated audio signal is available at pin 7 of IC1 and is connected to the low-pass filter and to the audio output jack through deemphasis network R15-C21. Low-pass filter IC2a filters some 30 kHz noise generated within the PLL. The peak-detecting circuit, IC2b, charges C23 to either the positive or negative peak, selectable with switch S1. M1 essentially shows the peak voltage across C23.

The null mode of S1 is used for adjusting the difference between the unmodulated carrier and local oscillator to 30 kHz. The output voltage from the PLL at pin 7 is a dc voltage since there is no modulation. Amplifiers IC2a and IC2b works as straightforward dc amplifiers and M1 is calibrated at 30 kHz for zero reading with R16, an offset potentiometer. During use, zero adjust is made by changing the local oscillator frequency with C9, the null control.

Construction

A 7″×5″×3″ aluminum box is used for the enclosure. The oscillator is mounted on a separate board and is shielded from the rest of the circuitry. Feedthrough capacitors for power to the oscillator and the PLL input signal are used to prevent rf leakage. The shielding extends wall to wall of the enclosure; slits were filed in the box lip to let the shields slide through. Both oscillator coils were close-wound with #22 enamel wire. The top of the coil connects to

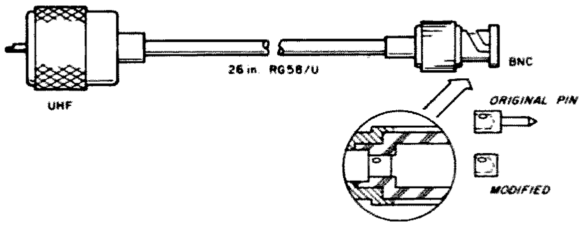

Fig. 1. Cable connectors.

the collector and the bottom end to the power supply. Tuned-circuit caps should be temperature-stable NPO discs or silver micas and are mounted at the coil with the shortest leads possible. The rest of the parts are mounted thorough the perfboard, bent over and soldered. The complete oscillator mounts on a 1.5″ x 1.75″ surface with ¾″-long spacers.

The mixing diode, D1, is mounted right behind the BNC connector. C1 reaches from the oscillator board, and L5 leads the signal to the PLL circuitry. D1 works best with a minimum of parallel capacitance. The PLL and meter circuitry together with the power supply also are mounted on perfboard. The parts are soldered to flea clips and are wired at the rear with a Vector wire pencil. All variable pots face the back for easy adjustment when the instrument is out of the enclosure. The meter is shielded from all the circuitry since rf could enter through its face.

The calculated value of the resistors used in the low-pass filter are shown on the schematic. The nearest standard value is listed in the parts list I used a borrowed LCR bridge to select C19-C22-R18-R19-R20 to within 1% of the calculated value. If this is not possible, use standard values and check the low-pass filter for flat response with an audio generator. With 1% parts, the response curve is flat to 2 kHz, drops to approximately

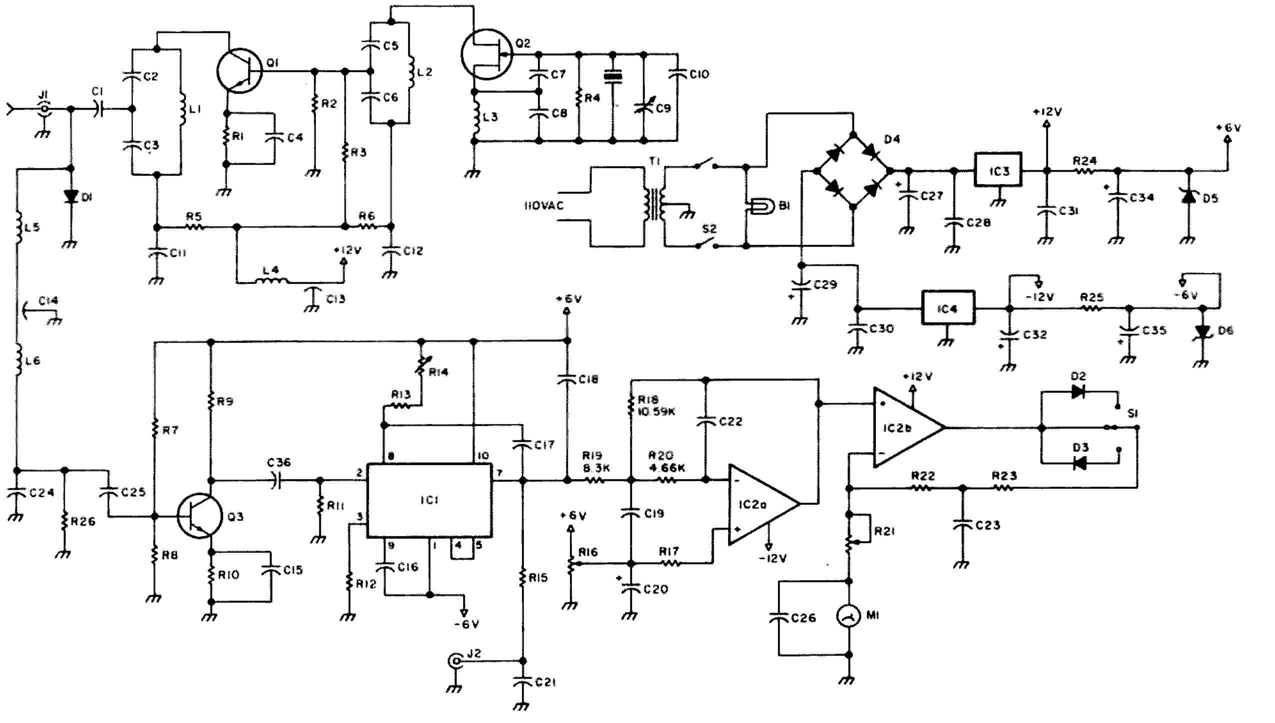

Fig. 2. Schematic.

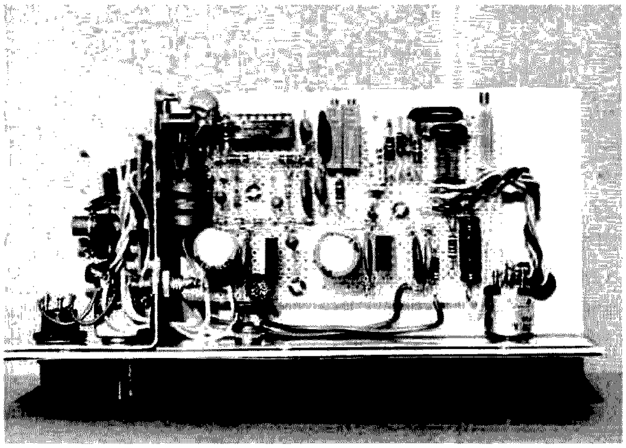

Photo B. Bottom view. Signal enters through C14 feedthrough. PLL circuitry and power supply are mounted on one board.

94% at 3 kHz, and 70% at 5 kHz. For accurate measurements of deviation, an audio tone of less than 2 kHz should be used. I used a 1.8-kHz "Sonalert" piezobuzzer right into the microphone. These units output a clean sine-wave tone, easy for a quick test.

The power-supply transformer is mounted in the back of the box, oscillator section, and is connected with a 3-pin molex® connector. The center tap is grounded to the box at the transformer. The connecting cable is constructed from 26" of RG-58/U cable. As shown in Fig. 1, a UHF connector is soldered to one end. This will connect to the T installed at the dummy load. The instrument end has a BNC with the center pin cut short; it does not connect to the mixing diode directly but is capacitively coupled. Mounting different connectors prevents incorrect installation. The cable should be ½ wavelength since, as a stub, it affects the swr. Never connect a regular feedthrough cable as it will blow the diode.

Special attention was paid to shielding. The instrument can be used with a small antenna and held within a few feet of the transmitter. The rf noise pickup, however, is a problem and can cause unpredictable meter readings. The best way is to use a tapped dummy load with coax connections and good shielding practices.

The microammeter is a 100-0-100 movement liberated from a local surplus store for $3.50. It is an accurate movement and originally came from a General Radio instrument. An off-center scale movement can be used but extra contacts will be needed on S1 to reverse the meter.

The parts are readily available. D1 is a UHF mixer diode purchased from a local Radio-TV supply firm. The negative voltage regulator and 10-turn pots are available from mail-order electronic parts suppliers. Coils, chokes, and caps are available from Radio Kit, Box 411S, Greenville NH 03048. They have a small catalog listing radio parts which are almost impossible to obtain elsewhere. Radio Shack fills out the remainder of the parts list.

Calibration and Use

The PLL was calibrated with an audio generator monitored by a frequency counter. A 30-kHz audio tone of approximately 40-mV p-p output is fed into amplifier Q3 at R26. L6-C24 is disconnected. Pin 7, IC1 is monitored with a dc voltmeter and R14 is adjusted to a point where there is no change in voltage between the audio tone connected and disconnected. This establishes the internal vco of the PLL at 30 kHz. Switch S1 is turned to center position, or null, and R21 is adjusted at approximately the midpoint of its resistance range. M1 is now adjusted for zero, or null, with R16.

Vary the audio generator above and below 30 kHz and note the meter movement. An increase in frequency should show an increase in meter movement, a frequency decrease, a decrease in meter movement. If it is the reverse, interchange D2-D3 wires to S1.

Set the audio generator at 35 kHz and adjust the meter reading to 5 kHz with R21. Turning S1 to + deviation should not have any effect on the meter reading. Conversely, adjust for 25 kHz and note a negative meter reading of 5 kHz in null, or −, deviation. Slowly decrease the frequency to 20 kHz. The meter should come close to 10-kHz deviation and then suddenly return to zero. The PLL has lost control at that point.

Set the audio generator 1 kHz below the point the PLL loses control and now slowly decrease the input voltage. Again at some input level the PLL will lose control. Carefully note this voltage; it is the minimum voltage required to give full-scale indication. It could be as low as 5-mV p-p. For reliable operation, the voltage from the mixing diode, D1, should be at least four times this minimum level. I checked the meter in 1-kHz steps and found the calibration better than 1%.

Reconnect the L6-C24 filter to R26 when the calibration is completed. The local oscillator is tuned up by first turning the tuning slugs all the way in. R26 is monitored with a dc voltmeter, and L2, L1 is tuned for a peak reading of approximately ¼ volts dc. Make sure the output is the 10th harmonic or 146.55 MHz, with a wavemeter or such, and not the 11th or 9th harmonic.

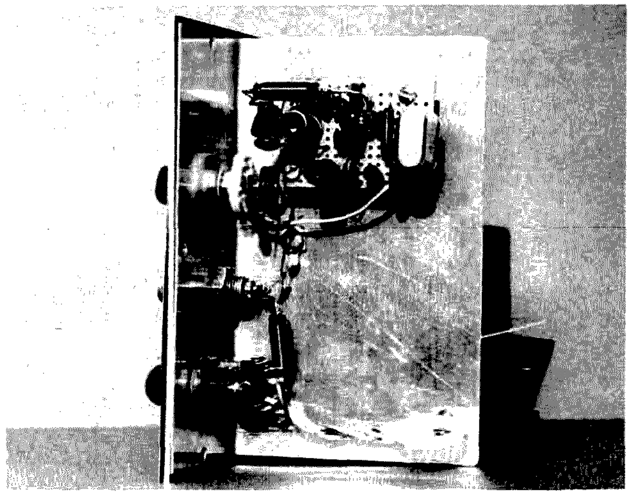

Photo C. Right side—the internal frequency generator. C1, D1, and L5 are shown connected to the BNC connector. L4 at the left top supplies power through feedthrough C13. The molex connector at the bottom connects to the transformer.

The transceiver is now connected to the dummy load with a T connector. Attach the special cable and tune the transceiver to 146.52 MHz direct. Set C9, the null control, at half capacitance. Attach a scope to resistor R26. The scope, during transmit, should display a sine wave of approximately 40-mV p-p amplitude and a frequency above 30 kHz. A value of 5 pF for C10, installed across C9, should bring the frequency to about 30 kHz. The idea is to have C9 in the middle of its operating range.

At this point, we are ready to try measuring deviation. I tested a 10-Watt unit and a 2-Watt hand-held in high and low power. With the deviation meter switched to null, push to transmit and zero the meter with the null control. Turn to + deviation and hum loudly into the microphone. The meter will show maximum positive deviation. Turn to − and repeat for negative deviation. The reading should be the same, and at 5 kHz.■

Build a Better Hamfest

These hints from 25 years of experience will help make your event a success.

After over a quarter of a century of hamfest attendance as a spectator, retail exhibitor, manufacturer, and hamfest committee member, I have been asked numerous times to put down a few thoughts as to what I and other exhibitors liked and disliked. I will comment mostly from the point of view of exhibitors, as they probably have the least input to a hamfest committee.

Every committee *wants* to do the very best job, and most put in lots of effort and time with the very best of intentions. I can remember several hamfests that really bent over backwards to give the exhibitors maximum exposure to the public. We could set up all day Friday, open the exhibits Friday night, 6:00 to 10:00 pm, open Saturday, 8:00 am to 6:00 pm, have a Saturday night party, and be open on Sunday from 9:00 am to 5:00 pm.

The committees in these instances really did mean well and had good intentions, but if an exhibitor has to fly in or drive many hours Friday to set up, the last thing he needs is to open the exhibit area Friday night. He is ready to collapse for awhile and get ready for Saturday and/or Sunday. After all, he probably worked the last 5 days also. Saturday 9:00 am to 3:00 or maybe 4:00 pm is enough for one day of standing around trying to be alert and cheerful!

Several hamfests have a Saturday night cocktail party with a free bar for the first hour for the exhibitors only, then open it up for the rest of the attendees with a cash bar. This has worked quite well in most cases and is certainly a good way to show appreciation to the exhibitors. And best of all, key members of the committee can be there to get information as to what the exhibitors like and dislike about the hamfest and get suggestions of how to make next year's better.

Now here is something which could be *very* important: A few small exhibitors may have only one person in the booth and it is *very* difficult for them to take coffee or rest breaks. Some hamfests have local Boy or Girl Scouts or C.A.P. squadron members to help out. Such local community groups often are looking for things to do and would be happy to help man a booth and watch things for a few minutes—or go and get coffee, donuts, or a sandwich.

Some committees arrange to have coffee and donuts for the exhibitors and bring them to the booth or have it available in a central location; some even have a room where exhibitors can sit down and relax for a few minutes.

I certainly do not mean to imply that all or any committees should do all of the things mentioned here. They are things that I have observed over the years and are meant only as food for thought. And some of these ideas are more important than others. For example: It would be a very useful and desirable thing if all hamfest organizers provided some means for exhibitors to be reached in an emergency situation. A telephone situated in the display area or, at the very least, near the PA system would be one possibility. Another possibility would be a telephone located near the person who is running the radio talk-in operation. Perhaps both locations could be covered. In any case, there have been emergencies at almost all hamfests where exhibitors had to be reached quickly. Some thought should be given to this problem.

Hamfest Dates

There are times when it is difficult or impossible to coordinate your event with others on the same date. You could be locked into a date by the facilities that you use. Last year there were several hamfests that had the same dates as others that we wanted to attend as exhibitors. I am sure that situations like this will continue as it is very difficult to arrange no-conflict dates. It helps, however, if you get your date out and announced ASAP. Keep plugging this date in publications and on the air if it is a large affair that you want the big manufacturers and dealers to attend. Make sure that they know the date of the next one ASAP after the last one. Some commitments (such as ARRL national conventions) are made more than a year in advance by exhibitors.

Security is a major concern with many exhibitors, and rightly so since some have many tens of thousands of dollars worth of equipment on display. During setup times, I have observed many people walking around convention areas without benefit of any ID (committee, exhibitor, or general public). *I think this is a real no-no,* for two reasons. First, when you are trying to set up your area, the last thing you need is a distraction, especially by curious committee members or

other exhibitors who probably are not customers. They may mean well, but as I said before, an exhibitor may have left before the chickens got up that morning and perhaps drove or flew many hours before arriving for a weekend hamfest. He may also have worked the week before and maybe the last several weekends in the hamfest season.

Second, it seems that over the last few years the need for more and better security has increased drastically. I'm not sure why; maybe it's just the economy, or maybe, with our lack of ability to enforce our laws and prosecute shoplifters, more people are willing to take a chance. Anyway, could it be time to need a bill of sale on your person for your new-looking HT as you walk in and out of the exhibit area? Time for a bill of sale for *any* package, box, or equipment that you carry in and out of the exhibit area? I certainly hope not, but the Consumer Electronics Show and others have had to take this approach, with guards on the doors doing briefcase inspections, etc.

Last year I went to numerous hamfests that had equipment stolen right off displays during show hours. At the Cedar Rapids national ARRL convention last summer, a sharp-eyed and concerned attendee witnessed an HT slide off a display and into the wrong person's possession. He reported it to the exhibitor who immediately gave chase and ran the person right into the arms of a policeman. I don't know if there was a prosecution or not, but the name *and call* of the individual were known by a lot of exhibitors in very short order.

In your flyers or exhibitor packages, a map of your location with respect to the local airport, expressways, and major landmarks is certainly nice—along with approximate times and mileages from them. A list of local motels, hotels, and *nice* restaurants along with any 800 numbers and local numbers, rates, and specialty menus would make it easier for a stranger to make a choice to meet his needs or desires. Quite often, you can arrange a block of rooms, especially in a dead season, and you can really get a price break.

SAROC used to hold its convention the first week after New Year's Eve—the slowest weekend in Las Vegas—and got super room and exhibit-area rates. (Now CES has taken this time slot for the very same reasons.) So don't overlook the expensive convention areas if you can use them in their slow times; a little income for them is better than zero. But be careful of union-contract areas. The exhibit area may be inexpensive, but the electricians and dray people may turn out to be very expensive.

An absolute must for good rapport with the commercial exhibitors is a thank-you-for-coming letter sent *no later* than 30 days after the hamfest. It also gives you the excellent opportunity to include a questionnaire: How did you like the hamfest? What could stand improvement? What services or functions would you like to see added or dropped? Was there anything *exceptionally* good or bad? Did you like the location and facilities? The list can go on and on.

If you use a form letter that requires only a check mark (✓) for yes or no and includes space for comments, you will get a better response. If you ask only for written comments, don't expect very many to answer you. Make it easy for the busy exhibitor to respond.

It is certainly appreciated when at least one person from the committee takes time and comes around once or twice, minimum, to each booth and *asks* if there is anything needed or wanted to make it a better show. Such visits should not interrupt a sale or a serious conversation. Committee members should wear some kind of ID to let exhibitors know who they are. And they should try to talk with the boss, if possible; all such good efforts might be for naught if only the hired help is seen when the boss might have something he feels is important to chat about.

Make sure, in all correspondence to exhibitors, that there is a phone number, name, and address of a responsible person who can make commitments for the event or at least will follow up with a prompt response. If you have a large event, supply a committee list of chairpersons complete with phone numbers and addresses and their responsibilities.

Booth fees at some events are negotiable, and at some they are not. Almost all hamfests need door prizes that have to come from someplace, and trading for them with booth space is probably one of the best ways to stretch a hamfest budget. I think that most dealers or manufacturers would rather trade merchandise than pay cash for a booth. There are bookkeeping problems on both sides sometimes in doing this, so play this one by ear to satisfy both sides.

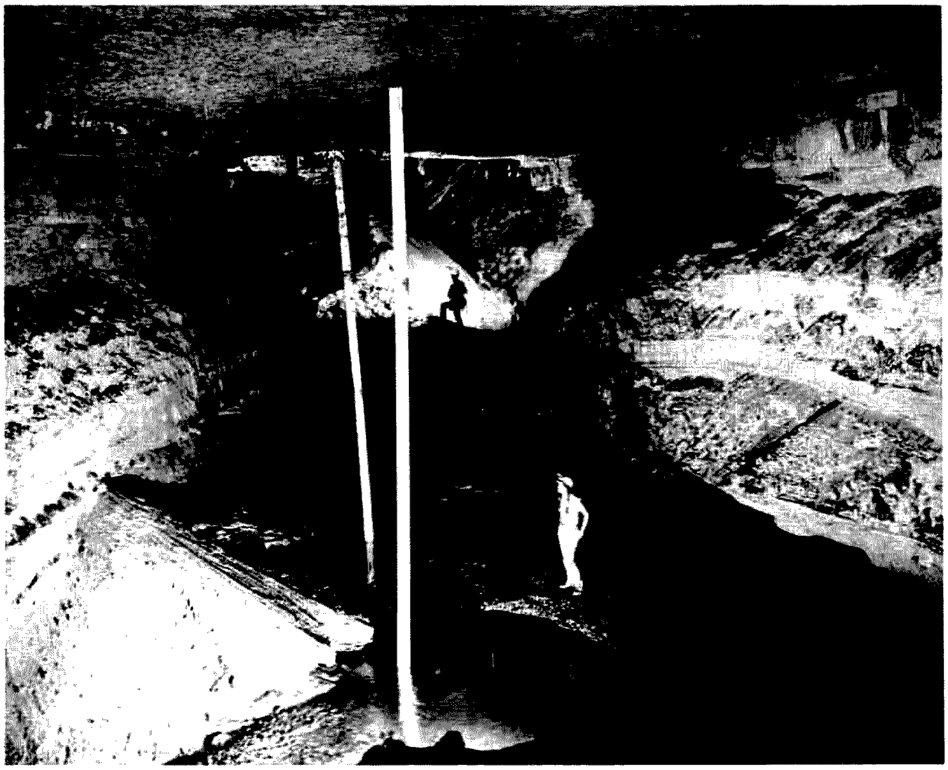
In conclusion, I'd like to add that hamfests are fun for all concerned, and a little more attention to some of the details can turn a mediocre hamfest into a spectacular show satisfying to exhibitors, committee members, and hams alike. I hope that some of these ideas and comments will help your hamfest become the most successful and talked-about one this year and for years to come. ■

Caveman Radio

With underground inductive transmission, 300 feet is almost DX.

Frank S. Reid W9MKV
PO Box 5283
Bloomington IN 47402

Magnetic-induction equipment which transmits signals through the ground is a valuable aid to cave-mapping and underground rescue. Even more useful than its communication ability is its ability to accurately find a spot on the surface above an underground transmitter. It can also determine depth within a few percent, using field-geometry measurements.



120-foot-deep wells near Park City, Kentucky, penetrated cave within two feet of radio targets. Drill drift caused error. Pipes contain hydrological instrumentation. (Photo by Samuel S. Frushour)

It's legal! Magnetic induction is not real radio—it's simply very-loosely-coupled transformer action. The FCC does not define equipment operating below 10 kHz as "radio frequency devices."

How It Works

Inductive communication is a very old technique (see "Who Really Invented Radio?—The Twisted Tale of Nathan B. Stubblefield," *73*, December, 1980). When amateur radio was banned during World War II, many hams communicated by "ground wave," i.e., magnetic induction and earth-current. ("Earth-current" is transmission of audio-frequency signals through the ground between pairs of widely-spaced ground rods connected to amplifiers.) Ranges greater than one mile were claimed.

Skin effect, which causes rf currents to travel only on the surfaces of conductors, normally prevents radio waves from penetrating ground or water more than a few feet. The depth of the "skin" increases as frequency is lowered; thus, submarines can receive transmissions from very powerful VLF stations. Experimenters have reported successful cave-to-surface communications on 160 meters. Others report positive but unpredictable results on higher frequencies.

Audio-frequency magnetic fields penetrate most geologic structures easily. There are methods for locating ore bodies, using magnetic-induction equipment as a sort of giant metal-detector (see *QST*, June, 1928).

Inductive communication is inherently short-range because magnetic dipole field strength decreases as the *cube* of the distance from the source, unlike radio waves which obey an inverse-square law. Conductive overburden will absorb the signal, but the inverse-cube attenuation is so predominant that absorption is rarely noticeable. Generating true radio (electromagnetic) waves at audio frequencies would require enormous antennas.

E. R. Roeschlein suggested using the directional properties of magnetic fields to map caves in an article in *Electronics*, September 23, 1960. Cavers, notably William Mixon and Richard Blenz, refined the equipment and developed depth-measuring techniques which are independent of signal strength (several articles appear in *Speleo Digest*, 1964).

Equipment

It's easy to get 300-foot range with very simple equipment. Longer ranges are more challenging.

A transmitter is just an audio oscillator driving an amplifier which is driving a coil. Impedance matching is important for maximum coil current. Perhaps the most important part of the transmitter is the keyer—a circuit to make it go "beep . . . beep . . . beep." In addition to the advantage of saving battery power, a pulsed signal is much easier for the receiver operator to distinguish against a background of interference than is a steady tone.

A simple resonant coil connected to an audio amplifier will work for a receiver. Use crystal earphones, because magnetic phones will cause feedback.

The circuit of Fig. 1 is a Q-multiplier. The resonant circuit is in *negative feedback* instead of being simply connected to the amplifier's input. The Q (regeneration) control taps some of the output and feeds it back to the noninverting (+) input. The amplifier forms a *negative resistance* which cancels the resistance of the coil. As the Q control is advanced, sensitivity and selectivity get higher and higher until the circuit goes into oscillation (infinite Q). Since it will oscillate, the circuit can also be used as a very-low-powered transmitter.

A 60-Hz notch filter will *not* get rid of power-line in-

WB9TLH operates underground transmitter on 3500-Hz CW, using microswitch for telegraph key.

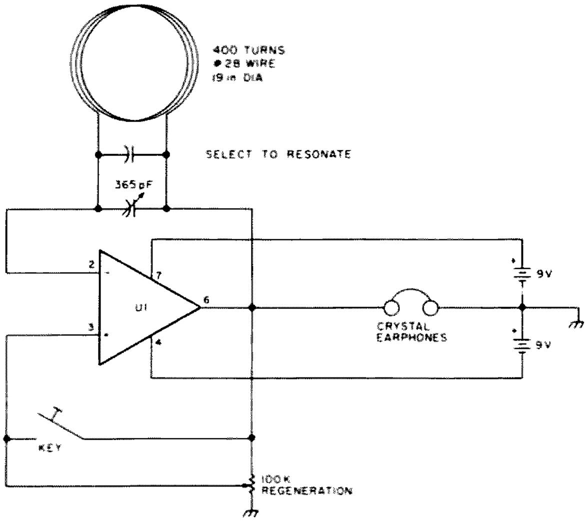


Fig. 1. One-chip transceiver uses Q-multiplier effect for high sensitivity and selectivity. Antenna needs no electrostatic shield. U1 is any 741-type op amp.

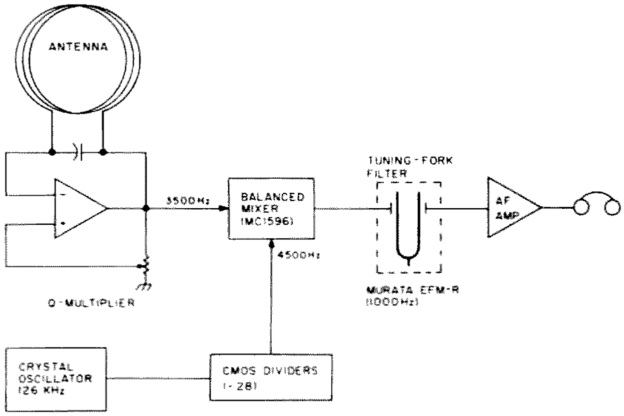

Fig. 2. Receiver with frequency conversion allows very high gain without feedback problems.

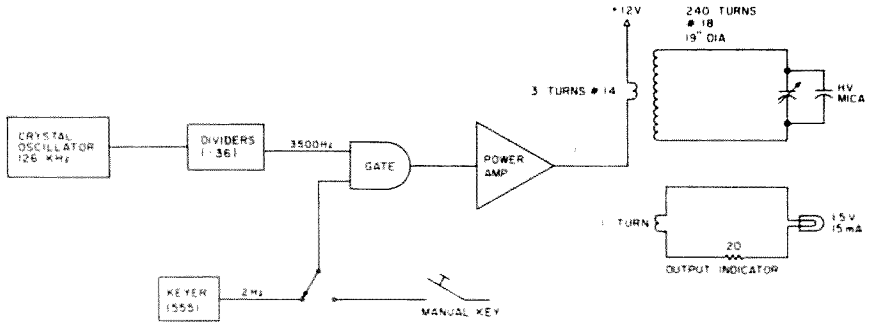

Fig. 3. A cave-radio transmitter. Precise frequency control is necessary if receiver uses very-narrow-bandwidth filters.

terference, which is not just 60 Hz but many harmonics. Don't use active filters indiscriminately. Very strong interference can *intermodulate* with the desired signal in an active filter, creating even worse interference.

Even with crystal earphones, receiver gain cannot be increased indefinitely. After a certain point, no amount of shielding and decoupling will prevent feedback. You can keep the antenna far from the amplifier, but then it's not portable. A balanced mixer and local oscillator can convert the input frequency to some other frequency, which can then be filtered and greatly amplified without feedback problems. Fig. 2 is a block diagram of one such receiver.

Interference

Power lines are the major source of interference, even in isolated areas. Harmonics of 60 Hz extend well into the ultrasonic frequencies. Power-line interference is usually directional and can be partially nulled out by the receiving antenna. To minimize interference, choose an operating frequency *in between* a pair of power-line harmonics and use a receiving filter narrow enough to reject the adjacent signals. Resonant-reed or tuning-fork filters of the type used in radio pagers can provide the necessary selectivity. Such extremely narrow bandwidths require precise frequency control and very slow CW speeds.

Surface location and depth of transmitter are found by null-seeking with directional antenna and by measuring shape of magnetic field.

Atmospheric noise from distant thunderstorms can be a problem in summer. Daytime atmospheric noise is minimal around 3.5 kHz (*National Speleological Society Bulletin*, vol. 32, no. 1, January, 1970). The noise level increases appreciably after dark. Atmospheric noise is polarized such that it nulls when the receive coil is horizontal.

What's the best frequency to use? Mid-range audio frequencies work well, and the equipment is easy to build. I use 3500 Hz. 3276.8 Hz would be a good frequency because it is easy to generate from a 32.768-kHz wristwatch crystal. 3276.8 Hz falls in between harmonics of both 50- and 60-Hz power lines, and so could be used in any country. At higher frequencies, ground absorption increases and audio amplifiers become less efficient. Some experimenters have tried SSB on ultrasonic frequencies, but have found no advantages to justify the complexity of the equipment. Below 2 kHz, atmospheric noise and power-line harmonics are very strong. Subaudible frequencies below 60 Hz have been used, with very complex receiving equipment.

The OMEGA navigation system transmits very strong signals on several frequencies between 10 and 14 kHz. OMEGA stations make good beacons for testing receivers. Each station transmits for one second in a sequence that repeats every ten seconds.

Antennas

For best performance, maximize the *magnetic moment* of the coils. Magnetic moment is Ampere-turns multiplied by the coil's area.

Doubling the range of an inductive system requires an eightfold increase in magnetic moment, other factors being constant. Self-resonance limits the number of turns a coil may have. An eightfold increase in current implies either much larger wire or a 64-fold power increase. It's easy to see that

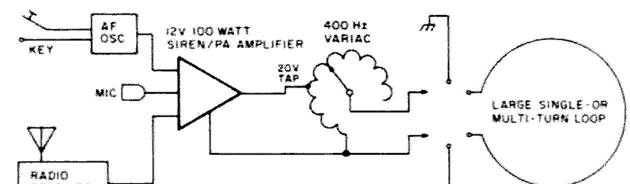

Fig. 4. Surface-to-cave transmitter uses large antenna and high power, so that underground equipment can be small. Surplus 400-Hz transformers are very cheap or free because there is little demand for them. (Caution—possible shock hazard between chassis and earth grounds if amplifier has no internal output transformer.)

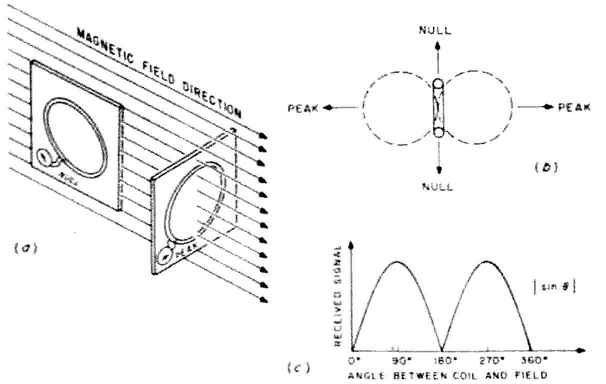

Fig. 5. (a) Received signal disappears when coil is parallel to magnetic field. (b) Note that magnetic-induction receiver coil's sensitivity pattern has null directions in the plane of the coil, unlike radio loop antennas. (c) Nulls are much sharper than peaks, but with very weak signals you may have to seek peaks instead of nulls.

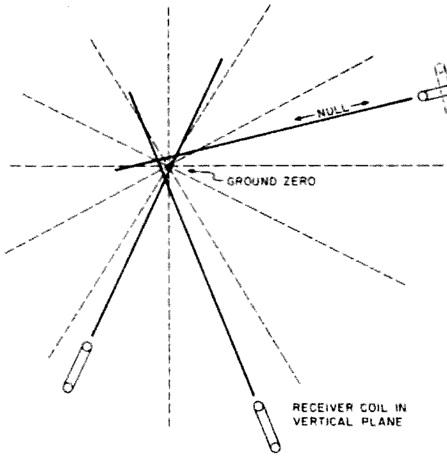

Fig. 6. Finding the approximate surface point above the transmitter (plan view).

the brute-force approach soon reaches limitations.

For a given length of wire, the optimum antenna is a single huge circular turn. Very large loops are OK for fixed locations, but coils for direction-finding must be rigid, flat, and portable. Transmitting coils must be small enough to fit through tight cave passages. In any case, the easiest route to long range is with coils of the largest manageable diameter. Build a transmitter of a few Watts, carefully match it to the coil, and concentrate the rest of your effort on a good receiver.

Ferrite-core antennas should perform well if properly designed. Ferrite cores can introduce problems of temperature instability, microphonics, and magnetic saturation. Doug DeMaw's recent book, *Ferromagnetic-Core Design and Applications Handbook*, published by Prentice-Hall, is an excellent reference.

Nathan B. Stubblefield may have discovered the interesting interaction between the magnetic-induction and earth-current modes of communication: Current injected into the ground between a pair of widely-spaced rods flows around a large underground area, creating a large magnetic moment. An inductive receiver will detect the signal. Likewise, a pair of ground probes can detect voltage induced by a distant current-carrying coil. Some cave-radio experimenters have built equipment which operates in either mode, allowing greater flexibility in varying conditions of ground conductivity.

Receiving antenna has inclinometer made from vernier radio dial and spirit-level for measuring vertical angles.

Voice Operation

My own equipment was designed primarily for direction-finding and minimum weight. It can transmit from cave to surface by CW, but it does not transceive. Two-way communication is not essential for surveying operations, but it can be very useful. (People who don't know Morse code can usually *send* it intelligibly if provided with a code list and a few minutes of instruction on lengths of dots, dashes, spaces, letter and word spacing, and abbreviations.)

For a "downlink" I use a 12-volt-operated, 100-Watt police siren/PA amplifier driving either a large loop of wire lying on the surface or a pair of ground rods. A surplus 400-Hz variable autotransformer matches the amplifier to different loads. The underground voice receiver has a ferrite-core coil connected to an audio amplifier through a high-pass LC filter which cuts off at 600 Hz, with 70 dB of rejection below 300 Hz. The filter rejects the strongest power-line harmonics. A band of voice energy called the *first formant* is lost, resulting in loss of the qualities that distinguish individuals' voices, but intelligibility remains. The female voice works best here.

Magnetic Direction-Finding

Someone must take the transmitter into the cave to the point of interest and turn it on at an appointed time. The transmit coil must be horizontal and very accurately level.

Received signal strength depends on how much magnetic flux passes through the coil. With the plane of the coil parallel to the field, no

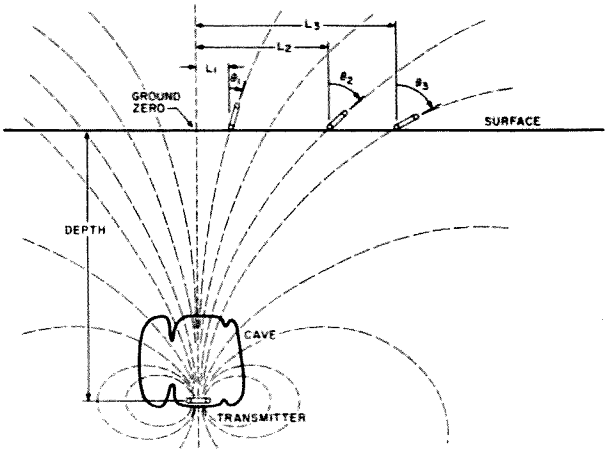

Fig. 7. Ground zero is pinpointed by finding the spot where the field is vertical. Then, distances (L) and vertical angles (Θ) are used in calculating depth of transmitter.

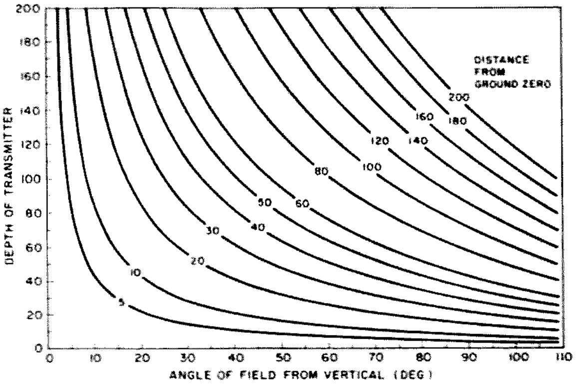

Fig. 8. Cave Radio Depth Chart (after W. Mixon). Each curve is depth vs. field angle for a different horizontal distance from ground zero. Use any distance units: feet, meters, etc. Example: For distance 50′ and angle 40°, depth is 102′. Thanks to Robert F. Blakely for providing this HP-85 computer plot.

CALCULATOR METHOD

Finding depth by calculator is fast, easy, eliminates plotting errors, and provides wider range than the graph. (The graph still has the advantages of low cost and easier error detection.) A programmable pocket calculator with nonvolatile memory, such as the Hewlett-Packard HP-29C, is ideal for calculating depth while on location.

HP-29C Program for Depth of Cave Radio

Equation solved for depth:

$$D = \frac{L(3 + \sqrt{9 + 8\tan^2 \Theta})}{4 \tan \Theta}$$

$0° < \Theta < 90°$

flux passes through the center and the signal disappears in a very sharp null (Fig. 5).

Viewed from above, the field of the transmit coil looks like straight lines radiating from the center (Fig. 6). The receiver operator can home in on the area of the underground transmitter by a technique similar to that of normal hidden-transmitter hunting: Hold the coil in a vertical plane and rotate to find the null direction, then "triangulate."

Once the approximate site has been found by horizontal nulls, the location can be refined to within a few inches, using vertical nulls. Fig. 7 shows a side view of the curved shape of the field. Point the coil toward maximum signal, then tilt it back and forth to find a null which indicates the direction of the field coming up out of the ground. Move in the direction of decreasing vertical angle to find a place where the null direction is straight down. Turn 90° horizontally and repeat the procedure, getting closer to the center of the field each time. "Ground zero" is the point where the vertical null is straight down, no matter what horizontal direction you point the coil's axis. An experienced operator can usually find ground zero in about ten minutes and determine depth in another ten.

Finding Depth

The receiver antenna should be mounted on a rigid, flat board or framework and must be equipped with some type of inclinometer, such as a carpenter's protractor. Estimate vertical angles to the nearest 1/10 degree when taking data for depth.

Mark ground zero with a stake or rock. Stretch a measuring tape horizontally away from ground zero and measure the vertical angle of the field at several different distances away. Use the distance-and-angle data in the calculator formula above or plot the data on the family of curves in Fig. 8. Average the results of several pairs of data. The depths should be consistent, falling near the average value and randomly either side of the average. An increasing or decreasing trend indicates an error in ground zero location or an unlevel transmit coil. Most of the error can be recovered by taking another set of data in the opposite direction away from ground zero and averaging the results of both sets.

Note that the slope of the depth function (Fig. 8) is very steep for small angles, i.e., a small error in measuring the angle will produce a large depth error. For best results, use only angles between 12° and 75°. (At vertical angles

near and greater than 90°, the null is less distinct and, of course, the signal is weaker at greater distances from ground zero.)

The depth chart (Fig. 8) derives from the formula: $\tan \theta = 3LD/(2D^2 - L^2)$, where: θ = angle of field (measured from vertical = 0°), L = horizontal distance from ground zero, and D = depth. The formula is an approximation which assumes that the transmit coil is very small relative to depth.

Note that the closed curves of the magnetic field are ellipses, not circles. Simple triangulation cannot be used to determine depth (D = L when θ = 71.57°, not 90°). An 8 1/2" × 11" working copy of the depth chart is available from the author for an SASE.

The Future

Extending the range of underground communication makes a fine project for hams, especially VLF enthusiasts. Experiments on 1750 meters should be especially interesting.

Correlation, signal-averaging, and other sophisticated techniques for weak-signal recovery are becoming increasingly attractive to amateurs with new developments in integrated circuits. Very-long-range cave radio could, of course, be accomplished by interfacing short-range cave-to-surface links with conventional amateur radio equipment. Future technology may allow communication through the entire Earth on modulated beams of neutrinos! ■

Here's the Split-Second Timer

In the darkroom or the shack, this beeper has 1001 uses. Its simplicity makes it the perfect beginner's project.

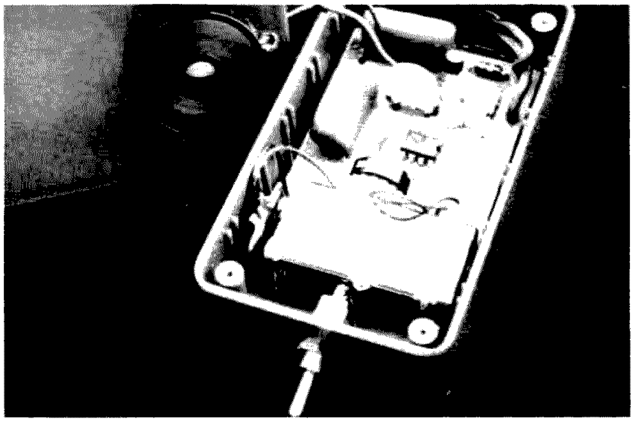
Editor's Note: This article, although not exclusively amateur radio oriented, so impressed us at *73* that we are presenting it here. The author has come up with a nifty audible clock circuit. The timer could be used in a photography darkroom, as suggested by the author, or in the ham shack to time your exposure of circuit boards. The timer is simple enough to build as a first-time project. We hope you enjoy this project as much as we did.

Like many hams that I've talked to, I have a second and maybe more expensive hobby—photography. Inflation has made my photo darkroom even darker with paper costs climbing to over 25 cents a sheet. Chemicals spiral upward along with paper prices while freelance jobs dwindle. The result is that I'm very money-conscious each time I open my bright yellow box of printing paper. I even scrawled "25¢ a sheet" on top of the box, but that didn't seem to cut back on the mountain of wasted paper.

Here's how to interface the beeper. A cube tap is pushed into the enlarger outlet of the mechanical darkroom timer. The red wire from the cube tap goes to my photo enlarger and the brown wire to the beeper. When the timer cycles line voltage to the enlarger outlet, both the beeper and the enlarger lamp come on together.

With rising paper costs in mind, I decided that the cure might be a new darkroom timer. Too many prints ended up in the wastebasket because of bad dodging and burning. What I needed was a timer that would help me be more accurate, print after print. But the new digital timers cost more than I was willing to spend.

My old mechanical timer worked fine as long as I left



Close-up detail of parts placement inside plastic case. The piezo buzzer is glued to the top of the case. The switch in the foreground is used to turn off the beeper while focusing under the enlarger.

it set on one particular time. The problem crept in when I needed to reset the timer to a new time to burn in part of the print. When I returned the pointer to the original time to make another print, that new print never looked the same as the first print.

Enter Bruce WA3PTU

I talked over my problem with Bruce Long WA3PTU. We reasoned that an audible beep sounding each second coupled to my present timer would permit me to set the timer for, say, 10 seconds and then never move it again. To add or subtract printing time would be easy. All I would have to do would be to count the seconds that ticked by, then block the enlarger's light path with my hand when the correct time was reached.

Dodging and burning prints could be done more accurately since I would hear the passing seconds as I worked over each print. All that was needed was an inexpensive add-on beeper (and, of course, the circuit from WA3PTU).

I built the beeper for about $11. The handful of parts came from the local Radio Shack store and fit into a plastic box. Calibration was simple using only my wristwatch. The beeper was interfaced with my darkroom timer by plugging it into a cube tap shared with my photo enlarger. The add-on beeper has made darkroom life more enjoyable and cost-efficient—so, let's build one.

How It Works

The beeper is simple. A piezo buzzer sounds each second that the enlarger lamp is on. Line voltage is also routed to the add-on beeper through a cube tap. That line voltage turns on a 2N2222 transistor switch in the beeper. The 2N2222 switches on the 555 timer circuit by grounding an internal 9-volt battery. When the mechanical darkroom timer shuts off the line voltage, the enlarger lamp and the beeper turn off, for practical purposes, simultaneously.

Part of the 555 timer circuit was borrowed from Don Lancaster's *TTL Cookbook*.[1] I won't repeat Lancaster's very complete description of why the circuit works. All that's necessary is to note that the combination of R1 and C1 produces a beep about .1 second long. The 5k pot adjusts the beep's volume.

The 500k pot calibrates the timing cycle. This pot is carefully adjusted until 61 beeps are timed in 60 seconds. That's right, 61 beeps. When the enlarger lamp and the beeper are first turned on, a beep sounds. That's the extra beep. I really wasn't sure that I could live with that first beep coinciding with the enlarger lamp turning on. Now, after 7 months of use, I expect that first beep and compensate for it. Look at it this way: When you have 20 identical prints to make of the family reunion, it doesn't matter if you remember 5 beeps or 6 beeps as the time for burning in Aunt Lydia's face. What counts is that you consistently give her face that same extra exposure on each of the 20 prints if you don't want to waste paper. Whether or not you count that extra first beep is your decision.

Building the Beeper

Now let's build the beeper. My beeper shown in the photos was built on a printed circuit board. However, a 2"×2" square of perfboard or an etched and drilled Radio Shack IC board, catalogue number 276-024, makes construction simple. The important thing is to make certain that you

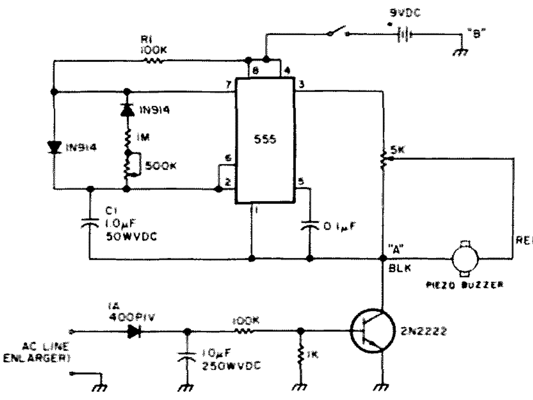

Fig. 1. Add-on beeper schematic.

assemble the parts in an *all plastic* box. That's a plastic box with a plastic panel. Do *not* substitute any of the multitude of boxes available with aluminum panels. The 110-volt-ac line is quite safe as long as it remains isolated inside the case. Aluminum panels could provide a dangerous path outside the box.

The circuit board and battery are friction-fit inside my case. Don't use metal screws to fasten the board to the box because of the shock hazard. Instead, glue the battery and board to the case with a few well-placed dabs of silicone rubber cement.

A word about parts. No, I don't manage a Radio Shack store or have stock in Tandy Corporation. The parts list has Radio Shack catalog numbers to help beginning builders. I'm certain that these commonly available parts can be found in most any ham junk box. Parts layout isn't critical, either. Observe the polarity of the piezo buzzer. The schematic is marked to show placement of the red and black leads.

Operation

I included a switch to turn off the beeper while focusing or composing under the enlarger. When you are ready to make that first print, turn on the beeper. Set the mechanical darkroom timer for your average printing time. I've standardized on 10 seconds. Never move the mechanical timer off the time you selected—in my case, 10 seconds. If you have a dense negative and must burn in parts of the print, simply press the mechanical timer's button again for another 10-second cycle and count off the extra time. You will probably find that the old mechanical timers are sufficiently accurate when used this way. Inaccuracies creep in when changing the time setting back and forth. For this reason it is much more accurate to set the timer and print as I described than it is to print for 10 seconds then reset the timer for another 5 seconds to burn in part of the print. Consistent dodging can be done by counting the beeps as you hold back underexposed parts of the negative.

Consistency and repeatability result from using the beeper and the "hands-off-the-timer" method. If you don't believe me now, wait until you finish that print order of 20 reunion pictures. Aunt Lydia will look the same on each print—guaranteed.

An Extra Added Bonus

Now that you've built the add-on beeper and love it, let's take it out of the darkroom. Remember that picture you tried to take last December of the Christmas tree and lights after dark in

Parts List

Quantity		Cat. No.	Price
1	Plastic box, 4" × 2-7/16" × 1-1/16" (Note: Box must be all plastic to isolate line voltage and prevent shock.)	270-221	$1.89
1	Piezo buzzer	273-060	2.99
2	Capacitors, 1 uF, 250 WV dc, mylar™ metal film	272-1055 ($.89 ea.)	1.78
1	Capacitor, .1 uF, 50 WV, disc	272-135	.79
1	Potentiometer, 500k	271-221	.59
1	Potentiometer, 5k	271-217	.59
2	Resistors, 100k, ¼ Watt, 5%	271-1347	.16
1	Resistor, 1k, ¼ Watt, 5%	271-1321	.08
1	Resistor, 1 meg, ¼ Watt, 5%	271-1356	.08
2	Diodes, silicon switching 1N914	276-1122	.20
1	Diode, 1 Amp, 400 piv	276-1103	.69
1	Timer IC, 555	276-1723	.99
1	Transistor, 2N2222	276-2009	.79
		Total	$11.62

Catalog numbers from 1982 Radio Shack Catalog No. 354.

the front yard? The Kodak *Professional Photoguide* suggests that with ASA 64 film and your camera lens set at f/8, a starting exposure is 5 seconds. Now, you could count "one-one-thousand, two-one-thousand . . ." or you could build a *second* add-on beeper to time that long exposure.

All you need is a PC cord to interface the beeper with your camera. Build another beeper *without* the ac line cord and transistor switching circuit. Cut off the end of the PC cord that mates with a flash unit and solder one PC cord wire to point A on the schematic and the other PC wire to point B. Plug the PC cord into the camera, set the shutter to Bulb, and hold open the shutter for an audible 5 seconds or 6 beeps.

Bracketing is just as easy as counting more or less beeps either side of the recommended starting exposure. Think you can count 5 seconds pretty accurately to yourself in your head? Well, the beeper might come in handy when making a picture of, let's see, a "moonlit snowscape." According to the *Professional Photoguide*, that's about 70 seconds at f/4, with Kodachrome 64 film.

Hmmm . . . Now if I want to bracket, that's 140 seconds and 35 seconds, but then I have to take into account reciprocity failure, so . . . Or was that 141 beeps and 36 beeps? Anyway, the important thing is to build a second beeper without line cord and interface it with your camera. That way there won't be any shock hazard.

The circuit is simple but the beeper works quite well. Build one and stop filling your darkroom wastebasket with printing paper. Instead, start thinking about where you're going to put that new tribander with all the money you save. ■

Peak Your Picture With Home-Brew SSTV Test Gear

Go from gray scale to color bars with these simple generators. No monitor should be without them.

In my spare time I enjoy viewing slow-scan television on my home-brew monitor and like to keep up to date with advances in this field. Also, I enjoy designing with all types of integrated circuits, CMOS in particular. Thus, I have combined these two interests into the two projects described here. Each generator has nine ICs and few other components and both can be built for well under $100.

The SSTV gray-scale generator is used as a standard to adjust brightness and contrast levels on commercial slow-scan monitors and to peak sync and bandpass filters on home-brew equipment. It also can be used to check repairs or modifications on any monitor.

In addition to the above-mentioned operations, the SSTV color-bar generator is useful when selecting red, green, and blue filters for color slow-scan photography. It provides a pattern with these colors plus mixtures of them into blue-green, violet, yellow, and white.

Gray-Scale Generator

The MM5369 is a crystal-controlled oscillator providing a square wave at 3.58 MHz. This signal is divided by a factor of 10 through each of the 4017 dividers. A 35.8-kHz signal is present on pin 9 of the 4520 binary divider. A binary code is fed into the 4514 decoder.

Meanwhile, the 4069 clock provides a 240-Hz square wave to pin 1 of the other binary divider in the 4520 package. Here, the binary-coded output selects one of the 16 available input pins from the two 4051 digital selectors and passes reset information from the 4514 decoder through pin 3 of both 4051 ICs to the reset pin (pin 15) of the first binary divider.

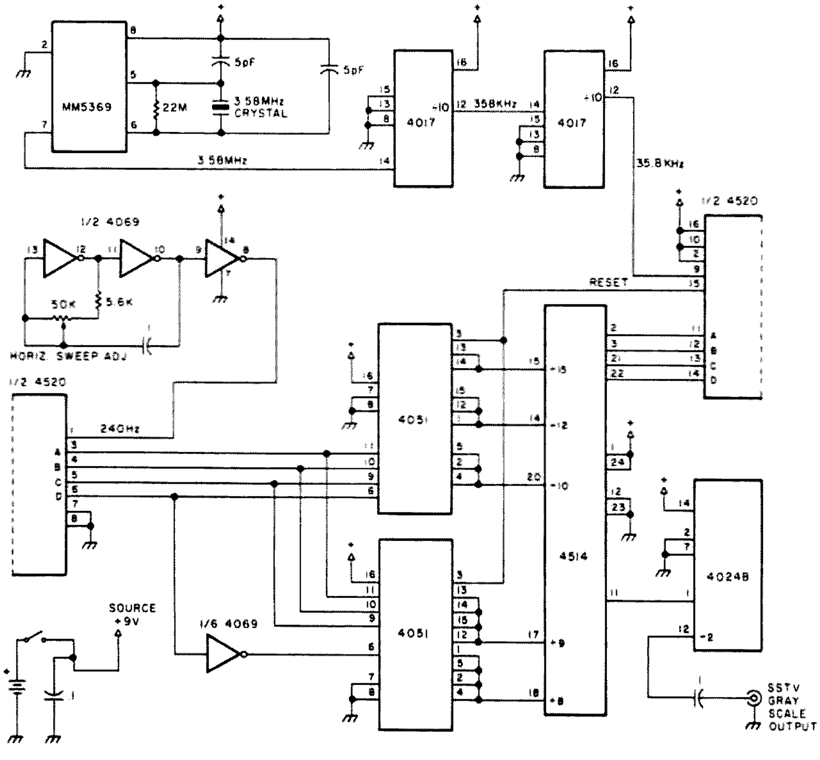

Fig. 1. CMOS SSTV gray-scale generator.

As the 16 input pins are swept through (top to bottom on the schematic), the 35.8-kHz frequency is divided by factors of 15, 12, 10, 9, and 8 respectively. This will constitute one scan line on the monitor. The 4024B takes frequencies from the "0" pin (pin 11) of the 4514 and divides all by a factor of two. The result is an SSTV gray scale with frequencies within one percent of 1200, 1500, 1800, 2000, and 2250 Hz. All are 50/50 duty-cycle square waves so gray-scale shades will result only from changes in frequency. The only adjustment necessary is horizontal sweep speed.

Color Bars for SSTV

The same general operation of the gray-scale generator can be redesigned to give us the three frame patterns necessary to produce, photographically, a slow-scan color-bar frame.

We start again with a 3.58-MHz oscillator and divide by a factor of 100, this time in a single 4518. A 35.8-kHz signal is fed to pin 9 of the 4520 and a binary-coded output is available at the address inputs of the 4514. Also, a clock frequency of 120 Hz is provided at pin 1 of the 4520 and a binary code is presented to a single 4051.

The action of the 4051 and the two sections of the 4053 can be described as switches in series. Binary data on address pins 9, 10, and 11 of the 4051 and control pins 9 and 10 of the 4053 will route data from the 4514 pins 15, 14, and 18 to pin 15 of the 4520. The timing of these connections will produce horizontal and vertical pulses as well as full cutoff and saturation (black and white) bars when viewed on the monitor. When looking at the three frame patterns, one can see a relationship forming between the width of the bars and the square-wave frequency at the RGB select switch.

A 555 timer is used as a 98/2 duty-cycle clock to control pin 10 of the 4053. This clock and the bottom 4053 switch provide a vertical sync option for the generator. For about two scan lines worth of time, the generator will produce a 1200-Hz tone. The monitor will look at this tone as a vertical sync pulse.

The 4013 is a divide-by-two stage that operates identically to the 4024B in the gray-scale generator. The output inverter is not necessary if one has a "B" series 4013 device.

Going Further

The heart of these audio-tone generators can be a good starting point for other projects. Add a memory (ROM) and send graphics or your call letters without a computer. Build a flying spot scanner, vidicon camera, or a totally solid-state SSTV camera with the new Reticon photodiode arrays (see *Radio Electronics*, March, 1982, page 75). ■

Op Art

Include the ubiquitous op amp in your next circuit. KCØEW tells how.

When the Linear IC Hall of Fame is established, it's a pretty safe bet that among the first to be inducted will be the operational amplifier, or op amp. From the venerable 709 and 741 to the latest wideband wonders, this class of component has found its way into more circuits than practically any other chip.

The op-amp IC has made possible designs that would have been prohibitively expensive or complex just a couple of decades ago. You can filter with them. You can amplify with them. You can add, subtract, multiply, divide, integrate, buffer, mix, and oscillate with them. And if you can learn just a little bit about how to use these versatile gizmos, you'll find that design challenges that looked almost impossible can be simple—with some imaginative use of "Op Art."

Simply put, an operational amplifier is just a very high gain voltage amp with high input impedance and practically no output impedance. A typical op amp will show a voltage gain of several hundred thousand, with an input impedance in the megohms.

On a schematic they're not much to look at—Fig. 1 shows the ubiquitous triangle symbol of the op amp. The inputs are marked + and −, denoting the inverting and non-inverting inputs, respectively. The output is at the tip of the triangle.

The op amp is really a differential-input device, meaning that the output is an amplified version of the voltage *difference* between the two inputs; the + and − symbols merely give an indication of the polarity, or phase, of the output with respect to the input. Both inputs must be used for the output to do anything meaningful.

So we've got a part which will amplify a voltage by a hundred thousand times or more. Seems like just the thing for a stage with lots of gain, right? Just think, we'll feed the input a few millivolts (maybe from that turntable over there) and drive our speakers directly from the output!

Well, not quite. The op amp isn't meant to be a power amplifier, and that hundred-thousand gain simply isn't usable in this fashion. This gain figure, called the *open-loop* gain, is very important but not like this. The op amp, or any other single stage with this much gain, tends to be very unstable when run without something to keep it under control. That doesn't mean that all this gain is useless; we've just got to find the right way to apply it. The thing that makes the op amp's huge gain very desirable (and the key to most op amp applications) is the principle of *feedback*.

Feedback simply means that we're going to take a small portion of the output of a given stage (or series of stages) and return it to the input. Feedback can cause an otherwise stable circuit to suddenly go into violent oscillation—as anyone who's ever spent some time with PA systems knows! The squealing heard when a microphone is placed too close to the speaker it's driving is an example of *positive* feedback—the output signal is returned in-phase with the input, adding to it and driving the system farther and farther into oscillation. But if you return the output so that it is out of phase with the input, in *negative* feedback, you can actually improve the stability of the circuit. Here's how it works.

Consider the simple block diagram shown in Fig. 2. The triangle here is used to indicate some amplifier (not necessarily an op amp) with a voltage gain of A. This means that the output voltage is A times as big as the input voltage (V_{in}). V_{in} is applied to the amplifier so that it appears as the voltage *difference* between the two input leads, so we're still talking about a differential amplifier.

So far, no big deal, right? But suppose we add a block which returns a part of the output back to the input, as

EQUATIONS

1. $V_a = V_{in} - FV_{out}$
2. $V_{out} = AV_a$
3. $V_{out} = A(V_{in} - FV_{out})$
4. $V_{out} = V_{in}(A/1 + AF)$
5. $V_{out} = V_{in}(A/AF)$
6. $V_{out} = V_{in}(1/F)$
7. $V_{out} = V_{in}[1/(R1/(R1 + R2))]$
8. $V_{out} = V_{in}(1 + R2/R1)$
9. $V_{out} = -V_{in}(R2/R1)$
10. $V_{out} = -[V1(RF/R1) + V2(RF/R2) + V3(RF/R3) + \ldots]$
11. $V_{out} = (V1 - V2)(R2/R1)$

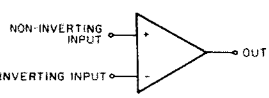

Fig. 1. The symbol for the op amp.

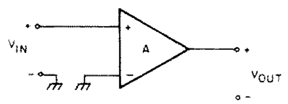

Fig. 2. An amplifier with a voltage gain of "A."

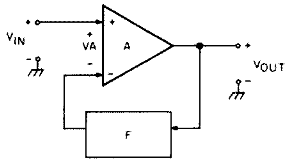

Fig. 3. An amplifier with feedback.

in Fig. 3. Here, the block marked F is doing just that. We'll use F as the gain of this block, saying that F times the output is fed back to the input. In Fig. 2, the output was just an amplified version (A times) of the input. But what's happening in this new arrangement?

Well, the output of the amplifier—the triangle stage—still has to be A times as big as the input. But the input to the amplifier is no longer just the input signal, V_{in}. The input to the amp—the voltage difference between the two input terminals—is now the difference between V_{in} and F times the output. If we call this signal V_a (for voltage at the amplifier), we can write Equation 1 (see box).

It is this combined signal that the amplifier block is working with, so the amplifier output (and the output of the whole thing, since they're the same) must be A times V_a (see Equation 2).

What we'd really like, though, is some relation between the original input signal (V_{in}) and the output. Well, Equation 1 gives us V_a in terms of both of these, so we can get rid of that pesky V_a just by plugging in the right side of 1 for V_a (see Equation 3).

This says that the output depends on both the input and itself. (Well, what did you expect with feedback?) A few more algebraic tricks: dividing both sides by V_{out} and rearranging gives us Equation 4.

This might not look all that impressive at first glance (heck, it might not look that impressive at *second* glance), but let's think a bit about what it means. Remember, A is the gain of

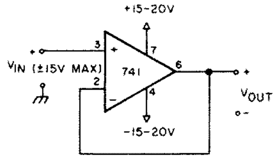

Fig. 4. A non-inverting buffer.

the triangle block in Fig. 3—the amplifier proper—and F is the gain of the feedback path around the amp. Since we know we're trying to find some use for a large gain amp, what happens if A in this equation becomes very large?

If A is a large number, then A times F must also be a large number, at least until F gets pretty small. And if A times F is large, then adding one to it shouldn't change it very much—I mean, 100,000 and 100,001 are pretty much the same, right? So in Equation 4, the 1 + (A × F) might just as well be simply A × F—the added one isn't going to make much difference one way or another. Well, if we drop the one we get Equation 5 which then, dividing through by A, results in Equation 6.

Now, *that's* something we can use. What this has all boiled down to is the fact that *if* our assumption about A × F being large is true, then the output does *not* depend on the actual gain of the amplifier at all! As long as the gain of the amplifier (A) is large enough to make A × F much bigger than one, the output of this whole gadget will depend only on the input and the gain of the feedback path, F. The gain of that path might actually turn out to be a loss; if F is one-fifth, then V_{out} will be five times the amplitude of V_{in} regardless of the actual gain of the op amp we use to build it!

What's actually happening here is that we're comparing a part of the output to the input and getting a signal (V_a) which is a measure of how far off the output is from the desired signal. V_a is an "error volt-

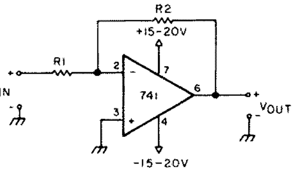

Fig. 5. An inverting amplifier.

age." If V_{out} were an exact copy of V_{in}, just five times bigger, and we compare V_{in} with one fifth of V_{out}, we would expect an error voltage of zero. This is how negative feedback controls the output of the stage.

As an example, look at Fig. 4. Here, F is one; all of the output is being fed back to the input. This says that the output will be an exact copy of the input. This circuit, called a *non-inverting buffer*, is useful for picking off a sample of a certain signal without loading down that signal's source—remember, the op amp has extremely high input impedance. If you'd rather get an inverted version of the signal, you can use the *inverting amplifier* circuit of Fig. 5, with R1 = R2. (Actually, Fig. 4 is a special case of the *non-inverting amplifier* shown in Fig. 6—it just has R2=0 and R1 infinite.)

Figs. 5 and 6 show how feedback is applied for the cases of inverting and non-inverting amps. Fig. 6, the non-inverting amp, is probably the easiest to understand: R2 and R1 form a voltage divider and the voltage across R1 is what is compared to the input. So, for this case, the F of our earlier equations is simply the voltage divider, and we can write Equation 7.

Equation 8, a rearranged Equation 7, is the usual way

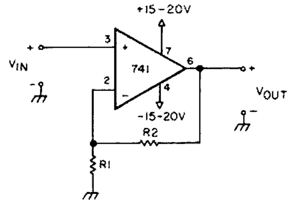

Fig. 6. A non-inverting amplifier.

of expressing the gain of this configuration. The inverting case is a bit more difficult to see since the feedback isn't in series with the input signal. But if you think of it in terms of current—the amount of current required through R2 to produce the same drop as a given amount through R1—then it looks like F will simply be the ratio of these resistances, and we get Equation 9. The minus sign shows up because this is an *inverting* amplifier—V_{out} is reversed from V_{in}. Notice that these circuits give us a quick and easy way to build voltage amplifiers with gains set simply by the proper selection of resistor values.

There are a couple of other things we can do with the inverting amp that you might be interested in. Since the gain is set by the ratio of the two resistors, we can use the circuit of Fig. 7 as a *mixer*. The output will be the sum of the input signals added in proportion to the ratio of their input resistor and the feedback resistor (see Equation 10). The input resistors might even be variable, as in Fig. 8, so that you can change the level of each signal simply by adjusting the proper potentiometer. This circuit could form the basis for an audio mixer for your home-brew PA system.

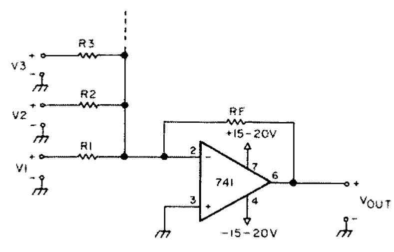

Fig. 7. An inverting amplifier used as a mixer.

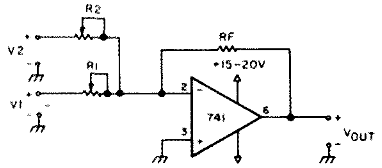

Fig. 8. Make the input resistors variable and you have the beginnings of an audio mixer.

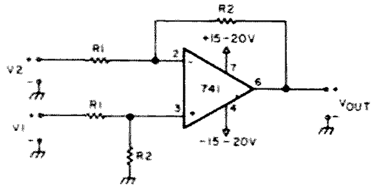

Fig. 9. A differential amplifier.

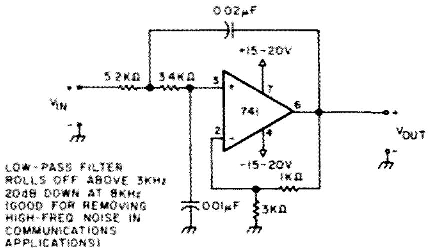

Fig. 10. A simple active filter.

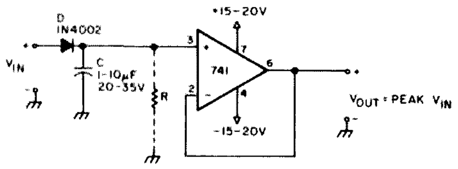

Fig. 11. A peak-detecting circuit.

Another interesting use for the op amp is the differential amplifier shown in Fig. 9. This circuit's output is related to the difference of the two input signals, V1 and V2. Note that the corresponding resistors on either side of the circuit are equal in value—R2A equals R2B, etc. The amplitude of the output is still set by the ratio of the resistances, and is expressed in equation II. This circuit can also be used for level shifting, if one of the inputs is fixed to a reference voltage.

But why limit ourselves to just resistances in the feedback loop? If we use some reactive components in this path (capacitors and inductors) we should be able to come up with a circuit whose output depends on the frequency of the input signal—in other words, a filter. Active filter design is a topic which can (and has) filled textbooks, but Fig. 10 shows a sample circuit to demonstrate the op amp's use in this area. Active filters turn out to be much simpler to design and build than their passive counterparts, due to the ease of isolating sections of the filter and the elimination of the need for inductors.

A couple of applications show some other uses of the op amp's characteristics. Fig. 11 is a *peak-detecting* circuit. Here, the capacitor charges to the peak voltage present at the input and stays there since it has no place to discharge. Remember, the input impedance of the op amp is very high, so it doesn't present much of a path for discharging the capacitor.

You should recognize the way the op amp is connected here—it's just the buffer from Fig. 4. One might place a resistor across the capacitor so that the cap will eventually discharge. The bigger the resistor, of course, the longer the cap will take to discharge and the closer the output will remain to the peak value. This circuit can be useful in tailoring meter responses, such as slowing down the response of some of the new bar-graph displays so that you can follow them more easily.

This should give you some idea of how to use the op amp for various jobs, and maybe already you can think of some applications for the circuits I've shown. There are, though, a few practical considerations to keep in mind.

First, the op amp usually will require both positive and negative supply voltages (though not always—see National Semiconductor's *Linear Databook* and *Linear Applications Handbook*). These supply voltages must not exceed the rating for the part you're using and will always limit the maximum amplitude allowed for the output. Make sure you're not asking for so much gain that you'd exceed this limit, or the output will clip at the maximum.

Also, while most modern op amps include some form of current limiting on the output, try not to use it. Keep your circuits running so that the op amp is running well within its maximum current-limit spec.

You should also be aware of the bandwidth and slew-rate limitations of the part you're using. *Slew rate*, usually expressed in something like volts per microsecond, is a measure of how fast the output voltage can change. This will determine how well the op amp can track signals at high frequency.

Compensation is another subject that often comes up for discussions of op-amp circuits. Here, I'm going to have to refer you to the manufacturer's data sheet for the op amp you're using. Some parts are *internally compensated*, while others will require that some external components (usually a resistor and capacitor in series) be added for compensation. All compensation means is that the frequency response of the amplifier is being adjusted to ensure that it will operate properly over the desired frequency range. This can be tailored to suit the application, but for now you're safest sticking with the recommended compensation for the part you're using. The 709, for example, wants around 2000 pF and 1.5k Ohms in series across its compensation leads; the 741 is internally compensated and needs no external components.

As with most ICs, supply bypassing is always a good idea—and don't forget you've got *two* supplies to worry about. A ceramic capacitor from each supply lead to ground, say around 0.1 uF, should be about right. You might want to add more, maybe a 10- or 20-uF tantalum if you're a good distance from the filter caps in your power supply or if you run into noise or oscillation problems.

The applications for the operational amplifier are practically innumerable—so go right ahead and see what you can do with your own version of Op Art. ■

Put the DX World on a Screen

Everything you need to know about a country can be at your fingertips. All you need is a VIC-20 and this program.

How many times have you been sitting at your receiver listening to the DX come in when you suddenly heard a prefix that you couldn't identify at all? Well, if you own a VIC-20 with at least an 8K expansion cartridge or an Apple II Plus, your worries are over. With this program, all you have to do after loading it is enter the prefix at the keyboard and a variety of pieces of helpful information will appear on your screen.

Immediately available to you will be the name of the country, its latitude and longitude, prefix, antenna bearings, and distance in miles and kilometers. At the touch of another key, the computer will check for any other country listed by the same prefix. If you still are unsure of the location of the country, the computer can indicate which countries border the one in question.

In the Apple program, many of the major cities in the United States and around the world are included in the data so that you can determine exactly how far it is to New York, Denver, Colorado, or even Paris, France. In the program for the unexpanded VIC, only major US cities have been included in the data. A useful feature of this program is that the user can customize it for individual needs. If you are a VHF enthusiast, you can enter cities located within your listening radius.

Adaptability

The locator program can be adapted to almost any size of memory from the VIC-20's small 3.5K to the Apple II Plus with its 48K. I have found that in order to get all the prefixes in the world excepting the US, one needs at least 11773 bytes, or 12K of memory.

With this program, bearings and distances can be figured by the latitude and longitude on the keyboard. In this mode, the computer can perform a search and identify the countries located around your coordinates. Another feature of this program is that if you enter the name of a country or island on the keyboard, the computer can tell you where the country is, its prefix, antenna bearing, and distance. At the touch of a key, the country's alternative prefix is provided, if it has one.

Program Run

After loading the program, type in the RUN command. At this time you will be presented with the following main menu with four selections: (1) Country or City, (2) Prefix, (3) Latitude and Longitude, and (4) Quit.

For our first example, let's take selection (1). Keystrokes: 1<RET>. Now you will be asked to enter the name of a country or city. Enter the name of the country in question. For our purpose, enter ITALY. Keystrokes: ITALY <RET>. The screen will clear. Then the flashing prompt SEARCHING DATA will appear. If the information is not found, the screen will clear, a prompt will say END OF DATA, and the program will return you to the main menu. If the data is found, the screen will clear and the information will appear.

First will be the name of the country. Next will be the latitude and longitude, followed by the prefix, antenna bearings, and the distance in miles or kilometers. At the bottom of your screen will be the prompt (F7)=SEARCH DATA OR HIT ANY KEY. If you press any key, you will return to the main menu. If you press the F7 key, the computer will search for any other listings for the country entered. If there are none, the program will return to the main menu. If there is another prefix, the alternative prefix and the country's data will be provided.

Now let's go back to the main menu again. Let's pick the second selection. Keystrokes: 2<RET>. You will now be asked for a prefix. For our example, let's use TT. Keystrokes: TT<RET>. Again the screen will go blank and the prompt SEARCHING DATA will appear. When the data is found, the prompt will stop flashing, the screen will clear, and the information for the Republic of Chad will appear. If you press the

F7 key, the computer will search for any other countries listed by the prefix TT. Finding none, the computer will return to the main menu.

For the third selection, keystroke 3<RET>. The screen will clear and then a prompt will appear asking for latitude. If it is a north latitude, enter the number as a positive number. If it is a south latitude, enter it as a negative number. For example, let's use negative 45 degrees. Keystrokes: −45 <RET>. If you enter a number larger than 90 or less than negative 90, you will get an error message and be asked for the information again. The program, as we say in computer language, will not crash.

After you have entered the latitude and pressed the Return key, another prompt will appear requesting the longitude. Enter east longitude as a positive number and west longitude as a negative number. For our example, enter a positive 120 degrees. Keystrokes: 120<RET>. The computer will not accept any number larger than a positive 180 or less than a negative 180. A prompt will appear to ask you if your data is correct. Enter either a 1 for Yes or 2 for No. If you type a 2, the program will ask you for the correct latitude and longitude.

Our data is correct so you can press 1. The screen will display the latitude and longitude, the antenna bearings, and the distance in miles to the coordinates you have entered. At the bottom of the screen you will find the prompt (F7)=SEARCH DATA OR HIT ANY KEY. Any key will return you to the main menu. If you press the F7 key, this screen will first clear and this prompt will appear: I WILL SEARCH MY FILE FOR DATA ON LOCATION NEAR YOUR COORDINATES. HOW WIDE OF SEARCH IN DEGREES? You can enter any number between 1 and 360. Let's enter 20. Keystrokes: 20<RET>. The computer will go through its data file and locate any coordinates within 20 degrees of the search area. If the computer finds any country around the entered coordinates, it will stop the search and print the data on the screen. If you press the F7 key again, it will continue the data search for another country around your coordinates. When the program comes to the end of the data file, the screen will clear and the prompt END OF DATA will appear and return you to the main menu.

The last selection on our menu is number 4. I do not think this needs any explanation.

Now that we have been through the programs, let me point out a few things. First, when entering a city or country name, it must be spelled correctly. If the country in question is an island, it needs to be entered as such, e.g., CAICOS IS. Secondly, when entering south, north, east, or west, there should be no space between the abbreviation, the period, and the name, e.g., W.SAMOA. Whenever the word Saint is used, it should be abbreviated as ST, e.g., ST. VINCENT IS. This is done to conserve as much memory for data statements as possible.

I chose Basic for the program because of the language adaptability, and this makes it easy for the user to customize the program for special needs. A big gun DXer may want prefixes from around the world while the net operator may want only cities across the nation.

The program design is as simple as I could make it to accommodate a lack of memory. Rewriting the program for the Sinclair, Atari, or the TRS computers should not be difficult. As you look through the listing, you will notice a few special characters. These generally concern the screen display. For a definition of some of the VIC special characters, refer to the sample run accompanying this article.

For a look at how the program works, start at line 10. Line 10 is where the main menu is printed. Line 24 is a very important line. This is where the user puts his information concerning his location. CLR will clear all variables. RESTORE returns the data pointer to the start of the data statements. The variable A is the latitude of the user's QTH. L1 is the variable for the user's longitude and SP$ is the name of the user's city and state. Line 25 is the input line for your selection from the main menu and line 26 sends the program on its way.

Line 50 is the start of the routine for entering the name of the city or country. C$ is the name of the country we are looking for. Line 55 is the gosub that sends the program to the read statement and a line of data is then read. After the data is read and the variables Z$ prefix, L$ name of the city or country, B latitude, and L2 longitude are filled in, then the program compares the L$ and the C$. If the L$ and C$ are the same, the program goes to subroutine 500 and then to line 200, the display routine. If the variables are different, the computer reads another line of data.

Line 57 checks to see if all data has been looked at. If it has, the program goes to line 250 and does an end-of-data routine. Lines 60 through 64 work the same as lines 50 through 58 except that the variables H$ and Z$ are compared for a match.

Lines 70 through 84 are the routine for entering the latitude and the longitude. Lines 85 through 110 are the area where I put the gosubs. Line 85 is the error message for whenever the user inputs data the computer cannot use. Line 100 is the flashing SEARCHING DATA prompt and the read statement. Line 110 is a delay loop.

Lines 200 through 227 contain the routine which displays the information after it has been processed by the math subroutine located on lines 500 through 900. Line 200 prints the value of L$, the name of the state or country. Line 201 prints the latitude, B. Line 202 prints the longitude, L2, and line 205 prints the prefix, Z$. Line 210 prints antenna bearings, R2, derived from the math routine. Line 215 prints the name of the starting point, home QTH, and the distance in miles from SP$. Line 220 prints the distance in kilometers from SP$. Line 224 prints the prompt at the end of the display, (F7)=SEARCH DATA OR HIT ANY KEY.

At this prompt, the program waits for you to press a key. If you press the function key, F7, the program will go into the search routine depending on what selection you choose from the main menu. Lines 227 through 230 take care of this function. If you press any other key, the program will return to the main menu, line 232.

Lines 235 through 244 are the search routine used for main menu selection number 3, the latitude and longitude. Line 239 checks for the end of data. Lines 240 through 243 filter the value of the latitude and longitude read in the data statement. If all conditions are met, the value of the variables is filled from the math routine (lines 500 through 900) and forwarded to the display routine. Line 250 is the executed line whenever the data read statement reaches the end of the data (line 3000).

Math Routine

The math routine was derived from two sources, the *ARRL Antenna Handbook* and a math routine used in a program published in *The Giant Book of Computer Software* (1st Ed., pp. 264-265). I made a lot of changes in order to save memory, but basically it works the same. The math routine is

Sample run.

verts L and B to radians. The remainder of line 610 computes the distance angle, looks at its value, and checks to see if it is positive. If P2 is less than 0, 180 is added to its value (line 645).

After P2 is taken care of, the program moves to line 650. Line 650 computes the distance in miles and kilometers. Line 655 computes the bearing angle and converts bearings to degrees rounded to nearest tenth. Lines 670 and 675 determine which quadrant the bearing angle is in and adjust the degrees. Line 680 makes some adjustments to the value of B2. Line 690 makes adjustments to the value of R4. Lines 710 through 865 perform any necessary adjustments to the value of R2, the bearing angle, and send the program to line 900. This is the RETURN statement used to send the program back to the main program after performing the subroutine.

I have not gone into a great deal of explanation of the math routine as the purpose of this article is not to explain the geometry. If you would like a better explanation of this subroutine, I suggest you consult the *ARRL Antenna Handbook* or any other advanced math book.

Conclusion

I hope this program can be of help to some of you. I have used it a lot. I have needed to make some simple changes in the data statements, but I have attempted to keep the program simple enough so that changes can be made easily. I know that this program will have to be updated occasionally. I used the most current information available. Most of the locations are figured to the center of the country, give or take a degree. Most of the small island latitudes and longitudes have been taken to the tenth of a degree to make the data very accurate.

If you find that you do not have the time to type in the program, I will send it to you on tape for the VIC. The cost is $5.00, and I need to know the amount of memory you have. I also have this program for the Apple II Plus and the VIC-20 on disk for $9.00. (Checks should be made out to me at my address, above.) If you do take the time to type it in and run into trouble, write to me describing the problem you are experiencing and I will try to correct it. I know that no program is perfect.

There are many things that can be done to spruce up the program, especially the Apple version. My main goal was to keep it as simple and efficient as possible, but you can have some fun trying to spruce it up a little. You can always add more data as you expand your memory configuration. Have fun and good luck! ■

73 INTERNATIONAL

Each month, 73 brings you ham radio news from around the world. In this collection of reports from our foreign correspondents, we present the latest news in DX, contests, and events, as well as keep you abreast of the technical achievements of hams in other countries.

If you would like to contribute to your country's column, write to your country's correspondent or to 73: Amateur Radio's Technical Journal, *Pine Street, Peterborough NH 03458, USA, Attn: Jack Burnett.*

THE AUSSIE YL

How often we have heard the pileups and QRM disappear when a rare DX station says those magic words "Please stand by—there's a YL calling." Even those persistent callers, jammers, and deliberate QRM merchants who have, unfortunately, become a sad fact of life on amateur radio these days seem to go QRT when the ladies are transmitting. Maybe it is chivalry, or perhaps a mark of respect to these adventurous young ladies who have involved themselves in what was predominantly a male hobby in the early days of amateur radio. Every so often, a YL operator is heard who is a fine example of why we OMs have that respect.

Austine VK3YL

Austine Henry VK3YL is such a young lady. As a life member of the Society of Wireless Pioneers and as a member of 54-years standing with the Wireless Institute of Australia, she has the distinction of having the longest YL membership record. In 1930, Austine was awarded a trophy from the WIA for the best piece of home-brew gear in the local WIA home-brew competition.

1930 was an active year for Austine, as she also became a member of the ARRL on April 14, 1930. She has 30 years of membership in the RSGB, plus she has been a member of NZART over the last few years. Austine has really kept her finger on the pulse of overseas amateur-radio activities. No wonder she has many tales to tell of the good old days in radio.

When she received her first crystal set as a child, she immediately pulled it to pieces to see how it worked, graduating to valve [tube] sets that she made herself, gaining enough expertise to pass her experimental license exam on May 13, 1930. Only the third woman to obtain an amateur license in Australia, Austine became VK3YL.

As there was no commercial gear available for amateurs in those days, Austine learned at an early stage how to get the best out of a home-brew 1-Watt-input transmitter. To get the crystals for her sets, she used to do a tour of the city opticians, getting their broken or rejected quartz lenses, and, if successful, would hurry home with them to grind her own crystals.

With this type of equipment, Austine had her first CW contact into Belgium on September 30, 1931, with Baron de la Rouche ON4HM. To commemorate this contact, the Baron sent her a bronze replica of the Sacred Guardian Monkey of Mons. She also had a successful contact with a South African amateur in the early 1930s, using a UV199 tube fed with dry batteries, with less than 1 Watt of input power, in a portable situation.

Being an adventurous young wisp of a girl, Austine was fond of horseback riding and driving a little sports car, plus riding motor bikes. It was only natural, therefore, to take up flying. On September 6, 1933, she became the first woman admitted to the Royal Australian Air Force Radio Reserve, the training for which included flying around in a Wapiti biplane. This plane, although old, was very solidly constructed and was used extensively to train both pilots and radio operators, with the pilot in the front cockpit and the radio instructor and pupil in the back cockpit. With these cramped conditions, the student virtually had to sit on the instructor's knee (lucky instructor!). The main requirement for flying in these conditions was to stand up when you landed. Otherwise, it the landing was bumpy and you were sitting down, you could crack your skull on all the gear.

Austine was most upset that they would not send her to the war zone as a radio operator in one of the planes, just because she was a woman, but despite other commitments during WWII, she spent a lot of her spare time at the WIA on a volunteer basis, instructing service personnel and others in the art of Morse code. It was not unusual for Austine to take them into her own home for free private tuition so that they could pass their exams.

After WWII, Austine maintained her interest in amateur radio, with a particular interest in DX. One of her most interesting contacts was in 1957 with Michael FO8AP/MM, on the ill-fated Tahiti Nui raft expedition between Tahiti and Chile. This expedition ended up 600 miles short of Chile when the raft broke apart after a week of storms. Michael was using a transceiver with 1 Watt of input power at that time. Can you imagine trying to send SOS, plus your position, on a raft of 20-inch logs that are breaking apart in the middle of the ocean with 30-foot waves pounding down on you? That would definitely take a steady hand on the key.

CW is a mode at which Austine has remained very proficient, proof of this being her entry to the DXCC Honor Roll as the first and only Australian YL to gain this achievement, but this is only one of Austine's many firsts in the field of amateur radio. Up until 25 years ago, Austine was using only a 40-meter Zepp antenna, graduating to a half-wave centerfed dipole, but in the last few years she has upgraded her antenna system to a triband beam. Her transmitters have graduated from home brew, to converted surplus WWII equipment, to these days, when she is using Drake equipment.

Austine Henry VK3YL.

Austine is quite proud of some of her earlier award achievements, some of which are: the first to work WAC-YL, Certificate No. 22 for the YL-DXCC from Canada (hand-printed in gold), and from Heather Mitchell VK3AZU (the designer of the Alara award), a certificate for being the first VK YL to receive this award.

Those are only a few of the various awards Austine has to her credit. She is also a foundation member of Yasme, winning Certificate No. 7 in the prestigious Yasme award, one in front of the famous Don Wallace W6AM who got Certificate No. 8 in 1980.

What more can be said about a woman who, after 54 years of amateur-radio operating, is still heard in the pileups, keeping her operating techniques in CW and SSB sharp, just in case there comes on the air one of the four countries she still needs to have worked the lot.

88s, Austine!

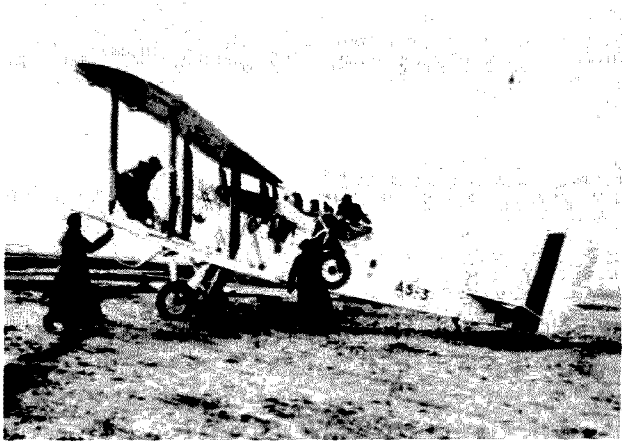
CB RADIO

CB radio has been both a blessing and a curse to amateur radio in Australia. It started with the truckers in the Blue Mountains of New South Wales (VK2), where it was put to good use as a safety device on the narrow, steep hills, but with the showing of the film *Convoy*, all of the rest of Australia became aware of what was to become a loss of 27 MHz to amateur radio in Australia and a headache for our Department of Communications, but a boom for amateur radio.

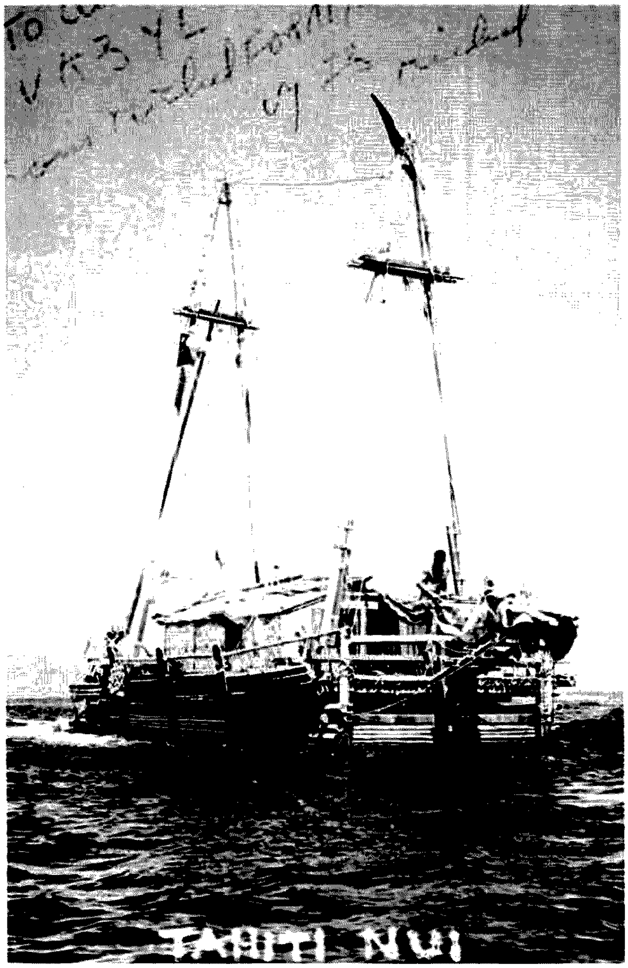
With the interest created by CB, it did not take long for people to realize that with ever-increasing chaos on 27 MHz, there had to be something better in the field of communications. It is here that both the Wireless Institute of Australia and the DOC, to their credit, got together with the result being a Novice class of amateur license.

To pass this, you had to answer a 50-question, multi-choice paper on relatively easy electrical laws, operating procedures, and basic radio theory. You also had a 30-question paper on rules and regulations (multi-choice). Your CW test was at 5 wpm, send and receive.

If you passed this exam, you were allowed to operate both SSB and CW on a section of 10, 15, and 80 meters, with a maximum power output of 30 Watts PEP. A few countries have been thinking of also



Point Cook, 1933: The Wapiti in which Austine 3YL/3D6 made her flying debut. (Picture given to her by Jim 3NY/3B6.)



The card sent to Austine by Michael FO8AP/MM who, here in 1957, is looking over the rear of his raft.

introducing a similar Novice-class license and, going by the upsurge in amateur radio in Australia, it would be a good thing, as up until the advent of CB and the Novice-class license, the amateur-radio scene in Australia was virtually stagnant.

As an example, going by WIA membership (which has remained at approximately 60% of the total amateur population), from 1963, with 3,500 members, to 1973, there was an increase of 1,000 (28%), but by 1983, with the advent of CB and the Novice license, there was an unprecedented upsurge in new amateurs and membership was 8,500. That represented a 53% 10-year increase, nearly twice that of the previous 10-year period.

However, like everything else in life, you get nothing for nothing. The cost to the amateurs so far has been the loss of the 27-MHz band and, with retailers down here now quite blatantly advertising CBs with a frequency coverage of 26.965 to 28.805 MHz in 5-KHz steps, how long before we also lose 28 MHz?

"It will never happen," I hear the oldtimers saying into their 807s, but the CB fraternity in Australia now legally has 40 channels and no restrictions on antennas (six-element beams are quite common) plus freely-advertised linear amplifiers of up to 600 Watts output for 27 MHz. What happened to the legal limit of 12 Watts PEP for CB? The CB operators in Australia also enjoy a section of the UHF band quite legally, with access to repeaters and, believe it or not, freely-advertised linear amps for UHF.

I would not be surprised if in the near future, due to our archaic import and resale laws in Australia, 14-MHz sets appear for resale, as it is quite legal to import and retail any type of equipment providing it is not dangerous to health or does not interfere with emergency services. A CB operator can quite legally buy himself an FT-902DM with an FL2100Z linear, connect it to his 6-element monobander and, unless he causes interference (with a resulting visit from the overworked DOC investigator), can operate illegally to his heart's content.

That is the negative—but worth thinking about—side of the CB input to amateur radio in Australia.

The positive side has many pluses. It is not unusual to hear on the CW section of the Novice band a couple of Novices rattling away on CW at 20 wpm; some are even faster. These speed merchants on the key usually are ex-service signal personnel or postoffice telegraphists who, over the years, have forgotten all about radio but, with the advent of the Novice license, have found that with a little study on solid-state basics, they can get back into the communications field. As most of these gentlemen are now retired, they tend to study and get their full-call license. The result is that many ex-signal ops of the various services during WWII now get on the air with their own net frequencies to chew the fat about old times.

We also have the lifetime SWL who could not pass the previous license test for the full call, but now, due to the Novice license, with a bit of study is able to transmit to stations he has logged as an SWL over many years.

In conclusion, due to the upsurge of CB radio we have had both gains and losses, and only time will tell if it has been good for amateur radio in Australia. I do personally feel, however, that with the advent of the latest toy, namely a cordless telephone with a 9-km range (together with other as-yet-untested frequency damaging devices being imported into this country), we may suffer an unprecedented interference problem on the amateur bands and commercial frequencies.

The extent of such interference could be such that the Department of Communications (DOC) may have some difficulty in controlling it, as in past instances with 27 MHz. There is some ray of hope, however, since at this very moment a new Act of Parliament (Radio Communications Bill) is in the final stages of debate and is expected to pass the Senate shortly. When this occurs, the Department of Communications will have little difficulty in obtaining a prosecution against illegal operations, since the mere possession of transmitting equipment without a license or just cause will be an indictable offense.

QSL BUREAU

The Brazilian amateurs who are members of the League (LABRE) may use the QSL Bureau to send and receive their QSL cards, free of charge. In this way, each QSL Bureau handles thousands of cards monthly and it is easy for us to spread out our QSL cards around the world. Inside Brazil, the service is very good and fast. The QSL travels from one Bureau to another in only one day.

Working so well, it is not difficult to receive a Brazilian card via the Bureau after a short time. Foreign amateurs may also send their QSL cards to Brazil, addressing them to the OSL Bureau when they are not able to find out the right direction. The QSL Bureaus are located in all capital cities (see box). The main one is in Brasilia, the Federal District.

RESULTS OF THE HUNTING LIONS ON THE AIR CONTEST—1983

The principal objective of this contest is to create and foster a spirit of international understanding and cooperation among Lions and ham-radio operators through worldwide communications. The contest is held in tribute to the birthday of Melvin Jones, the founder of Lionism. It is sponsored by Lions and coordinated by the Rio de Janeiro (Arpoador) Lions Club.

About 13,000 contacts were made among stations located in 114 countries. In the Single-Operator Class—Phone, the winner was VK6NO, followed by K7OX, ZD8JD, ZL1SZ, and PY1BPE. In the Single-Operator Class—CW, the highest score was for the very well-known operator Tim Chen BV2A, followed by PY2ASV, OH6OC, K4EBT, and OH9SV. For the Club Station Class—Phone, the winner was GJ3DVC, the Jersey Amateur Radio Society, and in CW, CT1ARS, the Southern Radioamateur Association of Portugal.

MCG AWARD

Sponsored by the Morse Clube Gaucho (CW Group), the MCG Award is available to all licensed amateurs for confirmed contacts with 5 (five) different MCG members. Contacts must have been made after May 1, 1980, on any amateur band, only two-way CW mode. No QSLs. Send GCR list of stations worked (call, date, time, band, mode, and report) and 5 IRCs for mailing expenses to: MCG Bureau, PO Box 2180, 90000 Porto Alegre, RS, Brazil.

For SWLs, the same rules apply.

MCG members: PY3AVF, PY3AZL, PY3AKS, PY3AZ, PY3AO, PY3BC,

PY3BYC, PY3BVI, PY3BOG, PY3BCD, PY3CMH, PY3CJI, PY3CFD, PY3CMZ, PY3CKI, PY3CNY, PY3COR, PY3CGJ, PY3CGW, PY3CEM, PY3FMC, PY3FJ, PY3FS, PY3HR, PY3HS, PY3JJ, PY3LIM, PY3MU, PY3OH, PY3OS, PY3PO, PY3PR, PY3SM, PY3TT, and PY3ZZ.

THREE STARS AWARD

Sponsored by the David Barros Scout Group, GREDB, the Three Stars Award is available to all licensed amateurs for confirmed contacts with 2 (two) GREDB members plus a contact with PY1EDB (the group station) and contacts with three different Brazilian prefixes. Contacts must have been made after January 1, 1962, on any amateur band and any mode. No QSLs. Send GCR list of stations worked (call, date, time, band, mode, and report), your personal QSL, and 10 IRCs for mailing expenses to: GREDB, PO Box 20033, 21022 Rio de Janeiro, RJ, Brazil.

GREDB members: PY1s ABK, AFA, AMG, ATR, AVV, AWA, AZF, BCZ, BON, BGI, BLG, BM, BPU, BUF, BV, BVB, CBG, CBW, CC, CCD, CCE, CCK, CCO, CDA, CGB, CKL, CKV, CKY, CLI, COA, CPC, CQV, CIP, DCO, DED, DIA, DWP, DMX, EEX, ELU, ENN, EHD, ER, FP, IP, IR, NE, RI, TBG, TBW, TCI, TFU, TFQ, TFW, THH, TNV, TOM, TPH, TPW, TTF, TTH, TUP, TUQ, UBX, UVP, USU, VBR, VIZ, VKK, VOP, VTU, VXO, WFR, WHO, WIO, WIR, WTA, XHK, XRI, XRX, XXP, YDQ, YJD, PY2BI, and PY4BCF.

JUBILEE OF LABRE

On February 2, 1984, the Brazilian Amateur Radio League (LABRE) will celebrate its 50th anniversary. The IV Brazilian Convention joining amateurs of the whole country will be held in Brasilia, the Federal District, for this purpose.

Besides the meetings and parties, etc., the convention will sponsor a lot of tourist happenings for those who haven't had the opportunity to know the capital city yet. In collaboration with LABRE, three excellent hotels will offer special prices for the amateurs.

Valmir J. Pereira PT2FA, President of LABRE, will do all he can to promote unforgettable events. For further information, please write to LABRE, PO Box 070004, 70000 Brasilia, OF, Brazil.

QSP-DX

To provide information for Brazilian DXers, Luc PT7WA with a group of PT7 friends established the *QSP-DX Bulletin*. In the bulletin, written in Portuguese, we can find details about DXpeditions, contests, rare countries on the air, QSL information, and everything interesting to the DXer, especially the newcomer.

The bulletin is bimonthly; after the second issue, about 150 amateurs had already subscribed. The subscription fee is only enougn to pay the printing and mailing expenses. If you want to provide the bulletin with any DX information, please write to *QSP-DX*, Rua Ageu Romero 83, 60000 Fortaleza, CE, Brazil.

CWMG AWARD

Sponsored by the Minas Gerais CW Club (CW Group), the CWMG Award is available to all licensed amateurs for confirmed contacts with 5 (five) different CWMG members. Contacts must have been made after May 1, 1978, on any amateur band, only two-way CW mode. No QSLs. Send GCR list of stations worked (*call*, date, *time*, band, *mode*, *and* report) and 8 IRCs for mailing expenses to: CWMG Award, PO Box 314, 30000 Belo Horizonte, MG, Brazil.

CWMG members: PY4AAF, PY4ABI, PY4ACV, PY4AD, PY4ADW, PY4AFP, PY4AH, PY4AM, PY4AP, PY4APF, PY4AOL, PY4AOM, PY4AUB, PY4AUN, PY4BAT, PY4BCR, PY4BLR, PY4BMO, PY4BZS, PY4BW, PY4CMG, PY4CO, PY4DD, PY4DM, PY4DS, PY4DT, PY4HR, PY4IF, PY4IR, PY4IS, PY4JD, PY4KS, PY4LB, PY4LJ, PY4MA, PY4MG, PY4OA, PY4OD, PY4OP, PY4PR, PY4RA, PY4RL, PY4SM, PY4SS, PY4ST, PY4WG, PY4WAS, PY4XUP, PY4ZI, and PP2ZI.

GMPR AWARD

Sponsored by the GMPR Group of CW, the GMPR Award is available to all licensed amateurs for confirmed contacts with 8 (six) different GMPR members. Contacts must have been made after July 30, 1982, on any amateur band, only two-way CW mode. No QSLs. Send GCR list of stations worked (call, date, time, band, mode, and report), your personal QSL, and 10 IRCs for mailing expenses to: GMPR Award, PO Box 4143, 80000 Curitiba, PR, Brazil.

For SWLs, the same rules apply.

Endorsements: Besides the six GMPR members, confirmed contacts with 2, 3, 4, or 5 stations located in the State of Parana (PY5) earn an endorsement. It is not necessary that they be GMPR members.

GMPR members: PY5AFC, PY5AFD, PY5AGX, PY5AGZ, PY5AIO, PY5AIW, PY5AKX, PY5ALF, PY5AVR, PY5BYC, PY5CIG, PY5CL, PY5CMS, PY5FI, PY5GI, PY5GJ, PY5HF, PY5IG, PY5IJ, PY5JL, PY5LA, PY5NGA, PY5OE, PY5PMR, PY5AJE, PY5RT, PY5VX, PY5XFR, PY5ZW, and PY1BVY.

1983 WORLDWIDE SOUTH AMERICA CW CONTEST

Sponsored by the Brazilian magazine, *Eletronica Popular*, and supervised by the Argentina GACW group and the Brazilian PPC Picapau Carioca, the 1983 WWSA CW Contest was a hit, considering it's only in its second year.

Little by little, slow but sure, hams are coming to this contest, the only one gathering South American countries and spreading QSOs all over the world during 24 hours of operation, from 1500 UTC Saturday to 1500 UTC Sunday, the last weekend in June.

Not only the fun of the party, but also this FB opportunity of meeting bunches of still rare South American calls and special prefixes is raising DXers' interest for this unique WWSA CW Contest.

Argentina's, Uruguay's, and Brazil's groups and DXers are trying hard to bring more and more South American countries to the fun, thus aiming at increasing the interest of hams in other continents in the WWSA CW Contest.

We sure hope to meet many of you at the 1984 WWSA CW Contest, to take place from Saturday, June 9, 1500 UTC to Sunday, June 10, 1500 UTC.

CANADA

Cary Honeywell VE3ARS
PO Box 2610, Station D
Ottawa, Ontario K1P 5W7
Canada

The Department of Communications in Ottawa recently lifted the requirements for logging in Canada. For some amateurs, this action means nothing, as I am sure better than half of the amateurs across Canada never logged their activities anyway. Rarely, if ever, was this requirement checked. It should be remembered, however, that logging is a form of self-defense in that you can always refer to your log should you be accused of an infraction of the regs.

The Canadian Amateur Radio Federation and the Canadian Division ARRL (CRRL) met at Cobourg, Ontario, during the summer to finalize a joint submission to the DOC regarding TRC24 (the requirements for examination for the amateur service). Between the two organizations, every area of importance was covered.

Each group submitted its own proposal and it seems that the DOC was open to these suggestions. The resultant redrafting of TRC24 should be common knowledge by this time. A great deal of credit for this work can be shared by many parties. Art Blick VE3AHU of Kingston, Ontario, the CARF General Manager, Ron Walsh VE3IDW, also of Kingston and one of CARF's Vice-Presidents, CRRL president Tom Atkins VE3CDM of Toronto, and ARRL Canadian Division Vice-Director Harry MacLean VE3GRO of London, Ontario, carried the amateur flame in a cooperative and constructive manner. The DOC was represented by G. Wintermeyer from the head office in Ottawa.

The 1983 CARF National Symposium was held in Halifax, Nova Scotia, during the middle of October this year. For those of you who don't know what this is: Amateurs from across Canada get together once a year (en masse) to provide direct input to the DOC on matters relating to the amateur service in Canada. The number of people attending these conferences is not usually great since most groups of amateurs provide only written submissions to be read and considered. This is far less expensive than sending a representative across the country for a one-day event. Full details will be provided in a future column.

A while back, a group of white caners in Toronto, Ontario, organized a reception to express appreciation for the work of an individual. Bill Choat VE3CO was stepping down as chief of the CNIB amateur-radio operation in Toronto, and some of his charges wanted him to be recognized for his efforts in the past. Bill has been in charge of this group for many years now, and through his efforts and the efforts of others, many white caners were given the opportunity to experience the joys of amateur radio, despite their handicap. Nearly 100 blind and sighted amateurs participated and I think Bill went away with the feeling that all was right with the world.

Canada's national amateur-radio journal, *TCA*, has been plagued with postal problems for several years now. Recently, an Ontario amateur wrote the Minister responsible for Canada Post, complaining of the late delivery of his July/August copy. Some time later, I, as editor of *TCA*, received a call from a Canada Post employee who wanted to know when the magazine had been mailed. When the caller discovered that more than three weeks had passed between mailing and delivery, she became very defensive and tried to leave me with the impression that the system was not only better than it was, but would get better as *time* went by. She would not elaborate on what amount of time would pass before this event, but I got the distinct impression that it would coincide with the "second coming," or at least the blooming of century plants.

Speaking of *TCA*, the November issue was mailed to every amateur in Canada as part of a membership drive on behalf of CARF. Canadian amateurs *living* in the USA did not receive a copy due to postal limitations and costs. If you would like to receive one, please write to the Canadian Amateur Radio Federation, PO Box 356 Station, Kingston, Ontario, Canada K1P 5W7. Depending on numbers remaining, we may be able to send you a copy. Enclose $1.50 to cover postage and handling costs (mostly postage). You will notice that this is also the cover price, so it balances out.

CZECHOSLOVAKIA

Rudy OK3KFO
Februaroveho vit'azstva
955 01 Topol'cany
Czechoslovakia

I have 25 years. I am a member of Radioclub OK3KFO in Topol'cany and have been an active amateur for 13 years. My call is OK3CMZ. I hope that you *73*

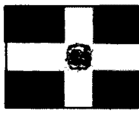
magazine readers will enjoy the information I send. Please excuse that I am self-taught in the English language.

I should like to inform readers of *73* about radio-amateur life in Czechoslovakia. In Czechoslovakia, we have approximately four thousand licensed radio amateurs, not counting 1500 SWLs. The most activity is in DX work; there is less activity with contests.

Czechoslovakia is a little republic. One day a week—Thursday—OK3KAB in Bratislava (capital city of Slovakia) broadcasts about all radio-amateur activity. The program is popular because it sends quality information.

Approximately 10% of the people work 144 MHz and 433 MHz. Over the last 10 years, Czechoslovakian microwave stations have reached good places in international contests. Other OKs are working over satellites, and approximately 10 work EME. Tens of thousands are devoted to constructing various mechanisms.

I know my first column is not very interesting so I would like readers of *73* to ask for what they would like to know about activity in Czechoslovakia.



DOMINICAN REPUBLIC

M. F. (Tim) Pimentel HI8MFP
PO Box 2191
Santo Domingo
Dominican Republic

Some of you have probably worked Dominican (HI) stations in the 20- or 15-meter band but have been less fortunate in contacting the other bands and getting QSLs.

To contact and get QSLs from HI is not an easy task, and exotic bands such as 6 and 160 meters seem to be "Mission Impossible," but even so, there are possibilities.

To be successful, you first have to know which station you're looking for, at what time you should search for it, and last, be lucky enough to find it. Once you have made your contact, it will be easy for you to receive the QSL because there are few people who work on 6 and 160 and those who do confirm on time.

In the 6-meter band we have key people such as Waldo HI8WPC and Domingo HI8DAF. The same applies in the 160-meter band with Jose HI8JAG, Mike HI8MRF, and Virgilio HI8VMA. These stations generally work from 0000 GMT to 0800 GMT. Within these times, schedules could be arranged by sending the abovementioned stations a note to Box 1157, Radio Club Dominicano, Santo Domingo, Dominican Republic.

Another difficult HI contact is the one via satellite. The only representative there is Jorge HI8JAF, and he is on the radio as long as his business activities allow him. Jorge is one who loves that particular type of communication, and on the first DXpedition to Beata Island (HI1RCD) in 1979, he made some contacts there. If any of you are interested in this particular kind of communication with an HI, you could write for additional information to: Jorge Abbott HI8JAF, Rafael F. Bonely *#8*, Ens. Evaristo Morales, Santo Domingo, Dominican Republic. I am sure he will fix a schedule and the QSL will get to you safely.

Another contact mode considered unobtainable in HI is CW. In the Dominican Republic, anybody who expects to get a ham-radio license is supposed to go through a CW exam. However, this is only in theory, because there are no effective mechanisms to guarantee that it will happen. For those 1500 that have already received their licenses, there's nothing to be done. The practice of CW is restricted to fewer than 1% of those listed in the *Callbook*; nevertheless, among them there are some excellent operators.

In CW, we have two young operators who are very good, Juiito HI3JEI and Carlos HI8CPT, plus the hard-working veterans HI3PC, HI8LC, HI8OMB, HI8KW, HI8RPD, and HI8DAF.

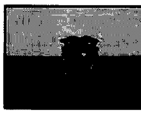
The Dominican Radio Club frequently offers CW courses to its members and guests; thus it maintains a live spirit in this mode even though it has lost popularity in our country.

Can you get a contact with a YL in the Dominican Republic? For chatting there may be some, but for QSLs and DXs, there are very few. However, there are some surprises: Charo HI8RPD enjoys DX, works regularly, works with CW, and sends QSLs besides. You can also find Azilde HI7HHH or Maritza HI8MSS, and both will send their QSLs gladly.

Undoubtedly the language barrier limits many HI ham operators, so communication is made more difficult. On the other hand, the small active group in DX knows English well enough to obtain their contacts. Abed HI8IH and Victor HI8VAT look frequently for DX on 40 and 80 meters, and the same goes for an active group in the HI3 zone with Antonio HI3AMF leading them.

It is my hope that, with these hints, it will be easier to get HI stations and your QSLs, too. Also, for five years, the Dominican Radio Club has had a national campaign among ham-radio operators to stimulate the sending of QSLs, and the results have been positive. The annual average has increased more than 70%. The QSL Bureau is managed by the Dominican Radio Club and has worked efficiently for many years.

Before closing, I'd like to add that we know how important QSLs are and how much they mean, especially to DXers. We will be glad to help you find confirmation of a contact which was made during the past five years; we will help all we can.



ECUADOR

B. Patricio Recalde S. HC2PP
PO Box 511
Guayaquil
Ecuador

July 23 and 24 last year will be remembered by the technical department of the Guayaquil Radio Club as historical. They were a Saturday and Sunday. What did we do?

Well, a party of amateurs, HC2NW, HC2OL, HC2IH, HC2LU, HC2NS, and HC2KY, went up Chimborazo, the highest volcano in Ecuador (6,310 meters—18,930 feet), in order to install a 40-meter link in a 2-meter repeater. The idea became reality after a mere four weeks of planning. All Saturday they kept working until around 1700 hours, which is late for the altitude at the repeater (4,400-4,500 meters—13,500 feet). They did a lot of testing, and now it is giving the best results.

Now, from all the coast part of our country, it is possible to access the repeater from your car and get through to 40 meters. The frequency is 7080 kHz, and you'd better look for Ecuador so you can test the 40-meter/2-meter link.

Getting there was a lot of fun (troubles + adventures = fun). Saturday evening, HC2IH's car got stuck in mud and snow, and on the way out, the steel bar that keeps the front wheels aligned broke loose. Well, at that time and in that place, all that was left to do was sleep and wait until the next day. The hero (?) who slept in the car (with the engine running, the heater on) was HC2LU. The temperature was below freezing (0° C), so the car didn't even heat up.

Anyway, on Sunday was a tougher test: to try to reach the members of an expedition that was on the Irazu volcano, at 4,250 meters, in San Jose, Costa Rica (TI)! A lot of arrangements had been made through the goodwill and work of TI2KC and HC2EC. At those heights, the wind, the temperature, etc., were a challenge; the people at both places did a good job preparing for the contacts.

In San Jose, they were ready with 10,000 Watts FM, SSB, and HF. The link in 40 meters was not working due to the lack of a better antenna with the Chimborazo expedition, so HC2PP was the guy that linked them all together via 2 meters and 40 meters. While everybody was getting ready, many amateurs from all places were very helpful in clearing frequencies and giving good advice.

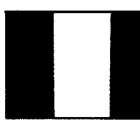
Exactly at 12:23 (HC)—1723 GMT—on July 24th—the Irazu expedition transmitted on 146.500 MHz with no results. After a few tries on FM and SSB on 2 meters, there were no positive contacts; the same was true with the Chimborazo expedition. Around 1800 GMT, we tried through a repeater situated where the Ecuadorian expedition was, and we heard three times that the repeater was activated. No modulation, but it gave us a nice feeling of something!

Anyway, after two hours, all the equipment and gear were diassembled. Our president, HC2KC, and the president of the Costa Rica Radio Club (TI2KC) interchanged greetings and thanks for all the efforts, and both confirmed that in the near future, with more testing, the link is going to work.

Well, they decided to try more testing in a new place, Cerro de la Meurte (Death Mountain), that is believed to be better. All amateurs who participated were not frustrated; we believe it is going to take some more coordinated efforts, and we are positive about out next results.

There is another project, and that is to try to put a repeater on a small island that belongs to Panama. Why? Because HC2NS, on old sailor, did access the repeater 146.895 (−) from that point, which is more than 200 nautical miles from the repeater, at 4,400-4,500 meters above sea level!

I will keep you informed, and we *are* going to make it!



FRANCE

Claude Guae F1DGY
11 Rue Emile Labiche
28100 Dreux
France

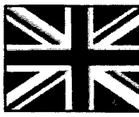
I would like to say some words about the first French association (REF—Reseau des Emetteurs Francais), founded in 1925. Some years ago, the situation was rather confused, but thanks to the work of a new and very good team, it is now completely reversed. We see that REF again has a fine future! Furthermore, dealings with the second association (URC—Union des Radio-Clubs) are more hearty than formerly. At the beginning, the two were at daggers drawn, but now they cooperate in facing difficulties (new license examinations, UHF, regulations, etc.).

Some hams and SWLs are getting in trouble: They have bought general-coverage receivers, called "scanners," which unfortunately are illegal here. As a matter of fact, people are brought up for trial and convicted (with a fine and receiver confiscation). However, REF has lodged an appeal. The law amounts to saying that French hams have the right to listen only to the amateur allocations. No comment.

Once again, we have heard on the air that tickets for part of the 28-MHz band would be granted without a Morse-code test. Actually, this is utterly false. It is a CB rumor which till now officials have turned down. On the other hand, new regulations for 27 MHz are generous: 40 channels, 4 Watts SSB (peak), 4 Watts FM, 1 Watt AM, and the possibilities of 6-dB-gain antennas. It goes without saying that CBers are not yet satisfied. This band is so busy that some people escape to the 6-MHz band.

65-year-old hams without Morse-code knowledge can ask again for the full licenses (F6) without taking the 10-wpm test. Since the beginning of this year and the new license regulations, this gift had been forgotten.

A new ham magazine is born: *Megahertz*. Covering microcomputers, astronomy, private FM broadcast, and of course all ham activities, this third French ham magazine looks promising and means that amateur radio in France enjoys good health!



GREAT BRITAIN

Jeff Maynard G4EJA
10 Churchfields
Widnes WA8 9RP
Cheshire
England

One of my particular interests is RTTY (WAC and some 70 countries worked to date). The RTTY enthusiast over here is well looked after by BARTG, the British Amateur Radio Teletype Group, which promotes RTTY activities, contests, and awards, advises on RTTY matters, transmits a RTTY bulletin, and publishes the BARTG newsletter. (Readers interested in joining BARTG should write to the Membership Secretary, Mrs. T. Crane, Greta Woods, Bromley Road, Ardleigh, Colchester C07 7SF, England—dues are about US$5 per year.)

A recent BARTG survey reveals that about 65% of its members still use traditional clanking teletypes tor their RTTY with the Creed line (444, 54, 7, etc.) being by far the most popular. Even more surprising, to me at least, was the comment that a number of stations have 4 or 5 such machines in constant use. I am not sure that the floor of my shack (in the house loft) would stand the weight of even one such machine. I am sure though that the rest of the family would rebel at the noise from a traditional teletype.

Something like 34% of BARTG members use electronic RTTY systems or home computers (with 5% using AMTOR). Commercial units are best represented by the Microwave modules line although Hal has captured about 13% of the UK market.

With my own all-electronic RTTY station (Dovetron terminal unit, Extel VDU, and ma-

Convert the Oddball Hy-Gain Board

Some of these boards have two crystals and some have three. Now you can put them all on 10-meter FM.

Recently, the popularity of the Hy-Gain surplus boards has been tremendous. However, there are several types of these boards on the market today, and each type requires a different method of attack. The 3-crystal model with the PLL-02 phase-locked-loop chip has been well discussed in a previous article.[1] The board I am going to discuss is the board with the part number PTBM051AOX, available from Surplus Electronics Corp.[2]

The major differences with this board compared with the other Hy-Gain boards is the 2-crystal approach. The third offset crystal has been eliminated so that all frequencies are generated by the 10.24-MHz reference crystal. The other crystal, 10.695, is used to offset the synthesizer/mixer output by the amount of the receiver first i-f.

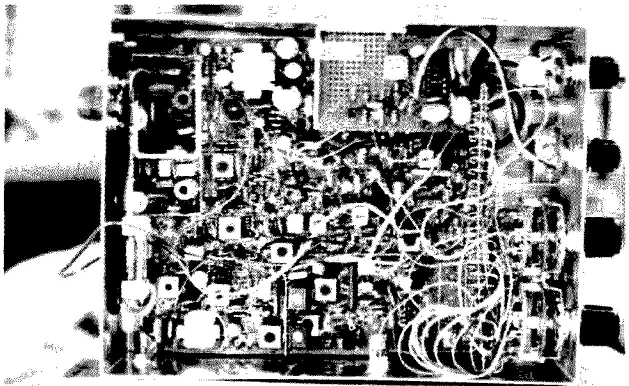
This presents three problems. First, with this mixing process, the PLL programming is upside down. That is, if you increase the divide-by-N, the frequency goes down, and since a prerequisite of any of my 10-meter FM conversions is a direct frequency readout system, this makes it a bit difficult. The second problem is that you cannot decide what divide-by-N equals which frequency. This is decided for you. The third problem is the odd 5-kHz output frequency. By that I mean that when this conversion is made, we want the operating frequency of the transceiver to be 29.600 MHz, not 29.595 or 29.605 MHz. So a change will have to be made there. All that is done here is to raise the reference frequency slightly, making each channel a few Hertz more than 10-kHz channel spacing.

Circuit Description

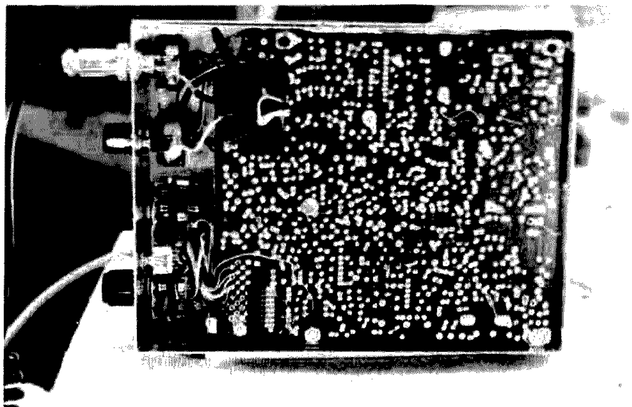
There will be three added circuits to the original board. Those are the FM detector/squelch board, the modulator board, and the frequency-selector board.

The FM detector/squelch board (see Fig. 1) consists of one IC and two transistors and is designed to interface the CB board easily. The 2111 IC is a common IC that is used in television receivers and scanners. This chip provides the i-f limiting and the quadrature detection necessary for FM detection. Transformer T01 is tuned to 455 kHz, and the transformer can be obtained from an old transistor radio. The primary winding is used.

The noise to operate the squelch is taken from pin 1 of the IC which is before the de-emphasis capacitor, C01. The noise is filtered and amplified by the two-



A top view of the radio. Notice the mounting of the three added boards.



This is a bottom look with the cover removed. Next to the piece of electrical tape is the connection to the input of the FM detector/squelch board.

transistor circuit, and the output is applied to the base of the audio switch in the receiver (Q13). The input at C02 is taken from the secondary of the last i-f transformer through a short length of RG-174 coax. The volume and squelch pots are front-panel-mounted.

The easiest board to construct is the modulator board (see Fig. 2). The input is taken from the audio output chip in the receiver. On receive, this line is shorted to ground, causing the modulator to be disabled. The gain pot provides audio voltage to the diode clipper, which clips the audio peaks to approximately 1.2 volts p-p. The deviation pot selects which portion of this clipped audio is to be applied to the vco. This provides for direct FMing of the transmitter.

The third board is the frequency selector board. There are three controls on the front panel. There are two single-pole, 10-position switches, 29.50-29.59 and 29.60-29.60 MHz. There is also a three-position toggle switch (SPDT C-O), used so that either 29.50-29.59 MHz simplex, 29.60-29.69 MHz simplex, or 29.50-29.59 transmit and 29.60-29.69 MHz receive can be selected. The last combination is for repeater offsets.

A look at the frequency selector board circuit (see

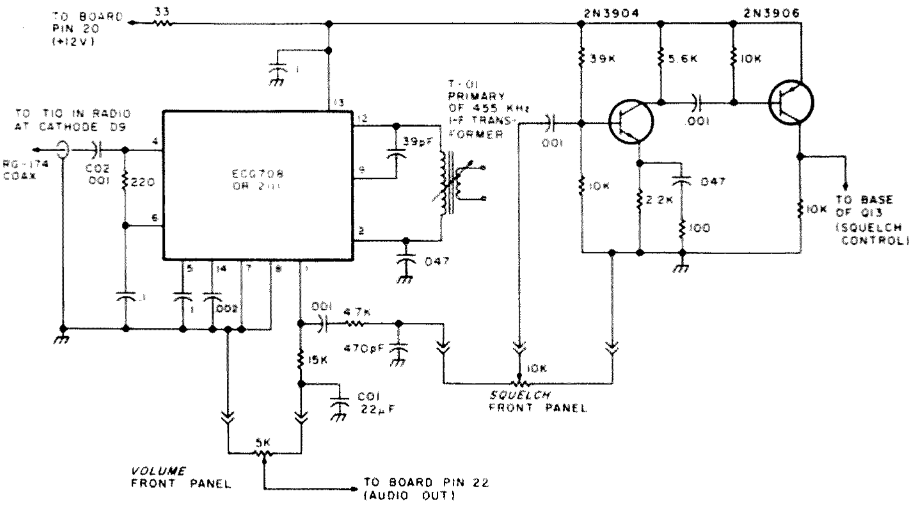


Fig. 1. FM detector/squelch board. Capacitors are in uF, 25 volts disc ceramic unless otherwise noted. Resistors are ¼ W.

Fig. 3) shows a diode matrix and a two-transistor circuit. The two transistors select which of the two single-pole, 10-position switches gets the 5 volts. The switch that gets the 5 volts is the switch that is active for frequency selection.

The steering for this circuit comes from board pin 12, which is operated by the PTT. This pin is high on receive and low on transmit. This is what happens: With the SPDT C-O switch in the center-off position, the 29.60-29.69 selector gets the 5 volts on receive and the 29.50-29.59 on transmit. By switching the SPDT C-O switch to one of the two other positions, the switching from pin 12 is disabled and locks up to a certain 10-position switch in transmit and receive.

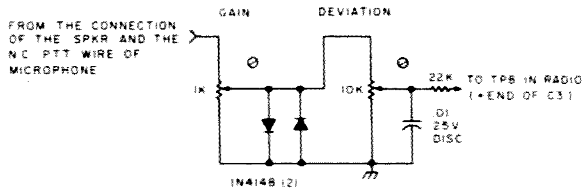

Fig. 2. FM modulator board.

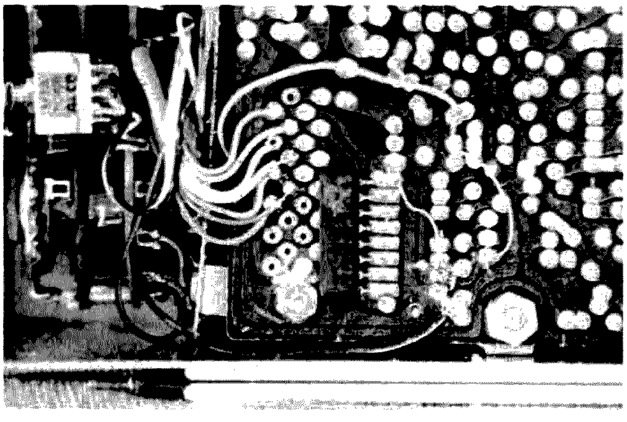
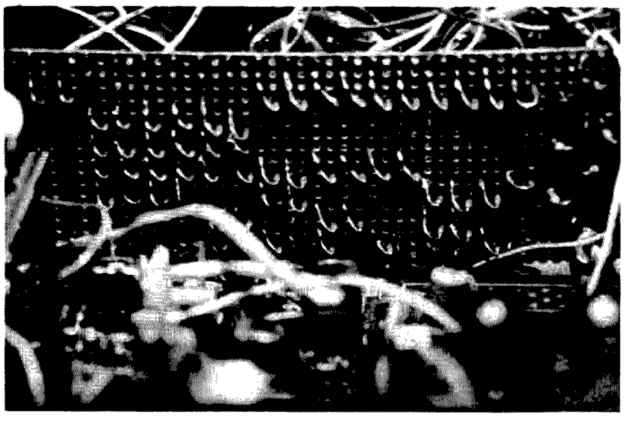
The diode matrix programs the PLL-02 IC in the radio. On the right of the frequency selector circuit are the binary weight values for the PLL-02 IC, along with the pins to which the wires must be connected. Along the top are listed the total binary weighting values for the various switch positions. Next to the switch positions are the last two digits of the operating frequency. The 5 volts to operate this circuit is brought from a 5-volt regulator which is part of the Hy-Gain board.

Construction

First, a few modifications to the Hy-Gain board must be done. Connect board pins 38 and 39 together. Re-



A close-up of the PLL-02 IC. The thick wires go to the frequency selector board, and the thin wires are the circuit changes made to the PLL-02 circuit.



A close-up view of the frequency selector board, showing how the diodes are installed and the 20 bare wires that go to the selector switches.

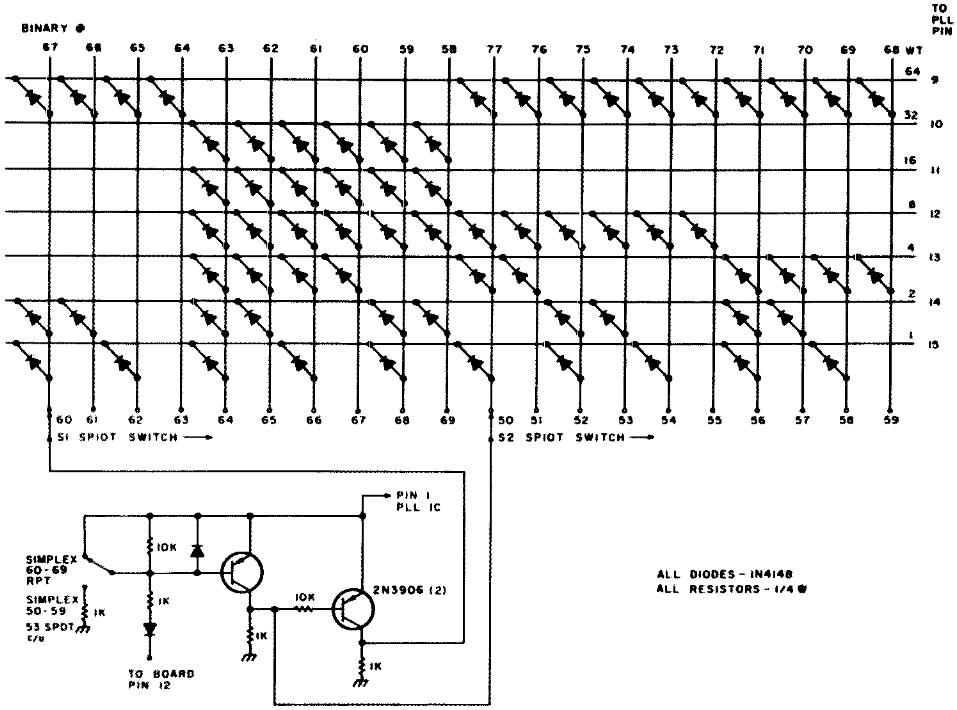


Fig. 3. Frequency selector board.

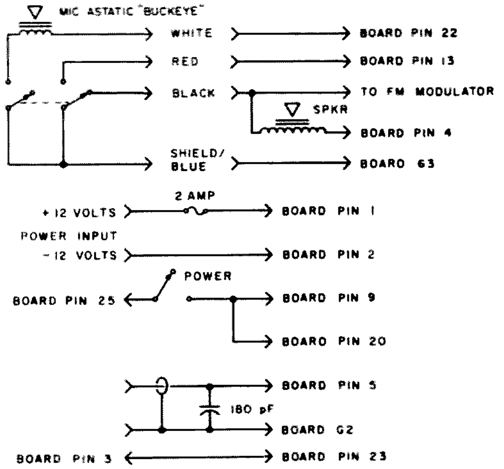

Fig. 4. Other hookups.

move R69, R71, D13, RV2, and C12. Connect a wire from board pin 20 to where the cathode of D13 was. To modify the PLL chip wiring, first isolate PLL IC pin 7 from the original wiring. Connect PLL IC pin 7 to PLL IC pin 8. Run a wire from PLL IC pin 1 to jumper J4. The other connections to the board are shown on the schematics. The three boards are made from .1"-spacing perfboard.

To make the diode matrix, on one side of the perfboard string 7 bare wires 4.5 inches (11.3 cm) across on one side. On the other side, string 20 bare wires perpendicular to those on the other side. Be sure to skip a row of holes between each string of wires. Then the diodes can be placed with one lead bent over in through the holes and soldered.

The FM detector can be mounted to the square hole above the BA521 IC with a small angle bracket. The modulator perfboard can be glued against the side of vco coil L1, being sure that nothing interferes with the tuning of the coil. The frequency board can be mounted across the front of the CB board, standing up vertically.

Tuning

For tuning, you will need a dc voltmeter, an rf probe, a signal generator (or a weak signal from an amateur transceiver), a frequency counter, and a General Cement model 9440 tuning tool.[3] A small hex head plastic tuning tool is also handy. Nothing ruins a powdered iron slug faster than trying to tune up with a regular screwdriver.

First, set the transceiver on 29.60 MHz simplex. Place a dc voltmeter on pin 6 of the PLL-02. Carefully tune vco coil L1 until 5 volts or so is reached. Move the voltmeter to pin 5 of the PLL-02. Carefully adjust vco coil L1 for 2.5 volts.

Next, attach a dummy load to the antenna jack. Place the rf probe on the base of Q3 (rf predriver). Adjust T1, L2, T2, L5, and T3 for maximum rf. Then move the rf probe to the antenna jack and adjust L7, L11, and L12 for maximum. Place the frequency counter on the antenna jack, and the counter should read 29.600 MHz. If the reading is a few kHz off, adjust trimmer CT1. If the reading is unstable, check the vco tuning. Run through all channels and see how each frequency looks. If an error shows, check the matrix and associated wiring.

Now, on receive, place the dc voltmeter on board pin 39 and adjust T5, T6, L14, T7, T8, T9, and T10 for maximum. Be careful not to overload. Adjust the quadrature coil on the FM detector/squelch board, with no signal, for maximum noise. Later tune when listening to another FM signal for best sound.

As a building hint, the housing for this radio can be built from aluminum. The box size is 6" (15.24 cm) by 8.5" (21.6 cm) by 2.5" (6.25 cm). Two U-shaped pieces of metal make up the top and bottom covers which fit over the ring of metal which makes up the main chassis.

That's it. Just look at the way I constructed it. As they say in the old country, "Ein Bild sagt tausend Worte."[4] I would like to thank Bob Russo WB2BMM for taking the photos shown here. If I can be of further help, please write, include an SASE, and I will try to help. ■

DRESS UP YOUR CLUB! Jackets, tee-shirts, hats, sportshirts, etc., with your logo or we'll custom design. Wavelength Productions, 20-22 120th St., College Point NY 11356. BNB048

FREE SAMPLE—send stamp. Buy/sell radio, computer equipment in "Electronic Exchange," Box 486E, Forest Lake MN 55025. BNB049

DEALERS IN SURPLUS TEST INSTRUMENTS, microwave equipment, and components. Wanted: Late test equipment (H.P., Tek, G.R., Narda, etc.), waveguide/coax components. Immediate needs: H.P. K382A, R382A, S382C, 432A, 6522A, 415E, G.R. 874- and 900-series coax items, G.R. 1633, 1863, 1864. Request want list. Lectronics, 1423 Ferry Ave., Camden NJ 08104; (609)-541-4200. BNB050

HELP! Cleaning garage—test eqpt., 6m and 2m FM gear, tubes, 1000s of service manuals for all makes and models of commercial FM xceivers 1975 and older. Reasonable prices. Send SASE for list. Tom McLaughlin WB4NEX, PO Box 411, Mango FL 33550; (813)-681-9709. BNB051

WANTED—your unused Teletype™ repair parts. High prices paid! Send SASE for list of Teletypewriter parts and supplies. TYPETRONICS, Box 8873, Fort Lauderdale FL 33310; (305)-583-1340 after 9:00 pm. N4TT. BNB052

WANTED: Old bugs for my telegraph and radiotelegraph key collection. I am trying to find each make and model of bug manufactured before 1950. Vibroplex, Martin, McElroy, Bunnell, Mecograph, MacDonald, D & K, Warner, etc. Also looking for Spark keys, Boston keys, cooties, sideswipers, and large or unusual radiotelegraph keys. 73 de Neal McEwen K5RW, 1128 Midway, Richardson TX 75081; 1-(214)-234-1653. BNB053

ON MARCH 11, 1984, the Morgan County Repeater Association Club will sponsor the Martinsville Hamfest at the Indiana Fairgrounds Pavilion Building in Indianapolis. Dealers, vendors, forums, and free paved parking. Doors open to the public at 8:00 am. Table reservations: Aileen Scales, 3142 Market Place, Bloomington IN 47401. BNB039

WYOMING-UTAH RANCH LAND. 10 acres, $60 down, $60/month. FREE information, maps, photographs. Trade equity for ham gear, home computer, test equipment, etc. Owner—Mike Gauthier K6ICS, 9550-B—Gallatin Rd., Downey CA 90240. BNB001

MOBILE IGNITION SHIELDING. Free literature. Estes Engineering, 930 Marine Drive, Port Angeles WA 98362. BNB006

QSL MANAGER ALBUM™. Beautiful leather-grained vinyl ring binder for displaying 240 of your prized QSL cards. 30-day guarantee. $18.95 ppd or send stamp for flyer. Walter Beaton WD8DVX, 3780 Cecilia Ave., Cleveland OH 44109. BNB009

WANTED: Early telegraph instruments for my collection. Keys, sounders, call boxes, registers, meters, and related items including pre-1910 paper. Larry Nutting WD6DTC, 5957 Yerba Buena, Santa Rosa CA 95405. BNB018

COLOR COMPUTER owners—call (212)-441-2807 for FREE color computer hardware and software catalog or write to Spectrum Projects, 93-15 86 Drive, Woodhaven NY 11421. BNB023

FOURTH ANNUAL Ohio State Convention and Flea Market: Join in the even bigger "Cincinnati ARRL '84," February 25 and 26. Activities for hams and electronics enthusiasts: forums, meetings, vendors, Wouff Hong, women's activities, banquet, hospitality suite, more. Sure cure for "cabin fever." Hospitality suite Friday and Saturday nights. The $5 convention registration includes all convention awards. Flea market is $4/space for two days—ham and electronics items, only. Write: Cincinnati ARRL '84, POB 11300, Cincinnati OH 45211 or telephone (513)-825-8234. Vendor and exhibitor inquiries invited. BNB024

WANTED: Cash paid for used SPEED RADAR EQUIPMENT. Write or call: Brian R. Esterman, PO Box 8141, Northfield IL 60093; (312)-251-8901. BNB030

RTTY FDM DEMODULATORS. FDM RTTY exists on satellites, **FM SCA** broadcast subcarriers (e.g., Commodity News Service), and HF radio. Four solid-state synthesized models, NSA surplus, new-used, $50 to $350. Call/write for brochure. Electrovalue Industrial, Inc., Box 376-WF, Morris Plains NJ 07950; (201)-267-1117. BNB032

SPECIAL NOTICE—Buy and sell your amateur equipment, computers, and video equipment on our national computer system that you access from your home, etc. Ads are updated daily. Low cost is only $15.00 per year for unlimited access 24 hours a day. For details, send SASE. NARWID ELECTRONICS, 61 Bellot Road, Ringwood NJ 07456. BNB037

TRS-80 1/3/4 RTTY/ASCII/MORSE. Free specs. Software and hardware schematic, $24.95 postpaid. KCQ Software, 6319 Boeuf Trace, Alexandria LA 71301. BNB038

ON MARCH 11, 1984, the Morgan County Repeater Association Club will sponsor the Martinsville Hamfest at the Indiana Fairgrounds Pavilion Building in Indianapolis. Dealers, vendors, forums, and free paved parking. Doors open to the public at 8:00 am. Table reservations: Aileen Scales, 3142 Market Place, Bloomington IN 47401. BNB040

FOR SALE OR TRADE: Swan 100MX 5-band solid-state transceiver and ac PS and Heathkit SB-201 amplifier, $325 each. Wanted: CW transceiver. W7LHO, (505)-471-6377. BNB041

BUMPER STICKER—"My Favorite Radio Station is (your callsign)." Display anywhere! Great gift idea. Only $3. Arpress, Dept. ST, 1556 Hicks Pike, Walton KY 41094. BNB042

PRINTERS: LA36 Decwriter II with keyboard, variable-width paper, etc., $325. CDI 1030 with keyboard, built-in modem, $125. W9QH, 11209 Hwy. U, Wausau WI 54401. BNB043

WWV RECEIVER, $35. Rf signal generator, 60 kc to 60 mc, $35. Hickock tube tester, $30. Audio signal generator, $35. K6KZT, 2255 Alexander, Los Osos CA 93402. BNB044

MILITARY TECHNICAL MANUALS for old and obsolete equipment. 60-page catalog, $3.00. Military Technical Manual Service, 2266 Senasac Ave., Long Beach CA 90815. BNB045

RUBBER STAMPS: Name, call, and address. $3.75 postpaid, US. Floyd Durand W5YZC, PO Box 67, Westwego LA 70094. BNB046

DX HIDDEN ASSET LOOP ANTENNA. Get on the air, comply with no-visible-antenna rules, from most indoor locations. Inexpensive, easy-to-build antenna couples directly to 50-Ohm coax; no antenna matcher required. Omnidirectional with vertical, bi-directional with horizontal polarization. Vswr typically 1.2:1 at resonance; useful bandwidth 3 to 5 percent of resonant frequency. Plans and instructions, $12.50 postpaid. H. Stewart Designs, PO Box 643, Oregon City OR 97045. BNB047

SOCIAL EVENTS

Listings in this column are provided free of charge on a space-available basis. The following information should be included in every announcement: sponsor, event, date, time, place, city, state, admission charge (if any), features, talk-in frequencies, and the name of whom to contact for further information. Announcements must be received by 73 Magazine by the first of the month, two months prior to the month in which the event takes place. Mail to Editorial Offices, 73 Magazine, Pine St., Peterborough NH 03458.

TRAVERSE CITY MI
FEB 11

The Cherryland Amateur Radio Club will hold its 10th annual swap and shop on February 11, 1984, from 8:00 am to 1:00 pm, at the Immaculate Conception School Gym, 2 blocks south and 1 block west of the intersection of M-37 and M-22, Traverse City MI. Registration will be at the door. Talk-in on 146.25/.85. For more information, call Jerry Cermak K8YVU at (616)-947-4848.

MANSFIELD OH
FEB 12

The Mansfield Midwinter Hamfest/Auction will be held on Sunday, February 12, 1984, beginning at 8:00 am, at the Richland County Fairgrounds, Mansfield OH. Tickets are $2.00 in advance and $3.00 at the door. Tables are $5.00 in advance and $6.00 at the door. Half tables are available. Talk-in on 146.34/.94. For additional information or advance tickets and tables, send an SASE to Dean Wrasse KB8MG, 1094 Beal Road, Mansfield OH 44905, or phone (419)-589-2415.

MELVILLE NY
FEB 19

The Long Island Mobile Amateur Radio Club will hold the LIMARC Indoor Hamfair '84 on February 19, 1984, from 0900 to 1600, at the Electrician's Hall, 41 Pinelawn Road, Melville NY. Admission is $3.00 each for everyone. Table reservations are $10.00 each, payable in advance to Bob Reed WB2DIN, 2970 Valentine Place, Wantagh NY 11793. Food and refreshments will be available. Talk-in on 146.25/146.85 (W2VL/R) or 146.52 simplex. For additional information, contact Al Flapan WA2FBQ at (516)-796-2965 or Hank Wener WB2ALW at (516)-484-4322.

LANCASTER PA
FEB 19

SERCOM, Inc., and the Red Rose Repeater Association will sponsor the 1984 Lancaster Hamfest on Sunday, February 19, 1984, from 0800 to 1600, at the Guernsey Sales Pavilion, US Routes 30 and 896, Lancaster PA. General admission is $3.00 for all hams and dealer personnel; tailgating is free with general admission, weather permitting. Commercial tables (main hall) are $15.00 and noncommercial tables (rear annex) are $6.00. Talk-in on 146.61 and 147.015. For reservations, send a check payable to SERCOM, Inc., to Hamfest Committee, PO Box 6082, Lancaster PA 17603.

ELKIN NC
FEB 19

The seventh annual Elkin Winter Hamfest will be held on Sunday, February 19, 1984, at the Elkin National Guard Armory, located two miles off Interstate 77 at Exit 85 in Elkin NC. Doors will open to the public at 0830, and breakfast and lunch will be served at the hamfest by the Foothills ARC of Wilkesboro NC and the Briarpatch ARC of Galax VA. Talk-in on 144.77/145.37, 146.22/.82, and 147.69/.09. For table reservations (which are limited) or other information, contact either George Reeves WD4BMG, Route 6, Box 412, North Wilkesboro NC 28659, (919)-670-2803, or Tommy Lineberry WD4BTF, 308 Poplar Street, Galax VA 24333, (703)-236-8424.

GLASGOW KY
FEB 25

The annual Glasgow Swapfest will be held on Saturday, February 25, 1984, beginning at 8:00 am Central time, at the Glasgow Flea Market Building, 2 miles south of Glasgow, just off highway 31E. Admission is $2.00 per person. There is no additional charge for exhibitors. The first table per exhibitor will be free, and extra tables will be available for $3.00 each. There will be a large heated building, free parking, free coffee, and a large flea market. Talk-in on 146.34/.94 or 147.63/.03. For further information, write Bernie Schwitzgebel WA4JZO, 121 Adairland Court, Glasgow KY 42141.

FRIDLEY MN
FEB 25

The Robbinsdale Amateur Radio Club will hold its 3rd annual Midwinter Madness Hobby Electronics Show on Saturday, February 25, 1984, from 9:00 am to 3:00 pm, at Totino-Grace High School, 1350 Gardena Avenue NE, Fridley MN (a Minneapolis suburb). Admission is $3.00 in advance and $4.00 at the door. There will be manufacturers and dealers of ham, computer, satellite, and R/C gear, as well as seminars and a flea market. Talk-in on 146.52 simplex or the 147.60/.00 repeater (KØLTC). For more information, contact Robbinsdale ARC, PO Box 22613, Robbinsdale MN 55422, or call Bob at (612)-533-7354.

AKRON OH
FEB 26

The Cuyahoga Falls ARC will hold its 30th annual electronic equipment auction and hamfest on Sunday, February 26, 1984, from 8:00 am to 4:00 pm, at North High School, Akron OH. There is easy access from the Tallmadge Avenue off-ramp of North Expressway (Rte. 8). Tickets are $2.50 in advance and $3.00 at the door. Some tables are available for $2.00 or sellers may bring their own; advance reservations are advised. Talk-in on .87/.27. For more details or reservations (please include an SASE), write CFARC, PO Box 6, Cuyahoga Falls OH 44222. Table reservations may also be made by calling Bill Sovinsky K8JSL at (216)-923-3830 and will be held until 9:00 am.

EGG HARBOR CITY NJ
MAR 10

The Shore Points Amateur Radio Club, Inc., will hold the Springfest '84 on Saturday, March 10, 1984, from 9:00 am to 4:00 pm, at the Atlantic County 4-H Center, Egg Harbor City NJ (approximately 15 miles west of Atlantic City). Admission for buyers is $2.50 in advance and $3.00 at the door; sellers' space is $5.00 (bring your own table). There will be 8,000 square feet of heated indoor selling space, and covered tailgating will be available, weather permitting. For more information, write SPARC, PO Box 142, Absecon NJ 08201.

INDIANAPOLIS IN
MAR 11

The Morgan County Repeater Association Club will hold the Martinsville Hamfest on March 11, 1964, indoors at the Indiana State Fairgrounds Pavilion Building, Indianapolis IN. Admission is $4.00 at the door. Premium tables are $30.00 each, flea-market tables are $8.00 each, and flea-market space without a table is $1.00. All tables must be reserved in advance and setup will be Saturday, March 10, from 1:00 pm to 9:00 pm. Space setup will be Sunday, March 11, from 6:00 am to 8:00 am. There will be free paved parking. Talk-in on 147.21 and 146.52 simplex. For more information or table reservations, send an SASE to Aileen Scales KC9YA, 3142 Market Place, Bloomington IN 47401 before March 1.

WINCHESTER IN
MAR 11

The Randolph Amateur Radio Association will hold its 5th hamfest on Sunday, March 11, 1984, from 8:00 am to 5:00 pm, in the National Guard Armory, Winchester IN. Ticket donation is $3.00 and children under 12 years old will be admitted free. Table space (by reservation only) is $5.00 with a table and $2.50 without. There will be a flea market, dealers, programs, food, and drink. Setups will be on Saturday from 6:00 pm to 8:00 pm and on Sunday from 6:00 am to 8:00 am. Talk-in on 147.90/.30, 224.90/223.30, and 146.50. For reservations and more information, contact RARA, Box 203, Winchester IN 47394, or phone Jake Life W9VJX at (317)-584-9361.

MIDLAND TX
MAR 17-18

The Midland Amateur Radio Club will hold its annual St. Patrick's Swapfest on Saturday and Sunday, March 17-18, 1984, at the Midland County Exhibit Building, east of Midland TX on the north side of Highway 80. The hours on Saturday are from 10:00 am to 6:00 pm and on Sunday from 8:00 am to 2:30 pm. Registration is $5.00 in advance and $6.00 at the door; tables are $6.00 each. Refreshments will be available. Talk-in on .18/.76 and .33/.93. For further information and reservations, please contact Midland Amateur Radio Club, PO Box 4401, Midland TX 79704.

DAYTON OH
APR 27-29

The 1984 Dayton Hamvention's International VHF/UHF Conference will be held concurrently with the Hamvention from Friday through Sunday, April 27-29, 1984, at the Hara Arena and Exhibition Center, Dayton OH. There will be technical forums by acknowledged experts; noise-figure, dynamic-range, and antenna-range measurement contests; and a hospitality suite with refreshments. Technical papers and presentations on VHF/UHF topics of interest are being solicited for consideration. Potential speakers should submit their requests immediately. For further information, contact Jim Stitt WA8ONQ, VHF/UHF Conference Moderator, 4126 Crest Manor, Hamilton OH 45011.

DAYTON OH
APR 27-29

The Dayton Amateur Radio Association, Inc., will sponsor the Dayton Hamvention on April 27-29, 1984, at the Hara Arena and Exhibition Center, Dayton OH. Admission, valid for all three days, is $7.50 in advance and $10.00 at the door. The Saturday evening Grand Banquet and Entertainment is $14.00 in advance and $16.00 at the door. Harry Dannals W2HD, past president of the ARRL, will be the featured speaker. Because seating is limited, early reservations are requested. There will be a giant flea market starting at noon on Friday and continuing all day Saturday and Sunday. Flea-market space is $15.00 for all three days and will be sold in advance only. Entrance for setups will be available starting Wednesday and the special flea-market telephone is (513)-223-0923. Other features will include forums, awards, and exhibits. For special motel rates and reservations, write Hamvention Housing, Box 1288, Dayton OH 45402; no telephone reservations will be accepted. Address all other inquiries to Box 44, Dayton OH 45401, or phone (513)-433-7720. Please send advance registration checks to Dayton Hamvention, Box 2205, Dayton OH 45401.

Changes in Procedures for Approval of Proposed Antenna Structures in the Amateur Radio Service; Announcement of Effective Date and Correction

AGENCY: Federal Communications Commission.

ACTION: Final Rule; announcement of effective date and correction.

SUMMARY: The effective date of rules amending this document sets Parts 17 and 97 to change procedures for approval of proposed antenna structures in the Amateur Radio Service (2-5-81; 48 FR 10915). The rule amendments were adopted by the Commission on January 8, 1981, but their effective date has been held in abeyance pending clearance of reporting requirements by the General Accounting Office. The amendments are necessary to permit amateur radio operators to file a single form to obtain approval of proposed antenna structures, instead of the two forms (610 and 714) currently required. The effect of this action is a simplification of the antenna approval process for both amateur radio licensees and the Commission.

The antenna approval form number is 854.

DATE: The effective date of the rules changes is January 3, 1984.

In § 17.4(h), where there is a blank space following the word Form, insert the number 854. In § 97.45(a), where there is a blank space following the word Form, insert the number 854.

Oak Harbor WA 98277

DX AWARDS FROM SWEDEN

The Bull Award

In order to make the province of Dalsland, Sweden, better known and to increase the activity of the amateurs in that region, the Melleruds Radio Club (SK6CM) decided to issue the Bull Award.

To qualify for this diploma, stations in Norway, Sweden, Finland, and Denmark must achieve 10 points, other European stations must achieve 5 points, and stations outside Europe must obtain 2 points credit. Every QSO with a radio amateur residing in Dalsland will give the applicant 1 point toward his or her goal. Should you have a QSO with SK6CM, 2 points will be credited to your total. All bands and modes will be allowed, but only one QSO with each station will count. All QSOs must be on or after January 1, 1979. Contacts via a repeater or satellite will not count.

Applications must list each callsign worked, date, time, GMT, band, mode, and the applicant's own name, call, and full mailing address. QSLs are not required. General certification rules apply. The award fee is 5 US dollars or 20 Swedish kroner. Send your application and award fee to Melleruds Radio Club, 464-00 Mellerud, Sweden.

As of April 25, 1979, the following amateurs would qualify for contacts to obtain this award: SK6CM, SM6s: AGW, ALJ, AMU, ASJ, AWZ, BER, BGG, BLE, BOT, BPX, CGI, CJK, CLX, CMK, CNC, COY, COZ, CQK, CUA, CWK, CYU, DKU, DXY, EOI, EPA, ESW, EUC, EUT, FCM, FFK, FLR, FNE, GAS, GDP, GMR, GQJ, HQZ, HRL, IHF, JJZ, JKB, JMA, JOD, JOG, JOM, JOO, JQA, JRB, JRY, JUJ, KFA, KFB, KFF, and ST.

The SWL Activity Club of Sweden and their award manager were very kind to send me complete award program information about the two major DX awards being offered by their organization.

Worked All Zone-14 Countries Award

This award is available to amateurs in three levels of achievement: Class A—work 27 countries in CQ Zone 14, Class B—work 22 countries in CQ Zone 14, and Class C—work 15 countries in CQ Zone 14.

There are no band or mode limitations, nor are there any date restrictions known at this time. Applications for WAZ14CA are sent with US$2.00 or 10 IRCs to SWL Club Activity, Fack 55, S-780, 40 Mockfjard, Sweden. GCR apply.

Countries in CQ Zone 14 are: CT1, CT2, C31, DA/DF/DJ/DK/DL, DM, EA, EA6, EI, F, G, GD, GI, GJ, GM, GU, GW, HB9, HB0, LA, LX, ON, OY, OZ, PA/PI, SL/SK/SM, ZB2, 3A, 4U (Geneva).

Worked ITU Zones 17/18 Award

This award is available to amateurs in three levels of operation: Class A—work all countries in ITU Zones 17/18, Class B—work 7 countries in ITU Zones 17/18, including TF (Iceland), and Class C—work 5 countries in ITU Zones 17/18.

Endorsements will be made available for single-band or -mode achievements. Applications must be sent to the SWL Club Activity with 10 IRCs or US$2.00. Mailing address is Fack 55, S-780, 40 Mockfjard, Sweden.

Countries located in ITU Zones 17/18 are: ITU Zone 17—TF; ITU Zone 18—JW, JX, LA, OH, OH0, OJ0/OH0M, OY, OZ, ZM.

Morokulien Award

Our good DX friend, Erland Belrup SM7COS, enlightened us with news about the charitable Morokulien (SJ9WL/LG5LG) activity in the unique "state" on the Norwegian-Swedish border, east of Oslo, featuring radio calls LG5LG and SJ9WL and a lot more.

Recognizing the independency of this area, the Morokullen activities have been stimulated to benefit the handicapped radio amateurs in Norway and Sweden. Likewise, applicants for the Morokulien Award find their donated award fees going to aid these less fortunate people . . . a cause all of us can be proud to have assisted.

This unique DX award is available to licensed amateurs and SWLs. Only contacts after July, 1968, will count. Applicants are asked not to send QSL cards. GCR apply. Europeans must contact LG5LG and SJ9WL on two bands and on different days for a total of four days of operation.

All other applicants must work each of these two stations, each on a different day.

You may forward your application to the attention of Ulf Strandberg LA2ZN, Konglev. 3, N-2200 Kongsvinger, Norway. Please be sure to enclose an award fee of US$3.00 or 8 IRCs. Additional contributions are most appreciated.

DX AWARD FROM ROMANIA

The Romanian Radio Amateur Federation takes pleasure in announcing the YO DX Club Award available to amateurs and SWL stations the world over.

YO DX Club Award

To qualify for the YODXC Award, applicants in Europe need to confirm contact with five YO DX Club members; stations outside Europe need confirm only two YO DX Club membership contacts. All QSOs must be made after August 23, 1949, and may be made on any mode or combination of modes and any band in the HF, VHF, or UHF segments.

To apply, have your list verified by at least two amateurs and send your list with US$1.00 or 7 IRCs to: FRR (YODXC), PO Box 1395, R 78100 Bucuresti 5, Romania.

As of January 1, 1978, the following YO DX Club members count towards this award:

YO2s: ABW, AVP, BA, BB, BN, BS, BU, BV, CD, FP, GL, GZ, IS, KAB, KAC, KAR, OY, RA, VB, VF.

YO3s: AAJ, AAQ, AC, AVE, BAA, CR, DZ, FF, FU, JF, JU, JW, KAA, KBC, KSD, NN, OK, QO, RD, RF, RG, RK, RO, RX, VN, YZ.

YO4s: ASG, CS, CT, HW, KAK, KBJ, KCA, WO, WU, XF.

YO5s: AFJ, AMO, ATV, AUG, AVN, AY, BW, DS, KAD, KAU, KLA, LC, LD, LP, NB, NU, NZ, UW.

YO6s: ADM, AW, EX, KAF, KAL, KBA, KBM, LG, UX, XI.

YO7s: BI, DL, DO, KAJ, NA, NM, VS.

YO8s: AGZ, CF, DD, FZ, GF, KAE, KAN, KGA, ME, MH, OK, OP, RL.

YO9s: APJ, ASS, BGV, CN, EM, GP, HH, HI, HT, IA, IF, KAG, KPD, VI, WL.

YO0s: ITU, YROA.

In YO-land, the suffix for the same licensed ham is the same for any prefix.

DX AWARDS FROM THE RADIO CLUB OF PARAGUAYO

The All Mediterranean Countries Award

The AMCA is given for confirmed contacts with Mediterranean countries in three levels of achievement: Class A—41 countries, Class B—30 countries, and Class C—20 countries. A ZP contact is obligatory in any class of award. The following prefixes qualify as valid contacts: A2, A5, AC3, C31, CP, HA, HB, HB0, HV, JT, LX, OE, OK, TL, TT, TZ, UC2, UD6, UG6, UH8, UI8, UL7, UM8, UO5, XT, XW8, YA, ZE, ZP, 3D6, 4U1, 5U7, 5X5, 7P8, 7Q7, M1(9A), 9J2, 9N1, 9U, 9X.

All Zone 11 Prefix Award

The AZ11PX Award is given for confirmed contacts with prefixes in CQ Zone 11 as follows: Class A—30 prefixes, Class B—19 prefixes, and Class C—12 prefixes.

ZP1 to ZP9, PY1 to PY0, and the special prefixes used for WPX contests are the only prefixes which qualify for this very difficult award.

The Tropics of Cancer and Capricorn Award

The TCCA Award is afforded to those applicants who confirm contacts with countries touched by the Tropics of Cancer and Capricorn boundaries. A ZP contact is obligatory for this award. For Class A, 28 country contacts are required from the list below. Class B requires 20 countries; Class C requires 12 countries. The following prefixes qualify as valid contacts:

Tropic of Cancer: S2/3, BV, BY, EA9, KH8, A4, A6, SU, TZ, C6, VU, XE, XZ, 5A, 5T5, 5U7, 7X, 7Z.

Tropic of Capricorn: A2, CE, C9, LY, PY, VK, ZP, ZS, ZS3, 5R8.

The Diploma Sud-America

The DSA Award is given for contacts with countries located in ITU Zones 12, 13, 14, 15, 16, and 73 as follows: Class A—33 DX countries and 6 ITU zones, Class B—25 DX countries and 6 ITU zones, and Class C—18 DX countries and 5 ITU zones.

Countries which are qualifying contacts are:

Zone 12—FY, HC, HC8, HK, HK0 (Malpelo), OA, PZ, 8R, YV, CP1/8/9.

Zone 13—PY8/7/8, PY0 (Fernando de Noronha), PY0 (St. Peter, St. Paul).

Zone 14—CE1/2/3/4/5, CE0X, CE0Z, CP2/3/4/5/6/7, ZP, CX, LU-A/U/Y.

Zone 15—PY1/2/3/4/5/9, PY0 (Trinidad Island).

Zone 16—CE6/7/8, VP8 (Falkland), LU-V/W/X.

Zone 73—KC4USP, LU-Z, CE9AA/AM, VP8 (Graham Land), VP8 (Georgia), VP8 (So. Orkney), VP8 (So. Sandwich), VP8 (So. Shetland).

Diploma Paraguay

The DP Award is given for confirmed contacts with five different ZP stations. Stations in South America are required to contact 15 ZP operators.

Worked All ZP

The WAZP Award is being offered to amateurs making at least one confirmed contact with ZP stations in each of the ZP call districts, ZP1-ZP9.

Diploma Departmentos Del Paraguay

The DDP is given for confirmed contacts with the nation's capital and different departments into which Paraguay is divided. Class A requires 20 contacts; Class B requires 16 contacts; Class C requires 12 contacts.

Departments by prefix are: ZP1—Boqueron, Chaco, Nueva, Asuncion; ZP2—Altos, Pte. Hayes; ZP3—Amambay, Concepcion; ZP4—Canendiyu, San Pedro; ZP5—Asuncion (nation's capital); ZP6—Central, Cordillera, Paraguari; ZP7—Caaguazu, Caazapa, Guaira; ZP8—Misiones, Neembucu; ZP9—Alto Parana, Itapua.

Contacts must be made on or after May 15, 1952, to qualify for any of the awards sponsored by the Radio Club of Paraguay. A certified list of contacts with a fee of 5 IRCs for each award should be sent to: Elio Donna ZP5CE, Award Manager, RC Paraguayo, PL Box 512, Asuncion, Paraguay.

3905 CENTURY CLUB AWARDS

Representing the 3905 Century Club, Bill Herbert WA2ZYM writes to share with us the various awards available to amateurs who frequent their net operation.

The 3905 Century Club is basically a WAS (Worked All States) net which grew out of the old Bicentennial Net on 80 meters back in 1976. The net now operates daily on 40 and 80 meters, 0100-0500Z on 7.233 MHz and 0500-0800Z on 3.905.

Naturally, as time went on, it became apparent that an awards program of some kind was in the offing. As amateurs work each other on the band, they gather a point per contact. Once 100 points are earned, you become a full-fledged member of the club and are issued a certificate to illustrate your affiliation.

As members continue their contacts on the net, several levels of achievement are recognized, with the ultimate being the 1,000-Point Award, which is certainly no overnight venture.

Among the certificates afforded net participants is the 3905 Century Club State Capitals Awards, which requires the applicant to contact at least 35 state capital cities. Endorsements are given for 40, 45, and the maximum of 50 state capitals worked on the sponsor net.

HAROAA AWARDS

We believe the many long hours of dedicated operation should not go unnoticed, nor should the high degree of enthusiasm of amateur-radio operators go neglected in their pursuit of self-set goals. That is why we have an awards column in this magazine and why I introduce to you the awards and certificates made available by HAROAA.

As we review each one individually, we find that all their awards are of high quality and will make a very impressive addition to any radio shack.

GCR apply in making application for HAROAA Awards. Each award is two dollars or 5 IRCs. At your request, special endorsements will be added for CW, SSB, RTTY, SSTV, FM, QRP, All YL, or single band. There is no date restriction on contacts made and satellite contacts are permitted.

HAROAA DX Award

For this, the most popular of all HAROAA achievement awards, the applicant is awarded recognition for contacting 10 DX stations. Endorsements are also given for 25, 50, 75, 100, 200, and 500 DX

contacts. Keep in mind we are not speaking of DX countries, but instead, DX "contacts," which makes this award unique.

Great Lakes Award

This award requires one contact from each state bordering the Great Lakes: New York, Pennsylvania, Ohio, Michigan, Indiana, Illinois, Wisconsin, and Minnesota.

Insomnia Award

This award is earned for communicating with a single amateur station anywhere in the world for a minimum of one hour between the hours of 1:00 and 5:00 am. Truly a super conversation piece for any ham shack.

Super Certificate Hunters Award

This award is designed for the serious certificate hunter. To earn this award, you must have a minimum of ten amateur-radio awards in your possession. Simply list these awards on your application and note the certificate number of each. Special endorsements are given for your collection of 25, 50, 75, 100, and 100 plus.

Official Traffic Handler Award

This award is a self-issued achievement, allowing you to display the fact that you are indeed an official handler of radio traffic.

HAROAA Super Operator Award

This certificate is rendered for those providing a service on behalf of amateur radio, such as weather observer, public service, emergency, helping a new ham, providing communications for a community function, etc. The requirements are for the applicant to briefly describe the event of service. The officials at HAROAA will determine whether it deserves this special recognition.

For your personal copy of HAROAA award program rules or to apply for any awards presented here, write: HAROAA Award Program, PO Box 341, Hinckley OH 44233.

NORAC WINTER CARNIVAL

The North Okanagan Radio Amateur Club will have a special station set up during its Winter Carnival (western Canada's largest). This is a free award but we would sure appreciate $1.00 or 2 IRCs to cover the postage. The award is available to all amateurs worldwide who contact 3 Vernon area stations or QSO once with our club station VE7NOR; any mode or band is permissible. Our special station will be operating daily from February 1 until February 12, 1984. Times will be from 2100Z to 2430Z. Look for us in the General portion of each band, about 50 kHz up, calling "CQ Winter Carnival Award."

SCHOLARSHIP HONORS SENATOR GOLDWATER

In Washington DC on November 9, Senator Barry Goldwater (R-Arizona) announced to his fellow ham-radio operators around the world that the American Radio Relay League had established an annual $5,000 scholarship award in his honor.

The League will award the scholarship to a licensed radio amateur enrolled in college-level study of electronics, communications engineering, or a related field. The program will be administered by the ARRL Foundation, Inc., the League's tax-exempt research and educational organization.

Goldwater, known to thousands of radio amateurs as K7UGA, made the announcement from his "ham shack" on Capitol Hill. Within seconds after the ceremonial transmission, Goldwater began receiving congratulatory messages from ham operators throughout the US and several foreign countries.

The late Vic Clark, League president, explained that Goldwater was selected as honoree for the organization's new scholarship because his "selflessness and dedication to purpose as a government servant is widely recognized and deeply appreciated by both his fellow citizens and the radio amateurs of our country."

"Through his amateur-radio involvement, Senator Goldwater has brought joy to thousands of members of our armed services," Clark said, recalling that the Arizona senator opened his radio facilities for around-the-clock operations during the Vietnam War to provide a communications link between US military personnel in Southeast Asia and their families.

Goldwater, whose interest in amateur radio dates back to his teenage years, said the value of ham operators has been demonstrated repeatedly in times of local or national emergency.

The recent Grenada mission is a case in point. Practically no normal communications were available to the public. Ham-radio operators quickly opened links with the Caribbean island, particularly handling messages relating to the safety of several hundred American students at St. George's College. It was through these amateur channels that the press and public received most of their information during the early days of the mission.

For a brief while, Americans were once again reminded of the important role played by radio amateurs. More often, though, the crucial contribution made by ham-radio operators has become "so commonplace that it often goes unnoticed and uncredited," Goldwater said.

Information about the scholarship program can be obtained from the ARRL Foundation, 225 Main St., Newington CT 06111.

HAM HELP

I need schematics and manuals for the Hallicrafters S77 communications receiver, Heathkit HR-10 receiver, and Johnson Viking II transmitter. Thank you.

Shawn Jerin
4-710 West Leila Ave.
Tampa FL 33616

Has anyone had any trouble building the "Down-Under Depth Sounder" (July, 1983)? Mine won't work.

C. G. Wortham N9AKD
28 W. 559 Rogers Ave.
Warrenville IL 60555

I wonder if anyone has a parts catalog so that us old-timers can find radio and ham gear such as transformers, coils, chokes, and hard-to-find tubes.

Clarence L. Frady
1207-A Old 70 West
Black Mountain NC 28711

Needed: schematic for a DSI counter, Model 5600A. Happy to pay reproduction costs.

John E. Greve
4211 7th Ave.
Rock Island IL 61201

CORRECTIONS

Two errors crept into recent issues. In November (page 103), we inadvertently listed DA1TN as the third-place DX multi-op finisher in the 1983 40m World SSB Championship. The correct callsign is DA1US.

Also, in "Idiot Buzzer for the 1978 Honda Civic" ("Circuits," December, page 99), the bottom three diodes are reversed.

Jack Burnett
Executive Editor

NEW PRODUCTS

TC-1 PLUS ATV TRANSMITTER/ DOWNCONVERTER

P. C. Electronics has upgraded their TC-1 all-in-one-box 420-450-MHz full-color ATV unit with some new features. The new unit is called the TC-1 Plus. With more and more amateurs using computers and VCRs on ATV, separate video and audio inputs were added to the existing camera and mike inputs. This allows front-panel switching back and forth between the camera and computer, or transmitting the VCR audio along with voice-over commenting using a microphone. It has made learning Basic computer language over the air and retransmitting the Space Shuttle video and audio easy.

Capability for external 13.8 V dc has been added to the built-in ac supply for those who want to go mobile or portable on battery power during Field Day, emergency services, CAP searches, parades, marathons, or other public-service events.

A video monitor output is now provided to enable seeing your own picture exactly as it is transmitted in order to better set modulation levels, lighting, etc. This is accomplished by the built-in diode detector on the transmitter rf power output stripline which then connects to the composite video-monitor line-driver circuit.

The TC-1 Plus has the new TXA5-5 exciter/modulator which features two-frequency plug-in crystal switching with just the addition of an SPST switch. Also, the bulletin sync stretcher and hi/lo power switch capability enable superior stable color video if a higher-power linear amplifier, such as the Mirage 100-Watt D1010N, is added later or run barefoot at its greater than 10 Watt PEP rf output.

The 420-450-MHz tunable downconverter has the low noise NE64535 preamp stage to dig out the weak signals. It acts like a super hot UHF TV tuner but covers only the 70cm ham band when connected to your TV set antenna input and set for channel 3 or 4. Both color video and sound live action ATV are available on your TV set just as the broadcast stations provide. The standards are the same.

With the TC-1 Plus, the only other items necessary to get on ATV are a good 70cm antenna and low-loss coax, your TV set, and any device with a standard low-voltage p-p composite video output commonly found on black and white CCTV cameras, home video color cameras and VCRs, computers, RTTY/video converters, etc. A Technician class or higher amateur-radio license is required for operation and purchase from P. C. Electronics.

For more information and a complete catalog of ATV equipment, antennas, cameras, modules, and accessories, call or write *P. C. Electronics, 2522 Paxson Lane, Arcadia CA 91006; (818)-447-4565.*

SOFTWARE PROTECTION SYSTEM

Software Protection Devices, Inc., a division of Wayne Green Enterprises, has introduced Copyrighter, a hardware-based protection system using encryption technology. The Copyrighter system has been proven by beta testing to provide pirate-proof software protection.

Software to be protected by Copyrighter is first encoded using a Data Encryption Standard (DES) algorithm which scrambles the machine code of the program. The customer, on the first use of the protected program, calls an 800 number and obtains a code which will unlock the program. The user types in this enabling number to decode the DES encryption and prepare it for use with the Copyrighter CPU (C-CPU).

The C-CPU is a standard CPU with a different decoder built into each unit. It is installed by a dealer on owned equipment or at the factory on new computers.

One C-CPU can be used to decode any number of protected programs, yet it will run unprotected software with no interference. This system does not slow down the CPU, even on protected programs. A protected program may be freely backed-up by the user on any medium and will run only on the user's computer.

Copyrighter software protection boundaries are flexible to allow the publisher to leave certain portions of their software, such as I/O routines, unprotected and modifiable by the user. All unprotected portions may be written in any programming language.

For more information, contact *Ken Witham* at *Wayne Green Enterprises, Inc., 80 Pine St., Peterborough, NH 03458; (603)-924-9471.* Reader Service number 480.

The System 70X satellite receiver from Lowrance Electronics.

SATELLITE RECEIVER

Lowrance Electronics of Tulsa, Oklahoma, has introduced a new satellite receiver for 1984. The new receiver unit, called the System 70, follows the firm's system 7 and will be manufactured at the company's headquarters in Tulsa. The receiver will be marketed through a worldwide distributor network.

The System 70 receivers feature detent tuning, polarity control, a signal-strength meter, built-in modulator, scan tuning, and wide and narrow audio filters. The receivers are available as the standard model 70X or the stereo version, 70S, which decodes both matrix and discrete stereo sound and features simplified stereo tuning. Both models carry a full one-year warranty.

For additional information, contact *Lowrance Electronics, Inc., 12000 E. Skelly Drive, Tulsa OK 74128.* Reader Service number 479.

NEW TRIBAND BEAMS

Palomar Engineers has announced the availability of two triband beams. Model DX-33 has three elements on 10, 15, and 20 meters. Model DX-43 has four elements.

These antennas have long been used by European DXers and are being made available in the US for the first time.

Designed for use with solid-state transceivers, the antennas feature low swr and wide bandwidth. Gain and front-to-back ratio are particularly good. Each trap is individually sweep tested at the factory for uniform performance. Stainless-steel U-bolts are used throughout.

For more information, contact *Palomar Engineers, 1924-F West Mission Road, Escondido CA 92025; (619)-747-3343.*

NEW SOFTWARE FOR THE TRS-80

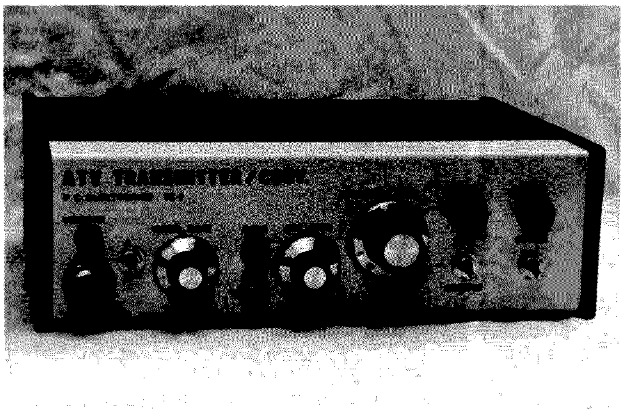
Woodall Software has announced a TRS-80 program for transmission and reception of RTTY that does not require a TV or interface for operation. The SOFTTY program will work as well or better than software/hardware packages requiring a PLL decoder. Only the much more expensive TUs may give consistently better results.

Gary Woodall has devised an algorithm for this program that samples the incoming audio signal to measure the tone frequency and shift using the cassette READ port. This method is very effective and makes the system immune to most noise. The only thing that may be a problem is other signals which are almost exactly on your operating frequency.

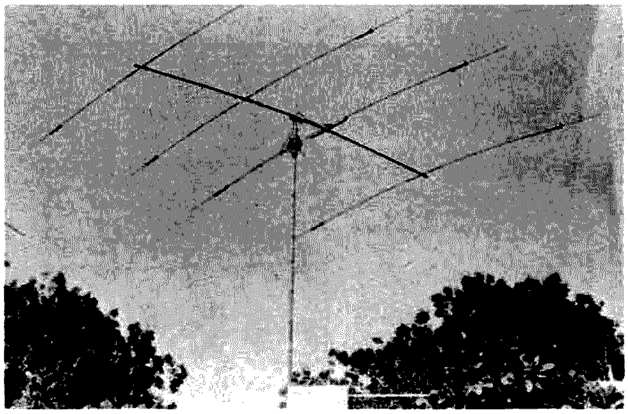
The program was written entirely in Z-80 machine language to obtain the processing speed necessary for the algorithm and associated functions. Timing is very critical and necessitated close attention to T states and M cycles during programming (down to micro-seconds).

The tone-generating section of SOFTTY simulates the two RTTY tones by producing an alternating time-controlled voltage and outputting via the cassette WRITE port. The output from the AUX plug is then fed into the microphone input circuit of the transmitter. Most mike input circuits will smooth the simulated sine-wave signal, making it sound like a true sine wave when transmitted.

SOFTTY Version 1.0 has split-screen



P. C. Electronics' ATV unit.



Triband beams from Palomar Engineers.

The IC-27A mobile unit from Icom.

The Icom IC-271H transceiver.

operation so that the main buffer may be filled while decoding and displaying the received signal. A choice of high and low toners is keyboard selectable, as well as normal and inverted (mark/space or space /mark) tone detection.

SOFTTY 1.0 is set for a 170-Hz tone shift used by amateur-radio operators. Other versions are available for different shifts used by news and weather services. A visual tuning indicator makes setup easy to accomplish.

There are five programmable buffers available, each of which can hold up to 255 characters. They can be filled from the keyboard and saved to magnetic tape for later retrieval.

For more information, contact *Bill Gouge or Gary Woodall at Woodall and Associates, PO Box 284, 11 Glenda Drive, Plainfield IN 46168; (317)-271-2565.* Reader Service number 481.

NEW FROM ICOM

Icom has introduced three new models of amateur equipment: the IC-27A two-meter 25-Watt mobile unit, the IC-04A and IC-04AT 440-MHz hand-held transceivers, and the IC-271H 100-Watt two-meter base-station transceiver.

IC-27A

The IC-27A is an important breakthrough in two-meter mobile communications. Measuring 1-1/2 inches high by 5-1/2 inches wide, the IC-27A contains an internal speaker making it easy to mount.

Although the IC-27A is compact, it has not sacrificed any features. Standard features include 25 Watts of output power, 32 PL™ frequencies, ten full-function tunable memories, scanning of memories and the band, priority scan, and a microphone which includes a 16-button touchtone™ pad for access to a repeater or dialing through to an autopatch. An optional speech synthesizer also is available to verbally announce the receiver frequency of the transceiver through the push of a button.

The IC-25A, measuring 2 inches wide by 5-1/2 inches high, will continue to be available for those individuals preferring a 25-Watt two-meter mobile unit with larger operating knobs.

IC-04A and IC-04AT

Icom has announced their latest in 440-MHz hand-held transceivers: the IC-04A and IC-04AT. These multi-function, multi-feature hand-helds for 440-449.995 MHz feature frequency entry, control functions, and 32 PL tones which are controlled by the 16-button pad on the face of the radio. Also included are priority scanning (both of memories and programmable band scan) and DTMF (04AT only).

For scanning, 5-kHz increments are front-panel selectable. Ten memories with internal lithium battery backup afford flexibility for channelizing operation for easy access to most-used channels. The custom LCD readout with S-meter is unique.

The IC-04A and IC-04AT have the same styling, control features, and functions as the IC-02A(T) and utilize the existing accessory line available for the IC-2A and IC-2AT plus new accessories such as long-life and high-power battery packs.

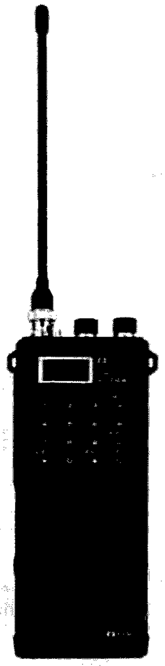
IC-271H

For two-meter communications, Icom also has developed the IC-271H, a transceiver with a high dynamic range receiver and a 100-Watt transmitter. Operating from the IC-PS30, IC-PS15, or the internal IC-PS35 (optional), the IC-271H integrates all the functions of the latest CPU-controlled radios.

Standard features include 100 Watts of power, 32 built-in subaudible tones, 32 full-function tunable memories, 10-Hz PLL locking, easy-to-read fluorescent display, scanning, and mode scan. It is 11-1/4 inches wide by 4-3/8 inches high.

To facilitate the operation of the IC-271H, Icom has incorporated a duplex touch switch, all-mode squelch, receive audio tone control, S-meter, center meter, seven-year lithium battery memory backup, 24-pin accessory connector, and microphone. Optional features include a switchable preamplifier, CTCSS encoder/decoder (encoder is standard), computer interface, and voice synthesizer.

For more information, contact *Icom America, Inc., 2112 116th Ave. N.E., Bellevue WA 98004; (206)-454-8155.*



The IC-04A 440-MHz hand-held from Icom.

LETTERS

LOG PROGRAM AVAILABLE

The response to my article "Foolproof Logging" on page 58 of the November, 1983, issue of *73* was overwhelming. I had noted in the article that if enough persons were interested, I would make the program available.

The program is now available for the TRS-80 Model III under TRSDOS 1.3 and for the IBM-PC under PC-DOS 1.1 or 2.0. The cost is $35.00 each including the diskette and user's manual. Postage is included in the cost. A version written in dBASE-II source code will be available by January 1, 1984, for several computers.

John E. Fall KL7GRF
Long Beach CA

NO SNOBS IN SANTA FE

In response to the letter from Mr. Fearon printed in the October issue, please be advised that the snobbery he felt in Albuquerque has not reached the higher elevations and arrived in Santa Fe. Being 60 miles apart, there is a world of difference in all attitudes and amateur radio especially.

The Northern New Mexico Amateur Radio Club in Sante Fe will be more than happy to assist Mr. Fearon in directing him to hams who have the time and energy to be an Elmer. When I made up my mind to go for a ticket, I started going to the Saturday morning breakfasts the club holds each week at The Pantry restaurant. There I met the most helpful and supportive crowd of guys and gals and before you knew it, I had my ticket.

The NNMARC holds regular classes both for the Novice and for upgrading to other classes. All are at no charge.

The hams who helped me on the way to a license were most eager to do so and extended every courtesy to the point of going out of their way several times, especially when it came time for the Novice exam and code test.

So, not all Southwest hams are snobs, and I hope Mr. Fearon has by now found that to be true.

Michael Langford KA5SAT
Santa Fe NM

ALBATROSS

The editorial in the October issue of *73* revealed some interesting things. I have found *73* to be a very enjoyable magazine. The editorial touched on one area I am in agreement with. *QST* and the League are getting to be a useless albatross to amateur radio. The magazine has fewer and fewer technical articles and more and more pages of contest results and pat-em-on-the-back data.

I am of the old school of home brew: If you want a transformer, wind it. I've even made my own tubes out of light bulbs. Now I run my computer on what the filament used to draw.

I am an amateur more interested in construction than in operating, so the "incentive" of the League left me cold. Similarly, there is a trend to buy everything from Japan, yet we developed the technology they copied or stole.

This country still has creative engineers, people who are amateurs. I call it poor-boy research, amateur because of low funds, not lack of skill. This country is becoming a high-technology and farm export country, though our government and corporations are too stupid to foster education or family farms.

I like *73*'s view of trying to stay ahead of the pack. The concept of developing a colledge (no, I didn't misspell college) can provide an "edge" to a student not fulfilled by some of our prestigious struc-

tured schools, provided it teaches creativity. Creativity is a rare commodity at best, yet it is the very thing that once made this country great.

Escalating the college via cable is a good limited short-term idea. But cable TV is dead, only still quivering because of greed and failure to make it duplex. The time will soon come when fiber optics will replace it, allowing duplex operation. There is your future.

In the meantime, the proliferation of satellite dishes (7-10') will fill the void of cable. Direct satellite broadcast (2' dishes) will bankrupt the cable companies.

The concept of interactive teaching is an area not touched. Suppose the main program (class) was on laser disk, supported and controlled by a magnetic diskette for your microcomputer. Q&A would be on the disk and your terminal CRT. Further support could be by packet transmitted to the satellite or local data line.

At present, I spend about $1000 (plus) four times a year to go to schools: $500 travel, $500-$800 class and lodging. Wouldn't it be more profitable if I could take an interactive class here for $750 a year total?

The University of Wisconsin at Madison and Milwaukee has superb extension programs. George Washington University, Georgia Tech, and UCLA have extension work in engineering. These people have skilled people come in from all over the country to teach a class, yet the school only organizes the class. I have made friends all over the country this way and gotten credits as a bonus.

Norman OK

CALL FOR PAPERS

The American Radio Relay League will hold its Third Amateur Radio Computer Networking Conference on April 15, 1984, in Trenton, New Jersey. The conference will be in cooperation with the 9th Trenton Computer Festival (TCF84) being held April 14-15 at Trenton State College.

The deadline for camera-ready papers is March 1, 1984. All papers should be mailed to Paul L. Rinaldo W4RI, American Radio Relay League, 225 Main Street, Newington CT 06111. If you plan to present a paper, please request an author's guide and identify the title of your paper immediately. Proceedings will be sold at the conference and by mail from ARRL Headquarters.

Technical papers are invited on all aspects of amateur packet radio, AMTOR, computer-based message systems, digital speech, presentation-level graphics, and related amateur-radio digital communications via terrestrial, ionospheric, meteor-scatter, and satellite media including AMSAT-OSCAR 10 and PACSAT. Topics may include network and system architecture, proposed standards, hardware, software, protocols, modulation and encoding schemes, applications, and practical experience.

Paul Rinaldo W4RI
Newington CT

MARKETABLE EDUCATION

I enjoyed the editorial in the October issue of *73*. However, I would go a little bit further. I think that education is a big issue *now* and, if handled correctly, will bring huge profits for the first businesses to take full advantage of it. I think that the attention focused on education by the presidential commission and the media has helped to make the time ripe for business to enter. I speak with some experience, since I now teach mathematics and computer science at the college level. The emphasis placed on computers and high technology has created an anxiety among the general public to the point where those people unacquainted with computers either fear them or feel guilty about it. I have several friends who have made decent amounts of money by conducting private classes in Basic and in the operation of specific home computers.

I think that video disks—the interactive kind—would be fantastic educational media. There is now out an arcade game using interactive video disks and the kids line up ten deep waiting to use it at the arcades. Compared to standard video games, the graphics (or effective memory) of these things is really astounding.

On a slightly different subject, I think that if a simple and reliable packet node controller could be developed to the point where it was a black box whose use was transparent to the user, it would revolutionize both the ham-radio and the home-computer communities. With the popularity of computer networks such as Compuserve and The Source and with drastic rises in local telephone rates imminent, the time will very soon be ripe for both a digital (no-code) license and PACSAT-type satellites.

ON LANGUAGE

At a recent meeting of the WA2DCS computer club, John KI2U asked me if I was working on any interesting computer projects. John always expresses interest in my programming endeavors; perhaps it's because I tend to write unusual programs. I have been known to spend months doing some of the weirdest things ever done with a computer (at least by means of a program).

One of my favorite projects that I finished this past year was an adventure game called "Time Warp." This program needs three interconnected computers to run, not to mention a sound system. The game is based on the movie, *The Rocky Horror Picture Show*, and the objects are to save Dr. Frank N. Furter from death and to lead some other characters to safety. I'm not so sure if my results were worth the effort, but at least I gained some insight on how to interconnect computers to handle a distributed processing task.

Another of my favorite programs was an absolutely silly piece of PL/I code to play the game "dots." (I'm sure you know how to play dots—two players take turns connecting dots in a grid. The player who can make the most boxes wins.) This program was written on punch cards for an IBM 370 computer. As I had no interactive terminal at my disposal, I had to look at the output to see what move the program made and then punch my move on a card and resubmit the program deck to the computer operator. A complete game took about 4 hours to play. It played a pretty good game, and as far as I know, nobody else has ever analyzed this game before. Maybe I'll start something. (First Pacman, then Q-bert, and now, dots!)

My latest major project on a computer was an implementation of the programming language SNOBOL for microcomputers. After I informed John of this, he asked this thought-provoking question: "Why can't you develop a special ham-radio computer language?" He gave me some thoughts on what such a language might contain—Morse, Baudot, or ASCII I/O statements, as well as interrupt handling, I/O buffering, math functions for metric conversion, and "great circle" functions.

I didn't feel that ham-radio applications warranted their own language. After all, the things that John suggested could be handled with a subprogram library. Nevertheless, the suggestion started a lively discussion among our club members. So let's hear what you think about the matter. If anyone has suggestions on what a ham-radio computer language might include and what the structure might be, drop me a line. It would be interesting to see if there is a need for such a thing.

The issue of computer languages is, in itself, a hot topic. I am frequently asked what the best language is or what the easiest language is. Unfortunately, there are no answers to these questions, but because this subject generates such interest, I will devote some space to matters regarding languages and compatibility among computers.

Everything—

—you've always wanted to know about assembly language and... A number of people have written me asking about assembly language. The question I have been hearing most is how one should go about getting started with it. "It just seems so darn *complicated*" is the common cry of distress. As I tend to use many assembly-language programming examples, some people have commented that they felt lost while reading through a listing.

My reason for using assembly language is simply that there is no other way of doing certain things with a computer. When one uses a so-called "high-level" language such as Basic or FORTRAN, one finds oneself shielded from the machine. You are, so to speak, a few levels removed from the hardware of the machine. Unfortunately, this lack of intimacy between user and machine prevents the user from establishing complete control. One must be happy with how the interpreter or compiler chooses to do certain things. (Please pardon my anthropomorphism; it simply makes the sentences less cumbersome.) Like most others, I like to take the easy solution to a problem. In many instances, assembly language *is* that easy solution.

My own first experience with assembly language came from a course I took at Hofstra University: CS 110. The course assumed some prior PL/I programming knowledge and made the student realize that computers worked on a much *simpler* level than PL/I. Of course, everyone realized that the mechanism for the computer's understanding of PL/I was a program called a "compiler," but not too much thought was given to that fact. The compiler was simply regarded as a "black box." Nobody cared how it performed its black magic; the only thing people concerned themselves with was what went in and what came out.

The point of this diversion is that assembly language is *simpler* than any other programming language. That's right—simpler! The instructions are very primitive: Move a byte of data, add two binary numbers, compare a number to zero. In fact, while microcomputers usually have at least fifty different instructions, only a few are needed. The late computer scientist, Alan Turing, proved that only a few very primitive operations on binary data would suffice to compute any problem that a better equipped (i.e., a larger instruction set) machine could handle. In particular, all a computer needed were the basic logical operators and a branch statement.

With all this historical information aside, it is time for us to consider the matter of a painless approach to learning assembly language. First, get it out of your mind that this is a complicated matter. It is, in fact, a simple one—so simple that people tend to make it much more difficult. Let's start at the beginning.

In the beginning, there was machine language. Programmers would program by punching holes or flipping switches corresponding directly to memory locations in the computer. This was a tedious affair, but engineering and math types were content with this method for a number of years.

The instructions that a computer program consists of are represented as numbers in the computer's memory, and the same memory is used for both data and instructions. That means that the contents of a byte containing the binary number 10101010 could be anything from a computer instruction to a data item. One cannot tell the exact meaning of an isolated byte of memory—it must be looked at in context.

Needless to say, this business of binary numbers soon got confusing. It was extremely difficult to debug a program consisting solely of spots on a storage tube, or perhaps binary numbers represented in base 16 or base 32. Because of this, assembly language was developed.

Assembly language and machine language are very closely related. There is a one-to-one correspondence between statements written in the two languages. It is best to think of assembly language as a tool for writing machine-language programs. Much of the tedious memorizing and mathematical calculating that a programmer must take care of when programming in machine language are dutifully performed by the assembler.

The primary function of the assembler is to provide a set of mnemonic codes for the binary instructions of the computer. It is much easier to remember that BNE means "branch if not equal to zero" than that 01001100 means jump to the memory location specified by the next two bytes.

Assembly language also allows the user to work with decimal or hexadecimal numbers; conversion from one radix to another is another function handled by most assemblers. Finally, an assembler allows a person to create a program to run in various parts of memory. A machine-language program generally cannot be relocated to another portion of memory. An

assembly-language program can be placed into another portion of memory by reassembly of the program.

Each microprocessor has its own machine language and, therefore, its own assembly language. For example, the Atari computer and the Apple computer both use a microprocessor chip in the 6502 family. Because of this, they both have the capability of "understanding" the same assembly language. The obvious conclusion a person could make is that those two machines would be software compatible, at least at the machine-language level. Unfortunately, this conclusion is erroneous.

There is another factor to consider when dealing with software compatibility: differences in hardware. Let's continue with the Apple vs. Atari comparison and look at some of the hardware differences. Consider the simple matter of the clock speeds of the computers. The Atari's internal clock, which controls the speed of the microprocessor, runs at about 1.8 MHz as compared with the 1.024 of the Apple.

Does this mean that the same machine-language program will run 56% faster on an Atari? No! The Atari will be about the same speed, if not slower, because of Atari's special display processor chip. This chip takes control of the computer's bus every so often in order to fetch display data from memory. In order to do this "direct memory access" (DMA) of data, the 6502 microprocessor must be "halted" during the DMA cycle.

Another thing that slows down the computer's performance is Atari's use of interrupts. Every 60th of a second, and sometimes more often, the microprocessor is interrupted from the program that it is executing and runs a system-maintenance routine. All this interrupt and DMA business simply means that the amount of time the Atari computer takes to execute a program cannot be calculated by simply knowing the clock speed, nor can the speed of the computer be compared to another computer's just by looking at the clock frequency.

The reason that we have to consider hardware when dealing with assembly language is that one cannot separate the two. It is necessary to have some hardware knowledge in order to program effectively in assembly language. This is especially true when doing I/O-related tasks. After all, how can you get data into or out of a computer without knowing the hardware configuration?

Just keep in mind that assembly language is simpler than any other language. Think small. Each statement can do only very little. If you approach the matter with this attitude, you will find learning assembly language to be equally simple.

High-Level Languages

High-level languages remove the user from the computer's hardware. Many things that an assembly language must worry about are "shielded" by the language processor. It is this shielding that makes some things impossible to do in a high-level language; sometimes complete control is needed. However, most of the time a high-level language (such as Basic) is the better choice. The easiest solution is often the high-level language.

A wide variety of high-level languages is now available for microcomputers. In addition to Basic, implementations of C, PL/I, Algol, Pascal, FORTRAN, LISP, Ada, COBOL, PL/M, Forth, and Logo are commonly available. I will devote some time to these and comment on their suitability for amateur radio applications in future months.

Graphics

I still need more feedback on the development of a graphics standard for amateur radio. As I mentioned in past columns, I would like to establish some standards to allow users of different computers to exchange graphics data. Possible techniques could include "unit square" graphics (where coordinates are given relative to a 1 by 1 screen thereby making the center point 0.5,0.5) or standard graphics character sets. Any comments along these lines would be appreciated. Don't forget: include an SASE to ensure a reply!

FUN!

BASIC ELECTRONICS

I've just finished looking through the FCC's new list of suggested questions for Novice-class exams. Most of the material looks pretty good. Still, it comes off looking kind of dull—row upon row of gray boilerplate. I can't help but think that the FCC could have done better by coming to me. Boy, would I have put together a test for them—you know, crossword puzzles, matching, acrostics, and so on. Don't laugh. Is it any sillier to make prospective hams memorize a binary code system? ASCII code yes, Morse code no. At least my puzzles would have a relevance to current technology, which is more than you can say for those silly dits and dahs.

Taking things a step further, imagine the new look in study guides. Page after page of puzzle solutions. Can't you just see Dick Bash at the Dayton Hamvention hawking his *Final Exam Crossword Dictionary*?

Hey, FCC! I can still help you with the General, Advance, and Extra-class tests lists. Drop me a line.

ELEMENT 1 MULTIPLE CHOICE

1) An electrical generator's magnets are:
   1) small
   2) non-polarized
   3) oppositely-polarized
   4) similarly-polarized

2) What is the current value in the circuit of an 8-Watt lamp running at 200 volts?
   1) 0.04 Amps
   2) 40 Amps
   3) 400 Amps
   4) .4 Amps

3) The henry is the unit of:
   1) work
   2) voltage
   3) capacitance
   4) inductance

4) Impedance is:
   1) the total opposition offered by a circuit to the flow of alternating current
   2) the total opposition offered by a circuit to the flow of direct current
   3) the complete resistance offered by a circuit to ac or dc
   4) determined by dividing voltage by resistance

5) The two most common semiconductor materials are:
   1) germanium and curium
   2) silicon and argon
   3) iron and lead
   4) germanium and silicon

6) Transistors can:
   1) amplify voltage
   2) amplify current and voltage
   3) amplify current
   4) none of the above

7) The banded end of a diode indicates the:
   1) anode
   2) cathode
   3) emitter
   4) filament

8) A multivibrator is a type of:
   1) Hartley oscillator
   2) Armstrong oscillator
   3) Colpitts oscillator
   4) resistance-capacitance oscillator

9) A disconnected capacitor:
   1) is harmless
   2) does not contain energy
   3) can be used as a transistor
   4) can kill you

10) D'Arsonval:
   1) was the inventor of the transistor
   2) is a type of analog meter
   3) is a type of digital meter
   4) refers to D'Arsonval's Law

ELEMENT 2 MATCHING

Match the term to its definition.

Column A	Column B
1) Acorn	A) Diode rectifier
2) Klystron	B) Unit of work
3) Nuvistor	C) Squat UHF tube
4) Dyne	D) Miniature metal/ceramic tube
5) Newton	E) Microwave tube—has a bunch cavity
6) Magnetron	F) Air-filled VLF tube
7) Phototube	G) Microwave diode
8) Mercury-vapor tube	H) Miniature tube with pins extending from its ends and sides
9) Thyratron	I) Gas triode or tetrode
10) Doorknob	J) Converts light energy to electrical energy
	K) Unit of force

ELEMENT 3 TRUE-FALSE

	True	False
1) The daraf is the unit of elastance.	_____	_____
2) Doubling a number and adding one is called "dibbling."	_____	_____
3) One handy oscilloscope use is the measurement of capacitors.	_____	_____
4) The coulomb is the unit of quality.	_____	_____
5) In magnetism, opposites repel while likes attract.	_____	_____
6) A "zig-zag" is a type of rectifier circuit.	_____	_____
7) A "zener" can be used as a voltage regulator.	_____	_____
8) There are two individual rectifiers in a bridge rectifier.	_____	_____
9) Batteries generate voltage through photosynthesis.	_____	_____
10) A logic probe is used to test 5-volt dc circuits.	_____	_____

ELEMENT 4 FILL IN THE BLANK

1) A________is a precisely dimensioned, hollow metal pipe through which microwave energy is sent.

2) The instrument that presents visual representations of an electrical quantity is an ________.

3) The soft form of carbon used in most resistors is called________.

4) The main control electrode in a vacuum tube is the________.

5) In a bipolar transistor, emitted current travels toward the________.

THE ANSWERS

Element 1:
1-3, 2-1, 3-4, 4-1, 5-4, 6-2, 7-2, 8-4, 9-4, 10-2.

Element 2:
1-H, 1-E, 2-D, 4-B, 5-K, 6-B, 7-J, 8-A, 9-I, 10-C.

Element 3:

1—True	It measures the opposition of the capacitor to be charged. Incidentally, "daraf" is farad spelled backwards.
2—True	Not to be confused with "dribbling," which is a basketball term.
3—False	By studying its waveform, I guess.
4—False	Quantity.
5—False	It's the other way around.
6—True	A variation on the three-phase, half-wave star theme.
7—True	Zener diode.
8—False	Four.
9—False	Plants use photosynthesis, batteries generate voltage with chemicals.
10—True	Computer circuits.

Element 4:
1—waveguide
2—oscilloscope
3—graphite
4—grid
5—collector

SCORING

Element 1:
Two and one-half points for each correct answer.

Element 2:
Two and one-half points for each correct match.

Element 3:
Two and one-half points for each correct answer.

Element 4:
Five points for each word correctly filled in.

Are you up on your basics?
1-20 points—Your Bash is showing.
21-40 points—Good thing the FCC doesn't re-test.
41-60 points—Qualified for your license class.
61-80 points—Time to upgrade?
81-100 points—Obviously, you hold an MSEE degree.

REVIEW

THE YAESU FT-980 TRANSCEIVER

As transceivers became completely solid state, size and weight were reduced dramatically, so I was particularly surprised at the FT-980, the latest descendant of the Yaesu FT-line. This now-famous line began with the FT-400 and became perhaps most popular with the FT-100 series. But the FT-980 HF Transceiver CAT System (for, I suppose, computer-aided transceiver) is no lightweight and it's packed full of features aimed at providing the serious radio amateur with the best communications tool available. For this review, along with the FT-980 I had the optional SP-980 speaker system and the MD-981 stand microphone. More about these accessories later. General specifications for the transceiver are shown in Table 1.

Packed in with the set was a pretty good installation and operation manual that explains the rig's capabilities. The manual included a couple of loose sheets that detail connections for an alternate means of keying a linear amp if it requires more than 200 mA of switching and updated filter installation instructions. Because this FT-980 had all the optional AM and CW filters already installed and I was trying to key a linear with current requirements less than 200 mA, these provided no extra trouble—and I doubt they would anyway.

The manual is reasonably well written and doesn't contain many misspellings and odd sentence structures typical with some imported equipment. Separate from the manual are 22 pages of schematics and 7 pages of block diagrams! If you have the "right stuff" to tear into the FT-980, at least you'll have a fighting chance with this documentation. Also in the manual is a thorough description of accessory interconnection along with pinouts for each plug and connector. An added bonus in the package is a nice four-color map of Japan for award use; it's in Japanese, though.

So much for the documentation—let's get this unit on the bench and start operating. "Oof," says I. "This thing weighs a ton." Actually, it weighs close to 40 pounds with all the options installed. In the shipping box I found a bag of all kinds of plugs and connectors, tilt feet, fuses, three-wire line cord, and two AA-cells for the power-off memory retention. The AA-cells were the first of several oddities. Memory backup is provided solely through these cells—no nicads, lithium cell, or anything else. Yaesu says to replace them every six months or "adios" to the FT-980's memory.

As with several other available "competition-grade" transceivers, the FT-980 covers all the amateur bands, including WARC, and acts as a separate 150-kHz-to-29.9999-MHz general-coverage receiver. With the memory backup energized, upon power-up the FT-980 greets you exactly as you last left it. Should you elect not to use the memory back-up or should the AA-cells fail, the 980 defaults to 7.000 MHz, general coverage.

Rocking the power switch on illuminates the two large analog meters and the blue digital frequency/mode displays. The meters provide quite a monitoring capability as shown in Fig. 1. The upper digital display includes frequency readout to 10 Hz as well as USB, LSB, CWN (narrow), CWW (wide), AMN, AMW, FSW, and FM, to match the position of the Mode switch.

Receive Features

To operate, first select Ham or Gen (eral) coverage by depressing the appropriate push-button. Band selection is made through three momentary-contact push-buttons: Up, Down, and Repeat. These as well as most other functions are selected via momentary-contact push-buttons that function either as toggles (push-on/push-off) or as simple entry switches. A soft beep verifies that switch contact has been made and the beep can be turned off.

Operating frequency can be selected five ways: 1) main tuning knob, 2) 10-kHz/step push-button, 3) Up/Down 5-kHz push-buttons, 4) a keypad, and 5) up to 12 memory frequencies selected by a rotary switch. Yaesu's optional stand and hand-held microphones afford frequency selection via push-buttons, although without as many options.

Upon power-up, I was impressed with

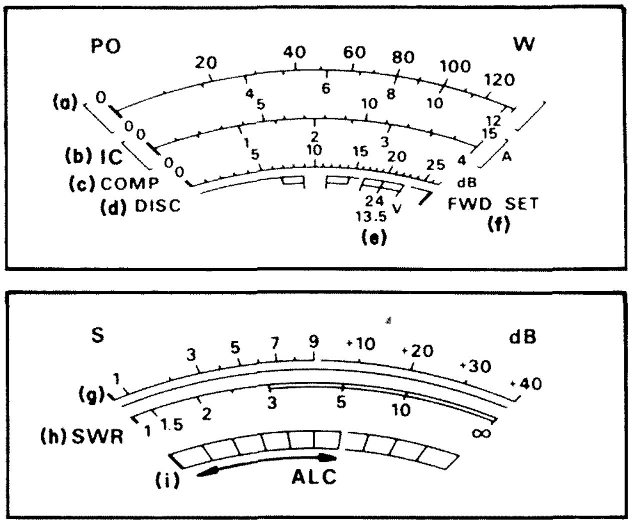

Fig. 1. Details of the FT-980's two multifunction meters: a) power output in Watts (output of 10-Watt low-power version of FT-980 is read on bottom of this scale); b) output-transistor transmit current (all modes); c) SSB speech processor compression; d) center-scale tuning for FM reception; e) Vcc safe zone; f) swr forward set mark; g) S-meter; h) swr scale; i) safe alc zone for SSB.

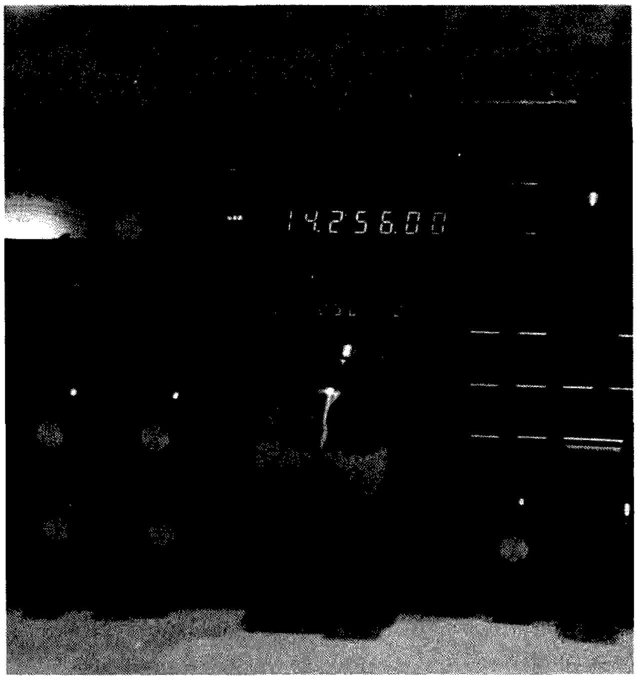

Fig. 2. Comparison of the digital (top) and analog (bottom) "sub-display" arrangements. The digital display is straightforward; the analog one is inscrutable.

TRANSMITTER

Frequency Range

Band	Frequency (MHz)
160	1.5–1.99999
80	3.5–3.99999
40	7.0–1.49999
30	10.0–10.49999
20	14.0–14.49999
17	18.0–18.49999
15	21.0–21.49999
12	24.5–24.99999
10	28.0–29.99999

Emission Types
LSB,USB (A3J/J3E)
CW (A1/A1A)
AM (A3/A3E)
AFSK (F1/J1B)
FM (F3/F3E)

Power Output
(Watts, all bands)

SSB, CW	100 (PEP)
AM	25
FM, FSK	50

Maximum FM Deviation
+5 kHz

AFSK Shift
170, 425, 850 Hz

Output Impedance
50 Ohms, unbalanced

Frequency Accuracy
Better than +3 ppm

RECEIVER

Frequency Range
150 kHz to 29.99999 MHz, continuous

Circuit Type
Triple-conversion superheterodyne

Image and I-f Rejection
Better than 70 dB

Dynamic Range
Better than 95 dB with 300-Hz CW filter

Audio Peak Filter Range
350-1400 Hz

I-f Notch Filter Range
(demodulated)
500–2700 Hz

Selectivity
(Adjusted for maximum i-f width)

Mode	−6 dB (width in kHz)	−60 dB
SSB,CW (W/N), FSK	2.5	4.2
CW (narrow)	0.3	0.6
CW (wide)	0.6	1.2
AM (no filters)	6.0	17.0
AM (wide)	5.0	12.0
AM (narrow)	3.0	9.0
FM	12.0	24.0

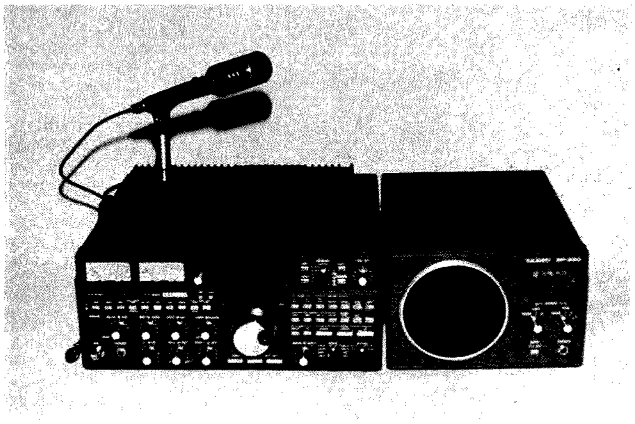
POWER REQUIREMENTS

Voltage
Ac: 100 to 120 volts or
200 to 234 volts
50–60 Hz

Power Consumption
Receive: 72 VA
Transmit: (100 Watts out): 530 VA

Physical Characteristics
Overall Dimensions:
15 inches wide
6-1/2 inches high
18-1/2 inches deep
Weight:
Approximately 38 pounds

Table 1. General specifications for the Yaesu HF Transceiver FT-980 CAT System.



The Yaesu FT-980 with companion mike and speaker.

Operating side of the FT-980. The curious pseudo-analog display is right above the main tuning control (more on this in the text and Fig. 2).

the audio quality of the receiver. It has an excellent built-in speaker. When the accessory speaker or headphones are plugged in, the internal speaker is disconnected.

On receive, you have AF gain, RF gain, Noise Blanker, Tone, Squelch (FM only), i-f Width and Shift, wide and narrow filters (if installed), a calibrated 0-30-dB rf attenuator (in 10-dB steps), a Mode switch, and Notch and APF (audio peak filter—CW only) controls to play with. You can do some pretty fine knob-twiddling and slice away at the pileups and heterodynes. The narrow filters are very sharp and a dial-lock push-button holds the frequency in case you accidentally bump the main tuning knob while tweaking all the other controls.

The frequency displays require some special mention. Beneath the upper digital frequency and mode display is another window, a sub-display that Yaesu calls a "...synthesized analog display [that] provides a relative frequency indication which scrolls when the frequency of the selected vfo is changed." What it amounts to is a digital simulation of an analog dial display of frequency. See Fig. 2. It's confusing; I couldn't find a single reason for its being there. Because a digital frequency display accurate to 10 Hz is right above it and this pseudo-analog display is accurate only to 1 kHz, I'm curious as to Yaesu's intentions. And while speaking of displays, a Dim push-button reduces meter and display brightness by about half for low-light or nighttime operating.

Other controls include push-buttons for transmit and receive clarifiers that actually use the main tuning control. This is a little strange if you are used to a separate clarifier knob. Also included are push-buttons for selecting which vfo (ham or general coverage) will be used for transmit (ham only) or receive (either) or which memory channels will do the frequency controlling. Split-frequency operation is possible, along with push-buttons to give you the difference between vfo and memory channel frequencies. It's relatively easy to store and retrieve a memory frequency, but it's too complex to describe here all the possible interactions, shifting, and operating options available. This transceiver does *not* have a built-in scan capability, but you can store, retrieve, and exchange memory and vfo frequencies handily. In place of a bfo control, there's a rear-panel CW pitch slide switch that selects 500, 600, or 700 Hz as the CW receive tone.

One thing that I really did miss was a WWV calibration control. Yaesu must figure that the synthesizer is right on because there is no way that I could find to adjust zero-beat with WWV. The specs say frequency accuracy is better than 3 ppm for 0-40 degrees C (32-104 degrees F). That means WWV should only be about 30 Hz off at 10 MHz!

Transmit Features

Satisfied that I wouldn't do any damage, I next tried loading the FT-980—no problem. Power output is adjustable with a Drive control. I was, however, a little suspicious of the built-in swr metering circuitry when it indicated an absolutely flat 1-MHz bandwidth on the 10-meter elements of my triband quad. The swr monitoring circuitry will protect the finals, though, reducing power out to about 75 percent of available output power at ideal (1:1) conditions when a 3:1 swr is encountered. An on-demand fan cooling system is employed to control output transistor temperature.

This rig also had the Curtis 8044-chip-based keyer option installed and the whole system is set up for full break-in operation. I was a little disappointed at the speed control of the keyer, though. It seemed to have a very narrow realistic speed range but would go phenomenally high.

The FT-980 has a nice control and metering setup for speech compression. You can read dB of compression and use the Monitor control and a pair of headphones to adjust the processor for maximum punch and minimum distortion while listening to yourself. And an Automatic Mike Gain control enables you to set a modulation threshold to help eliminate background noise. Although a little tricky to adjust, these controls can give you tremendous audio capabilities.

Recalling memory frequencies and returning to your original frequency, using the transmit and receive clarifiers, and figuring out just what split frequencies you are on is a little confusing at first. The yellow LEDs next to some of the switches help, but because the radio can do so much, it's a little overwhelming. You eventually feel comfortable after getting to experiment for a while. Three Tab push-buttons can be employed on transmit and receive to limit the frequency excursion between a high and low limit you select. As the manual states, possible uses for this feature include limiting operation to legal bands or subbands of an operator's license class.

An FSK Shift slide switch on the rear panel selects shifts of 170, 425, or 850 Hz while the mark tone stays at 2125 Hz. Power output is limited to 50 Watts for FSK as well as FM, 25 Watts on AM.

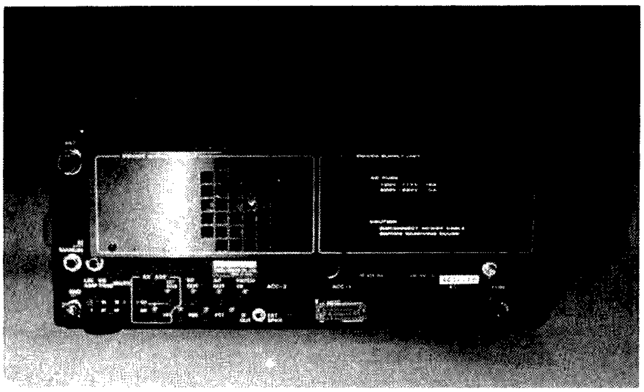
SP-980 Remote Speaker

This outboard speaker not only complements the FT-980, it also adds some more knobs to twiddle during receive.

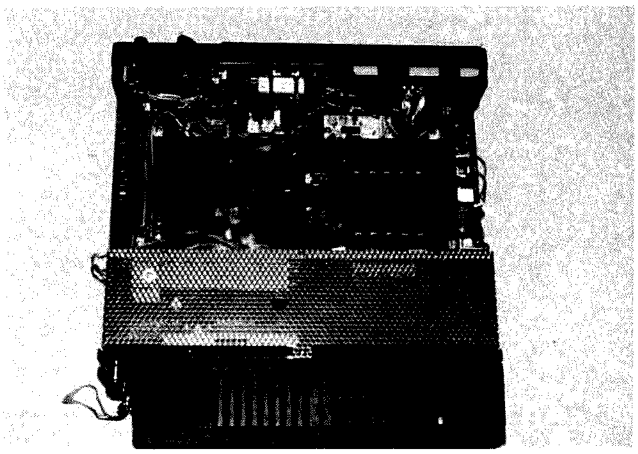
Built-in passive L-C circuits are switched in and out of the circuit via front-panel selector switches. Response curves on the front panel show the bandpasses produced as the Low and High filter switches are clicked through their ranges. An Input switch enables you to select from two separate audio inputs, and there's also a Phones jack. Combined with the Tone switch on the transceiver, the filters provide an extra dimension in receive capability. All in all, a nice addition to the station.

MD-1 Microphone

Yaesu's penchant for buttons and switches carries over into their "stand" microphone. In addition to a standby/transmit switch located on the mike itself, the rig's Up/Down/Fast frequency-select



Rear panel of the FT-980 has almost as many switches as the front panel. The projecting module holds the power amplifier (left) and the power supply (right).



Top view of the FT-980. The optional keyer module is the small rectangular PC board located at about the one-o'clock position. The vco, PLL, and vfo subassemblies are under the metal covers. Power supply and control circuitry are under the screened-in section at the rear.

buttons are duplicated on the mike stand, just in case you're comfortably settled into your easy chair and can't quite reach the tuning buttons on the rig. There's also push-to-talk and lock switches, a high (50k-Ohm)/low (600-Ohm) mike impedance switch, and a three-position tone switch. The mike can be easily removed from its cradle stand but the short cord limits your mobility. An optional MH-1 hand-held mike also is available that includes Up/Down/Fast push-buttons and a two-position tone switch.

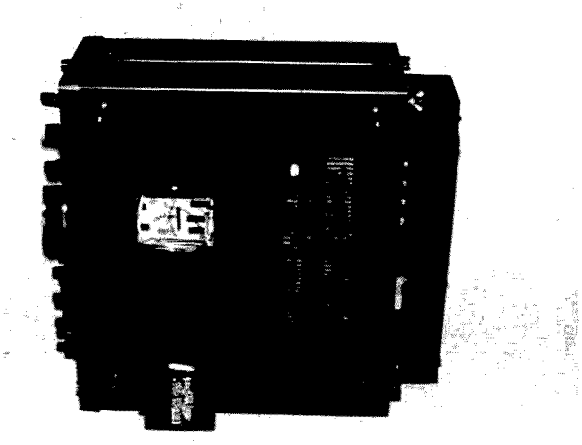
Conclusion

I really liked the FT-980. While it's designed with the serious amateur in mind, it also can help simplify the operating position because it can include a keyer, swr monitor, FM circuitry for transverter drive, full break-in QSK switching circuitry, a separate receive-only antenna switch, and a full array of interface connectors. It also has rear-panel jacks that access its internal microprocessor and a serial interface that allows external control via an outboard microcomputer. Unfortunately, details other than plug pinouts and some cryptic signal names are not provided. So you'll just have to experiment (carefully).

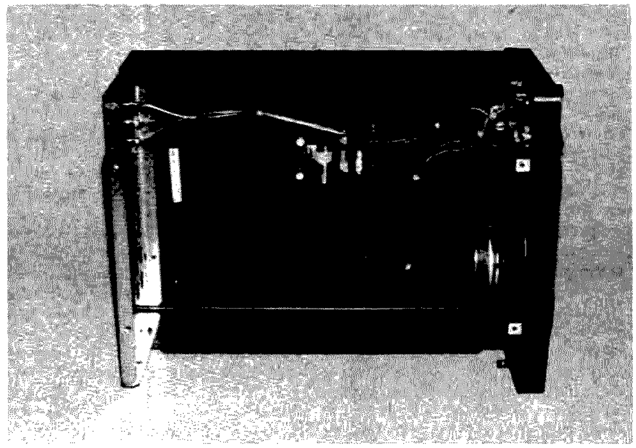
The current crop of amateur transceivers offers tremendous flexibility, along with capabilities unheard of a few years ago. The penalty for this is increasing cost and initial bewilderment when confronted with the maze of controls and switches. But get your hands on an FT-980 and spend some time getting used to it. I think you'll find this is one nice piece of equipment.

For more information, contact *Yaesu Electronics Corp., 6851 Walthall Way, Paramount CA 90723, (213)-633-4007.* Reader Service number 476.

Gene Smarte WB6TOV
Hancock NH



Bottom view. The small door to which the memory backup-supply AA-cells mount dangles free. The circuitry on this side is the i-f (left) and the rf (right). Most of the rig is fairly accessible.



Inside the SP-980 speaker. If you've ideas for station accessories, you have plenty of room here.

DX HIDDEN ASSET LOOP ANTENNA

H. Stewart Designs has just introduced a new antenna design called the DX Hidden Asset Loop Antenna. What you get for $12.50 are the *plans* to build the antenna and a *complete description* of the antenna itself, including history, performance, configuration, construction, and installation. It is called the DX Hidden Asset Loop because it is capable of working DX, it can be installed indoors and is thus "hidden," it is undeniably a loop, and it is an asset to your station. Read on and find out how we proved to our satisfaction that this antenna is well-named.

73 received a prototype antenna that had been made up by H. Stewart Designs to illustrate the construction materials and method of assembly. They even included a wooden mounting support!

Jim Gray W1XU asked me if I would be interested in reviewing the DX Hidden Asset Loop Antenna for *73*. I readily agreed. Not knowing what to expect, I went to work.

After opening the package, I discovered that I had a support board with vertical antenna sections already attached, two antenna loops, each consisting of three pieces of small-diameter aluminum tubing, connectors, clamps, four corner pieces with clamps, and one set of plans and instructions.

With the vertical elements already attached to the support board (which had all the necessary holes pre-drilled), it was easy to insert the four corner pieces (tubing elbows) through the holes provided and slide them over the ends of the vertical elements. The required distance between the two loops (39.5") was already pre-marked on the support board, so the next step was to clamp these pieces in place with the hose clamps.

Next, I assembled the loops themselves by butting the three pieces of tubing in the connectors and clamping them with the hose clamps. Then, I inserted the ends of each loop into the four elbow pieces to a depth indicated by black tape wrapped about 9" from each end and clamped them in place for a first trial. This resulted in an assembly that looked like two large basketball hoops, one above the other, attached to the board and connected to each other by a pair of vertical elements spaced a few inches apart, forming a loop at each end of the board. The instructions said that the antenna should resonate at 28.5 MHz if the dimensions were followed exactly during assembly. However, depending upon the environment in which the antenna is erected, it is possible that the resonant frequency will be slightly different due to house wiring, plumbing, proximity to power lines, etc. (In my case, with the antenna in the attic, no changes had to be made.)

I attached the vertical support board to a horizontal two-by-four that I nailed to the attic rafters. Now it was time to connect the coax to the parallel vertical elements. One of these is separated by about an inch in the middle, forming a gap across which the coax is fastened. The shield braid of the coax goes to one side (lower) of the element, and the center conductor goes to the other (upper) side. Soldering is easily and quickly accomplished. The coax was then led away from the antenna at right angles for about ten feet (instructions say for at least a half-wave—16 feet—for best results) and then downward through a plastic conduit to my shack in the basement.

After that, I was ready to get on the air, but I felt that a test of swr should be made first, so W1XU brought over his bridge. Applying power at 28.1 MHz (the lower end of the 10-meter Novice band), the swr came out at less than 1.5:1, so I decided not to change anything. Now for the on-the-air test!

Within an hour's time, I worked two Texas stations on 10 meters. The band had just opened, yet one station gave me a 579, and the other (a few minutes later) gave me a 599! This was with about 70 Watts output from my FT-707.

Just for fun, we switched to 40 meters to see if we could receive anything there. Signals were jumping! So, what the heck, it couldn't hurt to see if the antenna loaded on 40, could it? Believe it or not, it did, even though the swr was high. The FT-707 has a shut-down circuit in the final to protect it from overload, but I found that the output was still about 50 Watts . . . so I went ahead and called CQ. I worked one ham in Maine and another in New York, with a 559 and a 589, respectively! I was hooked on the DX Hidden Asset Loop Antenna. Even on 80 meters, the reception I get is remarkable, but I haven't had the nerve to try transmitting on 80.

I feel that the antenna is highly suited for emergency and Field Day communications and is ideal for the ham who lives in an apartment or condominium or otherwise must put up with limited space. The DX Hidden Asset Loop Antenna occupies a space only about six feet square and four feet high, so I can highly recommend it for any ham who has a space problem. Not only that, it works out like gangbusters on ten, so you will really have a DX antenna—I'm sure.

General Description

In essence, the DX Hidden Asset Loop Antenna is a single quad loop turned in upon itself. It retains the quad's characteristics of quiet reception, low cost, and ease of assembly. However, its configuration is such that it can be installed in a roughly cubical space that is approximately equal to one-sixth wavelength on a side at the operating frequency. The only other requirement is that the selected installation site permit the coax to be brought away from the antenna at right angles for at least one-half of an electrical wavelength.

One of the features of the DX Hidden Asset Loop Antenna is direct feed with 50-Ohm coaxial cable without an antenna coupler or matcher required. (We think that its performance would certainly not be hurt in the least by the unbalanced feed recommended, but, if desired, a balun could be installed at the feedpoint to ensure balanced feed of this balanced antenna.) The antenna is very broad-banded; you can expect a useful bandwidth of about 3 to 5 percent of the resonant frequency, meaning that on ten meters, it will cover between 500 kHz and 1 MHz from the resonant frequency. By sliding the adjustable-length pieces in and out, you can set the resonant frequency anywhere you want it in the band. Typically, the swr at resonance will be 1.5:1 or less, and it is probable that you will be able to get it below 1.2:1 with careful tuning. However, if the antenna is mounted close to conductors like house wiring or copper plumbing, you may have trouble getting the swr as low as otherwise possible. One good feature is that H. Stewart Designs covers these contingencies in the plans and instructions and tells you how to make the necessary adjustments to compensate.

The only comment that might be considered a negative aspect is that the DX Hidden Asset Loop Antenna is not yet available in kit form! You will have to make up your own kit from the instructions and plans . . . which won't be at all difficult to do. We hope that H. Stewart Designs will consider offering this unique and practical antenna in kit form later on, because we think they have a winner. I'm sure you will think so, too, after you build yours. Plans and instructions are $12.50 from *H. Stewart Designs, PO Box 643, Oregon City OR 97045.* Reader Service number 478.

BENCHER KEYER PADDLE

One of the great delights of CW is the beautiful "music" that can be generated by a good operator using good equipment. Today's CW operator has the advantage of a variety of keys and keyers to choose from, most of which have full iambic capability. As you know, iambic-mode keying allows certain characters to be formed more easily and quickly. For example, letters like F, L, Q, Y, and so forth require

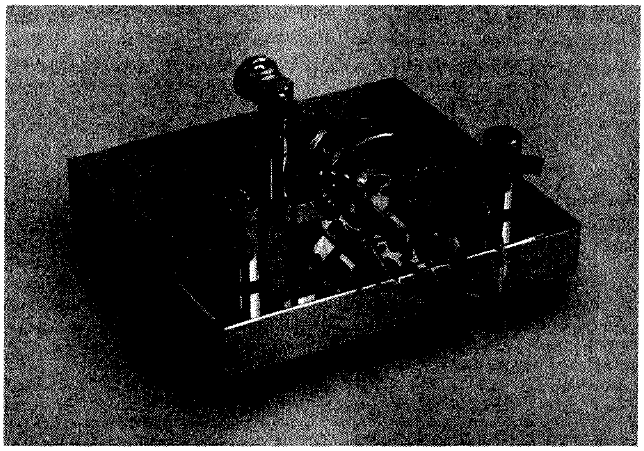
fewer paddle movements when keyed in the iambic mode.

Many operators have discovered the Bencher full-iambic keyer paddle, suitable for use with all of the electronic keyers and well known for its functional beauty. In fact, I have been using a Bencher paddle since 1979 and find that I like it better and better each year. It seems to be settling in. . . or perhaps I am the one that's settling in! Unfortunately, I never learned iambic keying, and I use the key in the ordinary bug fashion. Just the other day I was talking with Bob Locher W9KNI, who —with Jerry Benedict— is a partner in Bencher, Inc. (Benedict plus *Locher* = *Bencher.*) I lamented the fact that I had never learned iambic keying and therefore wasn't making full use of my paddle. Bob laughed and said, "You're not alone, but we have just developed something for hams like you and for hams who are used to a bug—a non-iambic paddle for use with either full-iambic or non-iambic keyers."

We chatted a while longer about keys, keyers, and paddles, and, after a bit of adroit arm-twisting on my part, Bob finally knuckled under and promised to send me one of the new paddles, realizing perhaps that I was one of the last old-fashioned holdouts who could never learn iambic CW. Maybe he just took pity on me.

Whatever the reason, I soon received a large box full of plastic worms. Buried within the plastic protection was a smaller box enclosing the key. Inside that box I found a cardboard partition or separator that holds the very heavy paddle base in place and prevents the relatively delicate paddle mechanism from being dislodged and damaged during shipment. The entire package is neat, strong, and extremely well designed. . . a hint about the contents, too!

The key itself looked much like the original—only better, if that is possible. It has



Model ST-2 Bencher paddle.

a heavy chrome-plated base with rubber feet that keep the key solidly in place on your bench or desk and inhibit its walking around when energetically operated. The paddles and their unique gimballed actuating mechanism are supported on sturdy pillars screwed into the base. The finger pads are clear plastic ovals (as opposed to triangles on the original Bencher paddles) with chamfered, or bevelled, edges that invite your fingers to slip over them while keying. . . providing a very nice feel.

The tension spring is very easy to adjust on this model because the spring loop is captured by an adjustable screw with a knurled knob at the center post. The contact space adjustment between paddles and slide posts is made as before, with Allen screws and lock screws set into the posts. Bencher has thoughtfully supplied the Allen wrench for you, attached to the underneath side of the base, where it can't get lost. Perfect spacing adjustment and tension, suited to your own specifications, can be obtained quickly and easily the first time you try.

The two sides of the key, that is, the paddle electrical contacts, are brought through the base by insulated bushings to solder lugs attached by 10-32 Phillips-head screws. The ground side of the key is a solder lug firmly screwed to the base itself. There is also a plastic retainer that firmly holds the lead wire from your paddle to your electronic keyer. The wire is not provided, of course, but the one you use now will be satisfactory. I use a vinyl-covered, double conductor, shielded cable. . . similar in size and appearance to a microphone cable, or a piece of coax. After the electrical attachments are made to the solder lugs, the cable is clamped down so that the connections can't pull loose.

You'll find the Bencher paddle easy and pleasant to use. . . it seems to invite your fingers to use it easily and correctly. In my own case, I was extremely pleased to find that I stopped making keying errors through misuse of the iambic feature. My CW improved perceptibly, if not dramatically. I think you'll like your new Bencher paddle, especially if (like me) you don't know iambic keying, yet you want a key that will enable you to get the most out of your electronic keyer and make beautiful "music."

The Bencher paddle, Model ST-1 (black-finished base), is available at $46.95 amateur net. Model ST-2 (chrome-finished base) is priced at $59.95, and Model ST-3 (gold-plated base, available on special order) costs $150.00. Write to *Bencher, Inc., 333 West Lake Street, Chicago IL 60606*. WHAT DO *YOU* THINK?

Have you recently purchased a new product that has been reviewed in *73*? If you have, write and tell us what *you* think about it. *73* will publish your comments so you can share them with other hams, as part of our continuing effort to bring you the best in new product information and reviews. Send your thoughts to Review Editor, *73: Amateur Radio's Technical Journal*, Peterborough NH 03458.

RTTY LOOP

Marc I. Leavey, M.D. WA3AJR
6 Jenny Lane
Pikesville MD 21208

It's February, and, not to offend the followers of your friendly neighborhood groundhog, I'd like to celebrate Valentine's Day this year. A Valentine to all of you readers, who send me the most interesting mail.

I would like to lead off with a note from Peter Martinez G3PLX of AMTOR fame. In part, Peter writes, "I am glad to see that interest is picking up over there after such a long time. It seemed for many years that AMTOR was strictly a European system.

"It is true that in the early days of AMTOR, I was offering a program that would run AMTOR on a 6800-based computer, but this was written in source code only and was incomplete in that it required all the interfacing to the computer hardware to be written. There were very few people able enough to use the program in this form.

"So this program is no longer available, and I turned my attention at that time to designing a small PCB, with on-board CPU, ROM, etc., which would enable people to get on the air much easier than tackling the difficult software task. The Mk2 version of this kit is still available from ICS Electronics Ltd, PO Box 2, Arundel, West Sussex, England, either in kit form or as a ready-made board. It requires a single 5-volt supply, and will interface at TTL serial Baudot code to any existing RTTY system.

"I think you will see that the initial approach to AMTOR in its early days 5 years or so ago has fallen by the wayside and given way to others. There are not, as then, very many experienced machine-code programmers amongst the amateur-radio fraternity, and most users now and in the future will prefer to buy ready-made hardware or software. There will be no shortage of either before very long."

I do appreciate these comments, excerpted from a much longer letter written by this pioneer of AMTOR.

Bill Emerson WA1EVD, D.M.D., passes along his comments that he would like to see a compilation of RTTY Loop columns and also that, "I hear more AMTOR now, but 60-wpm Baudot is still the common mode. Lingua Franca?" I suspect that Murray, or Baudot, will remain such for quite a while, Bill. With the number of machines out there, I doubt if the "sixty standard" will soon roll over and die.

Nonetheless, several of you are expressing various forms of interest in computerized RTTY. Lester L. Johnson AH6AA of Sandpoint, Idaho, relates having built a demodulator from an article in an old issue of *73*. He couples that with a commercial AFSK oscillator and a TRS-80(R) computer, model unspecified. Lester would like a way to interface his computer to the terminal unit and such. He notes that the I/O structure of the Model I TRS-80 is different than the Model III; but does not say which he has. I do not have any ready information to accomplish this, Lester, but I am sure that a number of our readers have. Let me hear from you out there, and I will publish the best schemes for all to benefit.

Lester also notes that he would like to run his rig, a Kenwood TS-120, on RTTY, with the power cut back to about ten Watts. I would say, off the top of my head, that this should be okay. Normally, cutting the power back to that extent should be sufficient to protect the finals from overheating. I have run my 100-Watt transmitter at about 50 or 60 Watts for prolonged periods without damage, but I like to take chances!

Another computer user is Anson R. Hyde K4EK, M.D. Dr. Anson, who lives in Alexandria, Virginia, just over the river from Washington DC, has used his IBM-PC on two-meter ASCII RTTY using a telephone modem to output tones. He would like to know if there are any programs around to run Murray on this machine. Well, that is one machine that I have seen *nothing* for RTTY printed on. I don't know if IBM-PC users are not the "hamming" type (I suspect that they are not) or if the average ham is looking for a more modestly priced machine (so that that is where the manufacturers concentrate their marketing), but RTTY for the IBM-PC? Zip! I would encourage anyone who has put together such a program to write it up and send it to me here for inclusion in a future column, or make it a full-scale article and send it to our fair editor. We're waiting, we're waiting!

Greetings to Dean E. Strand KA0KKZ of Davenport, Iowa. Dean passes along a string of thoughts, a few of which I shall share with you all. Dean notes that he is using a Robot 800 keyboard, and when using it on CW in the Novice bands, he likes to set it to send characters at ten words per minute, with five-word-per-minute spacing. He feels that this makes the code more copyable and helps the newcomer improve his code speed. I agree, Dean, and this has even been the way the best code tapes are made.

Dean writes he has difficulty tuning in stations using a dedicated scope display on his terminal unit. Well, in an edition of this column several years ago, I covered how to hook up a general-purpose oscilloscope to act as a tuning device for RTTY. All you need are mark and space signals out of your demodulator. Feed them to the vertical and horizontal input of any old scope and tune the "+" pattern to maximum. Cheap scopes can be picked up at most hamfests and can be used for other things when not tuning in a RTTY signal.

Like all of us, Dean is looking to computerize his station. He notes that "there are at least two ways to go, one to get a good general-purpose computer (when I say good, I mean DEC Rainbow, IBM-PC, or HP Professional class, not VIC or Atari

stuff) and use and interface...that includes AMTOR. The other way would be to get a...top-of-the-line unit...with all the whistles and bells." Now hold on, Dean. I think you might find that the top-of-the-line computers you mentioned might just be overkill for a ham shack. Don't knock the cheap stuff. I just got another small computer in here, a TRS-80C (also known as the CoCo), and am amazed at what can be done. The 6809 is a fantastic chip that can run rings around many other systems. If you want a big computer for business use or such, fine, but don't sell the little stuff short. It ain't so little anymore.

Leonard Laurel WA6FBL of Fort Bragg, California, is one of those with what might be considered a small system. He is looking to hook up his TI-99/4A on RTTY. Well, Len, as I write this column, the newspaper is filled with the news of Texas Instruments' decision to stop production of the 99/4A, so I don't know what the future holds. As with the IBM-PC, I have seen next to nothing in print about using the 99/4A on RTTY. I only hope that someone out there is doing it and sending the information in to be passed along. Good luck.

From the "left hand don't know what the right hand is doing" department comes a note from Karl Thurber W8FX from Millbrook, Alabama. Karl asks, "Have you run into anyone who has successfully interfaced a Commodore VIC-1525 printer to a Hal CT-2100 Communications Terminal? The Commodore printer (which is the standard one used commonly with the VIC-20 and C-64 computers) has a so-called 'Commodore serial ASCII' bus, while the CT-2100 has provisions for an 'ASCII printer' and 'RS-232C' output, neither of which appears to be suitable for connection to the 1525 printer without some sort of interface. A letter to Hal brought a 'we know nothing about that printer' response, so I'm stymied at this point."

The first thing which occurs to me is to check that both devices are operating at the same baud rate. It is possible that one may be set at, say, 110 baud—like for a Teletype KSR-33—where the other may be at 300 or1200 baud, such as most serial printers are. Also, check to see if the Ready To Send (RTS) and Clear To Send (CTS) lines are used to inhibit and enable print, and, if so, that they are hooked up correctly. Without some sort of documentation, those are my first suggestions. Perhaps others have done this hookup and will let us know. I have confidence in you all out there!

Several of you in your letters suggested, that a book compilation of the first several years of this column would be helpful. I agree with you, but it will take more than your notes to me and my intentions to make such a book a reality. Drop a line to the editor of *73*, and to me as well, and let us know that there are enough of you out there interested to make a go of it. In the meantime, keep up with all the new developments yet to come. With the arrival of the CoCo here in the shack, I hope to be able to take a look at some of the 6809 software that has been floating around beyond my reach for a while. As soon as I see it, I'll tell you about it—right here, in RTTY Loop.

CONTESTS

Robert Baker WB2GFE
15 Windsor Dr.
Atco NJ 08004

ARIZONA QSO PARTY
Starts: 1800 GMT February 4
Ends: 0600 GMT February 5

Sponsored by the Southern Arizona DX Association. Single-operator and club entries; all bands and modes but no repeater contacts allowed. Each station may be worked only once per band per mode.

EXCHANGE:

RS(T) and state, province, DXCC country, or Arizona county. Novices and Technicians also sign /N or /T respectively.

FREQUENCIES:

Phone—3895, 7230, 14280, 21365, 28560.
CW—60 kHz up from lower band edge.
Novice—25 kHz up from lower band edge.

SCORING:

Count 1 point per phone QSO, 2 points for each CW or other mode QSO, and 4 points per QSO with Novice or Technician in the Novice bands. Arizona stations multiply QSO points by number of states, provinces, and DXCC countries. Others multiply QSO points by number of Arizona counties (15 max.). The club station W7NQ also counts as 1 multiplier for non-Arizona stations. Non-Arizona stations working all Arizona counties and W7NQ may double the multiplier.

AWARDS

Certificates for the highest-scoring station in each category: Arizona, non-Arizona, and Novice/Technician. In addition, certificates for highest score in any Arizona county, state, province, or DXCC country in which there are entries.

Other certificates for Arizona and non-Arizona clubs whose members' scores combine for the highest score. Club entries must consist of at least 5 individual entries to be eligible. Club residency is determined by mailing address.

ENTRIES:

Individual entries should show each station worked, exchange plus time, frequency, and mode of each QSO. Include a summary sheet of your scoring and dupe sheets for bands with more than 50 QSOs. Entries may designate one club with which they are participating. Deadline for individual entries to be received is March 4.

Club entries should be submitted by a club officer with a summary of callsigns and claimed scores. To be counted toward the club total, the individual entries must also designate the club. Deadline for club summaries is April 4.

Include a large SASE for results. Entries should be addressed to: Southern Arizona DX Association, c/o Philip M. Stickney N7BUP, 1890 West Paseo Cuenca, Tucson AZ 85704.

ZERO DISTRICT QSO PARTY
1900 GMT February 4 to 0100 GMT February 5 and 1500 GMT February 5 to 2400 GMT February 5

Sponsored by the Davenport Radio Amateur Club. Stations outside of Zero district will work Zero stations only, Zeros may work any station. The same station may be worked once on each band (80, 40, 20, 15, and 10 meters only) and each mode (CW and phone). However, mobile stations may be worked each time they change counties.

EXCHANGE:

RS(T) and ARRL section. Zero-District stations also must send county.

FREQUENCIES:

3560, 7060, 14060, 21060, 28060, 3900, 7270, 14300, 21370, 28570, 3725, 7125, 21125, and 28125.

SCORING:

Each phone QSO is worth one point; CW QSOs are worth two points. Non-Zero-District stations multiply by the number of Zero-District counties. Zeros multiply QSO points by the total ARRL sections, Zero-District counties, and DXCC countries worked.

ENTRIES & AWARDS:

A plaque will be awarded to the high scorer in the Zero District and high scorer from outside Zero Land. Certificates will be awarded for high scores in each ARRL section, DXCC country, Novice/Technician class, and mobile categories. Results and a participation certificate will be issued to all entrants who include an SASE. Mail logs by March 10 to WØBXR, 2131 Myrtle, Davenport IA 52804.

SOUTH CAROLINA QSO PARTY
Starts: 1800 GMT February 4
Ends: 2359 GMT February 5

The QSO party is again sponsored by the Colleton County Contestors. The same station may be worked on each band and mode, simplex only. South Carolina mobile stations that change counties are considered new stations. Novice and Technician stations please sign /N or /T.

EXCHANGE:

RS(T) and state, province, country, or South Carolina county.

SCORING:

Phone contacts are worth 2 QSO points; CW contacts are worth 3 points. The multiplier for South Carolina stations is the number of states, provinces, and DX countries worked. Others multiply QSO points by the number of South Carolina counties worked (46 max.).

FREQUENCIES:

Phone—3895, 7230, 14280, 21365, 28560.
CW—3560, 7060, 14060, 21060, 28060.
Novice—3725, 7125, 21125, 28125.

AWARDS:

Certificates to top-scoring station in each South Carolina county, state, province, and DX country. Novices and Technicians compete only with other Novices and Technicians.

ENTRIES:

Include a summary sheet with your entry showing scoring and other information. Indicate each new multiplier in your log as it is worked. Novices and Technicians must indicate class on entry. Include a large SASE for results. Send entry by March 5 to: Colleton County Contestors, c/o Elliott Farrell, Jr. KE4VP, Rt. 3 Box 658, Walterboro SC 29488.

VERMONT QSO PARTY
2100 GMT February 4 to 0700 GMT February 5 and 1100 to 2400 GMT February 5

Sponsored by the Central Vermont Amateur Radio Club (W1BD). Each station may be contacted once on each band and mode (CW, phone, RTTY). CW and RTTY contacts must be in the CW and RTTY subbands.

CALENDAR

Feb 4-5	**South Carolina QSO Party**

W5PWG	Texas	200

EXCHANGE:

QSO number and state, province, country, or two-letter designator for Vermont county (AD, BE, CA, CH, ES, FR, GI, LA, OE, OS, RU, WA, WM, WR). Do not send RS(T).

FREQUENCIES:

Phone—3910, 7230, 14260, 14320, 21360, 28570, 50.110, 144.2.

CW—3530, 3730, 7030, 7130, 14060, 21060, 21160, 28060.

RTTY—3620 and **090 other RTTY subbands.

SCORING:

Score one point per phone contact, 2 points per CW or RTTY. Vermont stations multiply QSO points by number of states plus Canadian provinces plus ARRL countries (exclude US/Canada). Others multiply QSO points by the number of Vermont counties (14 max.).

AWARDS:

For non-Vermont stations, certificate to highest-scoring station in each state, province, and country. Certificates will be given each Vermont station submitting a log; annual plaque to highest-scoring Vermont station. W/VT Award given to stations working 13 of Vermont's 14 counties.

ENTRIES:

Send an SASE for official log and score sheets. Send logs/facsimiles, name, class of license, and address not later than March 1 to: D. Nevin KK1U, W. Hill, Northfield VT 05663. Include an SASE for a copy of the results.

NEW HAMPSHIRE QSO PARTY 1900 GMT February 4 to 0700 GMT February 5 and 1400 GMT February 5 to 0200 GMT February 6

Sponsored by the New Hampshire Amateur Radio Association. Stations may be worked once per band per mode. New Hampshire stations may work each other.

EXCHANGE:

Send RS(T) and country, ARRL section, or New Hampshire county, as appropriate.

FREQUENCIES:

Phone—3935, 3975, 7235, 14280, 21380, 38575, 50.115, 145.015.

CW—1810, 3555, 7055, 14055, 21055, 28055.

Novice—3730, 7130, 21130, 28130.

RTTY—3625, 7085, 14085, 21085, 28085.

SCORING:

New Hampshire stations score 1 point per QSO, multiplied by the number of ARRL sections plus countries plus New Hampshire counties. Others score 5 points per New Hampshire QSO times the number of New Hampshire counties worked.

ENTRIES:

Send your entry no later than March 15 to Pete Cantara K1IM, 19 Haverhill St., Hudson NH 03051. Include a large SASE for results.

DUTCH PACC CONTEST Starts: 1400 GMT February 11 Ends: 1700 GMT February 12

Use all bands, 160 through 10 meters on CW and SSB. No crossmode operations allowed. Each station may be worked only once per band regardless of mode. Operating categories include single operator, multi-operator, and SWL.

EXCHANGE:

RS(T) plus sequential QSO serial number starting with 001. Dutch stations will send their two-letter province abbreviation instead of a QSO number: GR, FR, DR, OV, GD, UT, YP, NH, ZH, ZL, NB, and LB.

SCORING:

Each QSO with PA, PB, or PI counts one point. Multiply QSO points by the number of provinces worked on each band (72 max.).

SWLS count one point per Dutch station heard and multiply by provinces heard on each band (72 max.).

ENTRIES:

As usual, a score calculation is required. Please use a multiplier column and insert multipliers only if new. A log must be signed for observations of the contest rules. SWL logs must contain condegroups given by the Dutch station and the foreign station worked with. Send logs no later than March 31 to: F. Th. Oosthoek PA0INA, PO Box 499, 4600 AL Bergen op Zoom, Netherlands.

A certificate will be awarded to each country winner in each category along with the second- and third-place stations provided that there are sufficient participants in that country. Certificates will also go to winners in each call district of JA, LU, PY, UA9/0, VE/VO, VK, W, ZL, and ZS.

BEACON

INDIANAPOLIS REPEATER ASSOCIATION

NEWSLETTER OF THE MONTH

We think that the *Beacon* is one of the best newsletters we've ever seen. Basically, it is *packed* with information: news notes, hamfest and club calendars, bylaw excerpts, net skeds, reports from members and other media, contest and DX info, League news, a membership application, and more. You name it and it's in the *Beacon*—and it's presented in a very neat, easy-to-read format. Congratulations to Editor Mike Head WB9ZQE and the Indianapolis Repeater Association. The *Beacon* is a real winner.

To enter your newsletter in *73*'s Newsletter of the Month Contest, send it to 73, Pine Street, Peterborough NH 03458, Attn: Newsletter of the Month.

AMERICA RADIO CLUB INTERNATIONAL DX CONTEST Starts: 0500 GMT February 18 Ends: 0500 GMT February 20

Any amateur station making two contacts with America Radio Club DX member operators during the two-day contest will be eligible to apply for the Special Silver QSL Award. Stations making three contacts will be eligible for the Special Gold QSL Award. Contacts must be made during the two-day period listed above. Suggested frequencies include all authorized frequencies in the 10-, 15-, 20-, and 40-meter phone and CW bands. Exchange RS(T) and QTH. SWL stations may also apply for this award on a heard basis. For special awards, send QSL and $2.00 in US funds or 6 IRCs to: America Radio Club QSO Contest, PO Box 3576, Hialeah FL 33013.

RESULTS

1983 DUTCH PACC CONTEST

USA WINNERS BY CALL AREA

	QSOs	Mult.	Score
K1KI	129	46	5934
WA2UDT	31	18	558
W3ARK	63	30	1890
W4VQ	106	37	3922

W6KZV	22	13	286

YL-ISSB COMMO SYSTEM QSO PARTIES Phone Starts: 0001 GMT February 18 Ends: 2359 GMT February 19 CW Starts: 0001 GMT March 17 Ends: 2359 GMT March 18

Use the General portion of all bands. Deadline for all logs, summary sheets, and comments is June 1. Entries should be addressed to: Rick and Minnie Connolly, Star Route 1, Crocker MO 65452. Individuals needing extra application and instruction forms send a 4 × 9 SASE to the same address.

CQ WORLDWIDE 180-METER CONTEST — SSB Starts: 2200 GMT February 24 Ends: 1600 GMT February 26

Operating classes include both single and multi-operator (maximum of 5 ops per station).

EXCHANGE:

RS plus QTH, state for USA, and province for Canada.

RESULTS

1983 A5 NORTH AMERICAN UHF-FSTV CONTEST

1	K6YGX/W6VCF	26,530
2	WB0ZJP	9,420
3	WB9MCF	5,440
4	W2WHK	4,520
5	KA0BVT	4,360
6	W2RPO	3,755
7	N2BJ	3,350
8	WA2CXW	2,815
9	WB2KGM	1,695

SCORING

Contacts with stations within own country are 2 points, other countries but same continent are 5 points, other continents are 10 points. KH6 and KL7 are considered countries.

Multipliers are each US state, VE province, and DX country. USA and Canada are *not* country multipliers. However, there are three VE1 provinces: New Brunswick, Nova Scotia, and Prince Edward Island. Final score is total QSO points times the sum of the multipliers. Maritime mobile scoring will be determined by the location.

AWARDS:

Certificates to the top scorers in each class in each US state, VE province, and DX country. Special plaques are also being awarded for top USA, Europe, and world scores.

PENALTIES:

Three additional contacts will be deleted from the score for each duplicate, false, or unverifiable contact removed from the log. A second multiplier also will removed for each one lost by this action.

Violation of the rules and regulations pertaining to amateur radio in the country of the contestant or the rule of the contest, or unsportsmanlike conduct, or taking credit for excessive duplicate contacts or multipliers will be deemed sufficient cause for disqualification. Disqualified stations or operators may be barred from competing in CQ contests for a period of up to three years.

ENTRIES:

Sample log and summary sheets may be obtained from *CQ* by sending a large SASE with sufficient postge to cover your request. It is not necessary to use the official form, you can use your own. Logs should have 40 contacts per page and show time in GMT, numbers sent and received, and separate columns for QSO points and multipliers. Indicate the multiplier only the first time it is worked.

Include a summary sheet with your entry showing the scoring and other essential information, and a signed declaration that all rules and regulations have been observed. Mailing deadline for SSB entries is March 31. Logs can be sent directly to the 160 Contest Director, Don McClenon N4IN, 3075 Florida Avenue, Melbourne FL 32901 USA. Alternatively, they can be sent to CQ 160-Meter Contest, 76 North Broadway, Hicksville NY 11801 USA. Please indicate "SSB" on the envelope!

3RD ANNUAL RTTY WORLD CHAMPIONSHIP 0000Z to 2400Z February 25, 1984

SPONSORED BY:

73: Amateur Radio's Technical Journal and *The RTTY Journal*.

OPERATOR CLASSES

(A) Single operator, single transmitter. (B) Multi-operator, single transmitter.

ENTRY CATEGORIES

(A) Single band. (B) Allband, 10-80 meters.

MISCELLANEOUS RULES

The same station may be worked once on each band. Crossmode contacts do not count. Single-operator stations may work 16 hours maximum, while multi-operator stations may operate the entire 24-hour period.

Off times are *no less* than 30 minutes each and must be noted in your log(s).

EXCHANGE

Stations within the 48 continental United States and Canada must transmit RST and state or province/territory. All others must transmit RST and consecutive contact number.

QSO POINTS

5 QSO points for contacts with W/VE stations located within the continental United States and Canada. 10 QSO points for all other contacts.

MULTIPLIER POINTS

1 multiplier point is awarded for each of the 48 continental United States (a District of Columbia contact may be substituted for a Maryland multiplier). Canadian provinces/territories, and DX countries worked on each band (excluding US and Canada).

FINAL POINTS

Total QSO points times total multipliers equals *claimed score*.

CONTEST ENTRIES

Entries must include a *separate* log for each band, a dupe sheet, a summary sheet, a multiplier checklist, and a list of equipment used. Contestants are asked to send an SASE to the contest address for official forms.

ENTRY DEADLINE

All entries must be postmarked no later than April 15, 1984.

DISQUALIFICATIONS

Omission of the required entry forms, operating in excess of legal power, manipulating scores or times to achieve a score advantage, or failure to omit duplicate contacts which would reduce the overall score more than 2% are all grounds for immediate disqualification. Decisions of the contest committee are final.

AWARDS

Contest awards will be issued in each entry category and operator class in each of the US call districts and Canadian provinces/territories, as well as in each DX country represented. Other awards may be issued at the discretion of the awards committee. A minimum of 25 QSOs must be worked to be eligible for awards.

CONTEST ADDRESS

RTTY World Championship, c/o *The RTTY Journal*, PO Box RY, Cardiff CA 92007.

QATAR

One of several tiny countries around the Persian Gulf, Qatar's chief claim to fame is its black, gooey, crude oil under a barren landscape. Actually, Qatar is a peninsula sticking into the Persian Gulf from Arabia, not far from the island country of Bahrain. Most of Qatar's 4000 square miles are barren sand and low hills; annual rainfall is about 5 inches. Most of the country's 170,000 inhabitants live in the capital city of Doha.

As are most Middle Eastern countries, Qatar is antagonistic toward strangers. These countries are highly suspicious of foreigners and not only discourage but actually prohibit most visitors. (Consider Iran's feelings toward Americans, for example.) DXpeditions and amateur operations by foreigners living in these countries are seldom permitted, and few of the native amateur operators spend much time handing out DX contacts or QSL cards. So the report of an American with a well-equipped station active from Qatar is good news indeed.

Mike Smedal A71AD (Photo A) is the first foreigner to receive an amateur-radio license since the country became independent 14 years ago. To qualify for the license, Mike had to show that he worked and lived in Qatar, and he had to pass a security clearance. That done and the $250 license fee paid, A71AD was on the air.

Mike's station includes a Yaesu FT-1 transceiver feeding a Yaesu FL-2100Z amp. When conditions get a little rough, Mike runs the output of the Yaesu amp into an export version of Alpha's 77SX amplifier! The antenna farm is also first class (Photo B): a Hy-Gain TH7DDX above a Hy-Gain 402BA two-element 40-meter beam. An inverted V provides 80-meter coverage. Mike says that the TH7 handles the high-power levels without difficulty. Mike runs RTTY on his Radio Shack TRS-80 Model I and is active on OSCAR, too.

The best times to look for Mike (and other Middle Eastern amateurs) are Thursday evening and Friday. The work week is six days long in Qatar, with Friday (the Arab holy day) as the day off. So their equivalent to our weekend is Thursday night and Friday.

On the subject of QSL cards, Mike writes, "Please tell everyone that we do not have a radio club in Qatar. Therefore, we do not have a QSL bureau. If [DXers] want a QSL card, please QSL direct to PO Box 4747, Doha, State of Qatar, Middle East."

SAUDI ARABIA

An exception to the no-visitor policy of the Middle Eastern countries was made for the recent visit of Lloyd and Iris Colvin, W6KG and W6QL, of Yasme DXpedition fame. The Colvins managed not only to visit most of the countries in the region, but also actually obtained permission to operate in many of them.

Iris faced special problems in Saudi Arabia. Women occupy a very special role in the Arab world, quite different from that in the more liberal Western nations. Women are seldom seen out in public, and then only heavily veiled. Those few women who do venture out of doors find themselves escorted to the head of the line and receive other special attentions. On the other hand, an unveiled woman in Saudi Arabia faces a nasty surprise from the local authorities.

Saudi policemen carry two items on their belts: a can of black spray paint and an ice pick. Upon seeing a woman with bare face or arms, the policeman will, very politely, spray black paint over the exposed skin! (The ice pick sees similar service in the Saudi's swift, uncomplicated justice system. Illegally parked automobiles are not ticketed or towed. The policeman simply stabs all four tires with the ice pick!) And petty theft is unknown; the Saudis still cut off the hand of an offender.

Photo A. Mike Smedal A71AD in his well-organized and well-equipped shack in Doha, Qatar.

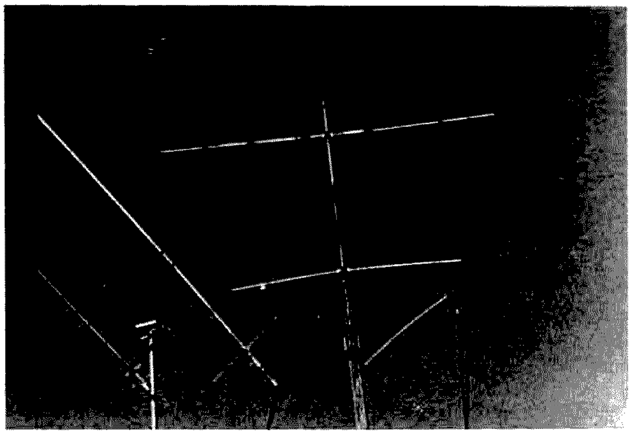

Photo B. The antenna farm at A71AD, including a TH7 and 2 elements on 40 meters. In the foreground are the Oscar 10 antennas.

In the amateur-radio field, most of the local hams are big wheels in the government or are in the Saudi family, which is the same thing. With the billions of dollars flowing into the country as the oil flows out, Saudi hams can afford good equipment. One local ham employs a graduate electronics engineer just to maintain his amateur-radio station!

However, the Saudi princes aren't likely to spend much time running stateside hams in pileups. One of your best bets to work Saudi Arabia is HZ1AB, the amateur-radio club at the American compound on the Persian Gulf, which is home in Saudi Arabia for about 50,000 foreigners. HZ1AB is another first-class station, with Collins S-lines, amplifiers, and a substantial antenna farm. The latter includes a rhombic, rotatable KLM tribander and a 2-element beam on 40 meters. The Colvins operated the ARRL CW DX Test from HZ1AB, but could work the States for only about 7 hours a day.

Among the regular operators of HZ1AB are Dave Ernest W7SE and N6OL. QSL the station through K8PYD, except for the February 19-20, 1983, operation by the Colvins, which is confirmed via Yasme, Box 2025, Castro Valley CA 94546.

QRO—EXCESSIVE POWER

Lloyd and Iris Colvin stopped by Houston between DXpeditions this past fall. At the International DX Seminar, held in conjunction with the ARRL National Convention, the Colvins joined several other prominent DXers and contesters on the panel discussion of excessive power in amateur radio. The problem of excessive power drew a large and interested crowd to hear the DXers discuss alternative solutions.

The seminar opened with a discussion of what we mean by "excessive power." Under the old FCC regulations, any amplifier was restricted to a maximum of about 800 Watts output. However, many of the "standard" off-the-shelf amplifiers openly sold in the amateur community were capable of significantly greater power levels, often 50% more. Active contesters and DXers owned amplifiers capable of running power levels above the FCC maximum because of the greater dependability and longer lifetime of an "over-rated" amp. A 1000-Watt amplifier running 1000 Watts all the time won't hold up as well as a 2000-Watt amp coasting along at half power.

However, there was always a strong temptation, particularly in DX pileups and contests, to run the amp flat out. "Tuning

Photo C. Gene Zimmerman W3ZZ (standing) makes a point at the Excessive Power seminar of the First International DX Symposium, in Houston. Al Slater G3FXB (left) and Bob Ehrhardt YS9RVE listen intently.

for maximum smoke" is the usual practice, and many amateurs have run "excessive power" for years. Under the new FCC power regulations, most of these amplifiers have been "grandfathered" into legality.

But there is a greater problem in excessive power than squeaking out a couple extra Watts over the legal limit. While some amateurs are still saving their bucks for a better antenna, some hams have quietly been installing *real* high-power amplifiers, amps that require 500–1000 Watts of *drive*.

The Houston seminar turned to the problem of what to do about that small number of amateurs who run super-power. Frequent contester (and occasional DXpeditioner) Gene Zimmerman K3ZZ (Photo C) suggested that the current rules about power during contests be changed. Gene recommended that inspectors stop by the shacks of hams seriously involved in the contest and look at the amplifiers. If any amp had final plate dissipation (or the transistor equivalent) of more than 1600 Watts, the contestant would be disqualified. He reasoned that if you don't have an amp capable of running excessive power, you won't run it! The same idea holds for DXers, of course, with the offending amateur losing the right to participate in DXCC, for example.

Al Slater G2FXB (Photo C) talked about a similar program used by the Radio Society of Great Britain for their Field Day, which is even more popular there than the same activity on this side of the Atlantic. The RSGB requires each Field Day team to register before the contest and include their operating locations. During the contest, a volunteer RSGB inspector stops by and checks that the group is meeting their strict rules of 30 Watts maximum input power!

This 30-Watt limit poses special problems for British amateurs; most standard transceivers have little or no output at the 30-Watt input level. So the G hams build special final amplifiers designed for maximum output with 30 Watts of input power. These simple amps often are fed with a 100-Watt output transceiver and are run so close to the limit that some groups change final tubes every hour of the contest!

The question of high power is of special interest to Al, who spends much of his time on 160 meters, where the British hams face a 10-Watt power limit. Al said the government licensing authorities no longer worry about power and have suspended their station inspections. Most hams run a full 200 Watts on 160 meters, and 2000-Watt amplifiers are not unknown.

In other comments on the high-power question, panelist Ellen White W1YL felt that the contest rules already permit disqualification of anyone running illegal power. On the other hand, Ellen felt that the idea of inspectors coordinated from League headquarters would be unworkable. Ellen favored handling excessive-power users at the local level, by drumming them out of the local DX club, for example.

Both Iris and Lloyd Colvin recommended increasing the existing power limits as a means to eliminate the "excessive-power" problem. Lloyd particularly suggested higher power limits on the lower frequencies, including .160. Iris noted the advantages of high power on DXpeditions, when the power helps to control the pileup. If the stateside stations calling can't hear the DX station very well, the rate of contacts drops and fewer hams get a chance to work the DX station.

Several members of the audience took exception to the idea of ever-increasing power limits. Tod Olsen KØTO disagreed with the concept of letting the manufacturers of amateur equipment decide what the legal or moral limits to excessive power should be. "Just because it is openly sold to hams doesn't mean that the power level is acceptable." Dick Norton N6AA felt that in the contest field the power level doesn't really matter as long as the final contest results are not affected. But if someone wins the contest or moves ahead of a legal power station by running excessive power, he should be disqualified.

I have my own definition of "excessive power." The FCC amateur regulations state that amateurs should always use the minimum power necessary for the communications. So two hams talking across town on 20 meters don't need the amplifiers, much less the excessive-power amps. And frankly, even a few thousand Watts of power cannot compensate for bad operating techniques or inadaquate antennas.

How much power is *really* needed for amateur communications? Listen any time to 14100. A series of beacons all over the world ticks down every ten minutes with ever-lower power levels. See how far down into the mud you can copy the beacons' signals. We'll be talking more about this beacon network and other propagation aids and suggestions in future issues. Stay tuned. Meanwhile, keep an ear out for some of these coming attractions.

Photo D. Jim Smith VKØNS is aiming for Kermadec Islands this season, after his event-filled DXpedition to Heard Island last year.

COMING ATTRACTIONS

The DXpedition circuit continues to hum in February, with two major expeditions scheduled for the month. Jim Smith VKØNS (Photo D) is spearheading an amateur and scientific DXpedition to the Kermadec Islands, a small, sparsely-inhabited group of volcanic islands about halfway between New Zealand and Tonga. Under the control of New Zealand, they have no special amateur call prefix.

The Kermadec Islands have been slowly moving up in the Most-Wanted-Countries list and now rank 17th, up with Spratly, Laos, and Clipperton. This DXpedition should satisfy a good chunk of that demand, with several operators and plenty of time on the island.

Jim Smith organized the Heard Island DX Association trip to Heard Island last winter and hopes for fewer problems on this year's DXpedition. Jim is also looking for donations for the trip and memberships in his Heard Island DX Association. Contact Jim via PO Box 90, Norfolk Island, South Pacific 2899.

Also scheduled for this month is a DXpedition to Aves Island, halfway around the world in the Caribbean. Isla de Aves (The Island of Birds) is a tiny part of a submerged reef about 150 miles west of the Windward Islands. The island is under the control of Venezuela, and the Venezuelan military restricts access most of the time.

The island itself is only about 1500 feet long and about 400 feet wide at the largest. Its maximum ten-foot elevation means it really is a large rock out in the middle of the ocean. Whenever the waves or tides are high in the Caribbean, landing on Aves is impossible. Only during a short period in mid-winter do calm conditions permit amateur operations.

Because of the restrictions and landing problems, DXpeditions to Aves are few and far between. Any station on the island is easy to work from the States, thanks to the excellent propagation from that part of the world. (Why do you think I lived there?) But you won't want to miss this DXpedition, as the next one might be years down the DX road. And Aves is already in the top 30 most wanted.

The DXpedition is sponsored by the Radio Club Venezolano, which is celebrating its 50th anniversary this year. The callsign on Aves will be YVØAA, with QSLs handled by YV5DFI, PO Box 50332, Caracas, Venezuela 1050-A, South America.

HAM HELP

We are happy to provide Ham Help listings free, on a space-available basis. We are not happy when we have to take time from other duties to decipher cryptic notes scrawled illegibly on dog-eared postcards and odd-sized scraps of paper. Please type or print your request (neatly!), double spaced, on an 8½" x 11" sheet of paper and use upper- and lowercase letters where appropriate. Also, please make a "1" look like a "1," not an "l," which could be an "el" or an "eye," and so on. Hard as it may be to believe, we are not familiar with every piece of equipment manufactured on Earth for the last 50 years! Thanks for your cooperation.

I'm looking for a schematic for a Lavoie oscilloscope, model no. LA265A. I will pay for copying and mailing costs.

L. C. Hocutt WE4O
4257 Via Alta Dr.
Mobile AL 36609

I am interested in obtaining the vox relay that plugs into the back of the Swan 700 transceiver. I would appreciate hearing from someone who may have one of these lying around that they don't have any future use for.

Augustus B. Wells
PO Box 50
Tunica LA 70782

I am looking for a copy of the instruction booklet for the Knight KG670 R/C tester made by Allied Radio. I will pay the costs for copying and mailing or for the original manual.

Lionel Roach KD5VO
3033 Teakwood
Garland TX 75042

Wanted: Collins 70E-7A PTO (permeability-tuned oscillator) for a Collins 75A1 receiver. This PTO covers 2-3 MHz and is used to tune the receiver.

Harold Smith W2GKE
26 Linden St.
Bayonne NJ 07002
(201)-436-1405

I am using the VIC-20 as a RTTY terminal with Kantronics interface and software. Can anyone help me with information on building an adapter which would let me use Atari cartridges on the VIC-20?

Robert F. Cann W4GBB
1606 Lochwood Dr.
Richmond VA 23233

I would appreciate receiving a copy of the schematic for an NCX-3 SSB/CW transceiver by National. I have the owner's manual already. I will gladly reimburse for costs.

Jeffry M. Blackmon W2YI
2107 Turnbull Road
Beavercreek OH 45431

I need the schematic for the Model TV-7D/U tube tester.

Stan LaDage W2EZM
431 Oakland Ave.
Maple Shade NJ 08052

I want to replace the tubes in my Collins R-392 receiver with solid-state devices. Any information on replacement parts would be greatly appreciated. I also need information on the R-392 Club and sources for 2-kHz filters for the Collins R-390A.

W2NSD/1
NEVER SAY DIE
editorial by Wayne Green

from page 6

lem was not unique, that indeed the problem was universal and probably at the root of the general dislike of cocktail parties. I have a problem there. While I may hate meeting people and being expected to be entertaining on demand, I can't stay away from the food. I think I'd take a plane to the Shetland Islands if they promised me an interesting meal.

Much of my life has been an extended diet interspersed with fantastic meals which make the dieting even more imperative. About ten years ago I got fed up, if you'll pardon the expression, and went on a diet for about nine months. I lost 85 pounds, going from 250 bloated pounds down to 165. What an un-orgy that was! These days I hang around 175, not looking too fat, but feeling ten pounds overweight and guilty when gorging on ice cream, cake, and such.

Getting back to my ego: I wonder if my hopes to inspire you to greater things come across as ego? I delight in getting letters from people who have several basic drives: One is to educate and another is to share my enthusiasms. You may have noticed that all of my magazines are both educational and fun—expressions of my drives.

I don't *believe* that you can make all of the money you want, I *know* it. I hate it when I get letters complaining that, gee, I can't afford your magazine, a new rig, or something. What rot! There are so many ways to make money these days that just about anybody who wants to can do it . . . from kids right up to the retired.

No, if you are going to pursue a life goal of swilling several thousands of gallons of beer and seeing every Monday-night football game, you're a loser. You don't get rich very often without working hard at it. But you have to work with some goals in mind. A lot of people work their butts off and never get anywhere. The brutal fact is that, though not by any conscious design, this is the normal pattern. You do have to outwork the average person to make it big.

Why am I getting ready to invest several million dollars in a college? Here we are at a time when colleges are going out of business all around the country and I want to start a college! Dumb or shrewd? Well, I think I have a plan which will teach kids to become entrepreneurs and to beat the system. The end result will be a bonanza for our country and a few thousand more millionaires. Everyone will win.

There's Wayne's ego again? Well, perhaps—yet I've gone over my idea with the presidents of ten colleges now and haven't yet found one who doesn't think it will work. I'm getting quite a bit of support.

The average *73* reader is way above the average person in this country. It isn't easy to get a ham ticket, even with the Bash method, so that's a filter. And beyond that, the average *73* reader is another step ahead of the average ham just by virtue of his interest in keeping up with technology. The ham who does not read *73* has far less of an opportunity to be a success just because he doesn't take advantage of this remarkable resource.

From that aspect, I really feel sorry for the foreign hams who can't afford *73* or who are prohibited from subscribing because their money can't be sent away.

Most of my time is spent these days looking for people to help me with my projects. I really need help—enthusiastic, non-smoking help. My editorial a few months ago discussed this and resulted in a couple hundred letters. Some of those people are already here in Peterborough helping me get new projects started.

One enterprise, a franchise chain of software stores, is getting started. I have a whole new approach to the business which should make it possible for several thousand people to make an awful lot of money. It's an ingenious concept that no one else has thought of yet, so we have a very good chance, despite the recent proliferation of software stores.

Software Production Devices, Inc., is also moving along on schedule. This isn't my idea, but when I saw what two chaps from Bangkok had come up with and realized how desperately the computer industry needs the product, it seemed like a good investment. Indeed, I know of no other practical appoach to software protection, and I think I know 'em all.

I have several new magazines in mind which are needed, each to help a new industry to grow just as *Byte* and *Kilobaud* helped the microcomputer industry to flower. Magazines can't be started unless I have editors, writers, ad sales, circulation, administration, typesetting, production, photography, accounting, data processing, promotion, and so on. It takes about 25 people (minimum) to make a magazine work, and between the seven magazines we have now, the two of McGraw-Hill, and a half dozen others in the area, we've just about cleaned out southern New Hampshire of available talent. Interested?

A surprising number of the people we've been hiring of late are hams, fliers, and computerists—quite a combination for success, I suspect.

And speaking about proj-

ects, a chap who used to work for me started his own computer mail-order business here in town and is already doing well over a million in sales per year. He started out with a small ad in *inCider*, my Apple magazine, and went over the million mark in sales the first month. I talk with him often. . .on the street, at the Folkway for lunch, or when he stops by my office.

He's a success because he did his homework and then had the guts to give it a try. The failures are those who spend their time watching TV, gossiping on the air, and wasting their lives. What a pity! Thousands of hams have used the hobby to get the technical smarts to develop new products and go into business with them. It only takes one good idea to make it.

That's one of my problems. I spend a good deal of my time staying abreast of the technology in communications and computers, with the result that I have a bright idea a day for a business. . .and a terrific idea a week. I lack only the people to help me make these ideas bear fruit.

A chap from Texas visited a few days ago. A ham, of course, a flier, and a computer nut. He was fascinated to see the high energy here, the people all working hard and obviously having one hell of a time. Sure, it's like a rabbit warren, but it's fun and very productive. People come here, often with little background, and they learn fast. Yes, he signed on and is moving here.

He found just what he wanted in a house in a couple of hours and is busy moving up here to help me start a new magazine. He's going to need a bunch of people to work with him. . .what are *you* doing? We're going crazy for people to help set type, paste up pages, shoot the pages into negatives, handle the circulation, and so on.

One of the new magazines I want to start will have as a goal the generation of several thousand new hams a year—maybe as many as 50,000 or even double that. No, I don't know of any way to let you work from home—you really have to be here.

Well, if you are all set with what you are doing, at least say hello on the air. I get a couple hours a week on 20m and my ego will be looking for you.

SATELLITES

PROJECT OSCAR

Project OSCAR, Inc., has prepared a new set of orbital predictions for the period covering the calendar year 1984. The predictions provide the UTC times and longitude for all south-to-north equatorial crossings of the 4 Russian satellites carrying Mode A transponders (RS5, RS6, RS7, and RS8). In addition, the UTC time and sub-satellite latitude and longitude are given for the apogee of each orbit of AMSAT OSCAR 10 (AO-10). This document, when used with the appropriate plotter, allows the user to determine the access times to all the presently available amateur-radio satellites carrying communication transponders.

The large expense incurred in producing and disseminating a calendar of this magnitude necessitates a request for a minimum donation of $10 for mailings to the US, Canada, and Mexico ($12 for all overseas mailings). To receive your copy of this set of orbital predictions, send a completed mailing label along with a check or money order payable to Project OSCAR, Inc., POB 1136, Los Altos CA 94022. The donation covers the cost of first-class mailing within the US, Canada, and Mexico, and airmail printed matter to overseas destinations.

from page 76

trix printer), I am obviously not a fan of mechanical systems. I was surprised, therefore, to note that 60% of traditionalists plan to keep their mechanized RTTY.

As more and more computers come into amateur-radio shacks, so the desire for higher transmission speeds takes on a more urgent note. After years of watching news agency reports print at 50 baud, the thought of 300 (or even 1200) baud is indeed enticing. A problem with the existing *de facto* amateur data-transmission standard (CUTS or Kansas City) is that it uses harmonically-related tones which will give very poor results in conditions of low signal-to-noise ratio.

BARTG has therefore proposed (for consideration at the IARU region conference in 1984) that existing RTTY standards be used as follows—300 baud, 170-Hz shift; 1200 baud, 850-Hz shift. FSK transmissions will have space on the lower radio frequency and AFSK will use 1275 Hz for space and 1445 Hz (170-Hz shift) or 2125 Hz (850-Hz shift) for mark for 300 baud or 1200 baud, respectively.

Further BARTG proposals for the conference include:

- The adoption of a 10-bit ASCII code using even or indeterminate parity (plus 1 start, 7 data, and 1 stop). (Author's note: Many commercial systems use 11 bits for asynchronous ASCII by adding a second stop bit.)
- The adoption of CCIR 476-1 at 100 baud (the basis of AMTOR) as the international amateur standard for an error-correcting code.
- Standard amateur RTTY speeds of 50, 75, and 100 baud (note the dropping of 45.45).
- Dropping the requirement that amateur RTTY stations regularly transmit voice or CW identifications when using CCITT alphabet no. 2 (Baudot).
- The adoption for amateur mailbox operations of the protocols used for Viewdata (Videotex).

I find the last proposal rather odd and think it is almost a backward step! Viewdata does not use error-correction and is asymmetric (uses different speeds in the forward/return directions).

A VISITING HAM'S GUIDE TO INDIA

The time is gone when the mention of India conjures up visions of snake charmers, elephants, and maharajas. All these are there, but there is much more of interest to the visitor—ham radio, for instance.

Those who believe that India is a backward country are in for a jolt. Your first exposure to India will, of course, be the airport (or the seaport, if you are the M/M type). Modern communications and facilities at these entry points convince the visitor that he has come to yet another advanced country. What, then, is this talk about underdeveloped and developing countries? That is for consumption by the World Bank and other UN organizations. Yes, we do have a lower *per capita* income, but everything is cheap in the same proportion. In brief, you can live in India on as many rupees as you would need dollars living in the US for a comparable standard of living. India builds its own nuclear power plants and launches its own satellites on its own rockets—a little late, but with the technological advantages of the state of the art. Soon, Indian hams will be using a satellite built by them and launched for them by the Indian Space Research Organization. It will probably be called the Indamsat—such an appropriate acronym!

So, you probably landed in Bombay on a Pan Am flight. Bombay has over 200 callsigns and most of them are members of a club called the Radio and Electronics Society of India. One of the dream shacks is that of Capt. D. Dasan VU2AID, a senior manager in Air India who also holds the Australian call VK6IK. Most shacks in Bombay have Icom or Kenwood equipment, thanks to VU2RX (who represents these two companies). Quite a few of them sport quads or tribander beams. Activity is mostly on the 14-, 21-, and 28-MHz bands. 2 meters is just getting started, but it will take a repeater to really turn this band on. It won't be long before one is installed. The calling frequencies are 145.0 and 145.5 MHz all over the country.

There are more than 50 callsigns in Delhi, but quite a few are inactive. The active calls were Bernd VU2LQA from the German embassy, Aoki VU2JPN from the Japanese embassy (both of whom have left India), and brothers Rakesh VU2RAK and Rahul VU2YK, who are still in Delhi. Brad VU2USE from the American embassy was active, but he has now been posted to some other country.

Madras has its share of active hams, including Chauhan VU2MV, President of the Federation of Amateur Radio Societies of India (FARSI), who uses a Ten-Tec Delta. Equipment in the Madras shacks is mostly Heath, Ten-Tec, and Yaesu. In this city of 4 million, you will find the pace of life brisk but not breakneck. Hams here will find time for a friendly chat with you, even if you arrive unannounced. Avoid morning visits if you can, except on holidays. Life begins early—around 5:00 in the morning—and most hams are at work (known in India as morning QTH) by 8:30. Most of them can receive visitors at their place of work and in any case can be got at on the telephone. The 2-meter net meets on 145.5 at 0800 and 2000 hours daily.

Bangalore, promoted as the Garden City of India, is about the same as Madras, except that work for many begins at 7:00 in the morning. The Bangalore boys are back home by 5 in the evening even after commuting tens of miles. Many of these are not available by telephone, but put your 2-meter rig on scan and you may meet many of them.

If you are planning a short visit of a few weeks to India, you will probably not have enough time to obtain a reciprocal license. You can, however, operate from an Indian shack with the permission of the OM, and you can save the trouble of bringing along your shack. However, the path towards W opens up at an inconvenient time for working hams (around 1100Z), so unless you plan to operate from a pensioner's shack, it is likely that you will get to everywhere except your homeland!

In the event that you are planning to have a home in India for a few months, you can apply for a license about the same time that you apply for a visa. Your application should be addressed to the Wireless Adviser to the Government of India, Dept. of Communications, WPC Wing, Sardar Patel Bhavan, Sardar Sq., Parliament Street, New Delhi 110 001. The application form can be obtained from that office or more promptly by writing The Federation of Amateur Radio Societies of India, 3 Thiru-Vi-Ka Road, Post Box No. 725, Madras 600 006, India (include 3 IRCs to cover postage). A self-addressed envelope will further speed up action; the forms will be posted the same day as your letter is received in India. Send 10 more IRCs if you want a copy of the Indian *Callbook* (which also contains telephone numbers).

You need not send money with your application, but do send a copy to the Federation. When you get your visa, write a letter to The Wireless Adviser to the Government of India, confirming that you got it. Send a copy to the Federation. You will normally get the license by the time you arrive in India, although much depends upon the workload in the licensing department at the time of your application.

The power allowed in India is 150 Watts rf output to antenna, which covers any barefoot transceiver other than the KWM2. Unless you are holding a Novice license, you will be allowed the use of the following bands: 7.000-7.100 MHz; 14.000-14.350 MHz; 21.000-21.450 MHz; 28.000-29.700 MHz; and 144-146 MHz.

The Indian government is extremely friendly towards amateur radio and foreign amateurs. If there is a delay in response to your application, interpret it generously as resulting from excessive workload. Once in a while the government may turn down your application. The reason will probably be the same as when the US embassy turns down an Indian application for a visa to visit the US. You cannot fight Capitol Hill, so resign yourself to operating from an Indian shack if your visa is not also refused. In the latter event, the problem neatly solves itself!

Now that you have a fairly good idea of what to do, plan your next vacation in India. Air India is a good airline and will be pleased to be of service if you choose to fly with them. You might even run into Capt. D. Dasan VU2AID, their operations manager, Vice-President of FARSI, on one of the jumbos or at one of the airports.

•••••

NEW OPERATING FREQUENCIES FOR HAMS

The government of India has authorized the following operating frequencies for VU2 hams. Certain frequencies as indicated (*) are shared with other services: 3500-3540* kHz; 3890-3900 kHz; 7000-7100 kHz; 1400-14350 kHz; 18068-18168* kHz; 21000-21450 kHz; 24890-24990* kHz; 28000-29700 kHz; and 144-146 MHz.

The type of emission allowed to grade II operators in the band up to 24.900 MHz is A1 only with 50 W maximum dc input power. On 28-29.7 MHz, A1, A3, A3A, A3J, and A3H are permitted. On 144-146 MHz, A3, A3A, A3J, and F3 are permitted with a power limit of 10 W.

For grade I license holders, A1, A3, F3, A3A, A3J, A3H, F1, F2, F3, and A5 are permitted on the HF band; A2 is permitted, in addition to the above, for the VHF band. Power is limited to 150 W in the HF band and 25 W in the VHF band for terrestrial and satellite work.

For the advanced amateur telegraph

N. L. Krishnan of Bharat Electronics.

station, A1, A3, A3A, A3J, A3H, F1, F2, F3, and A5 operations are permitted in the HF bands (with power limited to 150 W). Also, A1, A2, A3, A3A, A3J, F1, F2, F3, F4, A3H, A4, and A5 operations (with a power limit of 50 W for terrestrial and 100 W for satellite-working) are permitted.

VU2BEL

The Managing Director of Bharat Electronics Limited (BEL), Mr. N. L. Krishnan, has promised to help their club station (VU2BEL) with all facilities and equipment. There are more than 40 hams on the roll of the establishment. In addition to the club building, the establishment has provided their communications equipment, test equipment, antenna systems, etc. Now it is left to the inclination and interest of the hams to exploit and utilize the facilities openly offered by the Managing Director. He has whole-heartedly said that he is willing to help hams with projects for the design and development of new amateur equipment, especially ham gear which can be produced and marketed so that the national market for ham equipment can evolve.

The photograph shows the Managing Director operating one of the transceivers manufactured by BEL and given to the VU2BEL club station.

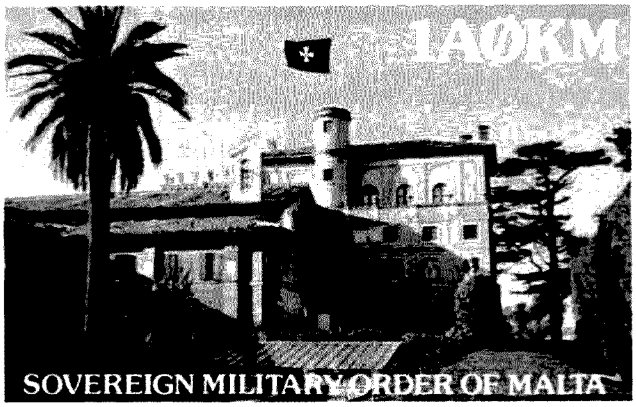
I hope that from the last few columns you haven't gotten the impression that the only amateur pioneering work being done here is in the VHF/UHF frontier. Yes, the lower end of the amateur spectrum is a new territory just beginning to be mapped here. You see, when in 1979 the World Administrative Radio Conference decided to expand the ham bands, the groundwork was laid for 160 meters to be opened up in this part of the world. So, for the hardy souls who brave the static-crash-torn reaches of the Top Band, we can now see what this band has to offer.

In the forefront of the pioneering effort here is Riki 4X4NJ of Gan Yavne on the Mediterranean coast about fifty kilometers south of Tel-Aviv. Riki's endeavors on 160 go back to pre-WARC years when, for the CQ Worldwide test in October, 1973, a special license was granted to set up a station. A full-size sloping dipole was hung from the top of the Four Seasons Hotel in Natanya, on a cliff overlooking the Mediterranean, and a Swan 160-meter transceiver on loan from VE3MR provided the means of exciting this effective antenna. From here on, Riki continued to experiment with this band from his own QTH, applying for special permission whenever an international contest would come up.

In October, 1982, along with 30, 17, and 12 meters, 160 became available to the Israeli radio amateur. 1810-1850 kHz may be used on a primary basis by Class A amateurs running a maximum of 100 Watts input and Class B operators with 10 Watts. 1850-200 kHz may be used by A licensees only on a secondary-non-interfering basis with 10 Watts input.

4X4NJ has since then worked all continents and run up the all-time record for Asia in the CQ WW contest. The credit must go to hard work, perseverance, and



The 1AØKM pictorial QSL card, showing the SMOM location, an ancient villa near the Tevere river which has been recognized as a national monument. For that reason, the tribander beam shown on the terrace (just right of the pine tree) had to be dismantled. A tilting-down five-bander vertical is now planned for the same terrace.

sparing no efforts on a good antenna system.

Riki began by loading the insulated guy wires of his 65-foot-high tower, resembling an inverted L sloping towards North America. Since then, the sky-wires have become more sophisticated, transmitting into a 100-foot wire hung from the top of the tower which is base loaded through a silver-plated coil. Sixteen 80-meter radials plus five quarter-wavelength 160-meter radials which are strung out temporarily over adjoining fields for contest weekends and assorted buried pipes comprise an effective ground system.

Receiving was at first the real problem: It was painstakingly difficult to dredge the far-off stations calling 4X4NJ out of the atmospheric noise. Thus, Riki switched between four different receiving antennas: the transmitting antenna plus attenuators, a horizontally-polarized omnidirectional dipole twelve feet up, a two-element vertical phased array composed of two twenty-foot elements with a rotatable pattern and remote transistor preamps, and an 80-foot-long non-terminated Beverage wire bi-directional to Europe and North America on one end and VK-ZL on the other. The Beverage, which Riki added last season, far outshone the previous receiving antennas, finding the North American stations, unreadable on the other antennas, were Q5 on this. This receiving antenna, added last winter, made it possible to hear better than Riki could be heard, so he decided that the next step in which to go was that of better transmitting effectiveness.

In early October, I got hold of Riki on the Tel Aviv repeater, and he told me of what appears to be his latest breakthrough. He recently completed a phased transmitting array with a very low angle of radiation and a rotary switch for selecting antenna direction. Construction details are being withheld until this antenna has been thoroughly tested out. Riki says that it appears to have a 15-to-20-dB front-to-back ratio and a forward gain of 6 to 10 dB. On receiving, it competes with the Beverage, and in certain instances actually outperforms it! Both G3BDQ and DJ8WL reported that he was coming in like a local, with a greatly improved signal, so Riki is expecting big things out of this antenna.

On the equipment end (notice that we've left this for last, as on 160, the antenna is what really makes the difference), Riki is using the Drake C-line, with a combination of i-f and af filtering to squeeze the weak signals out of the noise. At this time, 4X4NJ has worked on Top Band 72 countries (53 confirmed), 25 US states, and all continents.

We wish Riki best success on 160 this season, and hopefully some of you will have already made contact with him. There are other Israeli stations on 160 meters, but by far 4X4NJ is the most serious of all!

I would like to conclude this month by thanking all those who have taken the time to respond to this column, either by letter or on the air. It has been heartening for me to know that so many people are interested in what's happening in this country outside of the tense headline news. This underlines the human aspect of amateur radio that makes possible people-to-people contacts, bypassing international boundaries and tensions.

Until next month, Shalom (peace) and 73.

The 1AØKM crew. From left, standing: IØMGM, IØJX, IØAMU, IØMXM. IØIJ is sitting at the mike. The atmosphere of the very exclusive ham shack is enhanced by ancient and valuable pictures on the walls.

1AØKM—THE SOVEREIGN MILITARY ORDER OF MALTA HAM STATION

One of the most requested countries in the DXCC fan's world is the Sovereign Order of Malta, prefix 1AØ. This political entity, founded in 1099, recognized by Pope Pascal II in 1310, and known as SMOM—Sovrano Militare Ordine di Malta—is fully independent from the Italian state, and under the provisions of international law, it maintains diplomatic relations with many countries and international organizations. The main activity of the tiny political and territorial entity, which is located in a beautiful spot of Rome near the Tevere River, is concerned with worldwide assistance in the sanitary and social fields.

The 1AØKM station was activated in November, 1980, when the Knights of Malta asked some amateurs to give their assistance in setting up radio contacts with their field hospitals located in the territory hit by the tremendous earthquake in Irpinia, South Italy. Just following that event, 1AØKM operated for some months, until January, 1981, raising savage pileups whenever it appeared on the bands. During that period, the station made about 8,000 QSOs. The DX Advisory Committee of the ARRL, after a complete survey of the documents submitted by SMOM through the station operators, recognized the independent political status of the territory governed by the Knights of Malta and added the 1AØ prefix to the DXCC list, giving credit to the 1AØKM cards starting from its earliest operations. The amateurs who started up the station and the new country, and who at present are the exclusive operators allowed to carry out ham-radio activity there, are Al IØAMU, Tony IØIJ, Tony IØJX, Mario IØMGM, and Mario IØMXM.

Due to the room shortage in the ancient villa which houses SMOM, the 1AØKM station does not yet have a fixed setup, and the rigs, as well as the antennas, are being taken inside and assembled whenever the station must operate; this is neither practical nor fast.

A tribander beam antenna which was mounted on the building roof had to be disassembled for esthetic reasons, since the villa is recognized as an antique and a valuable monument.

At the time of this writing, the 1AØKM crew is trying to get a corner to set up a permanent shack and a permanent antenna. The already-mentioned willing boys taxed themselves and bought a Yaesu FT-901DM transceiver, a Henry R2DK Classic

amplifier, and a five band 18AVT ground plane. They plan to put the antenna on the building terrace, with provisions to tilt it down on the floor when not in operation. This stable arrangement will allow the station crew to put the 1A0 sigs on the air more frequently, possibly entering some international contests as well.

The official QSL manager is Mario I0MGM, but due to the very heavy task involved with such a management, the cards for contacts made with the other operators (I0IJ, I0JX, I0AMU, and I0MXM) may be sent directly to these boys, who will manage their own QSLs: Antonio Privitera I0IJ, Via Ceresio, 34, 00199 Rome; Antonio Vernucci I0JX, Via G. C. Abba, 8, 00141 Rome; Mario Gallavotti I0MGM, Via Cassia, 929, 00189 Rome; Alfonso Porretta I0AMU, Lgo S.Pio V, 16, 00165 Roma; and Mario Monaco I0MXM, Via R. Paolucci, 27/13, 00152 Rome.

HAM RADIO IN ITALY BEFORE WWII

It may be that the old-timers who started their activity before WWII are interested in knowing what amateur radio was like in Italy during the Fascist period. Italy had its own pioneers, like Adriano Ducati 1ACD, Giulio Salom 1MT, and others who broke the shortwave DX frontiers, establishing some world records in the roaring old times, around 1924–1925. They had government provisional permission then, as no laws or rules on amateur-radio activity had been issued in our country at that time. These laws or rules were never issued by the Fascist government, excluding one point of the Italian Postal Code where it was stated that "nobody shall exercise a transmitting radio station without the Post and Telegraph Ministry permission." Theoretically, ham radio was not forbidden, but on the other hand, the permission was not granted either. The reason for this was that the Fascists did not see with much pleasure every form of private contact between the Italian citizens and foreign democratic countries.

Naturally, radio had many fans in Italy, mostly devoted to home-brewing. There were three or four consumer magazines devoted to these fans, publishing descriptions, schematics, and advice on how to build BC radios, SW radios, and even amateur transmitters. There were also many good technicians, many of them very young, who home-brewed good SW receivers and listened to international BC stations and to foreign amateurs.

During that period, Ing. Ernesto Montu, an electronics engineer and university teacher who was famous in Italy for his *Radiotecnique Manual*, and who also had been one of the ham-radio pioneers many years before, founded the ARI, the association which still officially represents amateur radio in our country. At the same time, some amateur stations appeared on the bands in a clandestine way, with self-assigned callsigns. They did not communicate their names or QTHs, and they operated undisturbed. Their number started to grow, and in the meantime, Ing. Montu started a very small (but very dangerous in those times) QSL bureau in his own home, which also housed the ARI headquarters and a new magazine, *Radio Giornale*, the official journal of the association.

Year after year, the number of Italian hams increased. They tried to have a clean and purely technical kind of operation, in order not to raise any suspicion as to their intentions. The political police and the postal police played a very fair game and were highly tolerant as they apparently seemed to ignore that kind of activity.

I was almost a kid then and was deeply involved with radio, home-brewing receivers—at first simple crystal types, then regenerative sets with two or more tubes. When I first received shortwave, I was fascinated by the code transmissions and learned it in a hurry; then when I started to listen to the amateurs, I got really excited. I tried to get some information on how to get started, but the answers I got were vague. Some operators told me that they were Fascists, and that only Fascists could operate radio stations. Others warned me not to get involved in such a dangerous activity. I was 17 when I decided that I had to get on the air. My poor pocket (I was a student) permitted me to buy a '45 tube and an '80 rectifier, a supply transformer, and some other parts, all secondhand, and I started my activity with the 45' self-oscillating in a Hartley circuit and a Windom antenna.

I made a lot of DX contacts with that makeshift rig and got my WAC, which lived in my heart since I could not get the award from the ARRL! Although I did not declare my QTH and my name on the air, I found that some form of hidden intelligence, word after word, indication after indication, could be carried out in order to get in touch with other Italian fellows. That system worked, and I joined other friends and attended the annual meeting, a very clandestine one in Milano, where I knew Mr. Montu and had the chance to receive some QSL cards.

I had to rely only on that simple QRP rig and on a three-tube regenerative receiver, as my pocketbook did not permit much more. Many Italian hams were in possession of sophisticated transmitters, like crystal-controlled MOPAs with transmitting tubes in the power amplifier. Many of these tubes and components, like 807s and 813s, were coming into Italy through bootleggers from Switzerland. In Italy, we also had a very good commercially-produced receiver, with a six-band drum coil switching system, low-loss materials in the front end, S-meter, and optional bfo. It fit into a sumptuous mahogany cabinet like a BC receiver, but in reality, it was a real communication receiver. It was put out by IMCA, a firm owned by an underground Italian ham. That beautiful receiver was in many Italian shacks during the latter half of the thirties.

One day, I got an answer to a CQ from a very powerful station, presumably local, which gave a ham callsign and spoke perfect ham language. The operator, to my surprise, gave me an address in the same city where I lived—Bologna—and invited me to pay him a visit. His open style was very unusual in our community, but his invitation and his voice sounded so friendly that I decided to go. I turned pale when on the door I read: "Voluntary Militie for the National Security—Radio Center." I decided to turn back when a gentleman who was standing near the door asked me if I was I1PL. He said, "I imagined your surprise and your fear, so I was waiting just to reassure you, Old Man." He cordially invited me inside.

Wow! For the first time in my life I saw an RCA AR88 and an RME 69! All around were racks filled with radio gear. "Boy, what is that strange key with two black paddles? What does 'Vibroplex' mean?" I felt myself getting faint when I saw some shelves filled with *QSTs*, ARRL handbooks, and bunches of QSLs from everywhere in the world. "What kind of QSL bureau are you using?" I asked him. "Direct mail" was the answer. My surprise was endless, as there was a tight censorship of mail to and from abroad.

I visited another room where I saw several AR88s and some operators typewriting. Nobody explained to me what they were watching. My new friend was a lieutenant colonel of the Fascist Militia, a military organization composed of members of the Fascist Party which cooperated with the regular army and supported the Fascist idea within Italian society. I visited my new friend very often and introduced him to other amateurs of Bologna.

Going back in my memory to these old days, I now realize that the funny situation which had seen outlaw radio amateurs becoming friends of the people who denied licenses and transmitting permission was the mirror of Italian society in the late thirties when the Fascist dictatorship became more of a formality than a reality in everyday life, due to the humanitarian philosophy of the Italian people.

Three years later, when the tragedy of WWII was approaching and the German Army invaded Belgium and Holland, the European radio amateurs were silent, since the administrations had revoked their licenses. Italian hams were still operating, mainly with hams on other continents. One evening, the postal police, together with the political police, paid a visit to Italian ham shacks all over the Italian territory. I must say that they "paid a visit," since when they came to my home they showed extremely good manners. They had a perquisition order, but they asked kindly for permission to take a look at my shack. I was alone at home, as my mother was out, and tried to deny them entrance. They reassured me that there was nothing to worry about, but that they had to confiscate the I1PL station. They took away the rig, the key, the log, and the QSLs. My mother, when she came back, found me sitting on the outdoor step with tears in my eyes.

I ran to my friend the morning after. "Don't worry," he said. "Let the waters settle for a few days and you will have your rig back, but you have to promise that you and your friends will disassemble everything. There will be no more ham radio." A few days later, I was invited to the office of the political police, where I learned that we had been monitored for a very long time. They said that since I carried out only experimental work, I had to pay only the minimum amount of a fine, due to the infringement of the Postal Code: "Nobody shall exercise a transmitting radio station without . . .", etc. A few days later, I got my gear back and disassembled everything.

That was amateur radio before WWII in Italy.

LIMITED ACTIVITY ON 3.5 MHZ

At present and in the near future, until the Italian administration makes up its mind on issuing new rules, it will be practically impossible to work Italian stations on the usual CW, RTTY, and SSB DX subbands recommended by the IARU.

The story starts long ago in 1968 when the last Italian law ruling radio-amateur activity was issued. On that occasion, the Italian administration gave a singular interpretation to the concept of "sharing" the 3.5-MHz band between the Radioamateur Service and other fixed and mobile services. Since amateurs had a secondary status according to WARC statements at that time, they obtained in Italy only the following thin frequency slices: 3.613–3.627 and 3.647–3.667. The rest of the band was assigned to the other services.

Many years passed during which that limiting rule was slowly forgotten. During this long period, amateurs spread out from their narrow subbands and joined their foreign fellows on the whole band. After some years, Italian hams believed that the administration had issued new rules. The administration itself did not care much about this illegal operation, and that reinforced the conviction that everything was OK. I, like many others, never suspected that anything was wrong. In many instances, the ARI official magazine, *Radio Rivista*, published the amateur band plan for Italy, with the whole 3.5-MHz band assigned to amateurs according to the WARC frequency allocations, forgetting the principle that our administration had the right to forbid some frequencies to some services.

Suddenly, last spring, somebody inside these offices remembered the law. A tight monitoring started, and amateurs found outside legal subbands were warned, and some were fined. At the same time, another offensive started: Administration officers visited many ham shacks and fined all those who were found in possession of linear amplifiers, as the maximum legal power in Italy is 300 Watts input. Other minor discrepancies, like inaccurate logging, were verified and prosecuted, and some action was taken against amateurs working 144 MHz mobile from their cars. In fact, in Italy, any amateur mobile operation is forbidden, except for CBers who are authorized to carry radios in their cars.

From this perspective, other clouds could appear on the Italian amateur's horizon. The above-mentioned law does not take into consideration any unattended station outside the legal residence of the licensee: For that, all the VHF and UHF repeaters must be considered illegal and could be dismantled by administration officers. The same thing could be said about the SSB transmission mode: The old 1968 law authorizes only CW, AM, RTTY, and FM above 144 MHz; no further official act authorizing SSB has come since then.

Until today, our administration has closed both eyes; she could suddenly wake up, like she did about the 3.5-MHz band. We strongly hope that these archaic and out-of-date rules may be modified as soon as possible. But as a matter of fact, at present, Italian hams are at least out of the game as far as any 5-band activity is concerned, like contests, awards, etc.

Italian amateurs are still in shock after the withdrawal of the 3.5-MHz band. There are big discussions on the air and in the clubs. The ARI—Associazione Radioamatori Italiani—is accused of not having supported in due time the cause of Italian amateurs on that occasion. In fact, the ARI was absent when the Italian administration started its battle against amateurs. In addition, the ARI failed to warn amateurs about what was happening, so many of them continued to operate outside the permitted slices and were monitored and punished.

Italy is a very beautiful country. It is also a very contradictory one, due to its very young democracy and the problems raised by very fast growth. On one side, there is probably an excess of freedom due to a widely acclaimed liberalism—a clear reaction to the Fascist period. On the other side, most of the bureaucracy suffers from an old-fashioned paternalism to which they abdicate when in the counterpart they find power.

In the telecommunications field, the excess of freedom, unchained by a sentence of the Constitutional Court ("Everybody has the right, by any means, to express his thought"), led to an uncontrolled and abnormal growth of private TV and FM BC stations, operating unlicensed and unpermitted, with no technical control—a real jungle of interference with spurious radiation jamming other services, mainly the

aeronautical ones. The whole situation is absolutely inexpugnable due to the amount of political and commercial interests lying under it. The administration is also faced by other big problems, like the continuous increase of pirate stations. These stations work with amateur transceivers, often using linears and beams, and have invaded many frequencies allocated to the aeronautical mobile services, like 45 meters and segments of bands near 80 meters. An inestimable number of hand-held transceivers (which in Italy are sold with the same ease as a cigarette box) carry illegal private VHF and UHF communications. Due to the power underlying the TV and BC stations and the practical impossibility of locating thousands of illegal stations, the administration had to raise its hands. On the other hand, the administration, incapable of controlling the described mess and overloaded by the problems caused by the fast growth of the communications systems in our country, has a fair chance at repressing the amateurs who pose them further problems, since they are a weak and not a politically supported community.

At present, many Italian groups understand that their problems cannot be solved through traditional negotiation with the administration. They need a different platform. Maybe in the near future they will look for the support of the national media: TV, newspapers, and magazines. It may happen also that they decide to ask for support from fellow amateurs around the world and from ham magazines and foreign ham associations. We regret to inform the hams who read "73 International" around the world that, for the moment, Italian amateurs are cut out from the international path on the 3.5-MHz band and must disappear from the friendly competitions based on five-band communications. We do hope to be back with you very soon.

de MXXR

SENATOR COSSIGA

At the end of last July, a telegram was received at the editorial office of the Italian League. The telegram was sent from the Senate—more specifically, from the secretary of the president of the Senate. The telegram said that the president required another copy of the July issue of the national radio magazine, since his copy was probably lost in the mail. It was with great pleasure that a second copy was sent to Francesco Cossiga I0FCG, president of the Senate, the second highest dignitary of the state.

I0FCG has been active since 1973 but hasn't had too much time to devote to radio, and in particular, to DXing—his favorite aspect of the hobby. He has been helped by the DXers of the Rome area with info and QSL routes. During a recent interview with one weekly magazine, he said: "I am a radio amateur and I am sorry not to have too much time to dedicate to it. In any case, during the weekends and holidays that I spend in Sardinia where I come from, I like to chat with friends and contact Alaska, the USA, and New Zealand." Senator Cossiga was born 55 years ago, and after a few years of teaching at Sassari University, he joined the Christian Democrats and won a seat in the House of Parliament in 1958. He has served in various positions in the government and has also been Prime Minister.

NEW DX RECORDS

New records from I0SYN were established during July. A DXpedition sponsored by the Italian DX Blue Team took place during the end of June and the beginning of July. The trip started on June 29 from Perugia, in the center of Italy. The destination was the north of Africa. The group consisted of three Italians: I0SNY, I0KBL, and I0RSC, plus EA5RK. Ceuta, EA9, was reached by car on July 2 after a trip of 3000 kilometers. On July 5, the first record was made with a contact on 1296 MHz with I8TUS/8, for a distance of 1914 kilometers. After giving new ones on 144 and 432 to all Europe, the group started working on 10 GHz, and on July 8, several contacts of more than 1500 kilometers were made. The record contact was 1683 kilometers, with I0YLI/IE9. Next year the group will try again to activate other countries on various frequencies and to break some records.

OPERATING IN MEXICO

I have received quite a few letters from foreign colleagues with regards to operating within Mexico while on vacation. No doubt the following information will be useful to many who may have wondered this as well.

Can You Operate In Mexico?

Sure you can! However, just as in all lands, papers are required. And where there are papers, paperwork is involved. Mexico is not the exception. Some call it "red tape." It all depends on how you look at it. This brings to mind an expression that my mother often helped me to appreciate: "What's worth getting is worth waiting for!" It has come in handy and helped me keep a proper perspective of things in life.

What Do You Need To Do?

Well, there are different factors involved. First of all, this depends on whether your country and Mexico have a bilateral or reciprocal agreement or not. The United States does *not*. But if your country does, then you can write to Mexico for an application at the following address: Secretaria de Communicaciones y Transportes, Subdireccion de Operacion de Sistemas Radioelectricos, Depto. de Normas y Reglamentos, Mexico 12, D.F.

The application will state what present requirements are in your case. This, of course, all depends on what details are covered in the reciprocal agreement between your country and Mexico. A photocopy of your present ham license will definitely be asked for upon submitting your application. All foreign visitors will be given a license not exceeding one year from the date it was issued and not longer than the expiration date on your visa. If your home license expires even earlier, don't expect to receive a permit to operate in Mexico for a longer term than what you were issued in your homeland.

No Reciprocal Agreement, You Say?

There still exists the possibility of your getting a limited ham license here, so don't fret. The Mexican FCC (Secretaria de Communicaciones y Transportes—SCT) will establish the requirements that should be satisfied in addition to those requirements that are already set for national amateurs-to-be. The tourist receives a visa for no more than six months, so his license could not be issued for more than that amount of time. The immigrant has to renew his visa (FM-2) each year for five years, so he can be issued a renewed license each year upon presenting a photocopy of his renewed immigration papers.

In either case, if your country does not have a reciprocal agreement with Mexico, then three tests are to be taken.

1) *Morse code*. If you apply for a first-class license, you will be tested at 13 words per minute, second-class applicants will be tested at 10 words per minute, and the beginners will be tested at 5 words per minute. The restricted license (good for one year and not renewable) does not require the code test.

2) *Theory*. This includes electricity, magnetism, and radio communication. Yes, you guessed it! All in Spanish and in your own words! What better incentive could you have for brushing up on your Spanish, besides coming to Mexico?!

3) *Regulations*. You could compare this to a written driver's test. You'll have to know the laws and regulations of the airwaves here in Mexico, just as in any country.

Whether your country has a reciprocal agreement with Mexico or not, you will be required to send in with your application a letter of responsibility, where a national amateur (one who has the same or higher grade license than what you are applying for) states that he will become responsible for you. Many of our *73* readers have already established long-term friendships with different experienced Mexican amateurs over the years and perhaps even had an "eyeball" or two together. So that should not present a problem for you.

Study Matarial for the Mexican Ticket?

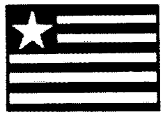
Why don't you write to Pablo A. Mooser M. XE1SR, Av. Schiller #329, Mexico 5, D.F., and get his book: *Guia de Estudios para la Licencia de Radioaficionado* (*Study Guide for the Ham Radio Amateur License*) in Spanish and study up right away! He can also recommend to you some other real fine publications available in Spanish as well, being President of the Amateur Radio League here in Mexico.

Which Class License Do You Want?

Well, then again, that only depends on your personal skills and know-how. Class I and Class II are similar (the only difference being that you can transmit with 1 kW with the Class I license in certain areas and with 250 Watts with the Class II license in certain areas. This is all explained in detail in the above-recommended book and in Mexico's official regulations.

After applying for your license, the Mexican government will then advise you where you should go to take your tests; a few months will be given as a margin. So it would be best for you to apply as far in advance as possible for these tests if your country has no bilateral agreement with Mexico.

Since Mexico borders with the United States, I know that many amateurs from the US visit this country frequently and some may have assumed that there is no way to operate here in Mexico. Nevertheless, my idea here has been to help you realize that you *can* operate as a legal amateur here in Mexico upon fulfilling the proper requirements, even though there is no reciprocal agreement between the US and Mexico. A Mexican amateur cannot get his US license either, unless he fulfills requirements asked by the FCC. And when you think of it, isn't this part of amateur radio? Don't forget that "what's worth getting is worth waiting for!" And thanks again for your many fine letters!



LIBERIA

Brother Donard Steffes, C.S.C.
EL2AL/WB8HFY
Brothers of the Holy Cross
St. Patrick High School
PO Box 1005
Monrovia
Republic of Liberia

Did you ever hear of a *fixed-frequency* amateur net?

Anything can happen in Liberia! We are setting up a fixed-frequency net in the forty-meter band at 7.060 MHz. It is not limited to fixed-frequency radios and it is not limited to stations in Liberia. Actually, the net is in operation at the present time and OX stations, with or without traffic, are welcome to check in. It meets every Sunday morning at zero eight hundred zulu and on other days at zero seven hundred zulu.

Then why all this talk about the fixed frequency?

Well, the Liberia Radio Amateur Association is receiving some two dozen fixed-frequency radios. They are Heathkits and will be converted and crystalled for 7.060 MHz. They will remain Association property and will be rented out for five dollars a year (or less if necessary).

Our Novice-class operators are permitted phone at 7.060 MHz so that they can participate in the net activities. This is important for their encouragement and at the same time it makes our net communication system more effective. This is a very important factor for us here in Liberia where phones and postal service either do not exist or are not dependable. Novices (and in some cases, Generals) cannot afford to buy amateur-radio equipment, so these fixed-frequency radios are going to fill a real need.

The 7.060-MHz frequency is a kind of "get-together frequency" for Liberia and the countries within hearing distance, so our young operators should have ample opportunity to "get out." At the same time, they can talk to each other and they can practice code, on the air, communicating with each other by code. We are excited about this little venture.

The fixed-frequency net is not needed in many other countries, but for us it holds real promise.

RADIO-AMATEUR EXAMS

Twice a year, spring and fall, the Dutch amateur-radio exams are held. All persons who want to get a D license (145 MHz, no code) or upgrade to C class (145 and higher, no code) have to pass this exam.

The exam for the Dutch novice D li-

cense consists of 40 multiple-choice questions about transmitters, receivers, antennas, filters, radio regulations, and license conditions. Three answers are given for each question; you must have at least 29 correct answers to pass this exam with good results.

For the C license, you have to fill in 50 questions and you have the choice of four answers to each question, but you must have 35 answers correct to get a C license.

For the D exam, you have 75 minutes to complete all the questions. For the C exam, you have 30 minutes more time to finish.

The exam is held in a large hall normally used as an exhibition hall. Hundreds of tables and chairs are placed in this enormous hall, with space enough between each table so that it is impossible to look at your neighbor's exam papers.

The exam questions are bundled in a small 15-page booklet. The answers to the questions must be written down on a computer form, so that the forms can be calculated by a computer.

The Dutch amateur-radio exams are not free. The cost is 50 Dutch guilders and must be paid in advance to the account of the Dutch PTT.

After passing the C exam, you can upgrade to the A status (all bands, all modes). For this A status, you must pass a code exam of 12 words a minute.

The results of the exams are mailed to each person who takes the exam. It takes three weeks before the results are mailed. In the meantime, however, there is another way to know the results.

After the exams, National Dutch Amateur Radio Station PAØAA has a special broadcast about the exam results. The Dutch television also publishes the results on the "Dutch Teletekst System."

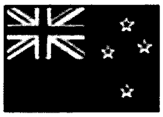
In 1982, a total of 1607 candidates came to the D exam. 2429 persons took the C exam. So it is plain to see that the interest in amateur radio is very much alive in Holland. Most of this interest is due to the code-free exam of the C and D licenses, but most of the amateurs try to master the code after some years working on VHF and UHF.

If you pass a Dutch amateur-radio exam with good results, you have to sign a paper, a kind of contract, which states that you agree with the license conditions and that you'll agree with rules to be taken by the authorities in the future. So you are agreeing with rules that you do not even know. Well, isn't that a bit strange?

On the day of the exam, the Dutch Radio Control Service has a very busy job. The reason for this is that some amateurs take their radio receivers with them into the exam building so they can receive the answers to all the questions. You can't believe it, but it is the truth. I'll tell you how this works out.

A person enters the exam room, takes his exam as quickly as possible, then goes away and walks to a parked car or a hotel room. In this car or hotel room, his friends are waiting for him and they sort out in no time the correct answers to the questions. They do this with the help of some smart guys and a couple of books. Now they transmit all the answers by radio into the exam room, where their friends are waiting with their receivers. Although the check-in at the exam room is very aharp, some manage to bring their receivers along.

You can imagine that the Dutch Radio Control Service does a lot of radio direction-finding at the exam. When I heard this story for the first time, I thought it was a joke! However, last year I heard it with my own ears on the FM band of my car radio.



NEW ZEALAND

459 Kennedy Road
Napier
New Zealand

ZL PREFIX CHANGES

NZART made proposals to the regulatory body, the New Zealand Post Office, that separate prefixes should be allocated to the Chatham Islands, the Kermadecs, and the Auckland/Campbell Islands instead of the present /C, etc., method of identification.

The proposals were adopted, and from January 1, 1984, the ZLØ-9 series will be used as follows: ZLØ—for visitors to New Zealand (no change); ZL1-4—for mainland New Zealand, i.e., North Island, South Island, and Stewart Island (no change); ZL5—Antarctica (no change); ZL6—New Zealand Intruder Watch (no change); ZL7—Chatham Islands; ZL8—Kermadecs; ZL9—Auckland/Campbell Islands.

The ZK series will be as follows: ZK1—Cook Islands (no change); ZK2—Niue (no change); ZK3—Tokelau Islands (previously ZM7); ZKØ, ZK4-9—reserved.

The ZMØ-9 series will continue to be held in reserve and used on special occasions at the discretion of the Post Office. So, prefix hunters and all other interested amateurs, as of January 1, 1984, there will be a few more prefixes available by working the New Zealand off-shore islands under their new callsigns.

THE AREC STORY CONTINUED

AREC in ZL today consists of about 75 Sections and between 800 and 900 active members. Because there are more AREC Sections in Auckland and Wellington regions than there are callsigns in the ZL1E and ZL2E series, the New Zealand Post Office has approved the use of ZL6E calls in the Auckland region and ZL7E calls in the Wellington region. So when you hear such calls as ZL6EBA and ZL7ECA, they are not a pirate station or some rare DX, but Amateur Radio Emergency Corps stations in the Auckland and Wellington regional areas operating emergency communications networks. Who knows what the next 50 years will bring? A massive increase in the South Island population could mean ZL8E and ZL9E callsigns for AREC.

Two features of AREC in ZL are unique. Both stem from the Post Office recognition of the Radio Emergency Corps from its inception.

The first unique feature is the distinctive callsign series allocated for AREC stations in which the first letter of each callsign following the prefix is always an "E". The special "E" callsigns identify stations engaged in emergency communications and warn other amateurs not to interfere with what may be urgent or vital traffic. No other country has the advantage of such a system.

The other feature is the allocation of spot frequencies within or on the edge of the amateur bands specifically for AREC use. These are 3500 kHz, 3900 kHz, 7100 kHz, and the exclusive band of 1900-1925 kHz. Other frequencies may also be used for AREC communications when and as required.

In the early days of AREC, all equipment was home-built and performance varied considerably depending upon the skill of the constructor and the skill of the operator. Initially, all operation was on CW. All operators were amateurs who, when involved in field searches, had to be fit enough to travel with the search parties and carry the extra weight of their radio equipment, too!

The postwar years saw the adaption of war-surplus equipment for AREC use. Subsequently, special radio equipment was developed and produced for AREC use, initially AM and CW, and in the last few years, SSB, the present AREC sets for field work being TR 105s, while most base stations and field-search HQ stations are modern-day transceivers suitable for operation from emergency power supplies.

The advent of modern amateur equipment has revolutionized AREC operations, operators now being able to use complex equipment that was not dreamed of in years gone by. Just as HF equipment had become plentiful for amateurs, the migration of VHF amateurs to the 2-meter FM band and the establishment of repeaters has revolutionized mobile and portable operation.

The facilities for purely local communications are excellent, and because most VHF equipment is easily portable, its suitability for emergency and Civil Defense applications is obvious. With VHF links between the search teams and field-search HQ, now the amateurs do not have to carry heavy equipment, but just a light hand-held with an additional battery supply, and they are good for several hours of search and rescue work.

Two organizations have been established and developed along with AREC since 1948. The first of these, the Search and Rescue Organization, is sponsored primarily by the Civil Aviation Division of the Ministry of Transport and the Police Department. Any search for missing persons or for missing aircraft comes under the control of one or the other of these government departments, and AREC has the continuing role in the provision of communications to and from the field and frequently in the field as well. AREC is financed by an annual grant from the Search and Rescue Organization.

AREC also has a role in the Civil Defense Communications Network, providing the communication between Civil Defense Headquarters and the Sector Posts in most Civil Defense areas.

The present Officer Commanding of the ZL AREC, Ron Morgan ZL2GQ/ZL2EX, is quoted here to conclude this resume of the emergency amateur service as it exists in New Zealand:

"As the latest in the line of OCs of AREC, I am aware of the work, the planning, and the efforts that have been put into the development of the AREC of today by my predecessors and conscious of the need to continue to make every effort to preserve the good repute in which the Corps is held. To me, amateur radio is the greatest hobby in the world. AREC is the aspect of amateur radio that can be of service to the community, and in return for the privilege of enjoying the hobby, I believe that I, and every other ZL radio amateur, too, owes support to the Corps."

AWARDS

Remember the Hastings Centennial Award, 0001 hours GMT, February 1, 1984, until 2400 hours GMT, February 29, 1984. All bands, all modes; see last month's column for details of contacts required.

BITS 'N' PIECES

Recently, another World Communications Year activity took place at the Hawkes Bay Royal Show (County Fair) when the Napier and Hastings Branches of NZART combined to display amateur radio to the public. During the three days of the Royal Show, the combined Branches were allocated the special callsign of ZL9WCY and operated amateur stations from the display stand at the show. Also, they had static displays of AREC equipment, old and present day, some vintage radio equipment, and present-day transceivers.

There were three working amateur stations, one on 20/15/10 meters, one on 40 meters, and the other on 2 meters for local communications. Propagation was not good for the HF bands, but some excellent QSOs were made with US amateurs and others that helped to demonstrate amateur radio to the public.

There was a third section to the display where the public could touch special display items such as a vintage receiver tuned to the local broadcast station, with the output fed into a scope showing the patterns of the carrier and the sound/speech. These "touch" display items proved very popular with young and old alike.

In an earlier column, when I described the national organization of amateur radio in ZL, it has been pointed out to me that I failed to indicate clearly the method by which our president is chosen.

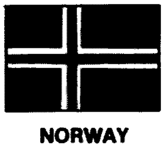
NZART is probably one of the few national radio organizations where the members elect the president every two years. For the biennial elections, nominations are called for all offices, including that of the president, so here in ZL the members of NZART elect their president, unlike other national organizations which appoint from one of the elected council or executive.

February is the month when all NZART Branches are making feverish preparations for the National Field Day Contest. This year, so I'm told, there will be a special YL team operating one of the non-active Branches somewhere in the North Island.

Good luck to the YL team; the extra multiplier and contact points will be appreciated by all National Field Day participant teams.

More 50-year certificates to members of the ZL Old-Timers Club have been issued. Congratulations to the following: M. D. Mason ZL1NW, Tauranga; S. C. Baveystock ZL1NX, Tauranga; Watty Briden ZL1PN, Auckland; George Anderson ZL2JG, Waikanae; Jack Moore ZL2JM, Fielding.

Dates to remember: June 1-4, 1984—the NZART Rose City Conference at Palmerston North. If you are planning a trip to ZL about that time, you will be most welcome at our annual convention. Enquiries to the Rose City Conference, PO Box 1718, Palmerston North, New Zealand, or to me at my home QTH.



NORWAY

Bjorn-Hugo Ark LA5YJ
N-3120 Andebu
Norway

Since my last column there have been some interesting activities in Norway. Of special interest was the yearly national convention of NRRL, held in Bodo, in northern Norway. This year's elections seemed both to underline the differences between the HQ members and the ordinary member and to smooth them out. I guess that's what democracy is all about, is it not?

Mr. Odd Andersen from the Norwegian Telecommunication Direktorat in Oslo gave a speech on the new license regulations expected to be issued. Word about a promised A license of 600 Watts output was very popular information for the nearly 100 members gathered—representing about a third of the total voting membership.

At a DX session earlier that morning, Alf Almedal LA5QK announced that they are at work getting Peter I Island recognized as a new DXCC country (which by now may already have been confirmed). He also said that a Norwegian Antarctic expedition will take place in late 1984, and that they were working to see that some of the members of that expedition will be ham operators. Rangnar Scholberg LA7FD and Mathias Bjerrang LA5NM, well-known operators from JX- and JW-land, held an interesting session about operation from the Arctic.

The convention was an absolute success, and the two local sections of NRRL, the Bodo and Fauske groups, could not have been praised more for their excellent planning and the smooth-running sessions.

Odd Andersen speaks at the NRRL convention.

DX CONVENTION

At the annual DX convention in Oslo, most of the eastern Norway members of the LADX group were gathered to elect a new president and members of the board. An unfortunate accident to Stig Lindblom LA7JO a week before kept members from central Norway away from the convention and kept the mood of the meeting rather low. Happily, LA7JO survived the fall from his 16-meter (48-foot) tower. He fell head first, and it is a mystery how he was able to survive without any greater harm than broken and crushed arms, although his condition was very serious for the first couple of days.

Svein Ovenstad LA3XI was elected as the new president of the LADX group. His predecessor was the late LA1KI, and the presidential chair had been empty for nearly a year since no one really wanted to touch the memory of our highly respected and beloved friend LA1KI, Norway's well-known top DXer for many years. The members of the board ran the LADX group in the meantime and did a good job.

Kare LA2GV was presented the trophy for being the top-score Norwegian operator in the SAC contest, 1982, in the single-operator/allband class. LA2GV had won the same trophy before, and I had the great pleasure of receiving the trophy on his behalf.

The LADX group is now looking into how to get SM0AGD to come over and talk about his DXpeditions to our members; it also is involved with a couple of rather interesting projects which the board seems to be keeping secret!

MALPELO DXPEDITION

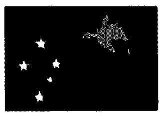
Hurray, Colombia! You did it! HK0TU (Malpelo) went on the air. The whole world was waiting, and *you* gave it to us. And congratulations for an excellent operation, which must have been very thoroughly prepared, with a touch of the good old days in it: not a foul word, no irritation over the often-too-eager operators trying to work them. This operation was something all the members of that crew could be proud of.

We here in Europe too well remember a certain PY0 operation not too long ago which will go into legend as one of the poorest SSB operations from a rare place in years. But a German group put that all right again. That group actually always does a good job, so anything else from that side would have been a shock. The Colombians did their effort to straighten this out in a tremendous manner. Thanks again, guys; good work.

DXers, well, it's time to look for Europe on the lower bands again.

40 has as always been very good, but when you are reading this, 80 and 160 will be at their peak to many areas. Remember, keep clear of the DX windows. You never know, day or night, when the bands will open. Most of the day and night there will be openings from Scandinavia both on 40 and 80 meters, toward North America and Japan. Listen in if you're interested in some good DX QSOs.

New countries we all are waiting for include Kermadec, Clipperton, China, Bouvet, Peter I Island, and San Felix. When will they come? Kermadec is due, China has been worked by many, but the rest? We'll wait and see, won't we? The thrill of a new one is always there, and the pleasure after working it, as well. Hours of strained listening, intensive calling, and then the feeling of your heart doing a couple of extra beats when your call is returned. And then the nervous tremble in your voice when confirming and giving your report, that's what it's all about! Thanks to the guys giving us that pleasure of working them.



PAPUA NEW GUINEA

Seigi Freymadl P29NSF
PO Box 165
Rabaul
Papua New Guinea

This will be my last contribution from Papua New Guinea. In fact, as I write this, the station has already been dismantled and the antennas have been taken down. All the ham gear is packed and en route to VK. P29NSF went QRT on October 3, 1983, and will reemerge as VK4VSF from Brisbane.

We have spent 22 years in Papua New Guinea and been witness to great changes in the country. We have seen the peaceful transgression from Australian administration to self-government to independence in 1975. We have seen a people emerge from the Stone Age into the 20th century. I have been a P2 amateur for 3½ years and enjoyed it immensely. An excellent location, good equipment, and a husband ready to indulge every whim connected with amateur radio made it a pleasure to operate. It has been fun being a DX station; being at the receiving end of pileups gives you a good feeling and it is very good experience. However, at times I have had to go QRT because some operators have no discipline or manners.

On September 20, 1983, at 0153 GMT, I worked VK4MAL aeronautical mobile, operator Barry, on 15m en route to Biak in West Irian, thence Manila and Hong Kong. There is quite a story attached to this one.

The aircraft, a 41-year-old DC3, saw service with the US Army during World War II and was bought by a retired pilot who flew it to Hong Kong for Cathay Pacific. It became that airline's first aircraft and flew the Hong Kong-to-Sydney run carrying passengers and mail.

In 1963, the old girl was sold to Mandated Territory Airline (MAL, hence the callsign) and flew in Papua New Guinea for 10 years. When Ansett Airlines of Papua New Guinea bought out MAL, the DC3 went to bush pilots of Queensland. The DC3 played a major role for bush pilots for another 10 years.

Now Cathay Pacific has bought the old bird back to display her in their museum in Hong Kong. A fitting retirement! The aircraft made a nostalgic flight into Port Moresby on September 19 under its original Cathay registration, VR-HDB, on one side and the Mandated Territory registration, VH-MAL, on the other side. The aircraft is painted in original Cathay Pacific colors.

After refueling in Port Moresby, the DC3 flew to Wewak and made an overnight stop there. I worked the station VK4MAL aeronautical mobile en route Wewak to Biak and consider myself privileged to have had the contact.

The aircraft was due in Hong Kong in time for the 37th anniversary of Cathay Pacific on September 23. Every "Territorian" has a soft spot for DC3 aircraft, as they gave wonderful service to the traveling public in this country in the past. Many a time have we flown "side-saddle" in a DC3! Nowadays Boeing 707s and F28s are used by Air Niugine, but several

The author has the pleasure of presenting a trophy to Kare LA2GV. He was the top-score Norwegian operator in the SAC contest in 1982.

Jorgen LA5UF and Svein LA3XI were represented among the top ten DXers in Norway.

DC3s are still with the Papua New Guinea Defense Force.

What news from the P2 amateur scene? A new arrival is Bob P29PR, ex-VS5RP and -G3REP. Bob has just joined the Post and Telecommunication Corporation in Port Moresby. He has a Kenwood TS-180 and is active mainly on CW on all bands. Bob hopes to put P2 back on the CW map! His favorite band is 1.8 MHz, but he has found the noise level extremely high. Bob reports reasonable success on 80m, but as yet has not managed to get into W-land on that band.

No doubt the ranks of amateurs will be swelled in Papua New Guinea as the OK Tedi Mine becomes fully operational in the Western Province. Already on the air from Tabubil are John P29NJS and Stan P29SO.

The Papuan Motor Sports Club in Port Moresby held its annual Independence Weekend Car Rally starting at 6 pm on September 14 and ending at 9 am on September 18. Throughout the event, communications were maintained by members of the Papua New Guinea Amateur Radio Society. The communications aspect was an unqualified success with stations working through the Moresby repeater and simplex, and as the rally moved further away from Port Moresby, on 40m during the day and on 80m at night.

Twenty-seven teams participated in the rally, amongst them six entries from Australia. Operating from O car was Peter P29NUK/ZUK, maintaining contact; the director of events, Wayne P29ZWW, upheld communications from another vehicle; the vehicle setting up control was manned by Bob P29BS. Finally, and bringing up the rear in the sweep vehicle, a sturdy 4WD to ensure that all cars had managed to get through safely, was Paul P29NPL. Manned relay stations were in operation, as well as field stations, and Rick P29ZFS was working as a manned 2m repeater. The complete success of the Independence Weekend Car Rally has convinced organizers to hold similar events throughout the year and Peter P29NUK intends to participate as navigator in the next one. Good work by the PNGARS!

The weekend of October 15-16 saw activity for the Jamboree of the Air and the Governor General of Papua New Guinea opened the event on P29JOA. Widespread interest was created, not only amongst guides and scouts, but also among police cadets with a view to forming a police radio club.

So much from me and from Papua New Guinea and my best wishes to everyone.

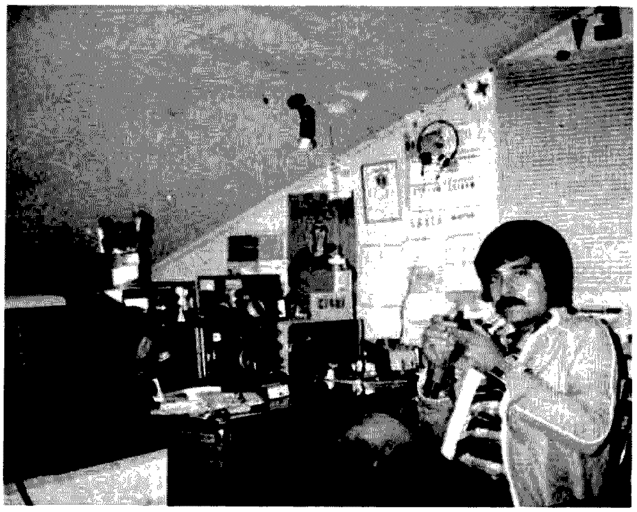
RADIO-LOCATION CONTEST

Amateur radio-location contests in Poland are becoming more and more popular. The Radio-Location Contest is organized in two bands, 3.5 MHz and 144 MHz. Competitions in each band are separate. Every entrant for the competition can compete in both bands or in only one of them. All participants of the contest are divided into the following categories:

(a) women irrespective of age;
(b) teenagers (boys and girls under 15 on January 1st of the year of the contest);



CT4UE in his shack.

(c) juniors under 18;
(d) men more than 18;
(e) seniors over 40.

Women, juniors, and men are appraised as a collective and as a team. The teams taking part in the top competition—the championship of Poland—represent provinces. The number of partakers from any province is to be limited to three in all categories. Individual contestants can take part in other competitions.

Every participant in the contest brings a radio receiver with antennas of one's own, a magnetic compass or the other one, a wristwatch, and a medical certificate of one's health. The use of a radio receiver with noises detectable at a distance of 10 meters is forbidden.

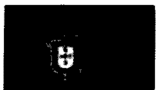
The organizer of the contest provides every participant with a map of the contest terrain. The terrain of the contest is to be predominantly arboreous and differences in its levels cannot be greater than 200 meters.

Five radio transmitters are to be placed at distances not less than 750 meters from each other. The overall length from the start through transmitter number 5 is to be 4-6 kilometers measured on the map. The transmitters are to be hidden so as not to be seen at a distance of 3 to 5 meters. The transmitters must not be placed in buildings or impenetrable places.

In each band, work the 5 transmitters successively: first minute—transmitter number 1, second minute—transmitter number 2..., fifth minute—transmitter number 5, sixth minute—transmitter number 1, and so on.

The emission A1 (telegraphy without modulation) is used in the 3.5-MHz band and A2 (telegraphy with modulation) is used in the 144-MHz band. Recommended keying rate is 30-45 marks/minute. All the transmitters are to operate best at the same frequency: 3500-3600 kHz in the 3.5-MHz band, and 144.500-144.845 kHz in the 144-MHz band. The power output of transmitters is to be 3-5 W and the stability of frequency not worse than 0.05%.

After a start signal one minute before the keying of the first transmitter, competitors in five-man groups run along alleyways 50-250 meters in length. When they are at the ends, their radio receivers are switched on and they begin to look for the transmitters. The sequence of detection is optional; however, transmitter number 5 must be found obligatorily and as the last. Transmitter number 5 ends its keying when all the competitors reach their goal. The time of the race and the number of detected transmitters determine one's place in the contest.



PORTUGAL

Luiz Miguel de Sousa CT4UE
PO Box 32
S. Joao do Estoril
2765 Portugal

It is with great pleasure and personal satisfaction that I write this first column for *73*. I will emphasize some aspects of the oldest association of radio amateurs we have in Portugal, known as REP—Rede dos Emissores Portugueses.

REP was first founded in December of 1926 by Mr. D. Eugenio de Avilez, formerly CT1AE, and other enthusiasts. It now has approximately 1900 members, more than 50% of the Portuguese hams. In 1980, it was recognized as a public utility by the government.

According to REP's constitution, we have elections every two years to elect our Board of Directors, and an Annual General Meeting is held to present and approve reports of the past year, including the accounts.

Being a member of IARU, REP offers a lot of services to its members. These are a few of them: reception and shipment of QSL cards from and to other bureaus, handling the paperwork required for examinations and new licenses, renewal of fixed, mobile, or portable licenses, supply of technical books, and publication of the REP magazine or an informative sheet every three months. In either of these two publications, members have the latest news about DX, electronics, awards, telecommunications via satellite, and other important matters.

Every year, we celebrate our anniversary and have a regional contest on VHF and HF with all the Portugese regions (CT1/4, CT2, CT3).

On Mondays at 2230 local time, a radio bulletin is transmitted by CT1REP through the repeaters and also on 80-meter phone. In addition to this, REP gives assistance to all foreign hams who wish to operate from this country. For those interested, we only need a letter requesting this service.

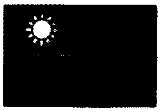
Owing to the existence of reciprocal agreements with some countries, it is very easy to operate from Portugal. At this time, we have reciprocity with the following countries: West Germany, Austria, Belgium, Denmark, Holland, Switzerland, Sweden, United States of America, England, Canada, Morocco, Brazil, Venezuela, South Africa, and Bolivia. More details about this will be given in the future.

The station that we have in REP is composed of a Yaesu transceiver (FT-902 DM), an FC-902 antenna coupler, an SP-901 external speaker, and an FV-901 DM, all this offered by Yaesu Musen in Japan. We also work on VHF using a Kenwood transceiver.

On the air, mostly around the DX frequencies, we might hear Portuguese hams using several modes of transmission—SSB, CW, SSTV, and RTTY. Some of them (very few) are also active through the satellites for ham use. It may be of interest to you to know that we have 15 repeaters on VHF and 2 on UHF.

We have our weekly meeting on Monday at 2100 local time. If you are in Lisbon, you are kindly invited to visit REP's headquarters, right in the heart of Lisbon. Last November, our good friend Frank Rose W1TIV came to see us and signed the Honour's Book.

Our address is Rua D. Pedro V, 7-4°, phone 361186. Just in case you forget the address, you may contact me at phone number 2688318 during the evenings.



TAIWAN

Tim Chen BV2A/BV2B
PO Box 30-547
Taipei, Taiwan 107
Republic of China

To direct the attention of our people to the contribution of communications toward world peace and social developments, the Directorate General of Posts, Republic of China, has released a set of two stamps for commemorating the World Communications Year. Also, Chinese Posts and Telecommunications Department has finally granted permission to a group of Italian hams allowing them to operate in Taiwan.

The DXpedition group, consisting of three members (instead of four as previously reported) of the ARI DX Blue Team (I2MQP/BV, I2BVS/BV, and I2NYN/BV) arrived in Taipei on September 18 via KLM Airlines. They were settled in a new hotel, "Long Life," close to BV2A/BV2B.

On September 19, Mr. Hu, secretary of the China Radio Association, lent hands to take delivery of two transceivers (IC-740, IC-2KL) and accessories from the customs at the CKS International Airport, 45 kilometers from Taipei City. A deposit equivalent to US $150 approximately instead of customs duty payment was placed for warranty of shipping all imported articles out of the country (ROC) within six months. As a matter of fact, all rigs after operation were duly reshipped out and the deposit money was refunded without any problem.

The imported equipment with a 2-element yagi and a vertical tribander were set up at a QTH near a public park on the roof on a 12-story building which is spacious for antenna installations and good for both receiving and transmitting purposes. The DXpedition station was dismantled on September 24, a half day earlier than the set schedule because of a strong developing and approaching typhoon.

This initial expedition activity was highly evaluated by us. Local authorities are glad to see that through amateur radio, we have

done a lot in promoting international goodwill and friendship between people of the world. Making eyeball QSOs further enhances better understanding.

Some local important newspapers—*The United Daily*, *The China News Agency*, and *The English China News*—had good comments on the worldwide friendly movements of amateur radio. This has brought to the attention of the public the progressive quality and unique relations existing in this field.

All visitors were entertained by the China Radio Association at the Army Officers Club. They were introduced to many important officials at the party. Before their departure for home in Milan, a sight-seeing tour was arranged for them to visit the National Palace Museum, where they found great pleasure and relaxation.

I am pleased to have contacted I2MQP/BV, I2BVS/BV, and I2NYN/BV to offer them a new country credit; it also made my day to have the two way communications domestically.

I hear a group of JAs are planning to make a DXpedition to BV-land in January, 1984. I shall report in due course.

The ARI DX Blue Team in Taiwan. Left to right: I2BVS/BV, I2NYN/BV, BV2A/BV2B, and I2MQP/BV.

FOX HUNTING

Eskilstuna Sandare Amatorer, Club SK5LW, hosted the 1983 Swedish Championships in Amateur Radio Direction Finding (ARDF), popularly called fox hunting.

The championship is a combination of one daytime and one nighttime hunt. Winner in this combination was Christer Eriksson followed by Gunnar Svensson, a well-known name in these circles here. Neither of them is a ham; this is a sport for anybody. Leif SM5EZM was third but winner of the day event. The total number of participants was 50, of which there were two YLs. Kurt SM5OW, at 85 years of age an old-timer in ARDF, placed 39th and is still going strong.

The "foxes" were five very-low-powered transmitters on 80-meter CW hidden in the woods. The hunters were equipped with maps, compasses, and small ARDF receivers. At night, a flashlight was needed. Some hunters said that they preferred rainy weather because then they didn't hesitate when they crossed a swamp since they were already wet!

DX MEETING IN OREBRO

Club SK4BX, Orebro Sandaramatorer, arranged the popular annual gathering of Swedish DXers. SK4BX is a very active club some 150 km west of Stockholm. The club members always participate in major contests and the QSL cards on the walls show that SK4BK is successful in the DX pileups. The club runs one repeater on VHF 145.850 MHz, and one on UHF 437.650 MHz, as well as a UHF beacon on 432.980 MHz.

In early 1982, the club moved into a fine building (restored by the members) located just outside the city of Orebro. This QTH has great antenna possibilities and the lack of immediate neighbors minimizes the risk of TVI/RFI complaints. The antenna tower is 40 meters high (130 ft.) with a TH5DX beam just under the 20-element Cue Dee yagi for 2 meters. Other antennas are for 160, 80, and 40 meters, and in the planning stage is an EME array for 70 centimeters.

Over 50 DXers got to meet in Orebro, some coming from as far away as the most southern part of SM7, an eight-hour drive by automobile. The top attraction was the talk and slide show by Erik SM6AGD, member of the DX Hall of Fame. During the last ten years, Erik has made quite a few very successful operations from the most rare spots throughout the DXworld.

Being a top-grade CW operator, he has made CW buffs as well as SSBers happy. During the last eight months of 1982, Erik toured the rare South Pacific islands and worked 47,260 contacts.

He tried to limit the number of slides to less than 300, but his interesting and witty comments during the two-hour talk made everybody wish he had brought more. The last slides showed his QSL manager, Joergen SM3CXS, plodding his way to the mailbox through five feet of Nordic December snow to pick up the daily pounds of QSL cards. Joergen has now bought a snowblower to speed up future QSLing.

The club's own DXpedition last summer to OJ0 Market Reef was shown by a professionally made film with authentic recorded sound. Goran SM4DHF, Kenneth SM4EMO, and Goran SM4HOO had to halt their operation after two days because of additional paperwork requested by the Finnish licensing authorities which luckily was resolved. During that silent period, they moved their rig and antenna a few feet east on the tiny reef and worked portable SM5! Market Reef is divided by the Finnish-Swedish national border.

SK4BX had furthermore managed to get a video recording from the Heard Island DXpedition slide show narrated by Jim VK9JKS himself.

SWEDISH HAMS DENIED SPECIAL WCY CALL

The United Nations declared 1983 as World Communications Year. In most countries, both the telecommunications authority and the radio amateurs have acknowledged the WCY by various special activities. One way of giving WCY publicity in many countries has been the issuing of special WCY callsigns. In Sweden, the league, SSA, applied for this kind of a call (suffix) to be used by club stations in each call area. However, the Swedish licensing authority, Televerket, has rejected this application.

MOTIONS TO IARU REGION 1 CONFERENCE

The International Amateur Radio Union (IARU) Region 1 Division was formed in 1950 to promote the special interests of the member societies in the International Telecommunication Union Region 1 (Europe, Africa, and parts of Asia) and to represent their interests at ITU conferences.

The Swedish amateur radio league, SSA (Sveriges Sandare Amatorer), has sent three motions to the IARU Region 1 Conference 1984. The first motion is about the Worldwide Grid-Locator System. In Europe, one system has been used for years, primarily in VHF/UHF traffic. It is extremely popular amongst VHF/UHF enthusiasts to collect locator squares in a manner similar to hunting for DXCC countries. The new worldwide locator system was accepted by Region 2 at the Cali Conference in Colombia in 1983, to be used in contests and for awards. Region 3 has also accepted this. The motion from SSA suggests an acceptance by Region 1 and implementation on January 1, 1985. Basically, the world surface is divided into fields by 18 lines longitude and 18 lines latitude. These fields are divided into squares that are 2 degrees longitude and 1 degree latitude, which will give very good accuracy in determining QTH position.

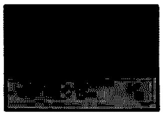
The second motion concerns the timing system for EME traffic which is different on 144 MHz than on 432 and 1296 MHz. The SSA wants the IARU to recommend uniformity as well as a timing system with one-minute sequences.

The third motion: Because of the collision between the satellite traffic and the Region 1 VHF band plan for repeater channels R8 and R9 on 145.800 and 145.825 MHz respectively, the SSA suggests one solution: channel R9 should be moved to 145.575 MHz (output). The beacons that might be interfered with on 144.975 MHz (input) should be moved. If and when the satellite organizations move away from 145.825 MHz, R9 repeaters could move back to their original frequency.

Furthermore, the SSA suggests that each IARU member society issue an amateur-radio traffic handbook in their own language, in addition to articles about rules and regulations, to be published in the member magazines. The lack of obedience concerning international telecommunication rules and regulations might partly be due to lack of knowledge and understanding.

SSA MEMBERSHIP FEE

The 1984 membership fee is 195 Swedish kronor (approximately 25 US dollars). The league issues the membership magazine, *QTC*, eleven times a year, runs the QSL bureau, and serves Swedish radio amateurs in various important ways. The work for the club is done voluntarily. The only salaried employees are clerks at the headquarters in Stockholm.



WEST GERMANY

Ralf Beyer DJ3NW
Opferkamp 14
3300 Braunschweig
Federal Republic of Germany

INTERRADIO '83

On the world's largest fairgrounds, the Interradio '83 opened its gates from October 28–30, 1983, in Hannover, Germany.

Because of the size of the exhibition area and the various activities taking place at the same time, I first found myself at a poultry show. But finally I arrived at hall 19, the place to meet radio amateurs, computer freaks, electronics hobby enthusiasts, and a fair number of equipment and component manufacturers.

The approximately 50 booths were occupied by a dozen equipment manufacturers, half a dozen computer firms, a similar number of component manufacturers/distributors, and some firms offering software support, books, and miscellaneous material needed to organize the ham shack. More than a dozen institutions were represented, including the national radio-amateur organization DARC, AMSAT-DL, DIG, and others.

About 8500 people, including the presidents of national radio-amateur societies from England, Luxembourg, Sweden, Spain, and The Netherlands, visited the convention and many of them took the opportunity to join the presentations provided in two meeting rooms. Papers presented included AMTOR, EME, and OSCAR 10. An indoor "Bier-Garten" provided plenty of room for get-togethers with old and new friends and for the usual small talk.

The meeting of the DXers saw about 100 participants and Baldur Drobnica DJ6SI showed a film about his earlier Glorioso and Juan da Nova DXpedition. Baldur answered questions on the ill-fated tour to Spratly, of course, but fortunately he was not forced to dwell on the details over and over again.

About 250 young students were shown around and many of them joined classes held on fundamentals of electronics and hands-on exercises for the construction of small electronics projects. More than 100 kits for easy-to-build electronic circuits and 60 kits for experiments with a microprocessor were sold at the show.

I enjoyed the meeting very much because of the variety of stimulating impressions, but I could not find anything on the international level which really turned me on. However, at least one interesting idea in this respect was the discussion of better support for future European DXpeditions. Existing plans to form national DX foundations seem to be channeled more and more towards a European DX foundation. A more sound financial support of DXpeditions and a better service of European needs in this field could be desirable outcomes of this move.

DEALER DIRECTORY

Culver City CA

Jun's Electronics, 3919 Sepulveda Blvd., Culver City CA 90230, 390-8003. Trades 463-1886 San Diego, 827-5732 (Reno NV).

Fontana CA

Complete lines ICOM, DenTron, Ten-Tec, Mirage, Cubic, Lunar, over 4000 electronic products for hobbyist, technician, experimenter. Also CB radio, landmobile. **Fontana Electronics, 8628 Sierra Ave., Fontana CA 92335, 822-7710.**

San Jose CA

Bay area's newest amateur radio store. New & used amateur radio sales & service. We feature Kenwood, ICOM, Azden, Yaesu, Ten-Tec, Santec & many more. **Shaver Radio, Inc., 1378 So. Bascom Ave., San Jose CA 95128, 998-1103.**

New Castle DE

Factory Authorized Dealer! Yaesu, ICOM, Ten-Tec, KDK, Azden, AEA, Kantronics, Santec. Full line of accessories. No sales tax in Delaware. One mile off I-95. **Delaware Amateur Supply, 71 Meadow Road, New Castle DE 19720, 328-7728.**

Bloomington IL

Rohn Towers—Wholesale direct to users. 23% to 34% discount from dealer price. All products available. Write or call for price list. Also we are wholesale distributors for Antenna Specialists, Regency, and Hy-Gain. **Hill Radio, 2503 G.E. Road, PO Box 1405, Bloomington IL 61701-0887, 663-2141.**

Boise ID

Rocky Mountain area's newest ham dealer. Call RJM first for AEA, Azden, KDK, Ten-Tec, Butternut, Cushcraft, and more! **RJM Electronics, 4204 Overland, Boise ID 83705, 343-4018.**

Preston ID

Ross WB7RYZ has the largest stock of amateur gear in the Intermountain West and the best prices. Call me for all your ham needs. **Ross Distributing, 78 So. State, Preston ID 83263, 852-0830.**

Littleton MA

The reliable ham store serving NE. Full line of ICOM & Kenwood. Yaesu HTs, Drake, Daiwa, B&W accessories. Curtis & Trac keyers. Larsen, Hustler, Telex/Hy-Gain products. Mirage amps., Astron P.S., Alpha Delta protectors, ARRL & Kantronics instruction aids. Whistler radar detectors. Full line of coax fittings. **TEL—COM Electronic Communications, 675 Great Rd. (Rt. 119), Littleton MA 01460, 486-3400/3040.**

Ann Arbor MI

See us for products like Ten-Tec, R. L. Drake, DenTron and many more. Open Monday through Saturday, 0830 to 1730. WB8VGR, WB8UXO, WD8OKN, and W8RP behind the counter. **Purchase Radio Supply, 327 E. Hoover Ave., Ann Arbor MI 48104, 668-8696.**

Livonia MI

Complete photovoltaic systems. Amateur radio, repeater, satellite, and computer applications! Call Paul WD8AHO. **Encon Photovoltaics, 27600 Schoolcraft Road, Livonia MI 48150, 523-1850.**

Hudson NH

Look!—hams, SWLs, and experimenters: parts, books, gear, antennas, towers. Call for quotes. **Polcari's ELECTRONICS CENTER, 61 Lowell Road (Route 3A), Hudson NH 03051, 883-5005.**

Albany, New York
UPSTATE NEW YORK

Kenwood, ICOM, Ten-Tec, Belden, Cushcraft, Larsen, Hustler, ARRL, Hy-Gain, B&W, MFJ, Mirage. New and used equipment. Serving the amateur community since 1942. **Adirondack Electronics, Inc., 1991 Central Avenue, Albany NY 12205, 456-0203** (one mile west of Northway exit 2W).

Columbus OH

The biggest and best ham store in the Midwest featuring Kenwood and other quality products with working displays. We sell only the best. Authorized Kenwood service. **Universal Amateur Radio, Inc., 1280 Aida Dr., Reynoldsburg (Columbus) OH 43068, 966-4267.**

Scranton PA

ICOM, Bird, Cushcraft, Beckman, Fluke, Larsen, Hustler, Antenna Specialists, Astron, Avanti, Belden, W2AU/W2VS, AEA, Vibroplex, HamKey, Amphenol, Sony, B&W, Coax-Seal, Cover Craft, J.W. Miller/Daiwa, ARRL, Ameco, Shure. **LaRue Electronics, 1112 Grandview St., Scranton PA 18509, 343-2124.**

Dallas TX

IBM PC/Apple aftermarket products; hobbyists' electronics project kits: $50.00 complete modem kit, subscription/satellite TV decoder kits, EPROM programmer/duplicator, popular memory IC testers, data sheets, application notes, and more than 6000 parts in stock. Semiconductors, discretes, video products, tools. Please write for your free literature/catalog. **Independent Electronics, 6415-06 Airline Rd., Dallas TX 75205.**

Baltimore/Washington

Avantek transistors, amplifiers, oscillators, and LNAs. Coaxial cable and connectors. Blonder Tongue dealer with Microwave laboratory. **Applied Specialties, Inc., 10101G Bacon Drive, Beltsville MD 20705. Wash. 595-5393, Balt. 792-2211. 7:30 am to 6:00 pm, Monday thru Friday.**

DEALERS

Your company name and message can contain up to 25 words for as little as $150 yearly (prepaid), or $15 per month (prepaid quarterly). No mention of mail-order business or area code permitted. Directory text and payment must reach us 60 days in advance of publication. For example, advertising for the May '84 issue must be in our hands by March 1st. Mail to 73 Magazine, Peterborough NH 03458. ATTN: Nancy Ciampa.

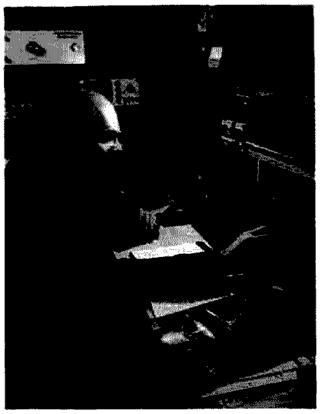
W2NSD/1
NEVER SAY DIE
editorial by Wayne Green



VIC CLARK W4KFC

News that Vic, the president of the ARRL, had died of a heart attack reached me at Comdex. I was very sorry to hear that, for Vic was undoubtedly the best president the League has had in many, many years. Indeed, I'd been working with him on the FCC's National Industry Advisory Committee just weeks ago and he had given me a lift to the airport after the meeting, giving us a chance to talk in private. I had a lot of hopes that *73* and *QST* would be able to work more closely as a result of our talks since it was obvious that our end goals were similar. Obviously, that wasn't anything I could write about while Vic was alive, and it becomes irrelevant now that he's a silent key.

What a relief it was when the ARRL board elected a president with some brains and with more of an interest in helping amateur radio than basking in the glory of being president. Vic didn't see the presidency as an honor, but as a challenge.

He had his hands full, keeping him from being able to make fast headway. On the one hand, virtually all of the dedicated League old-timers had gotten fed up with Baldwin when he was General Manager and left HQ. And there were still far too many CW-forever old-timers on the board, fighting change at every turn. But despite these serious handicaps, Vic was making progress.

Vic, like past president Herb Hoover, Jr., was interested in what he could do for amateur radio. We've had a serious loss.

HELLO, *COLUMBIA!*

W5LFL went up while I was off at the Comdex show in Las Vegas, so I missed the first few orbits. Comdex is a computer show—about 1,400 exhibits and 5,850 booths this year. That allows about one minute per exhibit—20 seconds per booth if one does not eat, rest, or go to the bathroom during show hours. It does not allow time to whip out an HT and try for W5LFL.

Since a surprising percentage of the successful computer firms are run by hams, I had a steady stream of 'em coming to the Wayne Green booth to say hello all through the show. Many of these chaps got fired up by my editorials back in 1975 and 1976 when I pointed out that hams had an edge in computers and that microcomputers were going to turn out to be a huge business eventually.

Once back home, I checked with the managing editor of *73* to find out the *Columbia* orbit schedule. Armed with that and the frequencies to be used, I headed for my ham shack. Split frequency can be a problem, but fortunately I had the KLM OSCAR rig handy.

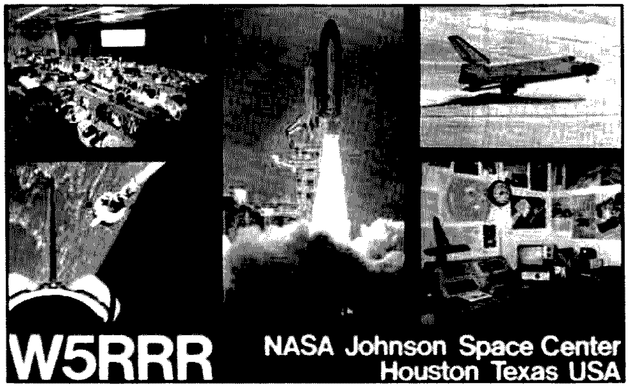
The repeater antenna should do the job okay. I hooked it to the KLM and started looking through the pile of microphones for the right one. I tried one after another with the four prongs.

Continued on page 130

ENCODED CODE

Congratulations to Verle D. Winningham K8VW of Fenton MI, winner of our first "Encoded Code" contest (January, pages 46-50). Other top finishers (in order) were Perry Donham KK2Y (Barneveld NY), Donald Bailey KB5BD (Nocona TX), David Rollins W7ILN (Las Vegas NV), Ron Sinclair KA1KTI (Epping NH), and Paul Gili N1CES (Brookline NH).

The solution is: "FIRST DECODING MAILED BURNETT YIELDS FIFTY DOLLARS." No, we're not going to tell you how to get it. Yes, "winning ham" sounds a little fishy to us, too.



QSL OF THE MONTH

To enter your QSL, put it in an envelope along with your choice of a book from *73*'s Radio Bookshop and mail it to *73*, Pine Street, Peterborough NH 03458, Attn: QSL of the Month. Entries not in envelopes or without a book choice will not be accepted.

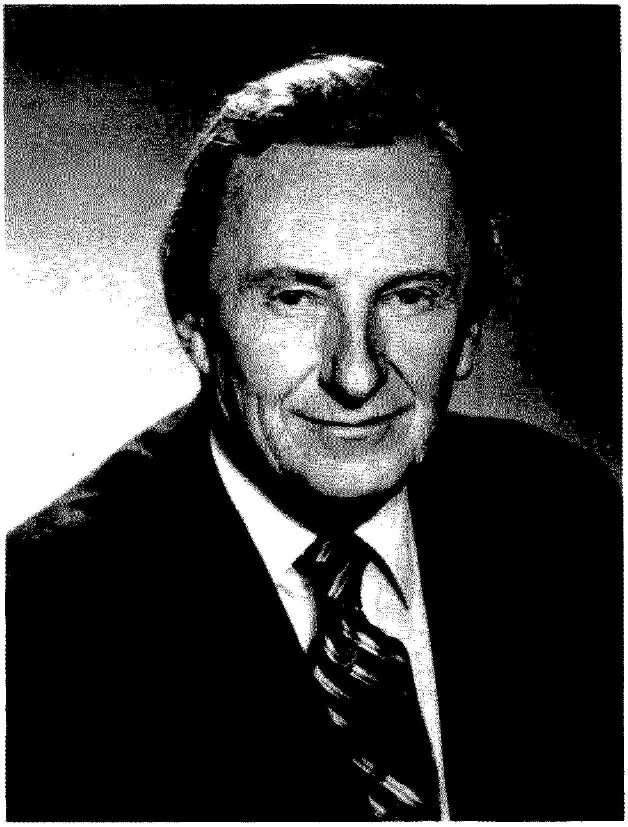
In Search of the Shuttle: Fun, Frustration, Fatigue

From Maine to Hawaii, our special correspondents gave W5LFL their best shots. Thank them.

K6DUE

Roy Neal K6DUE
NBC News
3000 West Alameda Avenue
Burbank CA 91523

Owen Garriott was flying over California when I heard him. It was his first time on the air from *Columbia* and he was full quieting on a hand-held with a rubber duckie. He was over California and I was in a hotel room in Nassau Bay, Texas, fifteen hundred miles away. It was a moment of incredible elation. We had done it! After more than 20 years of trying, *WE HAD DONE IT!* A ham was operating from space and a lot of people had made it happen, each contributing according to his expertise.



Roy Neal K6DUE

In the beginning, when NASA first flew its funny little (early) satellites, we hams had a field day, listening to the signals from space and watching orbiting *Echo* balloons blinking like stars in the twilight as we bounced signals off their sides. And we amateurs suggested to the then-new Space Administration that the Amateur Radio Service could form the cadre of a ground-based tracking network for all kinds of projects. We had operators and equipment and the will to participate.

But NASA, in that era, was extremely bureaucratic. They ignored us. Shortly before Alan Shepard flew the first manned mission, Colonel John "Shorty" Powers spent an evening at my home while I worked twenty meters. Paths were open worldwide that night and he talked with stations in Australia, South Africa, Europe, and South America. Powers took notes that night and went back to Project Mercury. As its Public Affairs Officer, he had influence. He recommended formalizing arrangements through the ARRL to form an emergency or backup communications network with the Amateur Service and using beacons on board the spacecraft.

The NASA management of that time refused to listen to anyone outside the agency. That's the same management that turned down an offer of a million dollars from the television networks at the outset of the Gemini Program to be used to provide on-board video. We were told, "If you want to give a million dollars, we can find better ways to spend the money." Today, by comparison, NASA provides very fine television indeed, partly as a way of maintaining public interest in its budget.

As time went on, Doctor Owen Garriott became an astronaut and so did Tony England. What set them apart from other members of the corps was that they were licensed amateur-radio operators, W5LFL and W0ORE, respectively.

In 1972, Garriott was named to fly . . . in *Skylab*, for two months in space. He and a dedicated group of hams at what was then the Manned Spacecraft Center in Houston applied for permission to carry amateur radio into orbit. Dick Fenner W5AVI even figured out how to do it technically. After all, W5LFL would be up there for quite a while with enough free time to enjoy a little relaxation. They were turned down again. No room for an antenna, the possibility of RFI, and lack of power on *Skylab* were cited as reasons, but the fact of the matter was that no one at NASA was on a high enough administration level willing to accept the responsibility of making a decision.

As a network correspondent specializing in aerospace and a producer who managed the pool radio and TV coverage for the combined networks of the world on the Shepard flight and *Apollo 12*, the second flight to the moon, I have known most of the principals at NASA. I worked with them, covering the

space program from the day it began, but my repeated requests and suggestions concerning the possible service of amateur radio in space fell on deaf ears. While the Air Force and the European Space Agency provided launch vehicles for piggyback rides that put amateur satellites into space, no one was able to dent the consciousness of the higher powers in NASA until the space shuttle.

With the advent of the shuttle, the door began to open. Space should be all things to all people and NASA's changing management wanted to investigate ways to make that happen.

Among the key men in management of the new regime, in charge of the shuttle program for the Space Administration, was AF L/Gen James Abrahamson. "Abe," as he is known, is a man of immense imagination with great ability in the engineering world to get things accomplished. He also is one of those rare individuals . . . a public figure who is willing to expose himself frequently to the media.

And so it happened that I was doing a rather routine interview with the General last fall, during a mission. During a quiet moment, while the camera crew was changing locations, I launched into one of my favorite themes. "Abe," I asked, "has anyone ever mentioned ham radio on a space shuttle to you?"

"No," came the answer, "but I'm interested. What do you have in mind?"

And so it began. We went on with the interview; when it was finished, we went back to discussing the Amateur Radio Service. I showed him my 2-meter transceiver. We talked for perhaps ten minutes, then General Abrahamson said: "I like it, Roy. Why don't you get a formal proposal together. If it makes sense, I'll approve it."

I floated out of the office and, quite literally, ran across the campus of the Johnson Space Center to the office of Chuck Biggs KC5RG, the Chief of Public Services. We called Doug Ward WA5SFY, who is Deputy Director of Public Affairs at the center. These men had been major supporters of the move to get ham radio into space over the years, and now it was time to start moving on what could be the most exciting DXpedition of all time.

W5LFL LOG
(Preliminary)

If you attempted to reach W5LFL and your callsign is not in the first list, look for one resembling it in the list of incomplete calls. To claim a contact, send as much information about your transmission as possible to ARRL Headquarters, Attn: W9KDR, 225 Main Street, Newington CT 06111.—Tnx W9KDR and KB1N.

We decided that the project would require sponsorship to stand any chance of approval . . . a nice, clean, nonprofit sponsorship such as the American Radio Relay League could provide. The League and other advisors at NASA Headquarters soon added a partner, the Amateur Satellite Corporation, AMSAT, to handle technical details in discussions with NASA.

Vic Clark, that brilliant man who was President of the League for too short a time, accepted the basic concept on my first phone call and promised to do his best to steer it through League channels. We talked about a videotaped documentary to be made under ARRL auspices. Our NASA friends suggested it would help in getting the agency's final approval. For the Amateur Radio Service, it would be a way of telling everyone in Owen Garriott's own words what he was trying to do. And, if we also showed what ham radio is all about, it might even attract the public.

In November, 1982, I sent a letter to Vic which he took to the Executive Committee, where it cleared its first hurdle, then it went on to the Board of Directors where "Amateur Radio's Newest Frontier" was authorized and its financing approved. Dave Sumner K1ZZ accepted the project as the League's General Manager and almost immediately became an enthusiastic supporter. Dave was another of the key figures that guided the project and made it happen.

In California, a group of amateurs who are also thorough television professionals volunteered their services. Bill Pasternak WA6ITF, a master maintenance technician at Metromedia in Hollywood, became Technical Supervisor and Field Producer for the documentary. Alan Kaul W6RCL, NBC's Nightly News West Coast Producer,

produced "Amateur Radio's Newest Frontier," and Frosty Oden N6ENV, who wins awards as a top editor at CBS, turned our tapes into a highly professional package. Howard Mark WØOZC reproduced them by the thousand and Pete O'Dell KB1N took care of the distribution through the League's Board of Directors. The tapes brought amateur radio in orbit another big step forward.

But all of that was predicated on NASA approval, and the politics of the agency present a fascinating illustration of what it takes to make things fly in government circles these days.

Doug Ward forwarded a memo to Brian Duff, NASA's Director of Public Affairs at that time. Duff assigned Dick Daniels W4PUJ, Director of Management Support at Headquarters, to study the project. It was at this point that Daniels made the recommendation and AMSAT joined the project. Bill Tynan W3XO for AMSAT and Dick Fenner W5AVI for the Johnson Space Center put together a draft proposal. It was a wonderfully worded document that stressed key factors. The project, it said, would appeal to the youth of the nation. It was firmly supported by prestigious organizations and made technically practical by advances in technology such as tiny transceivers and reliable battery packs that could be space-flight qualified.

Duff gave the draft proposal an enthusiastic endorsement and forwarded it to Robert Alnutt, the Acting Associate Administrator for External Relations. Alnutt endorsed it, dependent on "the various constraints in operating the shuttle." He referred the documents to General Abrahamson and to Gerry Griffin, the Johnson Center Director. And now we had come full cycle.

Owen Garriott W5LFL was scheduled to fly on STS-9 in the fall and that, for a time, looked like a roadblock. The cargo was dedicated entirely to the European Space Agency's Spacelab and the manifest had been closed for months.

Center Director Griffin lent his enthusiastic support, clearing the hurdles of astronaut assignments and training and authorizing supervisors to permit Dick Fenner W5AVI and the many other hams at the center to go about finding, designing, and testing equipment to ensure compatibility.

When the paperwork reached Harry Kraft, the Spacelab Program Manager at the Marshall Space Flight Center, he was approached by a number of ham operators on his staff. They convinced him that the project was worthwhile.

From the outset, the experiment was earmarked Public Affairs and was to be conducted at times when it would not interfere with Owen's Spacelab duties.

Ward, in Houston, was a key figure in guiding the project through the shoals of all these politics and, more than coincidentally, keeping Owen Garriott advised as the logjams were cleared.

And finally . . . on April 16, 1983: Vic Clark and I were in Sioux City, Iowa, at a ham convention when he got a telegram. If the equipment could be made to work compatibly and if no other complications were discovered, permission was granted to fly an amateur 2-meter transceiver on the flight of STS-9, to be operated by Dr. Owen Garriott in his off-duty time. I remember Vic's enthusiasm and how quickly it spread to the hams at that convention. It was an enthusiasm we were to see repeated at many other places we traveled together that year, telling audiences what to expect.

A month later, at the instigation of Doug Ward, there was a key meeting at the Johnson Space Center and that is where the plan really came together. Peter O'Dell KB1N, the League's Public Relations Coordinator, and Bernie Glassmeyer W9KDR had been brought in to handle the intricate details of getting out information to the members.

Vic Clark was there, of course, and so was Vern Riportella WA2LQQ, President Elect of AMSAT. Vern accepted responsibility for clearing frequencies. For NASA, there was Dick Fenner to describe the Motorola transceiver that had been chosen and the battery packs that would power it. Dick described a special antenna that had been designed and built by the hams of the Johnson Center Radio Club. R. W. "Bob" Harris was there, representing the Flight Directorate. Bob was responsible for putting out the orbital tracking information that later permitted hams all over the world to know when to listen for Garriott. Charles Chassay represented the Shuttle Program Office. He was, in the final analysis, the man who approved the on-board equipment.

But the most important member of that meeting was astronaut Owen Garriott W5LFL. His background as an electrical engineer led the discussion as it wove through the intricacies of equipment planning. His communication knowledge paid off handsomely as plans were made for what would eventually be the *modus operandi* of his time on the air. We discussed the use of a tape recorder and an astronaut's lightweight headset . . . the transmit and receive cycles. An amateur-radio flight plan was built in Houston on that day in May and it worked when W5LFL finally went on the air in December.

There's a lot more to the story of Owen Garriott's major step into the newest frontier of space and there are many more people who played key roles and should be mentioned, but time and space don't permit much more.

The dedication of Doug Ward, Dick Fenner, and a couple of dozen fellow hams in Houston and another group of equally dedicated amateurs at the Kennedy Space Center who repaired the transceiver and nursed it through a siege of rf interference aboard the *Columbia* cleared the technical hurdles prior to the mission.

Pete O'Dell KB1N and Wayne Yoshida KH6WZ worked for months before the flight and then around the clock at the Johnson Space Center to get out the word of Owen's feats as he worked (King Hussein JY1, Barry Goldwater K7UGA, his mother through club station W5HTK in Enid, Oklahoma, and his sons at the Johnson Space Center station). Pete's work in particular deserves a medal. He made it all work for the League. The center club's President Dale Martin KG5U and its many members were on the air around the clock, passing the latest word on orbits as fast as they got the in-flight changes from Bob Harris and Doug Ward.

The tenth day in space, the bonus day, was the best of them all. Owen worked dozens of stations and was heard by thousands even though orbital information was sketchy.

And it was then . . . to this reporter . . . that the whole flight seemed to come into focus. This really was a big deal . . . the fraternity of ham radio had seen one of its members do something exceptional. Owen Garriott, astronaut and W5LFL, had turned in another flawless performance in space. His fellow hams, here on Earth, had begun to achieve a little maturity on that final day in the places that needed to grow up. Most of the high-powered hogs who tried to ride roughshod over their neighbors had finally realized that signals from space would come through no matter what they did to interfere and that their chances of being heard were only a little better than the little guys.

And on that day, during the several great passes over the United States, all of us had good reason to be thankful . . . to Owen for a great flight, to General Abrahamson and to NASA for opening the doors of space to amateur radio, and to Vic Clark and the ARRL for the backing and support that made it all possible.

Amateur-radio operator Roy Neal began hamming in 1934 when he was first licensed as W3GIB in the Philadelphia suburb of Wayne, Pennsylvania. From home-brew equipment he migrated into early experimental work, including aeronautical mobile transceivers on 5 meters.

Immediately following World War II, Neal went back on the air as D4ACA, in Hochst, Germany. He was Program Manager for the American Forces Network in Europe and handled phone patches by the hundred.

Post war, back in Philadelphia, W3GIB was among the early experimenters with triband antennas and two-meter relay stations (known today as repeaters).

When he went to California in 1952, Roy picked up his present call, K6DUE. Active on most amateur bands ever since, he currently operates 220 MHz, 2 meters, and the 10- through 75-meter bands with occasional forays into satellite tracking to spice a diet of DX and mobile QSOs.

He is probably best known in the amateur fraternity because of his documentaries for the ARRL, "Moving Up To Amateur Radio," "The World of Amateur Radio," and "Amateur Radio's Newest Frontier."

I have no real story to tell. At least not this time. I was not among those lucky enough to contact Dr. Owen Garriott W5LFL as he traveled around the world on the spacecraft *Columbia*. I did hear him. In fact, I heard him make his very first QSO with Lance Collister WA1JXN in Frenchtown, Montana, about the time Owen was overhead on orbit 35, flying down the Pacific coastline. I was standing in the courtyard of Metromedia Square in Hollywood where I work, listening to 145.55 MHz on an Icom IC-2AT hand-held. The self-appointed "channel cops" were there, jumping on everyone's case if they "dared" to say a word on .55. There were even a few "touchtone jammers" playing their game, but all went away as W5LFL's booming signal from 200 km above us totally captured the channel. I listened as Owen first called CQ and a bit later began acknowledging the calls of those he was hearing. The output of the hand-held was patched to a cassette tape recorder and I to the latter through a pair of Senheisser earphones. I just stood there under one of our huge satellite antennas, leaning against a tree, knowing that Owen Garriott W5LFL's dream of becoming the first ham to operate a station from space had come true. I also knew that words penned by my friend Roy Neal K6DUE held new meaning. Many of you have probably heard them in the closing moments of the video presentation, "Amateur Radio's Newest Frontier." "Space has a future and amateur radio expects to be a vital part of it . . . the flight of Owen Garriott is only the beginning."

Indeed, W5LFL's flight on *Columbia* was "only the beginning." It was the start of a whole new era in the evolution of the Amateur Radio Service. Until now, amateurs had to be content with using objects such as the OSCAR-series satellites as "repeaters in space." Now, suddenly, a man had done what many thought would never happen. A

man had successfully contacted others on a one-to-one basis from Earth orbit, without the aid of NASA communications channels. He did it with the most basic of equipment: a 5-Watt hand-held and battery-powered radio and a simple antenna held to the aft flight-deck window by several strips of Velcro®. Other than the radio having to meet NASA specifications to be carried on board *Columbia*, there was really nothing special about Owen Garriett's station other than its location. Its utter simplicity raised many questions, not the least of which was "will it work, and if it does, can contacts be made and QSOs held?" We all now know that the Motorola talkie and home-brew antenna performed far above expectation. Owen proved that low power and a simple antenna could provide backup communications from Earth orbit. Indirectly, he even showed the possibility of direct personal communications from space in future times when passengers are taken into orbit. What Dr. Garriott did also gave new information about our service to the non-ham populace of the world. Never before had anything like this been attempted and the world's press corps was glued to the "happening" as it unfolded. The reports in newspapers, on the radio, and on television around the world showed hams as the pioneers of communication and finally dispelled the myth that radio amateurs were eccentric tinkerers who dwelled in attics and basements surrounded by sparks and wires. For a moment, we were the center of attention; it was an opportunity well used to bring amateur radio out of the proverbial closet forever.

Knowing that there would be many stories to tell about the flight of STS-9 and attempts by ground-based stations to garner a fleeting QSO with W5LFL, *73* commissioned 21 amateurs across the nation to keep diaries of their day-to-day efforts to make a contact. Those involved were as far east as New York and New England, as far west as California, Oregon, and Hawaii, as far south as Florida, and as far north as Alaska. Each ham has his own story. Each will have something a bit different to say and by reading their combined reports, you will get a graphic idea of what most amateurs around the world experienced during 6 of the 9 days of the flight of STS-9. First, we travel to Maine to find out how K1EFZ made out in his quest to contact Owen Garriott W5LFL, the first amateur to operate from space.

Ham it up!

Maine waits for space talk

Press Herald
Dec 1, 1983

✔ Spacelab's astronauts created brilliant flashes of blue light. Page 2.

By DIETER BRADBURY
Staff Writer

"Ham" radio operators across Maine will have their ears glued to their receivers this morning in an effort to communicate with the orbiting space shuttle Columbia.

Astronaut Owen Garriott, a mission specialist on board the Spacelab and an amateur radio operator, is carrying a five-watt, hand-held transceiver on board the flight.

During his off-duty hours, he will be trying to communicate with some of the thousands of ham radio operators around the world. If a link is established it would be the first amateur radio communication between the earth and a manned space vehicle.

The best time for communication with the Spacelab for hams in the northeastern United States will be between 10:27 and 10:47 a.m. this morning, according to the American Radio Relay League, a national organization of radio amateurs.

The shuttle will be in its 49th orbit, making a pass across the country that takes it over parts of the eastern seaboard during that period, the ARRL said.

Dana Luke of Westbrook, a ham who edits a statewide newsletter for radio enthusiasts, said he expects many of Maine's 2,464 hams to be at their sets during the orbit.

"It's the big topic of discussion every time you tune in on your set," Luke said. "Everybody's talking about it. I'm going to have my radio on, and I've got the capability to pick him up."

Under a plan developed jointly by NASA and the ARRL, Garriott will alternately transmit and receive for one-minute periods of up to an hour

During an even-minute period, he will identify the geographic area he will listen for and describe crew activities or views of the earth. During the odd-minute period, he will scan his receive frequency, 145.55 MHz, for call signs from the designated area.

In his next even-minute transmission period, he will then acknowledge any call signs he has received. Unless Garriott requests otherwise, hams will be limited to transmitting their call signs only

When this space-shuttle project was first announced, I had no idea that I would be involved to such an extent, but after the call from Jack Burnett on November 27, 1983, I suddenly was in the middle of it.

Having built the turnstile antenna described in the September *QST*, I was already prepared to listen and possibly make a call or two if the occasion arose.

On November 28, at 1100, I watched the shuttle take off and then figured out the orbit times for my location that Jack had given me. Didn't do any more until Wednesday.

Robert N. Harnois

Robert N. Harnois K1EFZ

In the meantime, I copied the RTTY bulletins from the ARRL and got the latest info on all the orbits. Also have been continuing receiving these bulletins every day.

The log explains my participation in monitoring the shuttle.

I was very pleased to be asked to participate in the telephone conference on Sunday, December 4, 1983. It was very interesting and informative and I wish I could have had more to report, but it seems that our location did not get the results that some of the other areas had. It was wonderful to be in such high-class company. Thanks for asking me.

I did not hear any malicious interference, only over-anxious and possibly misinformed operation—but nothing serious.

My station consists of a KDK 2016A on two meters with a five-element vertical beam up 60 feet. The turnstile antenna was added for this project. On HF, I have a Heath SB-104A and a TRS-80 Model 4 computer with the ROM-116 interface for RTTY. Have been a ham for 26 years; am a member of QCWA. I am retired from the US Postal Service. I work a couple days a week at a direct-mail service. For other hobbies, I am an avid tennis player, playing three times a week year round, and am a percussionist in the Portland Community Symphony Orchestra and the S. D. Warren Band in Westbrook. Do my own house repairs and like to build furniture. Of course, this computer that I'm using for this report is also one of my hobbies.

I am 69 years old. Having lost my first wife in 1978, I was remarried in June, 1982, to a very lovely lady who was also a widow. She had eight children and I suddenly had a lovely family with five grandchildren. We have a very happy life. We usually go to Florida every year for a month or so. I have one daughter who is also a ham operator; her call is K1GSF.

Three clippings from the Portland papers are the only ones I have seen so far. Have not seen any local TV coverage, but there could have been some that I missed.

The participation by the amateurs in this area was very enthusiastic and everyone is hoping that they were heard by W5LFL's receiver. I don't know of anyone who was acknowledged.

Nashua NH 03060

Members of the Nashua Area Radio Club prepared for the flight of the space shuttle *Columbia* for several months. Bob Wolf N1ABA and George Murphy K3RQ had been very active in working amateur satellites for several years, and the challenge of working STS-9 was a natural for them. Media interest was building up to the mission partly as a result of the Grenada situation that occurred about a month before the launch. I had not really set up anything at my home for monitoring the shuttle since I planned to go to Bob's house during the passes when W5LFL was on the air.

I was at Bob's shack during the first pass on Thursday, December 1, 1983. Present were reporters from the local papers, the *Nashua Telegraph* and the *Manchester Union Leader*. The shuttle came over, and with George at the azimuth and elevation controls and Bob at the 2m rig, the call was sent out. Unfortunately, Owen was in a news conference at the time of the pass, so all we heard was several minutes of noise punctuated by people mistakenly transmitting on the downlink. This all was slightly discouraging, but not to worry—there were many orbits to go!

The east-coast pass on Friday night (December 2) was to be a good one, but this was the night of the club annual Christmas party! We toyed with the idea of bringing a rig to the party, but rejected that as a bit of an overkill for a party. George K3RQ was coming to the party, but he delayed his departure long enough to make a try at a pass.

Again, nothing from the spacecraft, but George was undaunted. He proceeded to get ready for the Christmas party and George and Charlotte made a spectacular entrance!

I received a call from Jack Burnett at *73* informing us that we had been selected as one of a group across the country to keep a diary of our attempts to contact the shuttle. We were astounded to be included in a select group like this. I discussed this with Bob and George and we all suddenly realized that we were into paperwork!

Sunday night (December 4), Bob and I joined in the nationwide teleconference and really enjoyed the discussions from around the country. It was exciting to hear how people in various states were making out with PR and the attempts to contact Owen.

I discussed the passes scheduled for Monday morning (December 5) with Bob and agreed to meet at his house to listen to the next attempt. Sunday night was the first snowstorm of the season and several inches were on the ground by Monday morning. Bob lives about 2 miles from me via the main highway in Nashua. Monday morning it would have been easier to reach the shuttle! Traffic was tied up all over the city and I realized that I would never make it through the city. I turned around and proceeded to Bob's house via the neighboring town of Hollis. But the delay had set me back so far that by the time I got through Hollis, I realized that I would never make it to Bob's house in time. In desperation, I turned on the old Kenwood 7400 in the car, hoping that I would hear something with the quarter-wave whip on the rear deck.

At the appointed time, I suddenly heard "This is W5LFL in the spacecraft *Columbia* calling CQ North America."

I damn near drove the car off the road! He was full quieting with no flutter and no static. I listened to the whole pass and even put in some calls as I continued to Bob's house. What a thrill! I was struck by the solid link between a spacecraft orbiting the Earth 200 miles up and a commuter on a back road in a little town in New Hampshire.

Wednesday morning (December 7), I was ready at home with my 2-meter rig tied to my 8-element yagi and a tape recorder ready to go. I pointed the antenna south to try to catch as much of the pass as possible. Right on schedule, there he came! He was loud and clear and I copied three of his transmissions. My wife and I shared the headset on the tape deck as Owen called CQ.

As I tuned around the 10 transmit frequencies listening to the local hams calling the shuttle, I was struck with a vision of the view from the spacecraft if rf energy were visible. As he passed over a given area and made a call for stations, a blanket of rf energy would rise from the surface of the Earth and envelop the spacecraft!

Monday night (December 5), the Nashua Area Radio Club had its regular monthly meeting at the local library. On the agenda was a short presentation by Bob and George on the shuttle activities. By the time the meeting started, it was clear that a lot of people were there for the info on the shuttle. The tapes of the previous passes were played and the questions flew thick and fast! The repeaters were alive with people looking for orbit info and frequencies. I kept checking the articles in the local paper to see what immortal statements Bob and I were quoted as having uttered!

Bob Wolf N1ABA (left) and George Murphy K3RQ at Bob's station. Bob is operating the 2-meter rig while George is checking orbit data and running the tracking antenna

The interest in the shuttle activity is extremely high. I took the tape of the Wednesday morning transmissions into work. A small crowd quickly gathered to listen to W5LFL and was astounded by the clarity of the signal.

Station Equipment

- *Radio*: Kenwood TR-9130 multimode
- *Amplifier*: TE Systems 1412G, 150 Watts output with GaAsFET preamplifier
- *Antenna*: Cushcraft A144-10T, 10-element switchable left- and right-hand circular polarization. Antenna is 50 feet and is rotatable in azimuth and elevation.

Station Diary

August, 1983: Updated W3IWI (Tom Clark) Orbital Prediction Program to include STS-9 preliminary data.

September 12, 1983: Don Dillaby KA1GOZ of the *Nashua Telegraph* conducted interview with myself and George Murphy K3RQ.

September 13, 1983: Front-page article, with picture, appeared in the *Nashua Telegraph*

October 21, 1983: Follow-up story on STS-9 ham-in-space mis-

sion was run in the *Nashua Telegraph*.

October 23, 1983: Virginia Wegener of the *Manchester Union Leader* conducted interview with myself and George Murphy K3RQ.

October 30, 1983: Article, including picture, appeared in the *New Hampshire Sunday News* (Manchester).

November 28, 1983:

1400-1420Z: Logged into the AMSAT bulletin-board system and obtained current list of potential orbits for W5LFL.

November 30, 1983:

0200-0330Z: Checked into the AMSAT net on 3850 kHz. Received the latest inputs on projected orbit numbers for STS-9 as well as element set #MH-11-29-83. Inputs from W5RRR on the net giving calculated equator crossing times and longitudes for orbits 34A and 48A were also logged.

0330-0430Z: W3IWI computer program was updated with the new element set and orbital predictions run for the time given by W5RRR. Data correlated within 10 seconds and a fraction of a degree of equator crossing to that of W5RRR.

1721-1728Z: Monitored 145.55, 145.53, and 145.57 during orbit 34. Nothing heard even though the spacecraft was in range. No transmissions were made.

1728-1900Z: Rechecked all equipment and orbital calculations. Verified with as many sources as possible including Jim Pickard WA1PSI in Derry, New Hampshire, that no transmissions were heard in the area during orbit 34. Prepared for orbit 49 which we believe to be our best chance in this area to work W5LFL.

December 1, 1983: Newspaper article appeared in the *Nashua Telegraph* describing failure to hear W5LFL on orbit 34 which had been our first opportunity in this area.

1538-1546Z: Listened for W5LFL on orbit 49. This was the first scheduled east-coast pass and was one of the best, reaching an elevation of 42 degrees. In the shack were Bob Wolf N1ABA, George Murphy K3RQ, Bill Burden WB1BRE, Dot Burden, Don Dillaby KA1GOZ from the *Nashua Telegraph*, Virginia Wegener of the *Manchester Union Leader*, Gene Balinski WA1UXA, and Randy Ward KA9GHT. Nothing was heard, but we were informed shortly after the pass that Owen Garriott was in a press conference during this time.

1546-1630Z: Short group discussion about failure to hear anything on orbit 49. Everyone was a bit disappointed, but there was also a lot of optimism among the people present, especially when we found out about the press conference.

2000-2030Z: Calculated orbital information for orbit 57, which is due to pass overhead just after sunset. There is partial cloud cover at this time, but hope to get visual sighting to confirm orbital calculations.

2150-2200Z: The *Columbia* appeared to the northwest, just as predicted, passed to the north reaching an elevation of about 30 degrees, and went over the horizon to the southeast. It was a spectacular sight, appearing as a very bright fast-moving star. It was observed for approximately five minutes. This sighting *confirmed* the accuracy of the computer program.

December 2, 1983: Newspaper article including picture appeared in the *Nashua Telegraph* explaining our attempt to work W5LFL on orbit 49. The article explained that Owen was in a press conference at the time of the pass and for that reason was not available. Newspaper article describing our attempt on orbit 49 also appeared in the *Manchester Union Leader*.

2230-2315Z: Prepared for orbit 70. Checked all equipment and orbit calculations. Monitored WA3NAN for shuttle transmissions and additional information.

2315-2321Z: Listened for W5LFL on orbit 70 from the car en route between Nashua and Durham. Nothing heard on any of the downlink frequencies. Did not make any transmissions. K3RQ attempted to work orbit 70 from his home in Milford, New Hampshire. Virginia Wegener of the *Manchester Union Leader* was also present. Nothing was heard by George either.

December 3, 1983: No scheduled orbits for today but monitored WA3NAN on and off for most of the day. Ran orbital calculations for orbits 85, 96, and 97. Relayed information on orbits 96 and 97 via the 13/73 repeater. Orbit 85, although not a scheduled orbit for W5LFL, was predicted to pass just after sunset, and since there was no cloud cover, this was an ideal candidate for another visual sighting. If you can't hear him, at least you can see him.

2130-2140Z: *Columbia* again appeared right on schedule from the northwest, passed to the north at about 45 degrees elevation, and disappeared over the horizon to the southeast. It was just as spectacular and exciting as Thursday's sighting. Anticipation of hearing W5LFL on the downlink for the first time is building again.

December 4, 1983:

1300-1335Z: Prepared for orbits 95 and 97 while monitoring WA3NAN.

1335-1342Z: Listened for W5LFL on orbit 96. Heard and recorded two transmissions at 1334 and 1336Z while the *Columbia* was over Florida. Called on odd minutes on 145.03 MHz. Signals peaked at 59+20 dB. Antenna polarization favored RHCP. It was a tremendous feeling to hear Owen Garriott for the first time. It was hard to believe the quality and strength of the downlink signals. Many, many signals were also heard on the uplink. It is hard to imagine what it must have sounded like in the *Columbia*.

1342-1500Z: Continued to monitor WA3NAN on 40 meters and compare notes with several other stations who had heard the downlink signals on orbit 96. Talked with WA1PSI in Derry to exchange reports and check data for orbit 97. After hearing W5LFL for the first time, everyone was anxious for a second shot at it. Many people on the 13/73 repeater had not heard him or were not listening on orbit 96 but looked forward to orbit 97 after finding out he had finally been heard in the northeast.

1505-1515Z: Listened for W5LFL on orbit 97. Heard and recorded two transmissions at 1508 and 1510Z while the shuttle was over Texas and the Great Lakes. Signals favored LHCP polarization on this pass and peaked at 59. K3RQ monitored the pass from his QTH in Milford.

December 5, 1983: Newspaper article appeared in the *Nashua Telegraph* describing the transmissions heard on orbit 96 and our continued attempts to be heard by W5LFL.

1320-1332Z: Listened for W5LFL on orbit 112. Heard and recorded *four transmissions from the Columbia* as the spacecraft traveled up the east coast. Transmissions were heard at 1324, 1326, 1328, and 1330Z peaking at 59+20 dB. Called on odd minutes on several different uplink frequencies.

1332-1430Z: While monitoring the 13/73 repeater and WA3NAN *for new information, edited* the tapes for orbits 96, 97, and 112 for presentation at the Nashua Area

Radio Hams Fail In First Attempt To Contact Shuttle

By VIRGINIA WEGENER
Union Leader Correspondent

NASHUA

NASHUA — The line was busy between earth and space yesterday morning as the space shuttle Columbia slashed its way across New Hampshire skies while hundreds of ham radio operators around the state tried to get a call through But to no avail

"NOVEMBER ONE. ALPHA BRAVO ALPHA" "NOVEMBER ONE. ALPHA BRAVO ALPHA" Nashua ham Bob Wolf kept repeating his call letters over and over during the odd numbered minutes when orbiting astronaut Dr. Owen Garriott was scheduled to be listening (Garriott was slated to repeat the call letters on the even minutes, if he was able to receive and respond)

Wolf continued repeating his call letters in the hope that Garriott would hear them, while fellow ham, George Murphy of Milford, manned the antenna tracking the spacecraft as it raced along.

Fellow hams Bill Burden, president of the Nashua Area Radio Club; George Balinski and Don Dillaby, all of the Nashua club, and Randy Ward of Evansville, Ind., were all in the Wolf home on Shannee Drive in the hope of being there when Garriott broke through.

"There's only a total of eight minutes during each pass when the shuttle is in the right position to send and recieve," the various radio enthusiasts took turns explaining.

"We have 10 different frequencies we can transmit to him over.and he'll respond on the even minutes on one of three frequencies."

The spaceman-ham will only be allowed to broadcast to earth during his off times and then the most earthlings will hear is "CQ CQ, this is W5FLF calling ..." whatever call letters he has received during the sending time from earth.

"Even if he can't answer us because of his NASA comittments," another Nashua ham reported,"he'll try to record our calls so that when he gets back, we'll be notified that our calls were actually received in outer space."

Yesterday's unsuccessful attempt at communication didn't dampen the ham's enthusiasm, though. Tonight the shuttle sails over our area again and they'll all be at their respective stations at 6.15 p.m. for another try at reaching the shuttle.

Eavesdropping on outer space isn't restricted to those with ham radios, however. Anyone with a programmable seahner can tune in to frequency 145.55 MHZ while those with short wave radios can listen on 3.85 or 3.86 MHZ LSB.

But if O.G. doesn't call home tonight, he'll have one more chance to try Dec. 16.

Radio Club meeting. Exchanged signal reports and observations with many of the people who had monitored orbit 112. Many mobiles and several people with handie-talkies had heard W5LFL 59. Excitement was running high and *Columbia* fever was epidemic. Recorded element set #MH-12-5-83 for STS-9 from WA3NAN. Updated computer program and reran calculations for orbits 117, 128, 129, 132, and 133.

2109-2117Z: Listened for W5LFL on orbit 117. Nothing was heard. Transmitted on all uplink frequencies using both RHCP and LHCP during the pass.

December 6, 1983:

0000-0230Z: Nashua Area Radio Club meeting. Presented short update of STS-9 mission and played the recordings of downlink transmissions heard on orbits 96, 97, and 112. At least half of the 60 members present had heard one or more of the transmissions. Only a few had tried and failed to hear W5LFL. Dan X1XXX, one of the club members, was presented the "STS-9 COULD" award (Call On the Uplink Dummy). Note: The call has been changed to protect the innocent?

1311-1319Z: Listened for W5LFL on orbit 128. Nothing heard, but transmitted on all uplink frequencies during the pass.

2056-2104Z: Listened for W5LFL on orbit 133. Nothing heard, but transmitted on all frequencies during the pass.

December 7, 1983:

1130-1200Z: WA3NAN monitored while preparing for orbit 144.

1259-1307Z: Listened for W5LFL on orbit 144. Heard and recorded five transmissions at 1258:30, 1300, 1302, 1304, and 1308Z. AOS occurred at 1358:25 and LOS occurred at 1407:25. Signals peaked at 59+30 dB during the pass and favored RHCP at times and LHCP at other times. AOS occurred 30 seconds earlier than predicted.

2035-2044Z: Prepared for orbit 149. W5LFL has yet to appear on an afternoon pass, but will keep trying in hopes that the recorder is running.

2044-2052Z: Listened for W5LFL on orbit 149. Nothing heard, but transmitted on all uplink frequencies.

2100-2200Z: Ran computer calculations for orbits 160 and 161. Presented calculations for orbits 160 and 161 over the 13/73 repeater. Also discussed signals heard during orbit 144. Almost everybody was able to copy at least three of the five transmissions.

December 8, 1983:

1200-1246Z: WA3NAN monitored while preparing for orbit 160. Information received via WA3NAN indicated some problem with two of the computers, possibly associated with the maneuvering thrusters. At 1245 the scheduled landing was postponed until the problem with the computers was better understood.

1246-1300Z: Listened for W5LFL on orbit 160. Nothing was heard, and due to problems with the computers aboard the spacecraft, it was unlikely the recorder was running, so no transmissions were made.

Bill Burden is a native of Nashua, New Hampshire and has lived there most of his life. He is 47, married, and has three children. His wife Dot is waiting for her Novice ticket to arrive! Bill is a Program Manager at Sanders Associates in Nashua, where he has been employed for 28 years. He received his Novice license in 1976, his Technician in 1977, and upgraded to Extra in 1983. His primary activities include low-band CW, 2m FM, 220 FM, Field Day, and amateur radio/personal computer interfacing. Bill has been a member of the Nashua Area Radio Club for six years, serving as its president for three of those years. He has been appointed by the ARRL as Public Information Officer for NH and Assistant Director for New England for 1983, and he is a delegate to the NH Amateur Radio Association. Other activities include work on the NH March of Dimes and Nashua Red Cross Executive Boards and participation in Scottish Societies in New Hampshire and Vermont.

Lansing NY 14882

Interest in the space shuttle started mounting early in the spring when it became public knowledge we were about to send a *ham* into space. I never dreamed I would be fortunate enough to hear him, never mind call him. October 28 drew closer and every ham was spreading the word.

Our local club, the Tompkins County Amateur Radio Club, decided to get permission to set up a station on the Ithaca Commons, the downtown Ithaca pedestrian mall. Arrangements were completed for the October 28 lift-off. When the lift-off was postponed until November 28, our plans had to be dropped. The space was not available and we lacked ham power due to prior commitments, holiday time, and the fact that we could not arrange for a suitable location. I was ready to forget the whole project.

Monday, November 2: A few of the local hams were discussing the possibility of following through with our plans to have a station set up. We were in the middle of holding our Monday night Novice class and I had very strong feelings about the interest the project would create among the students. One of our newer younger members, Scott KA2AFN, volunteered to build a turnstile antenna. Needless to say, I grabbed at the offer. Scott met with all kinds of problems trying to get together the needed parts for our antenna.

Sunday, November 27: I was fortunate enough to have been chosen to work with other hams in the US in conjunction with Jack Burnett, Executive Editor of *73*. I was included in the first telephone conference call regarding our ham in space. My OM recorded the call on his reel to reel. It was a darn good idea, as I would have been at a complete loss without the information that was recorded. All I could think of was the fact that lift-off was tomorrow and I still lacked a circularly-polarized antenna.

Monday, November 28: The sun rose, the *Columbia* was off on schedule, and I became more frustrated by the hour. So the week progressed. By Thursday, December 1, I was completely oblivious of anything except the antenna. I called on 2 meters and the phone trying to get everything in order for this area's first chance to hear W5LFL.

Friday, December 2: This afternoon, about 5:10 EST, Scott arrived at my house, antenna in hand. We immediately went to work setting it up. At 5:45 pm, we were both out back, taking down the mast and my OM's CB antenna. It was about 25 degrees with winds about 15 mph and pitch black out there. We had a schedule to meet and we were determined to do it. We braved the elements and, finally, at 5:55 pm, into the house we ran, ignoring our frozen ears and fingers. We immediately checked the swr with a meter another club member, Lew KC2YF, had been kind enough to drop off at Scott's work QTH. Lo and behold . . . 1:1. What a fantastic job Scott had done. Scott had another commitment and was only able to stay around for a few minutes. I felt very badly, especially after all the work he had done. After Scott left, I sat with my ear glued to my rig, an Azden 2000 mobile unit. I was sure I had a very faint copy on W5LFL, but there was barely any audio. Later that evening when I was rag-chewing on the club's repeater, the guys convinced me it was other hams calling on W5LFL's frequency.

Saturday, December 3: I heard nothing. I went to bed feeling a little depressed, frustrated, and very disappointed.

Sunday, December 4: Bearing in mind what my Elmer used to preach to me—that a true ham never gives up—I turned the rig on as I was getting ready for church. W5LFL was calling "CQ North America." I was so shocked I couldn't move, and I didn't answer his call. That night, Jack Burnett arranged another conference call with the same group of hams. He gave the group all the latest and most updated information he could gather. When I finished on the call, I felt like I had been given a tremendous shot of confidence and encouragement—go get W5LFL! I spent most of the night planning my strategy.

Monday, December 5: Bright-eyed and bushy-tailed, I went into my shack, confident that not only was I going to hear W5LFL, but also that I was going to work him. I sat by my rig, tension building, excitement mounting, and completely confident of achieving my goal. Suddenly, "This is W5LFL, CQ North America." I grabbed the mike (dropped it), tried to turn the recorder on (couldn't remember how)—I was in a complete state of shock. Luckily, this mass state of confusion lasted just seconds, because I found myself calling him. In the interim, somehow I had turned the recorder on. I know it really

Wanda Lovejoy K2OX

couldn't have been my doing—it must have been my guardian angel. Within a few minutes, W5LFL was calling "CQ" again. It seemed to me that the only ham he was really talking to was me. I went back to him again. It was too far into the game for me to start acting as if I had any common sense at all, because I didn't. The thought never entered my mind(?) to wait for the full length of the window. My OM was still asleep and I ran in the bedroom screaming. Waking him from a sound sleep, he wasn't sure whether I had completely flipped or I had come close to electrocuting myself. He calmed me down, brought me back to Earth, and attempted to explain that the astronaut was really talking to all hams on the continent, but nobody was going to burst my bubble! From here on, my rig was not turned off as long as Owen was on board the *Columbia*. We set a bed up in the shack in case any unannounced transmissions were made. Please believe me, I concentrated so hard on working Owen (you've probably noticed Owen and I are on a first-name basis now) that I never got a chance to work W5RRR. Oh well, they will be at it again many times, but nobody will ever be able to do a repeat performance of what Owen Garriott accomplished.

Tuesday and Wednesday were both fun days, as several opportunities were available to work the *Columbia* again. I worked every chance I got and will never regret one minute of it.

Thursday, December 8: The *Columbia* comes home today. I still am trying to work Owen with the same enthusiasm and pleasure I have felt all week. I feel sure that when I see the *Columbia* touch down, tears will be shed and I will have a feeling of sadness because another friend via ham radio with whom we have shared a good deal of time is back home and getting ready to get back into his normal routine.

I am sure we'll have other hams in space—we know there will be many more space shuttles. We also know that NASA will continue its efforts giving us all still another reason to be proud we are Americans. But all of this will never be able to help us relive the most exciting history-making event shared by hundreds of thousands of hams worldwide which was made possible by one of our own, Owen Garriott W5LFL. I have never been as proud of anything as I am to have had the opportunity to play my small part in this chapter of amateur-radio history.

Thank you and God Bless You, Owen Garriott.

My sincere thanks to Jack Burnett and *73* for giving me this wonderful once-in-a-lifetime opportunity.

Wanda Lovejoy lives in Lansing, New York, with her OM, Gerry, not a ham but responsible for her being one. He urged her to try for her Novice license and then kept pushing her. She was first licensed in November, 1980, upgraded to General in March, 1981, to Advanced in April, and finally to Extra in June of 1981. She is 56 years old and retired from the New York Telephone Company. During the summer she enjoys their cottage on Cayuga Lake, fishing, swimming, and keeping the company of their four children and twelve grandchildren. She is the organist at Our Lady of the Lake Church in King Ferry, about seven miles north of her home. The only real hobby she has is ham radio. She is currently president of the Tompkins County Amateur Radio Club, which just finished its first Novice class—"we have 23 new Novices in the area from a class of 26." Since the final test on December 5, after checking the results, Wanda feels twelve feet tall. "It's such a pleasure to see people work so hard to accomplish their goal for the pleasure and satisfaction we all get from our hobby—ham radio."

Billy F. Williams, Jr. N4UF
PO Box 9673
Jacksonville FL 32208

It started here in Jacksonville, Florida, during late September when plans were made to publicize the STS-9 amateur-radio operation. Rudy Hubbard WA4PUP of Milton and I began the task with apprehension because of the lack of a precedent on which to base decisions. Rudy is Public Information Officer and I am Section Manager of the Northern Florida ARRL section which includes 44 of the state's 67 counties. Rudy has four Public Information Assistants (PIAs) who work with him.

We elected to start out "blitz" on October 1 in preparation for the proposed October 28 launch date. Packets of information were sent to the PIAs and media contacts which Rudy arranged. We were dealing with several unknowns. Would the signals from the STS-9 be audible? Would most hams brush the oppor-

Ham operator finds lucky number is 96

By Ford Risley
Staff Writer

John Moore's lucky number yesterday turned out to be 96.

Moore, a ham radio operator from Orange Park, talked with mission specialist Owen Garriott as the space shuttle Columbia was on its 96th orbit around Earth.

"It was quite a thrill because so many ham radio operators are trying to make contact," said Moore, a radio ham for almost 30 years.

Moore said as far as he knows, he is the first ham radio operator in the Jacksonville area and one of only four in the state to make contact with Columbia.

Garriott, who is an amateur-radio enthusiast, has taken a five-watt, battery-operated radio into space as part of his personal effects.

When he has time off from his duties on the Columbia, Garriott is holding his radio to a window when the shuttle is pointed toward earth.

Garriott then scans 10 radio frequencies. When the astronaut picks up signals from earth-bound operators, he replies with his call letters — W5LFL.

Moore, whose call letters are W5HUQ, made contact with Columbia at 8:34 a.m. yesterday — on his first try.

"I was very lucky," he said.

Besides good fortune, Moore credits his success to knowing precisely where the Columbia was going in its travels.

He said he got a computer printout with the space shuttle's exact orbits from NASA.

Moore, 44, said he made contact with Garriott as Columbia was over the southwest tip of Florida at an altitude of about 135 miles.

For Moore — who has talked with radio operators as far away as Japan and Russia — the challenge was not distance, but trying to get through while hundreds of other hams were trying to do the same.

Another problem is time.

The space shuttle is over the United States for eight to 10 minutes at a time. And Garriott will only be receiving signals for five or six days of the nine-day mission.

tunity off as too technical? What if we got the media excited and then found we couldn't deliver? These were among the questions which caused much concern.

In Jacksonville, interest in STS-9 was minimal but starting to develop. A few local hams were designing special antennas and a couple even ordered special arrays from commercial sources. The word was spread at our two large ham clubs and on the nets. Just as momentum was gaining, reports began surfacing that predicted certain delay of the launch. A couple of days later, these were confirmed and the earliest possible launch was set for November 28. A possibility existed that the mission would not be launched until February, 1984. Interest seemed to evaporate.

It turned out that the delay was beneficial and provided an ideal follow-up to one of the biggest amateur-radio events ever. On October 25, I heard reports of amateur radio being used by a medical student at St. Georges in Grenada to provide the only information out of a potentially explosive situation. Upon arriving at my job location, a community college with an amateur-radio station, I found KA2ORK/J3 on 20 meters. By noon, calls were coming in from local TV and radio stations. At 1:00 pm, the first camera crew arrived and began taping Mark's transmissions and asking questions about amateur radio. Grenada was instrumental in capturing attention and focusing the media's interest on amateur radio. STS-9 was to be an ideal follow-up a month later. As the reporters left with their stories and tapes, I reminded them about Dr. Garriott's STS-9 operation.

Around 4:00 am on Thanksgiving, November 24, I was tuning across the AM radio dial when I happened upon a station carrying the ABC Talkradio Network. The regular host of the program, I learned, is an amateur-radio operator. His name is Ray Briene N6FFT and he was interviewing Jay Holladay W6EJJ. The topic of discussion was amateur radio and STS-9. It was very enlightening. Many telephone calls were aired from hams around the US. Not being very familiar with satellite communications, the program helped me immensely and my interest in attempting contact with W5LFL increased.

The next day I was tuning my HF antennas for the CQ Worldwide CW contest and also installing a couple of VHF antennas. One was a Ringo Ranger at 70 feet and the other an 11-element Cushcraft beam at 25 feet. It would be odd to me later to discover that height means very little when communicating with a satellite. After completing the work, I began operating the 48-hour DX contest. Although band conditions on HF were atrocious, I did get several new band-countries.

On Sunday morning during the contest, I received a call from the local NBC TV affiliate seeking information on STS-9 which was to be launched the next day. The reporter seemed very interested and was slightly disappointed to learn that no communication be-

tween the shuttle and amateur-radio operators was scheduled until at least Wednesday. He agreed to check back with me on Tuesday. At precisely 11:00 am on Monday, November 28, STS-9 was launched. At 11:04 am, CBS television mentioned Dr. Garriott's ham radio and added that he said "73" and signed his call on the main system nine minutes before lift-off. Upon arriving home at 3:00 pm, I monitored W5RRR at the Johnson Space Center in Houston. Much confusion existed about the orbit times and which ones would be best for amateur-radio contact with W5LFL. Fortunately, the night before I had gotten the latest information from Jack Burnett, Executive Editor of *73* magazine. The ARRL sent out a list of elapsed times which I got on Saturday and my conversation with Jack gave me a couple of new ones which were not on the list. On the whole, I would rate the quality of information from both sources as very good.

I converted the elapsed-time listings into local EST for the 12 most likely orbits. I had doubts about the central USA possibilities but listed them anyway. The next step was to install my cassette tape recorder into the audio line of my 2-meter transceiver which is a Kenwood TR-7800. This was easily accomplished. I had heard that the KA4GXZ repeater in Clermont was planning to rebroadcast the shuttle/ground communications, so I tuned the rig to 145.39 MHz. Since Clermont is over 100 miles from Jacksonville, I didn't expect to hear much. Surprisingly, KA4GXZ/R was putting in a strong signal and this was the case during the whole operation. I learned that KA4GXZ had the machine linked to a similar operation on the Merritt Island repeater and that the K4DPZ/R Gainesville repeater was also tied in. These repeater operators are to be commended for their initiative in providing shuttle-to-ground audio. Anyone who monitored the shuttle transmissions on KA4GXZ/R is asked to send a card or note to the *Callbook* QTH so that owners Wayne Fletcher and John Mullan W4OQF can gauge interest for future launches. Those hearing the rebroadcast on other repeaters should drop notes to those responsible as well.

On November 28, the *Jacksonville Journal*, an afternoon daily, carried a front-page article and photo about Hank Fitz WB4URU and his preparations to work W5LFL. Hank is an experimenter extraordinaire and did an excellent job of getting the information across to the reporter—a task not to be taken lightly. The same day, I received a copy of an article from a Sanford newspaper which had been carried a few days earlier. Wimpy Wimberly KB4LB was featured along with a photo of him at his station. Wimpy is one of our most energetic Public Information Assistants who covers the Greater Orlando area.

Other than listening to the shuttle audio through KA4GXZ/R, there was really little else to do except to try to gauge the interest while answering an occasional telephone call from the media. The local TV and press gave the impression that they expected a mass contact operation by W5LFL, but I had serious doubts. His signal would be audible for only eight minutes at a time which would give a total of 96 minutes of operating time if all 12 passes were perfect. I estimated he might make 500 contacts at most during the eastern and central US passes. It was decided to start impressing this point upon the media. On Tuesday, I got a call from the NBC TV affiliate again and it was agreed they would send their news team to my home for the first of the 12 possibilities which would be orbit 34. I quoted the odds at 100 to 1 against a contact and 5 to 1 against hearing W5LFL. This was to be a low orbit and would pass about 1,000 miles west of Jacksonville. In retrospect, the 100 to 1 odds seem very conservative!

On Monday night, the local ABC television affiliate had some shots of Robbie Roberts KH6FMD/W4 preparing for the chase. They stopped by Robbie's house on the way back from Cape Canaveral.

Throughout Monday and Tuesday, I monitored area two-meter repeaters to get some idea of the extent of local efforts to contact STS-9. The biggest problem was confusion as to which lists and times were correct. Quite a few hams were using outdated lists, and while about 50% of those surveyed wanted to make an effort, only a handful had the correct times. Jacksonville Public Information Assistant Mike Reublin NF4L and I participated in a discussion on the 146.16/.76 repeater in which we disseminated the correct information from the data supplied by the ARRL and *73*.

As I tuned across two meters on Tuesday, I heard quite a variety in antennas to be used. Four-bay dipoles and 11-element beams seemed to be the most popular choices. Typical power levels were in the 100- to 200-Watt range with three stations contemplating the legal limit. My own 25 Watts seemed small, but I reasoned that it was more luck involved than station capability. I was to learn a lesson in that regard, though.

My day for Wednesday, November 30, was planned. I would go to work about 8:00 am, teach my morning electronics classes, and be home for lunch by 11:15 am. The NBC TV affiliate was to arrive at 11:30 am and we would tape the orbit 34 pass from 12:10 to 12:25 pm for broadcast on the evening news. Just as I was leaving work for lunch, I got a call from another TV station. The CBS affiliate wanted to send its live remote truck to my house. I explained the odds again and informed them that one station had already asked to be present but that any station was welcome to attend. They said the truck was on the way.

Arriving home, I heard the telephone ringing. The ABC affiliate also wanted to send out a crew. After again explaining the odds of contact, I invited them to attend as well. By 11:50 am, all three TV stations had their equipment in place and checked out. One station, the CBS affiliate, would be broadcasting live during the middle segment of the noon newscast. The others would be taping for 6:00 and 11:00 pm.

I figured that W5LFL would be audible from about 12:15 to 12:23. At 12:05, I began scanning the 10 frequencies and monitoring 145.55 MHz. The live report started and I made a 20-second call which was, of course, unanswered. I then was posed a couple of questions and stated that I hoped to be the lucky one to contact W5LFL despite the long odds. A similar stance was taken with the other reporters who taped interviews after the live report was over. I was trying to develop the angle of who would be the local lucky ham to make it through to STS-9. There was little to show so far. Even a little reception of W5LFL would have been helpful. Any ideas of a DXpedition-type operation were doused and the question was now "can a local ham make good?" Any local ham would suffice. The worst thing would be to have no local get through.

Fortunately, I tuned the HF rig to 14.280 MHz where W5RRR was operational. The reporters were still listening and we heard a loud pileup of stations calling to report that no one had heard W5LFL. There must have been 75 or 80 stations. That experience reinforced the angle of whether any local ham would be successful. If so, it should be a big news event. Later, we found out that Dr. Garriott was occupied with other duties. Incidentally, the idea of the tape recorder aboard the spacecraft was a very wise one. It took pressure off those who were involved with the media. We always could say we were confident that we would be on the tape but that no one would know until the mission was completed. This took the edge off of the unsuccessful attempts conducted in the presence of the media. The end result was a failure being turned into a selling point. As they left, the reporters gave me special numbers to call if any local station got through. I also promised to tape any interesting events.

The second of the 12 opportunities came on orbit 39 which was from 8:05 to 8:15 pm Wednesday evening. Again, this was to be a central US pass but the orbit was to be of higher altitude which would extend the communications corridor to include us on the fringes. Our weekly ARES net met at 7:30 pm on 2 meters and I read the schedule as a QNC. All 3 local affiliates carried the story on the 6:00 pm news along with pictures taken at my house that noon. Few locals had attempted on orbit 34, but interest in orbit 39 was much more intense. I decided to do most of my calls on 145.03 MHz. Some stations were using the "shotgun" approach with short calls spread over the 10 uplink channels. I spent about 30% of the time calling with the other time spent scanning the uplinks with my priority set on 145.55 MHz. I planned to make a tape of those calling to be edited and played at a future local ham club meeting.

There was no reception from W5LFL on orbit 39, so it would be the next morning (Thursday) before we would have our third shot in Jacksonville. Orbit 49 was scheduled for 10:27–10:47 am which would be a prime opportunity since it was the first east-coast pass on the list. Fortunately, I was able to get home long enough between classes to give it a shot. However, the astronauts were holding a live press conference at that exact time so our only hope was the tape recorder which might have been running. Some discouragement was being noted locally. We had been foiled on our first three attempts. Some had heard rumors of a Montana station making contact Wednesday night and other reports of very strong reception on the west coast had been noted. But locally, we were batting .000 being 0 for 3.

Friday evening provided the next opportunity. Orbit 70 was listed for 6:05–6:25 pm over the eastern USA, followed 90 minutes later by orbit 71 over central USA. Despite some frustration, more locals than ever were planning to give it a try. Both orbits passed without success. One local reported working W5LFL but I was suspicious of the claim. The source of information being second or third hand was very unreliable, and although I would have liked to get a story on the air, the potential for embarrassment was too much. I was later to find out that contact at the time stated was impossible. No one else locally had heard even a peep on either orbit.

Saturday was a breather with no scheduled orbits of operation in our area. My finances were looking up after the Thursday night televised pro football game which made me very happy. And they were to be even better still as a result of the nationally televised Florida Gator/Florida State Seminole football game. Looked like the Gators and the Raiders were having

much better luck than the local ham-radio operators.

Scattered blind calls were heard throughout Saturday evening. I even made a couple myself hoping for a break. Maybe Dr. Garriott would have a few unscheduled minutes and I would luck out. Maybe similar to a DX contest situation where thousands of stations are embroiled in a pileup and one ham moves up the band and hears an even rarer station calling CQ with no takers. At least I had plenty of local hams on tape for the meeting program. I had no way of knowing at the time, but Sunday was to be a very big day!

8:00 am Sunday arrived sooner than expected and it was time to stumble around getting ready for orbit 96. As the *Florida Times-Union* was to say in the next day's edition, 96 would be a ham's lucky number. It was tempting just to forget it and go back to sleep since we had been unsuccessful in even hearing W5LFL, but that idea didn't last long. After all, this pass was to be very close and our luck had to change.

At 8:35 am I heard W5LFL in a clear crisp signal! "I am still not able to read many of the signals in my headphones here because the background noise is just too high. We will have it all on tape and be able to sort it out when we get back on the ground. So this is W5LFL in the spacecraft *Columbia* now approaching the—let's see—we are coming across the Gulf at this time approaching the coast of Florida and then on up the east coast. W5LFL is calling CQ North America and I'll be standing by for the next 60 seconds."

A tremendous pileup ensued! A minute later we heard "W5LFL returning to Kilowatt Four Germany Foxtrot Germany. Your signals are loud and clear. Also a Kilowatt Victor Four Charlie . . ."

I looked up K4GFG in the *Callbook* and found he was licensed to Davie, Florida, near Miami. Also Dick Jansson WD4FAB of Orlando was recognized. And most important for Jax area hams, John Moore W5HUQ was logged by W5LFL! Actually, John had worked him just as he came up over the horizon. We had a local ham in contact with STS-9! A couple of minutes later, the telephone rang and John asked if I heard it. Indeed I had and the signal quality of W5LFL was sensational. Within the hour, a TV news team from the local ABC affiliate was en route to John's Orange Park QTH. They taped a very nice report which was aired on the 6:00 pm newscast. To make it even better, W5LFL had also contacted King Hussein JY1 and of course that was big news. It was a natural local tie-in!

Meanwhile, a similar scene was unfolding in Orlando where WD4FAB was also featured and gained much publicity for amateur radio. Only four Florida stations were to be logged during the regularly publicized orbits and I felt lucky to have one of them in the Jacksonville area and another in Orlando which is in the Northern Florida Section.

Orbit 96 faded away with 97 due in about 85 minutes. The next pass was to be over the central US and I doubted whether it would be heard in Jacksonville. But there was nothing else to do but give it a try. At 10:07 am, I was surprised to hear, "This is W 5 Lima Foxtrot Lima in the spacecraft *Columbia* calling CQ North America . . ." He went on to say he was over Texas. Signal quality was still excellent! A local ham, Bernie Munsey N4GBY, later reported hearing W5LFL very clearly on his mobile unit as he was heading south down Interstate 75 in southern Georgia. He was using only a 5/8-wavelength whip antenna.

At 9:07 pm that evening, I participated in a conference call with other hams who were writing reports for this article series. *73*'s Executive Editor Jack Burnett filled us in on the latest information and Bill Pasternak WA6ITF gave us insight with his observations. Each participant then gave a capsule version of activity in his or her area and a tape of a west-coast pass was played. It was a pleasure to be able to participate.

Next up was orbit 112, scheduled for 8:15-8:23 am on Monday. Again luck was with us. Although not as clear as the day before, W5LFL was heard with much the same announcement. The background noise was very high and the tape would tell the tale. W5LFL was not heard on orbit 113.

On the way back to classes, I picked up the morning paper and on the front page was a story headline: "Ham operator finds lucky number is 96." Of course, the article featured John Moore W5HUQ who did an excellent job of getting the information over to the reporters. Besides being lucky, John credited his success to knowing precisely where *Columbia* was going in its travels. He had a computer printout with the exact orbits from NASA. John's station included a pair of 7-element beams and a kilowatt. He has been very active with OSCAR and VHF, having all states worked on 6 meters along with 63 DXCC countries on 432 MHz where he operates EME. His rig is a Kenwood TS-700A.

Dick Jansson WD4FAB is also very active on VHF. He has served two terms on the ARRL VHF-UHF Advisory Committee (being the only fourth call area member). It was revealing to note that the stations

breaking through the tremendous background noise were top-notch operations while the simpler stations had great success in receiving W5LFL. I guess there is a message in that somewhere.

Orbit 129 on Tuesday was the next shot but was not heard by me or John. No dice either on 133 that afternoon. The last orbit on the regular schedule was 134 on Tuesday from 5:25-5:35 pm which was to be a central US pass. I heard two transmissions from W5LFL while he was over the Mississippi Valley carrying on a QSO with a station out that way. John Moore W5HUQ picked him up for 5 or 6 exchanges beginning with STS-9 crossing the snow line. John reported that KB4CRT in Tampa had contacted W5LFL, making him the fourth station in our state to do so.

Later Tuesday evening, I received a call from the news director of a very popular FM radio station. I played my tapes of W5LFL over the phone to him along with a sampling of the bedlam of the pileup. These were featured during morning drive time the next day. This was a good ending to a great event!

The only thing left to do was to try to work STS-9 on an unscheduled orbit during the last two days. Unfortunately, my class schedule had caught up with me and I didn't have as much time as I wanted, but scuttlebutt on the bands indicated orbits 150 and 151 on Wednesday might be a good bet. No luck here, but it was fun trying.

At this time, I cannot say which event was bigger, STS-9 or Grenada. I measure the significance of events by their long-term effect. One thing is for sure: The period of October 25-December 8, 1983, generated the most positive publicity for amateur radio that I can ever remember! I have been licensed since 1964 and have files of the 3 major ham publications going back to 1948. Nothing can match this 45-day period we just experienced! Another interesting point is that I never heard amateur radio referred to as CB once during all the publicity. At our college library are newspapers from many major cities and it is a pleasure to see big articles on amateur-radio operations in most of them.

The publicity generated by Grenada and STS-9 comes at a crucial time. We live in a political environment where the quiet get trampled. The FCC is insulting us with one proposal after another. I think they would like to drop amateur-radio licensing altogether and what we are seeing are token efforts. We must maintain high standards and become involved in promoting amateur radio or we may follow CB into complete deregulation. *73* is to be thanked for its promotion of this documentary. I have enjoyed working with Jack Burnett and the other hams involved.

Billy Williams N4UF is a professor of electronics at Florida Junior College. Now an Extra, he was first licensed in 1964. He has served as president of such organizations as the North Florida Amateur Radio Society, the Jacksonville RANGE Repeater Association, and the North Florida DX Association. He also is Section Manager of the Northern Florida Section of the ARRL and DX Awards Manager of CQ magazine.

KA4AKO

Robert C. Holley KA4AKO
PO Box 341
6184 East Ponce de Leon Avenue
Stone Mountain GA 30086

I kept a diary from Monday, November 28, through Thursday, December 8.

Monday, November 28: This station called *Columbia* W5LFL on 2 orbits. No reply was received from Owen Garriott on either try.

Tuesday, November 29: Mark Durfield KB4BPL, 15-year-old sophomore from Redan High School in DeKalb County, asked me to pick him up at his school during a study-hall period. With permission from his parents and the school, I transported him to his home amateur-radio station where he and I both made calls to *Columbia*. This was done 10:28 through 10:35 am. No reply received.

Wednesday-Saturday, November 30-December 3: Attempts were made on all eastern orbits to contact *Columbia*.

Sunday, December 4: Charles Griffin WB4UVF (Clarkston, Georgia) was monitoring 145.55 and he heard and taped W5LFL acknowledging K4GFG and another K call on orbit 96A.

Sunday, December 4: At 5:55 pm EST, Jim Truluck KB4A (Griffin, Georgia) reported to me via 2 meters that he had a good visual sighting of spacecraft *Columbia*.

Monday, December 5: At 8:28 am, this station heard W5LFL sign on with "This is W5LFL calling CQ America. I am ready to receive calls." Signal report from my mobile rig, a Yaesu 227R, ¼-wave magnetic-mount Larsen antenna; on an rf signal meter, 0 to 10, I received a 4.

Tuesday, Wednesday, and Thursday, December 6, 7, 8: No other contacts received from *Columbia*. KA4AKO continued to place calls each time the spacecraft passed over the Atlanta-Stone Mountain area. K4LDR, Atlanta, was contacted on 145.41, the club repeater. This group carried on excellent coverage on the space-shuttle operation, and I asked Pete to furnish me with all available data that his

group collected during the period that the craft was in flight. He has been very helpful in furnishing the diary of his and other stations.

This has been a great opportunity to work a special event and I appreciate being chosen and included to participate.

Robert C. Holley KA4AKO is 59 years old. He served in the US Navy during WWII and the Korean conflict. He was Post Office Clerk 15 years and Postmaster, Stone Mountain GA 30086, for 16 years. He holds a Technician license and has been an amateur since May, 1978. A member of the ARRL, Alford Memorial Radio Club, Atlanta Radio Club, and the West Central Georgia Repeater Association, his station consists of an Icom 25A transceiver, two Yaesu 227R transceivers, an Icom 215 2-meter transceiver, and two Tempo S-1 2-meter transceivers. He has two Whamo 10 scanners with two digital frequency selectors and a Regency M-100 scanner. His fixed-station antennna is a Ringo Ranger up 40 feet above ground.

K4LDR

P. J. F. Shaw K4LDR
268 Braden Drive
Tucker GA 30084

Following the launch of W5LFL aboard STS-9, the Metro Atlanta Telephone Pioneer Amateur Radio Club (MATPARC) began receiving computer-generated orbital data from Clark N5XX, Fish WA4HXE, Doug K4SWJ, and Stan WA4DYD. All data was rebroadcast via the MATPARC VHF repeater (W4PME/R 144.81/145.41) for the Atlanta area amateurs. Broadcasts were each hour, then every ten minutes during the one hour prior to the upcoming orbital communications opportunity.

Following each orbital opportunity, Pete K4LDR conducted a forum on the repeater where each participant shared his observations, thoughts, thrills, and experiences. K4LDI and WD4KYO were assistant net-control stations. WD4KYO copied ARRL teletype bulletins and passed them along. For those who did not receive signals from W5LFL on a particular obital pass, recorder tapes were played for their benefit.

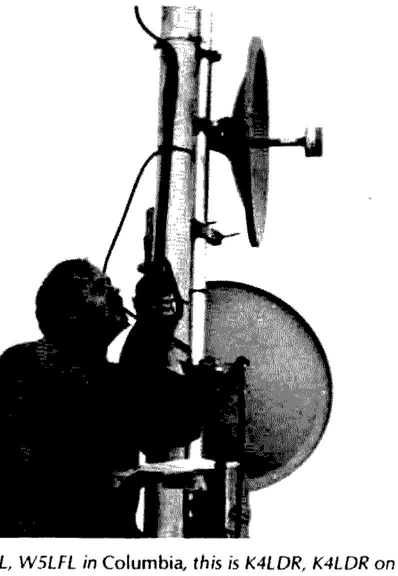
As the word of our endeavors spread, the MATPARC repeater system enjoyed more than 100 different amateurs participating, with 30 to 50 per net session. Stations from Alabama (Gadsden—90 miles distant), South Carolina (Laurens—140 miles), and all over north and central Georgia checked in, either asking for or providing information. Also participating were several handicapped amateurs that our group was pleased to have join us. It was clear that our MATPARC repeater exceeded the coverage we had calculated.

AK5Q, mobiling through Atlanta, heard and joined us. When he reached his home in Tennessee, he was unable to learn orbital information locally (he was a brand-new resident). He telephoned K4LDR on successive evenings to receive the 21.00 MATPARC Bulletin which forecasted orbital data for the following day. Also checking in was NK4E/aeronautical mobile. MATPARC was pleased to make so many friends that we didn't know we had.

For orbital passes during working hours, W4QO, WD4KYO, W4PME, K4LDI, WB4LFY, K4LDR, KA4SBD, and WB4IRR, with non-licensed interested guests, ascended to the roof of the Southern Bell Corporate Headquarters building (650' AGL/1650' AMSL) in hopes of hearing W5LFL (or being heard) with handie-talkies. Early morning trips to the breezy roof found ice, 35° F, and a windchill of 15° F.

At least one non-active amateur, K4LAR, who heard W5LFL on a scanner, was re-enthused and hastily arranged for a transceiver so that he could receive better and make calls also. Dick reported into our net absolutely overjoyed that he heard W5LFL; he is back into ham radio. Though handicapped and in a wheelchair, Dick assembled a Ranger II antenna and is ready to put it in the sky, with some assistance.

Dr. Garriott acknowledged two W4-area callsigns as he traversed Atlanta during orbit 144: WA4BEV and WA4EWA. Ken W4OCW telephoned WA4BEV in Valdosta, Georgia (230 miles south), but was unable to reach WA4EWA in Birmingham. Ken played his off-the-air tape for WA4BEV. BEV was absolutely ecstatic and thanked Ken six ways to Sunday. Ken was gracious and mailed BEV a copy of the tape segment.



"Calling W5LFL, W5LFL in Columbia*, this is K4LDR, K4LDR on Earth, over." (Photo by Bob WD4KYO)*

To date (12/9/83), none of the Atlanta area amateurs knows if he is part of W5LFL's log (tapes), but we all have hopes! Over seventy local amateurs participating in MATPARC net sessions received W5LFL transmissions. Many had tape recordings; all were thrilled and excited. K4LDR remarked that he is requesting an SWL card, for sure, and that the 2-cent confirmation card would deserve an $8.00 frame. All acknowledge that "this is the best thing that has happened in amateur radio since the first functioning OSCAR satellite obtained orbit."

Thanks to W5LFL, NASA, AMSAT, the ARRL—and all the behind-the-scenes people and . . . amateur radio!

KD5JO

Bob Buchanan KD5JO

Dallas TX 75243

I want to start my report by saying it was an exciting experience to monitor, listen, and transmit to astronaut Owen Garriott W5LFL as the shuttle *Columbia* passed over the Dallas area. The most frustrating part of the entire experience was the amateur-radio operators who constantly called on the downlink frequency of 144.550 MHz and made it virtually impossible to hear any signals from the spacecraft. This situation improved greatly with the passage of time.

It was a "golden time" for all of amateur radio and we were well recognized by numerous newspaper articles as well as coverage on TV and radio. I was not contacted by anyone from the media; the local coverage was of a general nature.

As soon as word got around that I was doing a diary-type report for *73* magazine, I had some great support from many local ham-radio operators. I want to recognize, in particular, Al Brinkerhoff WB5PMR (Dallas), the north Texas area coordinator for AMSAT, who shared with me a great deal of data which he took off his computer and made it possible for me to have very accurate data concerning the window when the spacecraft was close to the Dallas area. I also received a great deal of valuable information from Fred Maia W5YI, publisher of the *W5YI Report*. Now I would like to pass along to you the notes I made in my diary during the flight of *Columbia*.

Wednesday, November 30, Orbit 34A: This was the first pass over the central part of the United States. The Texas window was 11:14–11:21 am local time. The *Columbia* passed over the El Paso area, and no one in the Dallas area reported

hearing Owen Garriott. Many amateurs were transmitting on the downlink of 145.550, which made it virtually impossible to hear any calls that may have come from the spacecraft. I was operating a Yaesu 227R transceiver (10 Watts) and using a Ringo Ranger antenna up about 20 feet.

Wednesday, November 30, Orbit 39D: This was rumored to be one of the best orbits over the Dallas area, with the spacecraft reported to be just 100 miles away from us. Window time was 7:04-7:12 pm. No one in the Dallas metroplex area reported hearing the spacecraft on this orbit. We later heard that orbits 34A and 39D were scrubbed due to schedule changes that were necessary aboard the *Columbia*.

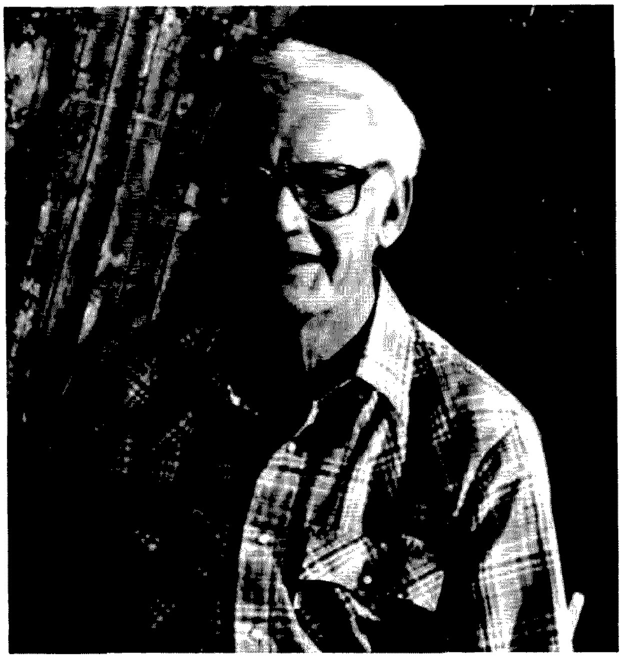
Thursday, December 1, Orbit 49A: The window time on this pass over was 9:33 to 9:41 am, and I listened to it in the car using an Icom 2AT with a 10-Watt amplifier. Did not hear any signals from the spacecraft.

Friday, December 2, Orbit 71D: This was a great day for KD5JO! I heard W5LFL for the first time at 6:48 pm. Owen was loud and clear, and he called CQ and said he would be listening for 70 seconds. He came back and started to repeat some of the calls, but QRM absolutely wiped him out! We did hear him say he would be listening for the next 90 seconds, and we transmitted again as we did during the 70-second period. No further word came from the spacecraft. My wife, Nancy, was in the ham shack with me during this orbit, and she was thrilled to hear the voice of Owen Garriott.

Sunday, December 4, Orbit 97A: The window on this orbit was 9:01 to 9:09 am and it was reported that *Columbia* was 100 miles east of Dallas. I heard W5LFL loud and clear at 9:06 CST, at which time he reported that his headset was not working well but that calls to the spacecraft were being recorded on tape and would be delivered to the ARRL as soon as *Columbia* completed the mission.

Monday, December 5, Orbit 113A: I listened for W5LFL on this orbit but did not hear him. I learned later that the *Columbia* crew was engaged in a press conference and a discussion with President Reagan at the time they were to be transmitting to the Dallas area. This was unfortunate, since this orbit was reported to be going directly over us at about 8:52 am CST. I also observed that not many stations were monitoring this morning pass; perhaps the interest and excitement level had decreased somewhat.

Tuesday, December 6, Orbit 129A: I heard W5LFL at 8:43 am CST. He said he would be monitoring the uplink frequencies for 90 seconds. His signal was 5-9±. I was in my car at the time using an Icom 2AT at 10 Watts and using a 5/8-wave antenna. Owen Garriott did not report back after his CQ call. The spacecraft was reported to be 100 miles west of Dallas.



Bob Buchanan KD5JO

Tuesday, December 6, Orbit 134D: I listened to this orbit in my car, also. I heard W5LFL at 4:31 pm loud and clear, and he passed about 100 miles to the west of Dallas. He made the comment that he could see the Texas area very clearly and was hoping he would be able to make contact with someone in his hometown. He said he would listen for 1-1/4 minutes for any calls from the area. He did not repeat any calls that he might have heard.

This concludes the entries in my diary. I was not able to monitor any more orbits that may have been scheduled. I want to close by saying I am very proud to have been a member of the team that was selected by *73* magazine to be involved in the flight of *Columbia*. I think we learned a great deal from this experience, and the information gathered should be valuable in future amateur-radio communications between Earth and space. A special thanks to Owen Garriott who took time from his busy schedule to make a great contribution to the entire amateur-radio community.

Bob Buchanan KD5JO is 52 years old, with three sons and two grandchildren. His wife, Nancy KA6ADA, has her Novice ticket which she received when the family lived in Laguna Beach, California. After 28 years of employment with Eastman Kodak, Bob took an early retirement from Sales and Marketing Management this past April. Presently, he is in management with the Primrose Oil Company of Dallas. Bob has been a ham for 25 years, and his other hobbies include fishing and photography.

A book could be written about the experiences of individual hams trying to contact the spacecraft *Columbia* and Owen Garriott W5LFL. Tall tales ("How I Worked W5LFL on 2½ Watts With a Hand-held") and similiar stories will be flying around hamfests until the next ham-in-space mission.

Signals from *Columbia* were strong and rode over the QRM on nearby passes and were even full quieting on some passes that were over the horizon.

W5LFL was heard in Texas on November 30 at 8:35-8:45 pm CST as the *Columbia* was passing over California on orbit 40D. The signals were full quieting in the Houston-Galveston area even though the *Columbia* was 1800 miles away over the horizon. E-skip was helpful in propagating several over-the-horizon signals. Houston-Galveston stations with good beams were able to copy W5LFL on orbit 40 with complete readability and signal strength of S5 to S9. He was also copied full quieting on several hand-helds using rubber-duckie antennas.

Roy Neal K6DUE had his hand-held on the bedside table in his room on the eleventh floor of his hotel in Nassau Bay (across the street from the Johnson Spacecraft Center), and signals from orbit 40 were strong enough to wake him up with a full-quieting signal.

Every type of receiver capable of receiving two-meter FM signals seemed to successfully hear the 5-Watt signal of W5LFL—scanners, hand-helds, and, of course, conventional base stations. During the flight of *Columbia* (STS-9), there was hardly a ham with two-meter FM capability in the Houston-Galveston area who did not at least listen for W5LFL.

If you only heard Owen Garriott on any of the orbits, send your reception report with an SASE to ARRL, STS-9, 225 Main Street, Newington CT 06111. (A reception report should include orbit number, time, your location, W5LFL's comments heard, and a description of your station.)

In spite of Murphy and his laws, hundreds of hams received contact confirmation as *Columbia* passed within range. Thousands more attempted to make contact, and several hundred will receive the WADL award (Worked All Down Links) for repeater offset mode, shifting from 600+ repeaters to the *Columbia* uplink frequencies without changing the offset-placed transmitted signals on the *Columbia* downlink frequencies, thus producing much QRM on W5LFL. More hams were heard on the uplink and downlink frequencies than had ever been heard on two meters before.

It will be interesting to see a profile of the ham stations that were actually heard, or recorded, by W5LFL. Were they all EME stations, or were some even handie-talkies? I understand the NASA club (W5RRR) is planning to develop such a profile report.

Hams tried to get every bit of performance possible from their stations, but for some this was too little, too late. I had circularly-polarized satellite antennas on hand but did not get them mounted in time, so I had only a discone and a turnstile antenna to use to try to make contact.

Rumors were wild about the types of stations used by hams. We heard that one ham in California (where else?) went out and bought ten transmitters, ten amplifiers, and ten antennas, put one on each of the ten uplink frequencies, and used them all simultaneously. I wonder if he ever made a contact.

WA5NOM, one of the first stations in the Houston area to be acknowledged by W5LFL, was operating an Icom 271 driving a 160-Watt amplifier feeding a Cushcraft 20-element twist antenna in an az-el mount as used for satellite work. It was calculated that his effective radiated power was more than 3,000 Watts.

On December 5, one of the Texas City hams (ND5D) worked W5LFL using modulated CW, with 10 Watts to a vertical antenna. The CW was believed to be acknowledged by W5LFL.

Effective radiated power (erp) used in the Houston-Galveston

area ranged from 2½ Watts to over three kilowatts. W5LFL had estimated that 40 Watts erp from a turnstile antenna would be adequate, but I believe he underestimated the QRM on each pass and the power needed to cut through. Stations heard calling W5LFL from the Houston-Galveston area included many 10-Watt stations using simple vertical antennas similar to the Ringo Ranger. Others used various types of beams: horizontally polarized, vertically polarized, or even circularly polarized. Stations used to work the OSCAR satellites seemed most effective.

The most successful antenna systems were circularly-polarized (right- and left-hand switchable) beam antennas on satellite-tracking mounts that could track the shuttle in its orbit. These satellite beams, and also horizontally-polarized beams aimed at the horizon, were able to pick up STS-9 at or slightly before (e.g., minus 3° elevation) it came over the horizon.

For passes below 20° elevation, the vertical-gain antennas (e.g., Ringo Ranger, Isopole, or similar), with their low angle of radiation, had good reception and probably good transmitted signals for most of the pass. Verticals, because of their overhead cone of silence, were not effective on direct overhead passes. However, when the pass was above 20° elevation, the turnstile and horizontal dipoles seemed to have the edge. The discone antenna and rubber duckies were not very effective, but W5LFL was heard on even these antennas.

It was amazing how many stations were actually heard. Two-meter FM simplex around 145.00 MHz, and particularly on the downlink of 145.55, appeared to have much more range than is usually considered possible on FM. (Maybe we have been missing a good many DX possibilities.)

The orbital predictions and information put out by the NASA club (W5RRR) were very helpful in following W5LFL and the *Columbia* for visual sightings as well as radio contacts. Hams all over owe the NASA club and the others involved with the ham-in-space program some very sincere thanks. Already, hams in the Houston-Galveston area are asking themselves, "What will I do different next time?" Some of the ideas that have already come up are:

● Make sure my transmitter is not in the repeater offset mode. Monitor my transmit frequency.

● Aim my beam at the point on the horizon where the shuttle (satellite) is expected to arrive, and start transmitting before it comes over the horizon. (This seems to provide an "edge effect" that enhances the signal at the horizon.)

● Have az-el antenna mounts that can track the shuttle pass.

● Set up switchable circularly-polarized antennas high enough to be above surrounding buildings and trees.

● Run more power. (This is one idea with which I do not agree. I believe we should keep our power down to avoid QRM. If all stations had kept power down to 40-100 Watts erp for STS-9, there would have been less QRM and more contacts with W5LFL.)

● Use vertical-gain antennas for passes below 20° and turnstile antennas for passes above 20°, since I cannot afford (financially or space-wise) a satellite antenna system.

● Try to transmit in clear spots (time-wise, or frequency) on the appropriate uplinks.

● Get some practice working the OSCAR satellites.

I hope you were successful in working Owen Garriott W5LFL on the *Columbia*. If you did not work him this time around, give some consideration to the comments and suggestions in this article and prepare for better luck next time.

WB8IFM

Gerd Schrick WB8IFM

Dayton OH 45432

Preparation in Dayton started back in September with a short presentation at the Dayton Amateur Radio Association (DARA) about OSCAR 10 and the space shuttle. In one of the following club meetings, wave polarization was discussed and a home-brew turnstile antenna demonstrated.

I mounted my turnstile, backed by a 4' × 4' screen fixed pointing south and 45° up, and was able to copy OSCAR 10 for many days without changing the position of the antenna. A planned test with an aircraft was not necessary. I have since replaced this simple "cross dipole backed by a screen reflector" with a 2 × 6-el crossed dipole with little if any improvement.

Sunday, 27 November: Time of launch gets close; clean off operating table to make room for the various 2m FM components. A 50-W transistor amplifier is dusted off and pressed into service. We have now the KDK 2015 with 12 W driving the amplifier and the output is 45 W. Good reports are received from several local hams.

Monday, 28 November: Space shuttle got off the ground; clock is

Radio operator picks up shuttle

Even though it's difficult to see the space shuttle Challenger as it passes the Dayton area, at least one local ham radio operator was able to pick up a transmission from space Friday evening.

Frank Schwab said that at 7:48 p.m. he picked up a transmission from astronaut Owen Garriott, an electronics expert who has been beaming ham radio broadcasts back to Earth.

Schwab said the astronaut repeated the call letters of several ham operators, but he was unable to hear whether his was among them.

"HE SAID HE was going to stand by for the next 90 seconds," Schwab said, as he played a tape recording of the transmission.

The astronaut then said "CQ," which meant he was calling for other operators.

The entire transmission lasted only about three minutes, until the shuttle was out of range, but Schwab said it was a "real thrill."

A ham radio operator for 37 years, Schwab said he probably picked up the transmission because he lives about seven miles north of the city — on Dog Leg Road — and doesn't have buildings or other obstructions.

Friday evening was one of the best times for local operators to receive transmissions from Garriott, who is broadcasting primarily on the frequency 145.55 MHz.

AND THE SHUTTLE will also be in range in the next few days, including Sunday around 10 a.m., Monday and Tuesday between 9:30 and 10 a.m. and Tuesday around 5:30 p.m.

Eye contact with the shuttle is a different story, however, according to a local astronomer.

Residents could get a pretty good look at the craft when it was visible for about four minutes Thursday.

However, cloudiness interfered with sighting Friday and likely will do so again Saturday, said James Reist, curator of astronomy for the Dayton Natural History Museum. Sunday through Tuesday, the Spacelab's orbit and distance may make it difficult to see, Reist said.

REIST SAID the the Spacelab would appear as a moving light in the sky.

The Lewis Research Center reported the following orbits for today through Tuesday:

• Today, 6:03 p.m., moving northwest to south, visible for 4 minutes, 27 seconds. Difficult to see except in extreme northern part of Montgomery County — 39 degrees above the horizon, 243 miles above the earth.

• Sunday, 5:53 p.m., moving west to south, visible for 3 minutes, 51 seconds. Very difficult to see but best chance in extreme western part of the county — 24 degrees above horizon, 347 miles above the earth.

• Monday, 5:43 p.m., moving west to south, visible for 3 minutes, 7 seconds. Very difficult to see but best chance in extreme western part of county — 16 degrees above the horizon, 464 miles above the earth.

• Tuesday, 5:33 p.m. West to southwest, visible for 1 minute, 41 seconds. Very difficult to see but best chance in extreme western part of the county — 11 degrees above horizon, 588 miles above the earth.

ticking. Must not forget to synchronize station clock (electric with second hand) to WWV. Turnstile antenna is "mounted" almost on the ground in our front yard; hope for no vandalism for the next week. A decision is made to use a second radio; an IC-2 is connected and set to Owen's main frequency. Two antenna switches are employed, one to connect either one or the other receiver and one to connect any of three antennas: a vertical dipole at 70', the 2 × 6-el OSCAR antenna (8' above ground), and the turnstile directly on the ground. Now all we have to do is worry about the schedule.

Tuesday, 29 November: Listening on the bands, local repeaters, etc., lots of numbers are exchanged, but no clear picture emerges. The AMSAT Net at 9:00 pm on 3850 is great confusion: lots of decimal points and digits to feed the hungry computers. However, at the end there is some useful data! Now we see the light, getting ready for the first try which will be tomorrow noontime—will be home for lunch at 12:00.

Wednesday, 30 November: Did I mention, we have no computer; we go by orbit period and rotation of the Earth. We have pre-published data and they are very close; still, we plan to be on a few minutes early and stay a few minutes late.

Orbit 34D: No sign of W5LFL, but a lot of local stations are calling during the odd minutes. I count at least seven stations! Next I try orbit 38D—although not scheduled, there may be a chance. But Owen does not show up. Over WA3NAN on 3860 I overhear the shuttle communication and Owen is doing experiments.

Orbit 39D: Another no show of Owen. Lots of locals call, but with the ten available calling frequencies, you can still find a clear spot (locally, mind you), but there is a 2000-mile-diameter circle with lots more signals calling the shuttle. Some stations call on 145.55, Owen's frequency, and are chased off! Afterwards, some comments from the 75m band: a WØ "did not hear a thing," a K5 "had my four boomers on him, heard nothing." Oh well, there is another pass tomorrow. Later in the evening, I hear Owen had been on over California on orbit 40. So, there *is* life up there!

Thursday, 1 December: Orbit 49A: Another dud. By now everybody just calls on the odd minutes and listens in between. I keep switching my three antennas, although I had calculated that even with a simple dipole he should be putting in a signal of S9 and 9+20 when overhead. Nonetheless, every dB should help on transmit.

Friday, 2 December: Only one good pass for our area at 6:00 pm. Again we have no luck; we have a club meeting tonight and a computer presentation is scheduled. During the day we had our first few inches of snow and as usual all kinds of problems with the automobile traffic. Three of us go together to the club meeting which turns out to be cancelled because of the poor weather. I had prepared a short presentation on the space shuttle and also a handout with orbit information through Tuesday. We have some lively discussion with the few people that showed up. The late news on TV shows some Kettering hams in a shopping center parking lot with a hand-held cross yagi. A good picture with the snow and rain pouring down; of course, they had no luck! It became known that the astronauts, including Owen, are kept very busy and that they are requesting an extra day in space.

Saturday, 3 December: This is a resting day for the US hams. The shuttle will be over Europe, Africa, and Asia. I consider putting up a brand-new antenna, 2×10-el cross yagi by TET, which I picked up Thursday night from Dan WD8IDZ. But because of the cold weather and the rain, I pass that up.

Sunday, 4 December: Orbit 97A: 9:55 am. This orbit starts like all the previous ones. Everybody calls, no response from the shuttle. Then out of the blue sky, at about 10:08 EST, there was Owen, loud and clear on the IC-2AT, S9 at least. For a moment I thought some local John was impersonating him. Owen says he hears a lot of stations, and not wanting to waste any time with acknowledging, he is just going to listen for the next 80 seconds. He also says he is just now over Texas, heading for the midwest. This is the signal we have been waiting for, and for the next ten minutes, everybody in the Dayton area calls. We do not hear him again, and I do not have a recording of his transmission.

During the next orbit, which is almost out of reach for us, over in the west, we call again but do not get a response. Afterwards I talk with Leo WA8ZHE and he surprises me with a super tape recording of an earlier unscheduled pass (orbit 96, 8:34 EST) where Owen actually confirms K4GFC and another K call.

Well, at least we heard him after all these days of frustration. Some success, and there is a chance that we are on the tape.

Monday, 5 December: Orbit 113A (9:42 to 10:05 EST): Although passing several hundred miles to the west of us, this ought to be a good chance. I call a lot and listen carefully on the even minutes. But there is no response. Today there is a lot less activity locally. It is a working day and also possibly a number of hams have exhausted their patience; good for the remaining ones. We had another telephone conference last night with other

hams from all across the US—including Alaska and Hawaii—skillfully conducted by Jack Burnett, Executive Editor of *73*. Hams from the larger metropolitan areas (LA, Chicago) complained about tremendous interference (intermod) and suggested it might be best to use a small antenna, such as a rubber duckie on a handie-talkie. No such problems were encountered in the Dayton area. By noontime we have to leave Dayton for Huntsville, Alabama, to do some receiver testing for the QRL. This is a 10-hour drive and we will have to stop over for the night. Driving south, we listen to the radio, mostly news about Lebanon, but then there is the 3-way conversation between President Reagan, West Germany's Chancellor Kohl, and the astronauts. Leaving a dreary and cloudy Ohio behind, we find some sunshine in southern Kentucky. We finally pull in for the night south of Nashville, Tennessee. Here we are in the Central time zone and with some "sharp thinking," the next 3 orbits are converted to local Central time. I brought my hand-held IC-2AT, an HB9CV portable antenna, and a tape recorder. My chances are rather slim to be heard with the low power (1 Watt), but I might get a good tape recording of Owen.

Tuesday, 6 December: Today there will be several good chances to pick up *Columbia*. Unfortunately, we will be traveling, setting up equipment, or in meetings with other engineers a lot, but I will try to break loose whenever Owen is in reach.

Orbit 129A, 8:30 am CST: We are at guardhouse no. 9 of the Redstone Arsenal, Alabama, checking in and waiting for an escort. I listen on my IC-2AT and hear nothing, but there are some locals who, after so many days, still do not have the frequencies straight. They are being chased off. Only a few stations call, so I try my luck again on this pass. Owen does not show up.

Orbit 133D, 2:45 pm CST: This orbit passes over New England, so the local stations do not even try to call the shuttle this time. However, I am at an excellent location this time and should try. I am next to NASA's Marshall Space Flight Center on top of one of the old static missile test towers, 250 feet up in the air. We can see for miles around; large areas on the ground are flooded from the recent heavy rains; I regret not having brought my binoculars. The Space Flight Center, by the way, is a complete ground-control station for the shuttle, like the primary one in Houston, Texas, and could take over operations immediately, if necessary. They have a press center set up, but there is little activity, since the scheduled teleconference with the astronauts was cancelled. The tape recorder is plugged in and 250 feet up in the penthouse we listen on the IC-2AT for the space shuttle. Unfortunately, we hear nothing. Now there is another orbit in 90 minutes; during this time we have to look for accommodations for the night. We have no reservations. Eventually we find a motel, but with the rush-hour traffic, we are a few minutes into the next orbit when we check in.

Orbit 134D, 4:18 pm CST: By the time I am in my motel room, it is 4:30. Immediately I turn the 2m radio on and after a short moment I hear some crackling noise that sounds like a voice. I grab the handie-talkie and rush outside to be in a better receiving position. There is Owen again loud and clear: "OK, here is W5LFL, over the beautiful Mississippi. I have to take a picture of that, but I also have to listen to the radio. . ." He is loud and clear on the hand-held IC-2AT with a rubber duckie. Immediately, I make frantic efforts to hook up the tape recorder for his next appearance. We cannot take the recorder, connected to an outlet, outside the room, and we do not hear Owen again.

For the next 2 days we will be very busy with an assignment, so we conclude our space-shuttle diary at this point. In hindsight, it was quite worthwhile. Although at times frustrating and no QSO resulted, we did hear W5LFL on 2 occasions, and Owen's voice from the space shuttle *Columbia* (on STS-9) will be impressed on my memory for a long time.

KC8JX

Larry Knapp KC8JX
5288 Ivy Drive
Stevensville MI 49127

"KC8JX, this is W5LFL." No, I never heard that. But oh, what a thrill it would have been if I had! Several in our fraternity heard it, including my good friend Jeff W7ID. It certainly wasn't for lack of trying—I was there for every orbit that could possibly be heard from southwestern Michigan.

It's amazing how such an event as this can make inactive hams active. I heard stations on 2 meters I didn't even know existed. Was there interference? Yes, a little. But after the first few days it was negligible. How did *you* prepare for this historic event? This is what I did.

First, I had to have an antenna. I had a Ringo Ranger, but I didn't think that would work very well, so I built a turnstile similar to those described in the *Handbook*. This was my first attempt at homebrewing, and it seemed to turn out very well. It certainly whets my appetite for more VHF antenna work. My boom was an old shovel handle and my elements, wire. The calculations of element lengths, phasing lines, matching sections, and reflector spacing were definitely more difficult than the 40- and 80-meter dipoles I built. I mounted the antenna, such as it was, on an unused tetherball pole and hoped for the best. This was all completed prior to the shuttle's launch.

On November 27, I participated in a teleconference call and received much valuable data which I passed on to local networks. This information was very helpful and held true throughout the mission. I tried throughout the week to get updated information through the telephone numbers which were published, but I finally gave up as the lines were always busy. All updated information was obtained nightly by listening to the AMSAT net frequency of 3850. I never was able to hear W5RRR, though I understand they were on the air.

It was now November 28, and the shuttle lift-off was perfect. Now the adventure could really begin. I had trouble figuring out the exact orbit times since they were given to me in mission elapsed time. I had never done any satellite work before, other than listening for OSCAR on 10 meters, plus I did not have a microcomputer handy to use. Today I also found that the speaker on my Yaesu FT-208R was inoperative, so I had one of the Heath technicians fashion a phone-jack patch cord. I could then use a remote speaker with the patch cord placed in the phone jack of the FT-208R. Now at least I could listen to the transmissions through a good speaker and, thus, any tape recordings would sound better. My turnstile could not be placed outside, as with the first winter storm approaching, high winds and snow could ruin my investment.

November 29 was still very cold and windy, so I still could not mount the antenna outside. It was good that no shuttle communications took place that day. I procured a VL-2280 from Dave Poplewski KC8IV at Heath Co., so my hand-held would have some punch—12 Watts. As the day ended, one final item had to be set up—my tape recorder. These last 2 days had been disasters at work, and consequently, I had to spend 3 to 4 hours each night fixing problems there. I was, therefore, late in getting everything set up. A real bright point of the day was finding the local repeater, KD8S (145.47), was broadcasting the shuttle communications. This was very convenient for us in southwestern Michigan and northern Indiana because of the current information being disseminated there.

November 30 arrived, and first communications with the shuttle were expected today. I was not able to be at home, but instead listened for the shuttle in the Heath Company Engineering Department. Owen was not active at that time. I then listened for the next flyover at 8 pm, orbit 39D. Still I didn't copy W5LFL. I am really wondering at this point whether my antenna works. By this time, the wind has really died down so I could put it up outside. I am also trying to find W5RRR on 20 and 40—no luck! At 8 pm, everyone in SW Michigan was calling W5LFL, many right on 145.55. Two meters finally sounds like 20-meter DX even with guardians of the frequency. Tonight also was the night for my weekly schedule with W7ID. After establishing contact, I found out that W5LFL had made his first contact with WA1JXN/7 in Montana at 0234Z, December 1st. These first reports indicated very strong signals from the shuttle; there were even some who heard him on hand-helds. What a thrill it must have been! Jeff W7ID forgot to turn on his tape recorder. Hope that won't happen to me. Tonight, I also listened to W1AW's bulletin and tuned in on 3850 to try to get more information.

On December 1, there were no scheduled communications orbits. I spent the day listening to the shuttle on the 145.47 repeater and tuned in to the W1AW bulletins and 3850.

Orbit 70D was deemed possible

Larry Knapp KC8JX

for December 2, so I was really ready this time. Oh, the QRM on 145.55! After this pass we really should gather on some repeater frequency and inform the multitudes, so we did. I guess because of Friday night, we really had a turnout on almost all Earth-to-shuttle frequencies. Found out −600 split on hand-held from 145.55 puts the transmit frequency on 144.95. I wonder how many of us were using this. I am trying to stay on 145.01 or 145.09. There don't seem to be many others there. No luck locally hearing 70D or 71D orbits. I'm really starting to doubt my station's capabilities. I did hear a tape made by someone in California who had good copy of W5LFL. Maybe that's the closest I'll ever come!

December 3—no flyovers scheduled. I spent the day with my family, doing some necessary Christmas shopping.

It is now Sunday, December 4, and I'm really hoping that today on orbit 96 or 97 I'll be able to hear W5LFL. I have given up most of the hope I had earlier of having my call answered, as it seems from information I have received that only those with power and good directional antennas will be answered. If I could only hear him, I'd be pleased! Then, finally, on orbit 97A, I heard him at 10:08 EST! Holy cow, was I thrilled! I was yelling for the family to come and listen. Maybe I'll even work him! (No, I didn't forget the recorder; in fact, I've got 5 minutes of my call on the recorder as I was afraid to turn it off lest I miss some of Owen's comments.) I did it! I did what I thought I could probably do—hear him. I doubt very seriously he'd ever hear my 12 Watts to a turnstile. Some of the local operators heard the earlier eastern pass, orbit 96. I didn't, but on the central pass, orbit 97, no one recorded any more than I did. I feel fortunate. I really am fired up for Monday's and Tuesday's passes.

December 5 was a disaster! Some of the locals picked up the eastern pass, but I didn't. I stayed home from work in the morning just for these flyovers. Now I'm ready for 113A. Darn news conference! He wasn't on.

December 6 was the last day I heard Owen—weak, but readable. I also found out that one of the local operators, KD8S, thought he was confirmed. I also stayed home from work this morning. Won't be able to do this much longer! The weather has turned worse as our first snowstorm appears. I took down the antenna. The spaceflight is nearly over now.

December 7. I had to be at work early. I did receive a call at work that W5LFL was heard briefly on both the eastern and central passes.

Well, I accomplished several goals just as the space shuttle did. I appreciate much more now VHF communications and the relative ease in constructing VHF antennas. It has certainly whet my appetite for OSCAR and VHF work. The entire experience has thrilled me just as much, if not more, than my first Novice contact almost 23 years ago, or the first time I heard OSCAR on 10 meters. What a thrill it must have been for Owen Garriott to hear WA1JXN/7, JY1, W7ID, and others. Would I try it again? Would Owen W5LFL? You bet!

I'd like to thank *73* magazine for its help in providing timely information and my co-writers for their support. But my special thanks go to my wife, Carol, my son, Alan, and my daughter, Amy, for their patience and their expert strong-arm motor control of my antenna. Their enthusiasm for this project for Dad is really appreciated. My coworkers, who were very interested and supportive, get special thanks as does Heath Company and fellow employees Dave Poplewski KC8IV and Ion White WAØTAQ. Without all of these people, I could not have been half-successful.

Larry Knapp KC8IX has been a licensed ham since 1961 and holds an Advanced-class license. After graduating from Illinois Wesleyan University in 1967, he went to work for Heath Company in the Credit Department. After a 4-year hitch with the Air Force at Keesler AFB, Mississippi, he returned to Heath and is currently Data Processing Manager. He is married and has two children, ages 12 and 9, and another one on the way. He has held the following calls: K0FRI, W9HXG, W5VUF, and W8IHE. His main enjoyments other than amateur radio are writing, camping, volleyball, and golf. He is active primarily on HF in contests and DX, finally having achieved DXCC in 1983. His primary VHF activity has been 2 meters with a hand-held purchased in 1983. He is a life member of the ARRL and has been president, activities chairman, and secretary of the local Blossomland Amateur Radio Association (BARA). He writes articles for the club bulletin and also was the chairman for the club's expedition in 1981 to Mackinac Island.

What follows is a log/diary of the past few days. First, to introduce myself very briefly, I am a retired electronics engineer who has had a ham license for 51 years. Instead of rocking and reminiscing, I sail on deep-sea oil tankers several months per year as radio officer.

Saturday, November 26: Received a telephone call from Jack Burnett, Executive Editor of *73* magazine. He asked if I wished to participate in an effort to contact W5LFL aboard the space shuttle *Columbia* and write up the results. It certainly seemed worth a try. I happily agreed to do so, noting that my 2-meter station is not much beyond the ordinary. I have an Icom 25A and a vertically-positioned dipole made from rod stock and mounted halfway up my 50-foot TV antenna mast. It has served me well for ten years. I also have a Tempo S-15 handie-talkie with rubber duckie.

Sunday, November 27, 4:00 pm: A conference call, lasting an hour, with Jack Burnett, Randy Stimson KZ7T, Bob Harnois K1EFZ, Dave Manley KH6B (in Hilo, Hawaii), Jon Gallo KB6WT, Wanda Lovejoy KO2X, Bill Pasternak WA6ITF, and many others, including one in Alaska. Orbit times, frequencies, and procedures were given—all the help that could come over the telephone was given so that we might be successful in contacting Owen Garriott W5LFL on the *Columbia*. With my conventional gear I had little hope of making contact, but I responded to the enthusiastic spirit of "Go gettum, boys." And I looked forward to a busy week which included five evenings with a Civil Defense course in Radiation Monitoring Instruction.

Note that in subsequent entries, most times will be in UTC. Since midnight UTC comes at 1900 local time, some early-hour UTC entries are under the preceding day's date.

Monday, November 28: First order of business: organizing notes from yesterday's lengthy conference call. Then I made up a paper slide rule for computing day, hour, and minute past launch into local time and date. Not wanting the low-band station to suffer, I spent some time setting up the newly-acquired TI99-4A and interface with the Icom 720A. Made RTTY contact with W1AXL on 20 meters. Also am committed to ringing the bell for Salvation Army two afternoons. •2300 to 0145—Attending CD class with HT tuned to 145.55. Nothing heard.

Tuesday, November 29: •1530 UTC—carrier heard on 145.55 (no modulation). •1531—Called W5LFL on 144.95. No answer. •1535—Called W5LFL on 144.95. No answer. •1608—A few squelch breaks on 145.55. Nothing intelligible heard. •1631—More squelch breaks on 145.55. •1633—N9EBI calling W5LFL on 144.95 (so I joined in the calling). No reply heard. •1645 to 1820—At Rotary Club meeting. HT along. Nothing heard. •2300 to 0130—Attending CD class with HT. Nothing heard.

Wednesday, November 30: •1500—Now scanning with 25A 145.54, −.55, and −.56; also reply frequency of 144.95. No signals heard. •1710—K9UGO calling W5LFL on 144.95. •1713—Called W5LFL on 144.95 in the clear. No answer heard. However, a carrier heard (weak). Does not end at beginning of odd minute. •1750 to 1920—Ringing the bell for Salvation Army. HT along. No signals. •2300 to 0150—At CD class. HT along. No signals.

Thursday, December 1: •1220—Left Bloomfield for Indianapolis, 70 miles away, to pick up daughter at airport. Have Icom 25A with ¼-wave mag mounted on car's back deck. •About 1530—Heard WA9RDF in QSO on 145.55, not with W5LFL. When asked about his use of 145.55 simplex, he stated that he had been using that frequency regularly for several years and saw no reason for leaving it now. •About 1547—Heard several stations calling W5LFL, so joined them. No answer heard. •2300 to 0139—At CD training with HT. No signals heard. Squelch broke due to low batteries. Interrupted the instruction. •0457—Staying up late tonight. Weak carrier heard, but not cutting off on the odd minutes. Not W5LFL. And so to bed.

Friday, December 2: •1712 to 1714—Carrier but no modulation on 145.55. •1715—W9LUU calls K9OMV on 145.55. •1721—Station heard on 144.95 calling W5LFL. I joined in, except my Icom was in simplex mode, and I was so informed by others. No reply heard from W5LFL. •1914—W5LFL heard for the first time (not strong; in and out). •1915—Called W5LFL on 144.95. No answer. •2300 to 0330—Final CD session with HT along. Was issued a diploma as Radiological Monitoring Instructor.

Saturday, December 3: •1400 to 1430—Busy on low bands, Saturday morning skeds. •1456—Several stations calling W5LFL. •1457—Called W5LFL on 145.95. No answer. W5LFL not heard. Busy most of the day with errands, putting up Christmas tree and lights. Numerous "Honey do" jobs. Also monitoring 145.55. •0235 to 0250—High-altitude aeronautical mobile KXØA heard and recorded over Tennessee at 42,000 feet. He called in on 145.55, but QSYed off like a gentleman.

Sunday, December 4: •Up at 7:30 am, scanning the frequencies while reading the Sunday paper. •1334—W5LFL heard weak but readable, calling CQ. •1335—Called W5LFL (on 144.94 to avoid any possible pileup). •1336—Believe I heard my call, "W9 Hot Dog" from W5LFL. (Quite weak, barely readable.) Then his signal came up. He stated that he was flying over Florida. I felt reservedly elated. Unless others heard his transmission, I would have to wait for mail confirmation. •0200 (9:00 pm local time)—Another nationwide conference call with the same list of participants. I was happy to announce my contact with Owen Garriott. What really made it great was that one of the conferees, Bob Harnois K1EFZ, had heard Owen over Florida make that 1336 UTC transmission, and thought that W5LFL had called "W9 Hot Dog." My suggestion during the telephone conference was to not wait for the orbit times but to

call when he was heard, and to call on other than a pileup frequency if possible.

Monday, December 5: Took a holiday. Monitored occasionally. Heard a few squelch breaks. Had a CW QSO on the HF bands. Joined my comrades on the FRUPAC Net at noon local time. Monitored 145.55 on the Icom 25A, but W5LFL was not heard.

Tuesday, December 6: •1307 to 1315—Activity heard. No W5LFL signal identified. •1427—Called W5LFL on 144.94. No reply heard. (Other stations were calling him on 144.95.) •2030—Local newspaper arrived. I am featured on front page. Wow! •2230—Heard him loudest and strongest to date. •2231—Called W5LFL on 144.94. •2232—W5LFL, loud and strong, says he is over the Mississippi River Valley and it looks good down there. No callsigns were mentioned. •2233—Called W5LFL on 144.94. No reply heard. He is now QSAØ.

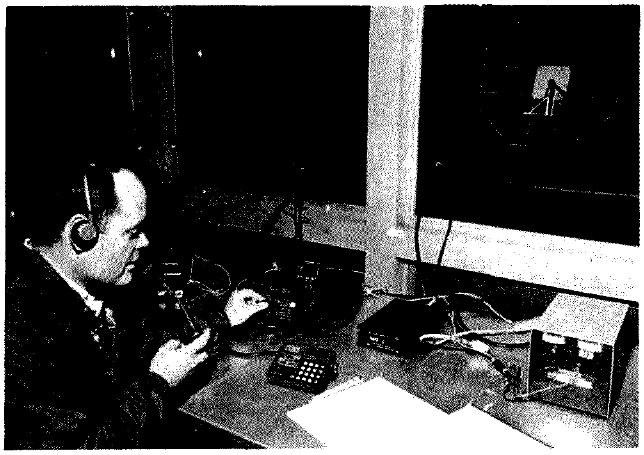
Wednesday, December 7: •1432—Heard "CQ North America" from W5LFL. Nice, strong signal. •1433—Called W5LFL on 144.94. Nothing heard. •1555—Called W5LFL on 144.94 because others heard calling on 144.95. No answer heard. •2218—Heard W5LFL talking briefly. •2219—Called him on 144.94. No answer heard.

Thursday, December 8: •1423—Called W5LFL on 144.94. No answer heard. •1610—Suddenly remembered that this is due at *73* magazine immediately if not sooner.

I am glad to have had the opportunity of participating in this effort and to have had the good fortune to at least hear Owen Garriott aboard the *Columbia*.

Paul L. Schmidt W9HD, 68, a member of the ARRL, has been continuously licensed for 51 years. A shore-based radioman in the Navy's FRUPAC organization in WWII, he is married and has 4 children and 5 grandchildren. His employment is now on deep-sea tankers and supertankers as radio officer. In 1977, he spent six months on a Navy tanker in the Orient and made a trip around the world in the process. In 1978, he sailed on a supertanker around the Horn from New Orleans to Valdez, Alaska. In 1980, he was on a grain boat to Israel via Bermuda, and in 1982, his tanker put in for overhaul at Khalkis, Greece, and the entire crew was repatriated to the USA.

His hobbies have always included amateur radio as well as photography, writing, and traveling. ("We will ride on anything that moves," he writes.)



George Isely WD9GIG at the mike; the antenna which was constantly adjusted can be seen outside.

St. Charles IL 60174

Various articles about the upcoming STS-9 mission with an amateur-radio operator, Owen Garriott W5LFL, aboard appeared in early 1983 in several amateur-radio and aviation publications, and I began to follow W5LFL's project with increasing interest.

August: The ARRL's videotape of "Amateur Radio's Newest Frontier" circulated—first midwest showing at Fox River Radio League Hamfest. Began to seriously think of trying to work W5LFL. My neighbor, Bill Smith W9LRG, and I discuss the best way to reach W5LFL while he is in orbit. We decide to construct a two-meter helical antenna based on the design work of John D. Krause W8JK.

Early September: Bill W9LRG completes work on a computer program for designing a helical antenna. I adapt his program for use on my home computer system.

Late September: Helical antenna construction started. Mathematical error results in wrong helix configuration; must rebuild helix.

October 18: STS-9 mission delayed ... helix reconstruction underway.

November 9-10: First helical antenna tests using a tapered feedline match ... antenna works, but swr too high.

November 15: Matching pi network installed and tested. Perfect match of approximate 140-Ohm feedpoint impedance to 50-Ohm coaxial cable.

November 30, Orbit 39D: First communication attempt with W5LFL. No signals heard from space shuttle *Columbia* ... heavy QRM on W5LFL's downlink frequency of 145.55 MHz by strong local station.

December 1, Orbit 49A: 2nd communication attempt ... no signals heard, but the QRM level is a little lower.

December 2, Orbit 70D: 3rd attempt ... still no signals from *Columbia*. Live CBS television coverage of this orbital pass and following pass. Disappointment for all concerned, but the coverage on TV was very good (shown during 6:00 pm news).

December 2, Orbit 71D: 4th attempt ... same as previous pass, no signals heard from *Columbia*. No signal reception reports by other hams in this area, either.

December 4, Orbit 97A, 8:55 to 9:23 am CST: 5th attempt ... finally some success. W5LFL is heard saying that he is "not transmitting callsigns back ..." On this as on all orbital passes, transmissions are made from this station during the odd minutes of each scheduled pass. By this time we are painfully aware that our helical antenna must be carefully tracked along the predicted space-shuttle flight path if we are to hear W5LFL. Movement of as little as 5 to 8 degrees shifts incoming signal from S-9 to down in the noise level.

December 5, 8:30 pm CST: Participate in 17-point conference telephone call put together by Jack Burnett of *73* magazine to discuss the W5LFL operation and the amateur community's efforts and results to date. Except for Pacific Northwest and Florida areas, nobody is having much success. Several suggestions are exchanged within this group about what techniques and antennas may or may not work. It is apparent that "new ground" is being broken with this operation. •*113A, 8:42 to 9:05 am CST*—Another overhead pass, as were orbits 70D and 97A. More suc-

Earth to Columbia: long distance calling

By Jan Myers
The Beacon-News

ST. CHARLES — "Columbia, this is WD9GIG," Dick Isely said over and over as he shot his radio signal 150 miles up in the air, trying to talk to astronaut Owen Garriott Friday evening.

"He's coming into us, Bill, it's noisy but I can read him," Isely shouted to his fellow radio ham, Bill Smith, as Smith kept adjusting the antenna in the back yard of the Isely home in St. Charles.

The pair, along with several other members of the Fox River Radio League — and assorted media — were standing by to beam ham radio signals to Columbia-Spacelab crew member Garriott as the craft's orbit came within 150 miles over the Midwest.

Every other minute, with a format suggested by NASA, Isely would broadcast his call signal heavenward hoping that in the following minute Garriott would respond.

Isely didn't expect a long, chatty conversation with Garriott — it would have been enough if he'd just said hello.

But, that didn't happen.

For the 20-minute periods between 5:05 and 5:25 p.m. and again from 6:35 to 6:55 p.m. Isely and Smith tried to communicate with Garriott without success.

Isely would repeat his call signal for the one minute period. Then everyone on the backporch of Isely's St. Charles home would hold their breath in anticipation — waiting for the voice from on high.

There was nothing but static.

Then Isely or Smith would fiddle with the dials on the receiver, make more adjustments on the angle of the antenna, squirm under the bright television lights and then try again.

"That's the life of a ham radio operator," a club member said.

"We listen a lot."

Isely began to get impatient. "Come on, Columbia, this is WD9GIG," he said over and over managing to get in about eight calls a minute.

"Go vertical, Bill. Tip it (the antenna) to the northeast — swing it east," Isely shouted.

Then another long minute passes and Isely is again saying his call signal.

And, so it went throughout the two attempts to reach the astronaut.

Since last Wednesday and during the upcoming week, ham operators throughout the U.S. will attempt to talk to Garriott as he orbits in space.

Garriott, one of two mission specialist on the six-man Columbia-Spacelab crew, is a lifelong ham operator. He is using his own time to pursue his hobby from space.

Chances of making contact with Garriott are slim, Isely said.

"If the antenna that is on a small window of the spaceship is facing downward we'd have a better chance of receiving his signal. But, the ship may be upright and that means Garriott's radio signals are going into outer space.

"The antenna on the spacecraft is only five watts. He may have answered us and we didn't hear him," Isely said.

Other ham operators across the nation have heard Garriott's ham radio call signal W5LFL and he has acknowledged hearing some from earth.

One of the first was Garriott's fellow club member Ken Schnell, a budget analyst at the Johnson Space Center.

Isely and Smith said they have been planning for this week for about six months.

"When we heard that Garriott would be taking the ham radio equipment aboard the Columbia, we decided to build a special antenna and attempt to communicate with him during the space flight."

Columbia was originally set to lift off in October, but the flight was delayed.

That delay helped Isely and Smith ready the antenna (the same type as used by NASA) which they designed and built, using ordinary items purchased at local hardware stores.

With their radios, the pair estimate they can produce about 1,000 watts of power — enough to bounce a signal off the moon.

Although Friday's attempt to communicate with Garriott was unsuccessful, Isely and Smith said they intend to keep trying.

"We have an excellent chance of getting through about 8:55 a.m. to 9:23 a.m. Sunday morning when the craft will pass over Monterrey, Mexico, to Flint, Mich. The spacecraft's track will be over central Indiana area about 9:23 a.m. and we may be able to make contact then," Isely said.

Ham radio buffs will get other chances to beam their signals skyward between 8:42 to 9:05 a.m. Monday, and two chances on Tuesday at 8:29 to 8:50 a.m. and 4:18 to 4:35 p.m.

cess in hearing Owen Garriott on several different antennas. My partner, W9LRG, is sick with the flu and I am not able to track the helix and operate at the same time... used a 14-element yagi controlled from my permanent shack in the basement.

December 6, Orbit 129A, 8:29 to 8:50 am CST: Overhead pass again using the same antenna as used in orbit 113A... my partner still sick in bed. Heard W5LFL confirm one 5th-area and two 8th-area calls on this pass. I begin to suspect that a different propagation mode may exist than what has been predicted. Decide to work the next (western US) pass to try out my idea. •*Orbit 130A, 10:10 to 10:20 am CST*—Using yagi antenna again, W5LFL is as loud or louder than on previous overhead pass, and I hear him confirm a 6th-area and two 9th-area calls even though he is over the Colorado area. Perhaps the path is better when the space shuttle is at or near the local horizon? •*Orbit 133D, 2:44 to 3:06 pm CST*—No signals heard on this horizon pass to the northeast of my QTH. •*Orbit 134D, 4:18 to 4:48 pm CST*—Two local area hams (Jim Emma KA9HQF and Gary Senesac KC9UM) take time away from their jobs to help me operate the helical antenna for this orbital pass. I finally obtain some adjusted azimuth and elevation figures, courtesy of W9TGB, to use for this pass. We have spectacular results...we copy W5LFL for three consecutive transmissions between 4:30 and 4:33 pm CST even though *Columbia* is only 10 to 15 degrees above our horizon to the southwest. This is my last attempt to communicate with W5LFL, and it is the best of the lot if my reception of his signals can be used as a measurement.

Observations and Comments

1. Most of the QRM on Owen Garriott's transmit frequency is accidental. In most cases, the operator in error breaks off in mid-call. Some of the worst local QRM is from the "Kilocycle Cops" trying to "keep the frequency clear" rather than from the problems caused by the inadvertent offenders.

2. Our helical antenna is much sharper in bandwidth than first predicted. This is both an advantage and a problem. The helix is almost completely immune to ground-based QRM, but is very much harder to lock onto the space shuttle, which moves quite rapidly across the sky.

3. Even after the STS-9 mission was in orbit, there was still a considerable amount of confusion about frequencies, transmission protocol, and orbital parameters. I have no suggestions to make to improve this situation...some people just never get the word.

4. Lack of widely-published orbital parameters tend to favor individuals with "connections" and previous experience with tracking antenna arrays—stacked beams in EME configuration, etc. These people could construct early into the mission, using the orbital numbers to track *Columbia* through the sky reasonably, while most of the amateur community had to rely on second-hand (often inaccurate) information. The ARRL did finally put out a bulletin on December 6th listing the STS-9 orbital parameters. Perhaps this data could be released a little sooner?

5. There appears to be some type of two-meter propagation phenomenon for low Earth-orbital communications different than that predicted. I suspect that W5LFL's transmission path was somewhat different from that of stations transmitting to him in the space shuttle. Ground-to-space propagation appeared to be best when the shuttle was at or near the local horizon while space-to-ground propagation appeared to be relatively constant regardless of *Columbia*'s elevation above the horizon. This may be a function of *Columbia*'s attitude with respect to the Earth's surface at a given point in time when W5LFL was on the air. I have no way of determining this from the information available to the general public.

6. A plot of table-of-observed-propagation distances using these factors discussed in paragraph 5 above could prove to be valuable for future operations of this nature.

7. It would be a great help to have a low-power amateur-radio beacon on future space shuttles where amateur-radio operation is to be attempted. As little as one Watt output should be sufficient for this purpose and would make it much, much easier to track the vehicle through the sky.

8. If possible, future amateur-radio operations from space should be conducted using spacecraft power either directly or by means of rechargeable battery packs so that power consumption in the transmit mode does not become a limiting factor. I have been led to believe that W5LFL had this constraint particularly when the STS-9 mission was extended by one day.

9. This was my first serious attempt at any form of space communications and I am quite pleased with our results—even if we do not obtain a two-way-contact confirmation. Bill Smith and I plan to modify this helix to a two-band configuration for OSCAR use in the near future. We sincerely hope that this will not be the only amateur-radio-from-space operation...we are looking forward to future operations of this type.

George Richard (Dick) Isely WD9GIG was born in 1939 in Ironton, Missouri. A full Navy scholarship to college graduated Dick as an officer and also obligated him to several years of service, which came after his marriage to Judy Miller. He became a naval aviator assigned to active duty with an anti-submarine squadron flying P2Vs over the Atlantic off the coast of Maine. After deployments in Sicily, Spain, and Cuba, Dick resigned his commission, in August 1966, and left the navy for civilian piloting with American Airlines. For 16 years he has had an active career as an American Airlines pilot and currently flies 2nd seat (copilot) on the Boeing 727. Dick got into ham radio literally by accident: a bad fall resulted in a broken leg. Frustrated by enforced inactivity, he started off with CB but soon graduated to ham radio. He has been Fox River Radio League president, during which time he was active in setting up "The World's Highest Ham Shack" on the observation deck of the Sears Tower in Chicago. With permission to stay overnight (never before allowed by Sears) and transmit and receive signals from all over the world, the FRRL gained for amateur radio a healthy shot of good publicity. In St. Charles, Dick has been prominent on the city's cable TV advisory committee.

KO9G

Pete Altman KO9G
1307 E. Pershing Avenue
Wheaton IL 60187

As luck would have it, my 2-meter rig developed an untraceable intermittent on top of this event, even though I was prepared with a 2-meter turnstile antenna on the roof and good clean coax connections in between.

With no chance to borrow another rig, I wound up serving as a "clearinghouse" for flight info, frequencies, etc., for fellow hams in the neighborhood. The current data given via our conference call prior to lift-off was made available to a number of amateurs in the area via both the local repeater and land lines. It encouraged their attempts to give real tries at contacting W5LFL.

Art Lang KR9K made several attempts using a TR-9130 running barefoot into a 20-element twist antenna. (Given the pressure of work, Art has been unable to furnish a written report.) He reports hearing W5LFL loud and clear on 3 passes (no confirmed QSL though) and was able to tape Owen's transmissions. Art reports that W5LFL was within good hearing range for roughly two minutes of each pass over this (midwest) area and that Owen was able (within that 2-minute opening) to confirm two or three contacts directly. Art also reports that KA9PUC, on vacation at the time in Florida, believed he was able to make a confirmed QSO with Owen using a 2-meter handie-talkie and a rubber duck.

Eugene "Gene" McAleer N9DUW submitted the following:

"On November 30, while in Atlanta, Georgia, I secured permission to go up on the roof of the Marriot Hotel

(17 stories plus) and listened for STS-9 and W5LFL but to no avail. No one in the area heard a signal as I understand and me with such a vantage point with my HT.

"On December 6 at 2214Z, I heard his (W5LFL's) call only very briefly and again returned the call using my Kenwood TR-7600 (10 Watts out) as I had done the previous day. My antenna was a Hy-Gain 5/8-wave ground plane approximately 20 feet above the housetop. (Gene is an airline pilot and on 12/6 was back at his home QTH.)

"Of course I recorded all this as well as a *very* clear signal from one of our club members (whom I shall leave nameless) calling W5LFL on the downlink frequency—hi.

"It was an enjoyable experience to have the signal direct and I was a great deal disappointed in the conduct of (fortunately) only a few of our fellow hams.

"My thanks to Goddard Space Center Amateur Radio Club (WA3NAN) for their very informative rebroadcast of the STS-9 communications.

"My QSL is on the way to the ARRL and I hopefully await a confirmation.

"That's it, Pete, short and direct."

The general consensus was that if you knew the orbital times (we did, thanks to Dick Isley WD9GIG, who "normalized" them to local time on his computer), you could easily hear the signals on 2 meters from the shuttle—for roughly 2 minutes out of each pass over the area—and readily with a receiver of average commercial sensitivity and almost whatever antenna you had on hand.

Making sure you're heard by an orbiting amateur, especially with crowded conditions in some parts of the country and short access times, apparently needs enough erp to "bust through."

Pete Altman KO9C is a copywriter and technical writer (and a lousy typist) who first got his ticket in 1954 (KN2MSM). He rejoined the ranks 5 years ago as N9AWF and earned KO9C two years ago—mostly because the 17-year-old next door (KA9EAT) got his Extra-class ticket (and who wants to live next door to that?).

Art Lang KR9K is an electrical engineer. He is one of the more active people in the area working satellites (contributed several contacts via Russian birds to the Field Day score) and is now even better prepared with a new tower installation. KR9K is also current president of Wheaton Community Radio Amateurs.

Gene McAleer N9DUW is a commercial airline pilot, especially active on the low bands chasing DX (his work schedule allows more time for 10- and 15-meter band openings).

THURSDAY, DECEMBER 8, 1983—CHAFFEE COUNTY TIMES—PAGE 1

Move over, Miss Piggy!

BV men await 'Hams in Space' sequel

A few years ago, the Muppets made a movie called "Pigs in Space."

But now the talk is about "Hams in Space."

Three Buena Vista ham radio operators listened in on the first ham broadcast from outer space last Friday—and the men are hoping that their broadcasts to the space shuttle Columbia were picked up by a recorder on the shuttle.

Art Ermish, whose call letters are KC0VL, Ken Eigsti, W0LSD, and Terry Huston, W8FK were among the ham operators from all over the world to hear the broadcast last Friday from the first-ever ham in space, Dr. Owen Garriot.

Garriot, a Columbia crew member and amateur radio operator, carried a small amateur radio station aboard the shuttle so he could contact hams around the world during the few off-duty hours he had away from his heavy astronaut workload.

"The unique feature of this event is that until now, no one ever had a chance to talk back to a spacecraft other than official NASA communicators," Huston said.

But, last Friday, Eigsti, Huston and Ermish were calling on their amateur radio stations as the Columbia sped over the night sky.

It took only about six minutes for the spacecraft to travel from the northwest to southwest horizon, so the timing had to be perfect, the men noted.

Ermish was able to hear the shuttle on his home base station while Eigsti was listening in on his mobile car radio and Huston heard Garriot on his portable walkie talkie.

"The signal from outer space was quite loud on all three of their stations," Huston said.

There were so many amateur radio operators calling the shuttle at one time that all the call signs were being taped/recorded by the ham in space so that he could sort out the individual calls when he got back to Earth.

So perhaps other than just hearing the first-ever ham signals from outer space, one of these Buena Vista hams may have made one of the first radio contacts between civilians and astronauts in outer space.

Huston says the three men are anxiously awaiting the return of the shuttle to Earth, carrying its precious tape recorded cargo."

Stay tuned.

SPACE HAMS—Three Buena Vista men heard the first-ever ham radio broadcast from outer space last week. Ken Eigsti, left, Art Ermish, and Terry Huston also transmitted messages to the Space Shuttle Columbia.

W8FK

Terry L. Huston W8FK
Box 1417
Buena Vista CO 81211

After all the weeks of anticipation, there he was. I mean right there on the speaker of my little handie-talkie was the first ham's voice from outer space. I was in such a state of disbelief that I almost forgot to press the push-to-talk switch of my microphone to return his call. I mean, after all, that *is* the HT that I talk to the local hams on. Can those really be signals from space coming on the very same radio? But wait, I've *got* to return the call. He won't be in there very long.

I scampered up the ladder to the loft in the A-frame where the other radio gear was. It was nothing fancy, but I was going to at least try to get my own signal back to the space shuttle. "W5LFL, this is W8FK calling, Whiskey Eight Foxtrot Kilowatt portable in the central Colorado Rocky Mountains." I don't believe this. I'm actually trying to talk to a man in outer space. I must be crazy. This is something that would be happening in those comic books I used to read as a kid. And here in my own lifetime I'm actually attempting to communicate with a spaceship?!

Hey, no time to think about that now. Even if I'm dreaming, it won't last very long. Better go for it.

I started to hear his voice even louder than before on his second transmission. "This is W5LFL aboard the space shuttle *Columbia* passing over the polar ice cap and listening for amateur-radio stations in North America. Go ahead, over." Got to start calling again. Let's see, Art and Ken are on those frequencies. Oh yes, here's my channel. The local hams were trying to spread out over 10 calling channels so we would have a better chance of one of us getting through to the shuttle. But can this really be happening? He's so far out there that maybe his signal is being received by a station in some other solar system. Got to quit thinking about that now. I've got to start calling again. "W5LFL, this is W8FK in Colorado."

I wonder if I've got a chance to get through. I mean it's only 10 Watts and a ground plane. But at least it's worth trying. I know Ken WØLSD is trying also. It's too bad about the cloud cover tonight. Skip W9GYA and I were going to try a makeshift tracking station. He was going to fire up his 160-Watt mobile installation and I was going to be the human tracking station. We figured with my 11-element beam attached to a broomstick and me standing on a stepladder pointing the antenna at the spacecraft as it went over, that Skip's 160 Watts would give us a real good erp and we might have a good chance of getting in.

But as luck would have it, our normal "banana-belt-of-Colorado" weather had turned to solid overcast this particular evening. (Is that guy's name Murphy? Who invited him anyway?) It looked like we wouldn't be able to see the shuttle tonight. We had been getting our share of the white stuff this winter and the Colorado ski areas were in their best shape for early December in many years. But unfortunately, I wasn't too impressed with it snowing this particular night (even though I had already been on those funny boards a dozen times and loved every minute of it). Just the night before, we had been outside looking for the shuttle and hoping to hear it as well. And sure enough, there went the brightest looking "star" in the sky overhead at a great rate of speed through a large hole in the clouds. It appeared right on time from the mountainous northwest horizon and sped high overhead, disappearing on the southeast horizon a mere few minutes later. That in itself was a real adrenaline rush, just watching those guys in space going over. But tonight we were actually hearing them, and even though the weather had clouded our plans to use the high-powered station with a moderately-sized tracking array (with that li'l ol' tracking facility—me), we were all bound and determined to try communicating with the first ham in spaceflight history.

So anyway, I had to overcome my rambling mind and concentrate on the task at hand. As Owen started to fade a bit on his third and final transmission of this orbit, I thought I would tune the channels that the earthbound hams were calling Owen on. Holy mackerel—every frequency was loaded with hams! Both Jack NØCDA and Art had done the same thing. We all heard some of the most exciting QRM ever to hit our eardrums. There were stations booming through on every channel.

Normally we don't hear much 2-meter activity up our way. We are located in the Upper Arkansas River Valley about 120 miles southwest of Denver and 90 miles west of Colorado Springs. There are a few hams between those front-range cities and our 8000-foot-high valley, but there are many mountains in between us to block the signals of the city hams from us. And over the Continental Divide and west to Aspen are all those 14,000-foot mountaintops of the Collegiate Peaks range, so there just doesn't seem to be any way that many signals can reach us from those population centers. But tonight we are hearing stations from all over. Several of the calls we located in the *Callbook* and tracked down later. One guy, Rod WØHON, actually was in Aurora, Colorado (a suburb

of Denver), over 100 miles away through the mountain peaks using only 10 Watts. We have trouble hearing the repeaters down there, let alone a little station. What kind of conditions are these that put so many strong signals into our area? Are all the city hams up in the high country for the weekend to increase their chances of contacting the shuttle? Is the spacecraft causing an atmospheric disturbance? Jack and Art compiled the following partial list of callsigns heard during those hectic moments of shuttle calling, with their home QTHs and approximate distances through the rugged Colorado high country from Buena Vista: NØAWD, Pueblo, 100 miles; KØILS, Littleton, 90 miles, NØBIB, Canon City, 70 miles; WA3CVC and NØERO, Florissant, 50 miles; WØSG, Englewood, 90 miles; and KAØPMT, Westcliff, 60 miles. What kind of stations were those guys using anyway?

Well, it sounds like Owen has faded from range. A look at the clock shows about 6 minutes have elapsed since I heard that first break of the squelch on the HT down in the kitchen. Wow, seems like 6 days with all that excitement packed into that short time. Better get on the local 146.745 machine and see how the others heard him. Talk about a double! This was a "quadruple!" I heard everyone on there at one time. There was NØCDA, W9GYA, KCØVL, and WØLSD almost simultaneously on the local machine. I tell you, as busy as we hams are during the week, it's seldom that all 5 of us are on at one time, but the space shuttle made it a special time. Everyone was so excited about hearing the signals. Something like this really brings out the little kid in you no matter what your age, and you should have heard the five 30- to 60-year-old little kids on the repeater now. The excitement level was running high.

"Yeah, Barb and I had to excuse ourselves from our host and hostess to go out to the car and listen to the shuttle," said Ken, who had been invited to dinner that night. Art and XYL Edith were inviting everyone over for happy hour, they were so excited. Skip and son Michael had hurried out of the local shoe store to try to make the schedule. Jack and XYL Alberta were at their home at the base of Mount Antero, and my dog Ali and I were near the repeater site at the base of another 14,000-foot peak, Mount Princeton. It sounded like a bunch of school kids who had had their first taste of ham radio all over again. What a fun time! The local frequency buzzed for quite a while. Ken and Barb had to get back to their host and hostess before they were thought to be too crazy, having rushed out into the cold Colorado night for what? To talk to a spaceship? *Right!* Edith finally understood why Art had been acting so weird earlier. I mean to say, the man had the window open all day for antenna-wire-stringing and this is wintertime in the high country. And Skip is used to talking and listening to aircraft in his job as a pilot for United Airlines, but this was a little bit higher control-tower-in-the-sky talking than usual. And where were all those stations coming from anyway that Jack and the rest of us heard on the uplink frequencies? Was that some strange propagation because the spacecraft was flying through the outer fringes of the Earth's atmosphere? We're still not sure why they were so strong in our area. We'll have to try to work those guys later for comparison.

Terry Huston, his HT, and 14,197-foot Mount Princeton in the background along with the Upper Arkansas River Valley.

After the initial shock wore off, we set about trying to talk to Owen on more of the passes. Somewhere along the line, Skip and I got the bright idea that just possibly a modulated F2 CW signal might get through over the thousands of voices calling. It was a real sight to see us holding a microphone in front of the code-practice oscillator with one hand while running the Morse-code key with the other hand. Who says CW isn't useful anymore?

Later in the week I had to ask a patient of mine if he would mind if I interrupted our eye examination to try to talk to outer space. I really expected a very strange look, but it turned out that the patient sitting in my chair was an SWL named Jerry. He had heard all the publicity about the event from the TV but didn't know where to set his scanner to receive Owen. So we hustled into the lab area of my office and grabbed the HT off the countertop and sure enough, Jerry got an earful of the astronaut as he flew across the daytime sky. We called again with the HT and telescoping 5/8-wave whip on a hope and a prayer that we would be heard. Imagine the thrill for some of the guys down on Earth as Owen repeated back a few of the callsigns that he could sort out from the thousands of hams calling him. A few lucky guys were actually hearing their own callsigns being acknowledged from outer space—right then and there. I would have had to be sitting down to take that if I had heard my own call. SWL Jerry was quite excited just to have heard the shuttle on that tiny HT.

As far as publicity for the event, our little group did alright. Ken took his HT down to the Buena Vista Middle School where Barb is a teacher and let her class hear the shuttle on one of the passes as he tried to call back to Owen. Skip recorded one of the passes and made the feature news for the rest of the day with the subsequent interview on the local KVRH radio station serving Salida and Buena Vista. He also sent a tape of one of Owen's transmissions along with his wife Kathy to the elementary school class she teaches in Salida. I wrote an article for the local newspaper and they printed it in the next issue, complete with a photograph taken by Art's XYL Edith. It was even "stop the presses" because I turned the article in as soon as I could but beyond the normal deadline for printing, but they thought it was important enough and timely enough to get in the next issue.

It was truly a remarkable event for our little group of hams. We're still trying to make schedules with some of the many stations that

✓See List of Advertisers on page 114

were heard on the calling frequencies to see if there was some special propagation during those days of shuttle flight, or if it could be an everyday occurrence if those antennas were pointed our way more often. Or does it have something to do with the adrenaline rush of hearing a spaceship that makes our radios get a little more excited and put out better? I'll bet it has to do with the same feeling as seeing ol' Saint Nick and his reindeer and sleigh, flying over the nighttime sky, delivering his payload to the world.

At any rate, what us "kids" experienced during those attempted QSOs is a feeling that none of us will ever forget. This was truly a pioneering event that will go down in recorded history for a long time to remember—the very first exchange of amateur-radio signals between human beings on Earth and outer space. I know for the 5 "kids" of Chaffee County, Colorado, it will be a lifelong memory and another bond in the truly fascinating world of ham radio. Amateur radio strikes our lives again!

KB6WT, KD6YG

Jon J. Gallo KB6WT
Jo Ann Gallo KD6YG
17540 Margate Street
Encino CA 91316

It all began when Bill Pasternak WA6ITF, publisher of Westlink and a *73* correspondent, telephoned to confirm that the flight of STS-9 is a go. We discuss antennas and decide to run comparisons between my OSCAR array 15 feet above the roof and an AEA Isopole at 105 feet. I'll be running 75 Watts. Bill asks whether my QTH would be available for some publicity shots for the local TV stations. I check with the XYL, KD6YG, and reply that both of us are willing to help. This is Monday, November 21, 8:00 pm.

Tuesday, November 22, 7:30 am

The morning drive to the office through the typical Los Angeles traffic jam on the San Diego Freeway. I sign on to the local 220-MHz repeater and am called by Roy Neal K6DUE of NBC. After discussing a holiday party at my QTH that Roy and his XYL will be attending, he mentions that he has talked to WA6ITF about the publicity shots and either he or Bill will be back in touch.

Saturday, November 26, 11:00 pm

KD6YG and I return from Thanksgiving vacation and find messages on the answering machine from both WA6ITF and Jack Burnett of *73*. Bill confirms that at least one local TV station wants to tape at our QTH on the first day W5LFL will be operating. Jack has left a message asking me to call him at home Sunday morning.

Sunday, November 27, 7:57 am

Jack Burnett calls to see if I would keep a diary of my experiences attempting to work Owen. KD6YG, who likes to sleep late on weekends, turns over in the waterbed and mutters something about cancelling our subscription to *73*. I go to the shack at the other end of the house and agree to take part in a conference call at 1 pm. The next step is to load Wordstar into the Apple II+ and start this diary.

Sunday, November 27, 1:00 pm

Conference call with Jack, Bill, and other hams from Indiana, Illinois, Alaska, Michigan, Hawaii, New York, Oregon, Texas, Ohio, and Georgia. WA6ITF goes over Owen's transmit and receive frequencies. Two audio tapes are played, one containing orbital information almost too fast to copy and the other an interview of W5LFL by Roy Neal.

Burnett explains that *73* wants a completely honest diary of our attempts to reach Owen and asks each of us to mail the diary to him on the evening of December 6, the last day in orbit. With Owen only having time for 400 or so QSOs, I'll have about 1 chance in 10,000 of getting through. The statistics remind me of some famous 20-meter pileups.

The call ends with a tribute by Jack Burnett to Peter O'Dell of the League for his work on the ham-in-space program and the sad news that Vic Clark W4KFC has died of a heart attack.

Monday, November 28, 7:00 am

Struggle out of bed and scan the two morning papers we have delivered daily. Both contain stories about Owen and both report the possibility that the flight will be delayed because of bad weather. I brew a cup of coffee and turn on the KA6DMY 220-MHz repeater and am reassured by the familiar "hollow" sound of the countdown being rebroadcast from the Jet Propulsion Lab repeater in Pasadena. The Apple II+ is turned on and loaded with Wordstar to continue the diary when I realize the countdown is at 10 seconds. A quick dash to the family room where I dispossess my 13-year-old son from early morning cartoons and turn to NBC where we watch the lift-off and listen to the familiar voice of Roy Neal.

Monday, November 28, 4 pm

My secretary interrupts a meeting to advise that KCOP, local channel 13, is on the phone. The person phoning doesn't seem to know much about amateur radio. We arrange to have them stop by to tape orbit 40D at 6:31 pm local time on Wednesday. They never show up or call back.

Monday, November 28, 7:45 pm

The night news producer for KTTV, local channel 11, calls. She stresses she has been reading the ARRL press releases and understands amateur radio is far different from CB. We tentatively arrange to have the crew come at 10 am on Wednesday for a live shot of orbit 35A, the first orbit over the western US.

Tuesday, November 29, all day

The phone has been ringing off the hook all day. Lenore Jenson W6NAZ, an expert in amateur-radio publicity, has given my name to a number of TV stations. KTTV calls to advise they will be out by 9 am tomorrow. CBS New York calls to tentatively schedule coverage for orbit 40D. The local ABC affiliate calls for an advance interview and will be out at 8:30 this evening.

I call Lenore to bring her up to date on the publicity schedule and spend the next hour in a round robin of calls with Lenore and Bill Pasternak attempting to determine whether Owen will be available for orbit 35A. The final decision is that it is a 50-50 tossup. KD6YG announces she is getting out of this madhouse for the evening and goes to a movie with girl friends.

I tune across two meters and find 145.550 MHz congested with catcalls and unidentified stations pretending they are the shuttle. Good grief! Is this what W5LFL is going to encounter?

Tuesday, November 29, 8:30 pm

I check into the AMSAT net for the latest orbital predictions. The crew from the local ABC affiliate arrives early and tapes for about 15 minutes. It is going to be cut to about a 45-second teaser for the late evening news. The interview ranges from the technical to personal observations on my excitement over the possibility of working the shuttle. The interviewer keeps asking what we expect to learn from operating the shuttle and I express the opinion that we are going to end up knowing more about low-power Earth-to-space communications than ever before. I wonder what they are going to leave in.

For a few minutes I check into the Southern California DX Club repeater and find nothing but discussions about the shuttle mixed with an anonymous voice using a southern accent and CB lingo pretending to talk to Owen. Anxiety over intentional interference increases.

Tuesday, November 29, 11:10 pm

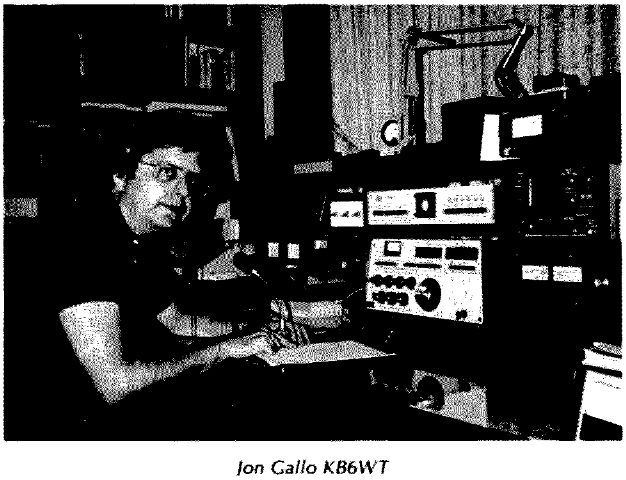
ABC airs about one minute of the interview stressing my personal excitement over attempting to work Owen. A few minutes later the phone rings and the caller, in a slow and somewhat "spaced out" voice, identifies himself as Mike and asks if I was the person in the interview. When I hesitantly admit my involvement, he says he is a 32-year-old Vietnam veteran and father of a 5-year-old girl and is tired of all the negative news reports on TV and wants to thank me for doing something that brings some good news to TV. In a state of semi-shock, I tell him I never expected such a call and appreciate the nice comment. We wish each other good night and I go to bed to prepare for what is beginning to look like tomorrow's ordeal with the media.

Wednesday, November 30, 7:00 am

I check into the Southern California DX Club repeater and find discussions of orbits mixed with DX announcements. Two of the locals mention being contacted by CBS and ABC for taping at their QTHs. Maybe I'll only have to deal with the two local stations today.

Wednesday, November 30, 9:30 am

The KTTV crew arrives and sets up for live coverage of orbit 35. KD6YG handles the calling and I'm in charge of azimuth and elevation controls. We are using 145.01 as the transmit frequency and 75 Watts to the KLM 144-150-16C circularly-polarized antenna. 145.550 is a madhouse, with stations calling Owen,



Jon Gallo KB6WT

policemen adding to the confusion by telling them to QSY, and a fair amount of deliberate interference. A great deal of the problem is attributable to the fact that one of the major daily newspapers in Los Angeles published a detailed article about W5LFL that reversed the uplink and downlink frequencies! Numerous amateurs will be calling on the uplink for several days as a result of this error. I do not hear W5LFL but am later informed on one repeater that the pass was successful and Owen was heard listing various W7s and on another that he was involved in a science experiment and never got on! KTTV tapes part of the pass and then conducts a 2-minute live interview that goes well. I pour myself a well-earned cup of coffee, put on a tie, and go to the office for a few hours.

Wednesday, November 30, 5:30 pm

The KABC crew arrives for a live feed of orbit 40. The operating plan this time is to use 145.01 at 6:35, 145.03 at 6:37, 145.05 at 6:39, 145.07 at 6:41, and back to 145.01 at 6:43. Power level will remain at 75 Watts. I spend about an hour on 145.550 simplex providing pass times and orbital data to stations needing this information. During the pass I was able to hear W5LFL quite well during three of the five minutes he was scheduled to transmit during the window. There was some intentional interference, but less than during orbit 35. However, there was a great deal of calling on the uplink and many policemen. I was unable to determine whether we got through. I deliberately use earphones so that the audio is not picked up by the TV crew. I subsequently find that other amateurs participating in live coverage provided complete audio and at least one local newspaper runs a first-page story stressing deliberate interference.

Thursday, December 1, 7:30 am

I check into the early morning AMSAT net and determine that orbit 49 will not be workable from Los Angeles. I leave for work without trying.

Thursday, December 1, 5:00 pm

Driving home from work, I monitor 145.550 MHz and listen to N6VI and WB7AIC acting as net-control stations and giving out information on orbit 56. A pattern seems to be forming. A good 95% of the amateurs on 145.550 appreciate this information. The remaining 5% are extremely negative and keep suggesting, often obscenely, that stations providing this information QSY. I am acquainted with several of the amateurs making negative comments and know them to be old-timers in their 60s or above and licensed for many decades.

Thursday, December 1, 6:24 pm

Signal acquisition on orbit 56 is loud and clear. I am operating alone this time and am using 145.01

Jo Ann Gallo KD6YC

MHz as the uplink. W5LFL is acquired during the last ten seconds of his 6:26 transmission. The 6:28 transmission is S9 with only one local policeman breaking in for a quick comment to someone he hears but I don't and about 5 seconds of interference. The 6:30 transmission starts out above S9 but can be read for only 10 seconds when a WB6 begins calling him on 145.550 and the rest of the pass is lost in the resulting exchange of insults and comments by channel cops. Comparing notes after the pass, it appears that even in QRM-free areas, loss of signal occurred in less than 2 minutes of good quality shuttle audio. My reception seemed significantly better than that obtained by many users of local repeaters and I spend much of the evening replaying the usable portions of the tape for local amateurs.

Friday, December 2, 6:00 pm

Driving home, I am informed that Owen was an S7 on orbit 71. I try on orbit 72 and W5LFL appears to be a no-show. Intentional interference on this orbit is worse than last night. I am later informed that Owen was on, but the attitude of the shuttle resulted in the antenna not being properly oriented for good reception in Los Angeles.

Saturday, December 3, 1:00 pm

Roy Neal calls from Houston to report that the shuttle mission is being extended an additional day. We compare notes about forthcoming orbits. Roy reports being able to receive Owen 5 × 9 using a handheld and rubber duckie in his hotel room in Houston. We agree that small antennas are best for receiving purposes in areas of high population density in order to minimize interference. I subsequently call Jack Burnett at his home to confirm the extra day of operation.

Sunday, December 4, 8:00 am

I check into the Southern California DX Club repeater and get orbital data for 98A. This time I decide to listen to all ten uplink frequencies before deciding on my transmit frequency. Feeling somewhat suicidal, I decide to disassemble my Icom 271A and install a newly purchased ac power supply in order to reduce the load on my 35-Amp dc power supply. More as a tribute to Icom than to my mechanical skills, the entire job is accomplished in minutes and works perfectly.

The pass begins with AOS scheduled for 1630 UTC in Los Angeles. A quick scan of the uplink frequencies shows slightly less rf on 145.03. There is less malicious interference than ever before and the number of policmen is also reduced. Unfortunately, W5LFL again appears to be a no-show. Comparing notes with local amateurs after the pass, no one heard Owen. The consensus is that the confusion is being reduced, but no one knows what to do about the channel cops.

Roy Neal calls from Houston at 9:45 am and plays the audio tape of the W5LFL/JY1 QSO. It was a pleasure to listen to a QRM-free pass. As a member of the DX Club subsequently states, a jammer in Jordan is likely to get more than his coax cut off!

Sunday, December 4, 6:00 pm

Conference call with *73* and the participating amateurs. We share our experiences, frustrations, and hopes. Parts of the country have had no success, while others, such as the northwest and south, have done very well. We go into a great deal of detail on antennas and press coverage and make final arrangements for submission of our diaries.

Sunday, December 4, 8:00 pm

My schedule suggests that I'll miss both orbits 114 and 119 tomorrow. KD6YC agrees to try to contact W5LFL. I check into the local AMSAT net to get orbital parameters and we jointly go over azimuth and elevation settings for each minute of both passes to make certain that Jo Ann is prepared.

Monday, December 5, 7:00 am

I drive off for my first meeting of the day and leave the station (and Apple II+) to KD6YC.

Monday, December 5, 8:19 am

I (KD6YC) finally get a solo chance at Owen on orbit 114. KB6WT goes to work and our 13-year-old leaves for school. Hoping the doorbell and telephone don't start ringing (I turn on the answering machine so I'll have some control over the situation), I turn on the gear and double-check the schedule. When the clock ticks to the right time, I jump in. While continuously repeating my callsign, I turn on the tape recorder, adjust the azimuth and elevation, and watch the clock. All goes well. The only sound I hear is someone saying, "He is talking to Houston." It would have been great to hear Owen. I plan my schedule for the day so I'll be at the radio to try again on the 4:08 pm pass.

Monday, December 5, 4:00 pm

Unfortunately, I (KB6WT) sneak out of the office early to be home for orbit 119. Once again W5LFL is a no-show. I heard very few calls to Owen on the uplink. Intentional interference probably amounted to no more than 30 seconds during the entire pass. Los Angeles seems to be getting its act together. (I find myself wondering whether Los Angeles has an undeserved reputation for poor operating. According to the 1983 *Callbook*, we account for 13% of all the amateurs in the country and a quarter of them live in L.A. That's about equal to the amateur population of such states as Massachusetts, New Jersey, Michigan, or Illinois!)

Tuesday, December 6, 8:00 am

KD6YC back at the Apple. The OM has to be at the office all day, so I get the shack all to myself for both orbits 130 and 135. I arrange for someone else to drive the carpool so I can be at the radio at 8:06 to try to reach Owen. It's exciting when I hear his voice acknowledging sixes "too numerous to write down." He is torn between the ham rig and the window—the view of California is fantastic, he says. Even listening to Owen Garriott call CQ from the spaceship *Columbia* is an incredible experience. Being the positive thinker that I am, I hope to hear my callsign acknowledged by Owen—what a thrill that would be.

Tuesday, December 6, 3:55 pm

My son, Don, is standing by to answer the telephone and the door if necessary so I won't be interrupted for these few precious minutes during orbit 135. This time the plan is to call for approximately 5 seconds on each uplink frequency. Now I find myself controlling azimuth and elevation, the tape recorder, 10 different transmit frequencies, and checking the clock all at the same time. I always said I

liked being able to do two things at once, but this is ridiculous! When Owen comes back after the second or third transmission, I'm pretty sure I hear Kilo Delta Six Yankee something. Did he say "Yankee Gulf"? Has he heard me? I glance at the tape recorder and realize that in all the confusion I had forgotton to turn it on. Now I have no way to double-check to be sure. I'm so frustrated! I could scream! I hope they hurry up with that official list of callsigns heard—the suspense is killing me.

Tuesday, December 6, 8:00 pm

KB6WT back at the diary. I check into the AMSAT net and obtain data for orbits 146 and 151, which are the only two likely passes over the west coast on Wednesday. If Owen is operating, the chances of getting through are likely the best yet since information on these orbits has not been given widespread publicity. Checking into the DX Club repeater, I find out that one local confirmed W5LFL using 160 Watts and a pair of KLM CP beams. That's only 6 dB more gain than I have available with 75 Watts and a single beam. Playing back the tape of today's two passes, it appears that there was no intentional interference on orbit 130 and less than 30 seconds of such interference on afternoon orbit 135. Also, the callers on the downlink and channel cops were less numerous.

Wednesday, December 7, 7:53 am

Owen shows up about two minutes later than predicted by the AMSAT net and is 60 dB over 9 while he announces he is over San Francisco. He acknowledges numerous sixes and fades out abruptly about two minutes in advance of expected LOS. The rapid fade is confirmed by several other amateurs in Los Angeles.

Wednesday, December 7, 3:41 pm

KD6YC back at the Apple. Well, here I am again, one more time, one final try to communicate with a fellow ham in space. I've gotten the system down pretty good. I'm very busy, but I sense after my first or second transmission that he isn't there and he isn't going to be there. You just know he's gone. I got a true feeling of how vast space really is. Well, Owen, it's been fun. We'll have to do it again sometime. See you in the newspapers.

Wednesday, December 7, 6:30 pm

With both the flight of STS-9 and this diary drawing to a close, some final thoughts seem to be in order.

The entire experience has been perhaps the high point of more than two decades of involvement in amateur radio. If I had to summarize it in two words, they would be "fun" and "fatigue."

In retrospect, the interference was much less than I expected and decreased dramatically with each pass.

Replaying the tapes of Owen's passes reveals that intentional interference accounted for less than 10% of the total interference I encountered. Calling Owen on the downlink accounted for another 30% or so. More than half the interference was the result of channel cops. Instead of a short transmission advising the offender that he was on the downlink, many policemen found it necessary to be both abusive and long-winded.

Attempting to work the shuttle as it approaches both AOS and LOS points is actually nothing more than a form of VHF weak-signal work. When attempting to pull a signal out of the noise level, a competing VHF signal many miles away renders the attempt impossible. If I could offer a single piece of advice based on this experience, it would be to stay off of the downlink for at least 10 minutes before and after AOS and LOS at any particular QTH. The mere fact that we have lost the shuttle in Los Angeles does not mean that we can start rag-chewing on the downlink. We will probably be interfering with another station some distance away at a better location or with better antennas.

I sure hope the ARRL releases a complete list of calls tape-recorded by Owen in the near future. The suspense is killing me!

Jon Gallo KB6WT is 41 and a partner in a large Los Angeles law firm where he specializes in estate planning and probate administration. Jo Ann Calio KD6YC is 38 and considering re-entering the job market now that the children are teenagers. They have been married 19 years and have a son aged 13 and a daughter aged 16. Both hold Advanced-class licenses. Jon has been licensed for 21 years and Jo Ann for 2 years.

Jo Ann's hobbies include photography and needlepoint. Jon's include photography, cabinet-making, and target-shooting.

Jon has been involved in amateur-radio-related legal problems on a voluntary basis for several years and is currently the president of a large UHF-oriented radio club in Los Angeles.

For the low bands, the shack consists of a Signal One 1030 transceiver, J.W. Miller automatic antenna tuner, and Henry 2K-4 amplifier. Antennas include two elements on 40 meters at 95 feet, a KLM KT34XA tribander at 80 feet, and a coaxial dipole for 75–80 meters. VHF interests extend from 144 MHz to 450 MHz.

For the STS-9 mission, the gear consisted of an Icom 271A multi-mode transceiver, a circularly-polarized 14-element beam with azimuth and elevation controls at 30 feet, and an AEA Isopole at 105 feet. The CP beam consistently outperformed the Isopole for reception. A Mirage B108 amplifier with built-in preamplifier was used on all passes.

KZ7T

Randy Stimson KZ7T
9890 SW Inglewood
Portland OR 97225

Jimmy Hollister, a radio personality from one of the leading radio stations in Portland, KEX-AM, said on the air just now (7:00 am, July 21, 1983) that he had heard there was going to be a ham aboard the space shuttle *Columbia* and asked if anybody knew about it. I was reluctant to talk to him, but my wife, Lorna Campbell KA7RFD, called him and handed me the telephone. One of the reasons that I went ahead was that I had just returned from a ham fair in Spokane, Washington, where Roy Neal from NBC was the speaker, so I did have some knowledge about the operation of the ham-radio person on the shuttle. During our conversation he asked if I would be willing to come to the KEX station, hook up my gear, and try to contact Owen Garriott live. I agreed to do so.

August 12: Realizing that I would need help technically and otherwise, I contacted Stan Griffiths W7NI, owner of Antronics of Oregon. Stan agreed to be the second member of the team. I talked to Stan about people who could help us technically with the antennas and other related gear. He suggested Lynn Hurd WB7UNU, so I contacted him. He agreed to help out, and all three of us decided we would set up our gear at KEX Radio. We did a lot of reading and research, looking up all the information we could find on the best type of antenna, and finally agreed upon the turnstile-type antenna which produces a circularly-polarized signal.

August 22: KEX said they had an engineer who was a ham, Michael Brown N7AXC, and Mike became the fourth member of the team. He was a great asset to us as not only could we now readily obtain access to the KEX roof and studios, but he knew the correct media personnel to contact.

August 25: Telephoned Peter O'Dell of the ARRL to request press releases and U-Matic tape.

August 27: Lynn WB7UNU and I built the first antenna. We used 1 × 2s, chicken wire, 2 × 2s, and 1/8" brass brazing rod, using RG-58 and RG-59 coax and using the proper heights from the ground plane. We referred to the *ARRL Antenna Book*. We had a very difficult time as we couldn't get it tuned to where we wanted it. The swr was running at 1.8-1.9 and it didn't seem to make any difference how much we changed the 1/8 rod. We decided to enlarge the size by using 1/4" copper tubing over it so we could slide it in and out. We got some of the swr readings down as low as 1.2-1.3 and it was a lot better. We tuned the first antenna.

September 3: I built the other four antennas but did not final tune them.

October 3: We realized we would need some press releases to come from KEX and would need

✓See List of Advertisers on page 114

someone to help us write them. H. Lea T. Ball AL7W agreed to be our press-release person and the fifth member of our team. We met together on two occasions to draft and finalize the press release, but on October 24, just before we sent it out, we heard that the shuttle flight for October 28 was cancelled and everything was put on hold.

November 15: Received audio tape from the ARRL and updated press kits. Realizing that all of a sudden it was upon us again, I contacted Mike N7AXC and we put the whole operation back into motion.

November 21: I began to gather up all of the equipment necessary to make this work. The equipment consisted of two 7850 Kenwoods, one 7950 Kenwood, one Icom IC-211, and one Yaesu FT-726R. The power supplies were one KPS 12 Kenwood, two Astron RS 35As, and one Astron RS 20A. We had the two Kenwood 7850s running at 40 W each, the Kenwood 7950 had a 160-W Mirage B3016 amplifier on it, the Icom IC-211 had a 160-W Mirage B3016 amplifier, and the Yaesu FT-726R also had a Mirage B3016 160-W amplifier. We were running three stations at 160 W each and two stations at 40–45 W, whichever the 7850 Kenwoods put out. We used the Yaesu for the primary receiver and also for recording and the Kenwood 7950 as a backup recorder.

From this point on, there were a lot of meetings discussing how we would approach the transmission. We decided that on the first odd minute we would use the first five uplink frequencies, the second odd minute the second five uplink frequencies, and if time permitted, we would revert to the original five uplink frequencies, and so on. We hoped this way we might make contact. We originally thought about all five people using all five callsigns, but decided against that primarily because if W5LFL heard one call, we thought probably he would then switch channels. We decided each would use his own call.

We sent press releases to AP and UPI, all TV stations, and the local newspaper. (We did not send to the local radio stations as we were operating from a radio station.) We had some response, and TV stations did ask for a press conference which we set up for November 25.

November 24: We set up all our gear in KEX's lobby. The antennas were placed 18' apart on the roof and were tuned. We marked everything with a number. Each coax, antenna, and rig was marked with the same number so that when we re-installed the equipment we didn't have to worry about the swr. (This was necessary as we were unable to leave our gear—apart from the antennas on the roof—at the KEX station.) We used RG-11 coax cable for the feed and had trouble getting the longest piece, 94', below an swr of 1.8 no matter what we did, so we decided we had to live with it. The shorter pieces came down to a 1.2 level. On the 25th, we put all the equipment back up and at 10 am PST we had our first TV news conference with KATU (ABC) and KPTV (independent). At this time, KOIN-TV called and said they had not gotten the information regarding the press conference and asked if we could hold another on November 27. We finished the press conference and tore all the equipment down again. (Up it went again on the 27th for the CBS KOIN-TV conference.)

Shirley Hancock of KOIN-TV interviews Randy KZ7T.

November 26: We put up the dish at Antronics of Oregon so that we could monitor NASA; we began monitoring the next day. From that point on, Pat Griffiths, wife of Stan W7NI, monitored it almost continually for us for any updates or changes. Later she also monitored W5RRR and we kept in constant telephone communication with her.

November 28: We had another meeting to figure out a better way to make contact with Owen, but we again agreed that the idea of single calls per person and on groups of five channels at a time, one channel per station, transmitting on the odd minute, was still the best way to operate. We also agreed to make only three attempts from KEX—orbits 39D and 40D on Wednesday, November 30, orbit 71D on Friday, December 2, and orbit 119D on Monday, December 5.

November 30: Our first contact. The first time we heard W5LFL we heard him acknowledge Lance Collister WA1JXN in Frenchtown, Montana, at 6:34 pm PST, orbit 40D. We had at KEX Radio all four local TV stations, KATU (ABC), KOIN-TV (CBS), KGW (NBC), and KPTV (independent). *The Oregonian* (newspaper) was there and also a reporter from KLCC who drove up from Eugene, Oregon. We were told we were on national television on NBC. Walt Morey WA7SDY, a good friend, videotaped all the events, including the coverage by the news media. Sherill Smith KA7KNG was of great help assembling and disassembling the gear on all three occasions.

December 1: Stayed home that night and heard Owen at 6:22 pm PST.

December 2: Mike N7AXC was unable to be present due to a prior commitment with jury duty, so Sherill KA7KNG became the fifth operator. Made our second contact from KEX at 4:40 pm PST. We think W5LFL may have heard W7NI who, on the last minute of our transmission, decided to change his method and switch from channel 1 to channel 2 after giving his call a few times. Owen said he had heard W7 with two other letters, switching from channel to channel, and would verify when he got back to NASA.

December 5: I had a live interview on KXL-AM radio in Portland at 2:15 pm which lasted about 10 minutes. We set up our gear for our third and final attempt for KEX. The pass was 119D. It was slated to start here at 4:07 pm PST. We started on the uplink on the same frequencies we had previously used. We tried at 4:07, heard nothing at 4:08, transmitted again at 4:09, again heard nothing, so we tried something brand new. We had two Morsematics, one an MM2, and we programmed all six operators' calls into memory. We included the call of Sherill KA7KNG as he had been our fifth operator on Friday night and was present again tonight. On the odd minute of 4:13 pm, we transmitted all calls—Morse code at 25 wpm. We did it twice. Six calls at 25 wpm took 17 seconds, then we went back to voice and we listened for the even minute. At 4:15, we did it again with CW, listened for the next minute, and then went back to straight voice. We figured if anything could have got through the QRM, it would have been Morse code. If anyone else had known about it, it wouldn't have worked at all, so we kept very quiet about our plan. This was our kicker. Unfortunately, we don't even know if Owen had his rig on. We were hoping that he would respond that he had heard Morse code. We could have tried this Friday night, but then we felt Monday would have been a disaster as everyone would have been trying. But it was a good trick and we used it as our final, desperate attempt. We had no contact with W5LFL, but we did have with us two television stations (KATU and KGW). We had excellent coverage from the news media throughout. We pulled up and separated our gear, each taking home an antenna and a large piece of coax as well as our own gear.

Special acknowledgements: Patricia Griffiths for her behind-the-scenes work; my wife, Lorna Campbell, spent endless hours helping me out, writing this report, taking telephone messages, driving around town getting things done; Sherill Smith, who did all the still photography and masses of the legwork; and, of course, KEX Radio in Portland. Without them, we wouldn't have had this coverage, and the KEX staff worked with us in a magnificent fashion.

W7NI Comments

I have been asked for an opinion as to the overall result we had here and what we might have done better. We did our part fairly well. As a matter of fact, I can't think of anything I would do differently with the exception of possibly running much higher power, since, as far as I know, the only people who got through were running considerably higher power to considerably better antennas which had the ability to track the shuttle automatically. That seems the way to get through.

As it is in virtually any other highly competitive activity, and this appears to be no exception, indeed, good sportsmanship doesn't reign. Wish it did! Sorry, but I don't think it does.

It probably would have been better if they had put the thing on a different frequency like 220 Megahertz instead of 2 meters and a different mode, CW say, instead of FM, something where there is some operator skill involved. A means, in a way, of weeding out some of the interference and some of the QRM. I really don't know what's going to happen next time they put one up. If they don't go to an odd frequency, if they remain on 2 meters, I think you'll see (you think it was chaotic this time!) a great deal more chaos next time because there will be a great deal more power on. We've sort of proven this time that high power gets through. It appears the moonbouncers were making it and there'll probably be a huge upsurge in powerful amplifiers in the next one. I think what we need is a 100-dB attenuator on the receiver.

AL7W Comments

My feeling on this whole experience with STS-9 is that those who made the decision to use frequency-modulated voice need to rethink the process. In a crowded band condition, which is all that could realistically be expected, all that discriminator in Owen's receiver is going to hear is a lot of noise with the exception of people who used their EME rigs and antennas. I am really disappointed in that decision. It would have meant a great deal more expense for myself to work him, but it would also have increased my chances to work him if we had used single sideband, or whatever. CW, of course, would have been the ideal mode since that is not only Owen's pet mode, but mine also. I find the idea of working him was great; I just question the wisdom of using FM and I also question, to a certain extent, the wisdom of using the 2-meter band.

WB7UNU Comments

I think that the experiment was a good one, but I hope in the future they use a frequency other than the most populated ham band so as to further the hobby by the expansion of user use on to the less used bands such as 220 or 450. People who use these frequencies are more serious about long distance. We also need better prior communication. It seemed anyone who had a radio added to the havoc, especially those people who knew nothing about it until the last minute and therefore transmitted on a downlink and on the even minute. All they knew was that there was a pass going over, and they pulled every dusty radio out of the closet and turned it on.

It would have been nice also to know those who had previously been contacted so as to remove them from the list of those attempting to contact the shuttle, such as the kilowatt moonbouncer station which was, at least in our opinion, desensitizing the receiver to the point that low-power operators were completely removed from the input of the radio. Hopefully, there will be some design changes on the next radio, whenever that may be, so that he can switch on attenuation to reduce that kind of effect.

I would like to see some way information could be exchanged between the voice link, between the shuttle and NASA, such as we see on SATCOM 1R which we are now allowed to watch and even rebroadcast. If there were some sort of key or indication that he was into that part of the activity, then we would have a little better indication what was going on.

Again, better communications. I called Westlink at 10 pm PST on Monday, December 5, and listened to a recording that gave the orbits for Friday, Saturday, and Sunday which had all passed. The indication on the tape was that it would be changed on Monday afternoon, but apparently that never occurred.

Antennas on the KEX roof.

KZ7T Comments

The hams got better and better as time went by. I did one thing on December 5, five minutes before Owen was even thinking about coming over Portland during orbit 119. I got on 5.550 on the odd minute and talked to all hams with 160-W power, reminding everyone to "check your clock, check your time, make sure you transmit on the odd minute, try not to transmit on the even minute, and remember politeness." I also said that two television stations were standing behind me with their mikes stuck into my speakers, so let's be a little careful what happens. That night was super; nothing but politeness, so we are learning how to handle this thing.

There is a lot of comment about forms other than VHF. There's talk about single sideband, 220, 440, HF, and every time you bring up one of these, it's fine if you have the gear, but a lot of people can't afford single sideband or 220 or 440, so I don't think that's the answer.

THE OREGONIAN, SATU

5 hams bone up for space

Radio operators target astronaut

Keeping their fingers crossed will be a key element in the strategy of five Portland-area amateur radio operators who hope to chat with an astronaut in space Wednesday evening.

Randy A. Stimson, H. Lea T. Ball, Michael D. Brown, Stanley A. Griffiths and Lynn C. Hurd, besides relying on the good-luck ploy, also will be using the latest equipment in a large, jointly operating base station. Their aim is to communicate with the space shuttle Columbia, scheduled for launch Monday.

Astronaut Owen Garriott, a ham radio buff, will be using a hand-held walkie-talkie to talk to Earth during his off-duty hours. He will be the first astronaut allowed to pursue his radio hobby from space through non-NASA channels.

Garriott, a mission specialist, will be working inside Spacelab, which the Columbia will be carrying it in its cargo bay.

Stimson of 9890 S.W. Inglewood St., Ball of 3945 S.E. Cora St., Brown of 3740 S.W. Comus St., Griffiths of Aloha, and Hurd of 4880 S.W. 195th Court have set up a group amateur radio operation at the KEX studios in Portland. The idea was hatched by station broadcaster Jimmy Hollister during one of his morning shows and he broadcast an appeal to ham operators in the area.

Brown is a KEX engineer with his own amateur radio station. The others also have ham stations.

"I think we have at least one chance in 25 of being heard by Garriott," Brown said. "We're hoping we have superior equipment over some of the other amateurs" who will try the same thing.

Stimson estimated that there are 4,000 to 5,000 hams within a 100-mile radius of Portland, 7,000 to 8,000 in the Seattle area and 2,000 to 3,000 in the Spokane area. As a result, the air waves likely will be busy with calls to the astronaut, Stimson said.

The best times to talk to Garriot from the Northwest will be when he is closest to overhead. Provided the Columbia is launched on schedule, it should be near, although 175 miles up, between 5 and 5:30 p.m. Wednesday, from 4:30 to 4:55 p.m. Dec. 2, from 4:07 to 4:20 p.m. Dec. 5 and from 3:45 to 4:07 p.m. Dec. 8.

Anyone with a programmable radio scanner should be able to pick up the broadcasts from space. Garriott is expected to be transmitting at 145.55 megahertz using call letters W5LFL.

Persons who do receive him and can verify it can obtain a card with his call letters by writing the American Radio Relay League-STS-9, 225 Main St., Newington, Conn., 06111.

Stimson suggested that, in sending for the card, the application should state the time, frequency and a brief outline of what the astronaut said.

Persons desiring the latest information on the frequency over which Garriot will broadcast can call 1-800-SCANNER.

Once again, persons around the world can use the telephone to listen to the astronauts and keep abreast of the flight.

Callers in the United States can utilize Dial-A-Shuttle by dialing 900-410-6272 to hear the astronauts live when they are in touch with mission control. When the shuttle is out of range, National Space Institute personnel will update callers on the status of the flight, the next expected communication time, and educational features about the trip.

Callers from the United States will be charged 50 cents for the first minute and 35 cents per additional minute.

Dick Powers WB7ADM, in Portland, had probably one of the best answers. A lottery system where all the hams could send in their calls if they would like to contact the next ham in space and, if nothing else, arbitrarily, or by computer, pull out so many calls for an area and they would be called from the space shuttle down to Earth. If they were listening, they could acknowledge. I'm positive we would get many more contacts. If a ham tried to jam on the uplink, he would be notified he was not being accepted, because it was not working. Those who acknowledged their callsign would get a QSL card.

I cannot believe W5LFL just had batteries and wasn't plugged into a power supply with limitless power—that's hard for me to understand.

I don't feel any magazine, *73*, *QST*, or any magazine, had enough articles prior to the event to help the hams figure out what was going on. I would have liked to know a lot more about the gear Owen was using. Could he hear on 55? How long can it last? What kind of reception was he getting? We don't feel he was getting good reception or that his receiver was that good, but we don't know. Could the magazines send newsletters out? If I belonged to the ARRL, I should receive a newsletter from them. If I subscribed to *73*, I should have gotten a newsletter from them. Hams in the area were asking us questions we knew nothing about and I probably had as much information as anyone in the area as I called the ARRL and got the press releases and the U-matic tapes, and I also heard Roy Neal speak in Spokane.

It seemed to be a feeble attempt. A lot of guys spent thousands of hours, not to mention money, for a feeble attempt and I don't think that's right. I feel that 2 meters is probably as good a mode as any. Some people think CW is the answer, probably because they are good at CW, but there are many hams who don't use CW. I think this mode was a good one.

When the news media first approached us and we had the first interviews, we stressed that our only goals were to hear Owen Garriott and to further the cause of ham radio. We told them this was the first time a civilian ham had been able to listen outside of NASA. We told them ham radio was fun; we like to see how far we can talk and get a QSL card back. We tried during every interview to make it seem like fun. We had positive feedback from everyone because we did hear Owen Garriott and we did fulfill our commitment.

Randy Stimson KZ7T, aged 57, is married to Lorna Campbell. He has three children from a previous marriage, all married, with six grandchildren among them. Born in Seattle, he has spent practically all his life in the tire in-

dustry, where he started during high school busting tires for a tire shop. He spent 20 years selling equipment, but now also does service, troubleshooting, and PR work. His territory covers eastern Oregon, Washington, Idaho, and western Montana. He has been a ham for three years and prefers the community-service side to the DXing. During the past year he was part of the communications group for the Kidney Association of Oregon Keg Roll, the Portland Rose Festival, two Sports Car Association of America Rallies, and several Bike-A-Thons. He belongs to the ARRL, the Oregon Tualatin Valley Amateur Radio Club, the Portland Amateur Radio Club, the Inland Empire VHF Radio Amateurs, the American Radio Relay Group, the NW Repeater Group, the 10-10 Club, and ARES. His wife, Lorna, is very active in a non-academic sorority group which encourages friendship among women and service to those less fortunate than themselves. They like to travel and try to visit Lorna's homeland (England) about every three years, usually combining the trip with one to another European country.

N7AXC

Michael D. Brown N7AXC
3740 SW Comus St.
Portland OR 97219

The morning DJ at KEX Radio, Portland, Oregon (where I am employed as an engineer), mentioned on July 21st Owen Garriott's planned attempts at ham-radio contacts with Earth-bound hams on the next shuttle flight. Through the DJ (Jim Hollister) and News Director Jim Howe, I was forwarded a few inquiries from local hams. I first made land-line contact with Ronald W. Magnus WA7GFE, Portland, and Ron and I were in contact several times by phone and at least once in person.

It was Hollister's wish that we attempt to set up a base station in the KEX studios so that we might have the attempt to broadcast the contacts, if not live, at least on tape shortly after the contacts. It was also my feeling that the KEX studios would provide a good central location for staff and interested listeners, as well as for the media, to witness the event. Ron was very helpful in providing me with preliminary information, including orbital maps, but was of the opinion that our location hugging a hill to the west would make the KEX site less than ideal for many if not most of the orbits.

Then Randy Stimson KZ7T and I first made telephone contact. We had a comedy of errors in missing each other's phone calls up to this time. I learned that Randy, along with Stan Griffiths W7NI and Lynn Hurd WB7UNU, had already been working on the project, after talking with Jimmy Hollister. Randy was of the opinion that we would be able to make adequate contact most of the time from the KEX studio location and convinced me of its advantageous location, for the above stated reasons. Upon closer examination of the orbital maps and some rough calculations as to the effects of the hill on our potential-contact windows, I agreed to work with them in putting on a large, jointly-operated base station at the KEX studios.

My special assignment was to interface with KEX and the media. We needed a location in the building (which was not easy, since all the available accesses to the roof came to locations far from any room in the building we could potentially use). We needed ap-

NEWS RELEASE

FOR RELEASE 10 AM 11-25-83

CONTACTS: RANDY STIMSON KZ7T 233-8545 297-1175;
H. LEA T. BALL AL7W 777-1032 775-0188;
MICHAEL BROWN N7AXC 225-1190 245-4889.

For the first time in history, private citizens will have a chance to talk directly to a man in space. Astronaut Dr. Owen Garriott, callsign W5LFL, will be talking to amateur (ham)-radio operators throughout the world while on board the STS-9 space-shuttle flight. The shuttle is due to blast off next Monday, November 28. Garriott, a NASA mission specialist, will use a low-power hand-held FM transceiver to make his contacts during his off-duty hours. He will be the first astronaut allowed to communicate with Earth through non-NASA channels.

The exact time of our attempted contacts with Dr. Garriott is not confirmed at this time, but will likely be between 5 and 8 pm, Wednesday, November 30.

The idea of setting up a group amateur-radio operation was conceived by KEX Radio morning personality, Jimmy Hollister, during one of his shows. He broadcast an appeal to ham-radio operators in the area. Five area hams, including KEX engineer Michael Brown, have arranged for a large, jointly-operating base station to be run from the KEX studios. (All the equipment involved will be set up and operating for the November 25 News Conference.)

Original proposals to place an amateur-radio transceiver aboard an orbiting US spacecraft surfaced when NASA was about to launch *Skylab*, in the early 70s. The plan was rejected because it came too late in the development of the program.

Space-shuttle flights presented another opportunity. The American Radio Relay League (ARRL) and the Radio Amateur Satellite Corp. (AMSAT) jointly requested that Garriott be allowed to operate a small transceiver aboard the shuttle. NASA accepted, on the stipulation that the plan would not interfere with mission activities and that safety regulations were met. The radio will be operated from the aft flight deck of the space-shuttle orbiter, *Columbia*, which is carrying the Spacelab in its cargo bay.

The KEX team news release.

See List of Advertisers on page 114

provals from management, programming, engineering, and other parties within the station. I began working on these decisions and approvals.

Over the next few weeks, we worked out all the problems of press releases, locations, and equipment. I got clearance for, and made arrangements for us to set up in, a portion of KEX's large front lobby. Ac power for our 5 rigs and associated equipment was to be run off two isolated circuits of 20-Amp capacity each. All equipment would be set up on neatly draped tables in the lobby and would be removed, for security purposes, between each contact session. Five antennas built by Stimson and Lynn Hurd WB7UNU would be placed on the roof of the building and held down with bricks. RG-11 lead-ins would have to be brought in through an ajar front door and rolled up and stored on the roof between contact sessions.

At that time, we also planned to set up a satellite dish monitoring NASA video and audio off SATCOM 1R. The dish was to be on a trailer, in the KEX parking lot. (It was later set up elsewhere.) I would rewrite a final draft of the news release, write up a news conference notice, and mail all materials to all local television and daily newspaper outlets. I would also contact all these media by telephone to personally invite them and answer any of their questions.

On November 24, we set up all gear in the KEX lobby for a dry run and antenna tuning. All equipment and coaxes were numbered, to speed up future setups. Everything had a place and a number. The 5 antennas were set up on the flat roof. We communicated from the roof to the lobby via 2 meters, as we tuned up the antennas' active elements for lowest vswr. The best antenna tuned up to 1.2:1, while the worst was about 1.85:1. That antenna also had the longest RG-11 lead-in—some 94 feet. (Please refer to Randy Stimson's diary for a rundown of the equipment used.) In addition to what he mentioned, we wired a Sony TC-92 cassette recorder into the Yaesu FT-726R for taping all receptions.

We set up all equipment again for the 10 am news conference on November 25. In attendance was KATU-2 and KPTV-12. Randy and I had rehearsed and planned a formal statement followed by a question and answer session. All TV stations preferred to go "by the seat of their pants" with a more informal approach. Both KATU and KPTV did major stories on us on their evening newscasts. On the 27th, we re-assembled all equipment for another arranged news conference with KOIN TV-6. They ran an excellent story on us that evenng.

On November 30, we heard Owen Garriott, with readability of poor to fair and signal strength of fair. Heard him for a portion of 1834 PST, all of 1836, and part of 1838. KATU, KGW, KOIN, and KPTV, which constitutes *all local TV stations with news departments(!)*, were there to cover the event. All ran excellent stories that night. We were on live, in one case, and were the lead story in another case. (Note: TV stations usually do a *live* news story only for what they consider to be very major events.) *The Oregonian* (the only major daily in Portland), with statewide distribution, also covered the story, as did KLCC radio in Eugene (some 120 miles away). KXL and KYXI radio also had stories prior to the contact session, even though we had not mailed any materials to any other radio stations. KEX played back the tape of Garriott on the evening talk show, "Northwest at Night," and ran several news stories on the contact that evening and the next morning. The KEX switchboard received numerous phone calls on the subject, mostly for information. We pushed the 1-800-SCANNER number and gave them the downlink frequency. Jimmy Hollister and the other KEX DJs were talking about the reception of Garriott all day, December 1, and played the tape of the reception during their shows.

Stimson heard Garriott when at his home at 1822 PST, with good readability and good to very good signal strength. A tape of the reception was run on KEX that evening.

No response was ever heard to our call letters from Garriott except probably once. On December 2, Owen acknowledged W7 and "2 other designators" he was not sure of. Stan Griffiths (of our group) is W7NI. Garriott said he would check his tape later to try to identify the W7 call.

Michael Brown, 31, has been involved in broadcast radio for 9 years. He currently serves as Radio Engineer for KEX. Married with one stepchild, he's an avid backpacker, skier, Sierra Club member, and musician.

Call to shuttle goes unanswered

By TERRY CARR
Daily News reporter

From 5:15 p.m. until 5:32 p.m. Wednesday, Allen Bianco filled every odd-numbered minute with letters, numbers and pleadings.

"W5LFL, W5LFL, space shuttle Columbia, this is KL7FKO. KL7 Fox Kilo Oscar, Anchorage, Alaska, calling W5LFL, space shuttle Columbia. Come in W5LFL," he said over and over again into his ham radio handset.

Nine times he repeated the call and nine times he got no response from the shuttle, which was somewhere 120 miles above Alaska and traveling at 10,500 mph.

"Here I've got the newspaper here and the guy doesn't want to say anything. Come on Garriott, say something," Bianco said after one attempt.

He stared at the tiny, silent speaker that was supposed to pick up the response from Dr. Owen Garriott, an amateur radio buff and one of two mission specialists aboard the space shuttle.

Bianco, a 52-year-old retired Anchorage policeman, is one of 13 ham radio operators in the United States chosen by "73" magazine to attempt to talk to Columbia during its nine-day flight. It is the first space flight during which communication with amateur radio operators is planned.

Before the shuttle returns Tuesday, Bianco will have seven more chances or "windows" when Columbia will be positioned in the right place above Alaska to hear him calling. The windows will vary in length from 13 to 30 minutes.

The procedure calls for him to broadcast on odd-numbered minutes, and allow the even-numbered minutes for Garriott's response.

The shuttle's antennas must be pointed toward Earth and Garriott must be awake and off-duty before the link can be made.

"I don't know what happened," Bianco said after Wednesday's window closed without contact with Columbia. "I will be talking to NASA tomorrow. I want to know if he was asleep and if I'm wasting my time. But I'm not disappointed. I enjoy it very much. I'm not giving up."

KL7FKO

Allen Bianco KL7FKO
PO Box 10-385
Anchorage AK 99511

The following is a diary of my experiences while attempting to contact W5LFL aboard the space shuttle *Columbia*.

Orbit 56D. Started to call at 17:15 Yukon Standard Time. *Anchorage Daily News* photographer Paul Brown and reporter were present. Transmissions were made at 17:15/17/19/21/23/27/29/31. No contact.

Orbit 72D. Started to call at 17:10 YST. Channel 2 (KTUU) present with reporter Geri de Hoog and cameraman Barry. At 17:14+, *heard the call of W5LF- without* the L almost immediately following my call. This signal was not strong at all and was in the noise; however, I don't think that this was a reply. The receive frequency was 145.550 MHz. I logged this as a no contact—could be a ham somewhere far from Anchorage. Transmissions made at 17:11/13/15/17/19/21/23/25 YST. No contact.

On that same night, I heard comments from Australian hams complaining that the windows were wrong. A friend of mine heard the same comments on HF and reported that to me the next day.

December 2. There are no windows today. However, the receivers were constantly on and the recorder was ready. A ham reported to me that Kenai (60 miles from Anchorage) heard the word "Columbia." I think this was just interference or some other ham calling. Called Jack Burnett, Executive Editor of *73*.

Orbit 98A. Started to call at 7:30 YST. Transmissions were made at 7:31/33/35/37/39. I made a mistake and also transmitted at 7:42 (after the window). No contact.

Orbit 114A. Started to call at 7:15 YST. Transmissions were made at 7:15/17/19/21/23/25/27. Following the last transmission at 7:27, I heard and recorded on tape what appeared to be "KL7F- Anchorage, Alaska," and "AGG." The transmission was cutting off and was barely above the squelch. I got a little shook up and transmitted a few times even though the window was supposedly closed. I now have my doubts about the windows and the times. Next window is at 15:07. I then left the house and had a friend of mine listen to the tape but he could not make it out. While there I received a phone call from Jack Burnett at 13:55 YST advising me of a conference call at 17:00 YST.

Orbit 119D. Started to call at 15:07/09/11/13/15/17/19. No contact. Conference call started at 16:57 and ended at approximately 18:25.

Orbit 130A. Started to call at 7:11/13/15/17/19 YST and continued for 3 more transmissions even though window was closed. No contact.

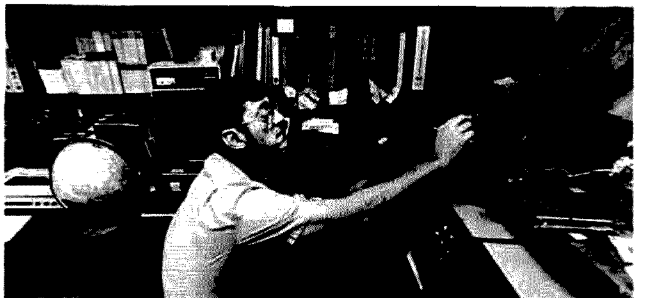
Orbit 132D. Even though that part of Canada was not supposed to be on my schedule, I transmitted at 10:01/03/05/07/09 YST. No contact.

Orbit 134D. I experienced QRM on 145.550 MHz from a local ham and I told him to get off the frequency. Transmitted at 13:19/21/23/25/27/29/31/33/35/37/41/43/45/46/49/51/55 YST. No contact.

Orbit 135D. No-QRM transmissions made at 14:45/47/49/51/53/55/57/59. I stopped. No contact.

My transmitter was a Yaesu 221R with a 10-element beam at 63 feet. My receivers were an Icom IC-290A scanning 145.530/550/570 with a 5/8 whip at 41 feet, a Yaesu 207R scanning 145.530/550/570 with a rubber duckie, and a Tempo FMP 203 at 145.550 MHz with a 5/8 whip at 22 feet.

I transmitted and listened and transmitted and listened and I real-



Allen Bianco KL7FKO tunes his equipment to the shuttle frequency.

ly don't know if he heard me or whether he acknowledged. But I did not give up. I was frustrated but I never gave up. Perhaps the next time the shuttle goes up, I will be able to tell everybody in town that I in fact did talk to it. The *Anchorage Daily News* came in and excitedly waited for Garriott to say something. KTUU (Channel 2) did the same. Radio Station KFQD was on the phone at the close of the windows. People I never knew called me and asked for the frequencies. I broadcast many a QST on two meters and read the windows. I borrowed another two-meter rig, an Icom IC-290A, so I could further monitor, and I didn't talk to Garriott. But that's OK. Perhaps he was asleep or busy or the shuttle ham antenna was facing the stars when it was passing over or near Alaska. But I will not give up. I will try again.

This is Allen Bianco KL7FKO, the Alaskan who enjoys life and his hobby.

Originally an Israeli, KL7FKO is a 52-year-old retired Anchorage policeman and the former owner of a color processing lab. In addition to ham radio, Allen and his wife, Debbie KL7GIS, enjoy traveling. Son Michael is studying for his ticket.

Here is my account of the STS-9/W5LFL mission, as viewed from Hawaii. On November 27, I participated in a teleconference call with Jack Burnett of *73*. This was like an hour pep-talk to live and breathe the STS-9 mission for the next few days. However, it seemed that there was little hope to hear W5LFL, let alone work him, from Hawaii. There were no scheduled active orbital passes over or near Hawaii.

In order to get a better overview of the orbital ground tracks of *Columbia*, a sine-wave curve was drawn on one of the plastic overlays of "The DX Edge." With this device and the given active passes, it became clear that some of the daily passes would come close to Hawaii even though W5LFL would be busy at work or would be fast asleep. The following is the log of the attempts.

November 28: *Columbia* STS-9/W5LFL lift-off as scheduled at 6:00 am Hawaii time. Listened to W5RRR, Johnson Space Center, and obtained info on W5LFL operation.

November 29: Listened to media coverage to determine if W5LFL operations would begin. Some confusion on the part of some radio stations when converting UTC to local times on the mainland. And further confusion when converting times to local time in Hawaii!

November 30: Orbit 35, 8:43 am—tried listening and transmitting with a hand-held (Ten-Tec 2591). Results: negative. Orbit 36, 10:05-10:14 am, Hawaii time, again same procedure as above from a downtown Hilo parking lot. Results: negative. Numerous attempts to call Westlink to get recorded message of latest info drew a blank—line was always busy. Dialed the ARRL number and got their recorded info which was essentially the same as info before the mission started. Orbit 42, 7:35-7:46 pm, close to Hawaii, but negative results using fixed station IC-290H/Isopole antenna.

December 1: Orbit 52, 9:56-10:04 am, and orbit 59, 8:58-9:06 pm. Both negative results. Started construction of a turnstile antenna for 2 meters. Used parts from 2 yagi beams for 2 meters.

December 2: Orbit 69, 11:14-11:20 am, and orbit 75, 8:43-8:52 pm. Both negative results in Hawaii. Used both the hand-held plus fixed-station equipment.

December 3: An attempt to get additional orbital information from W5RRR failed due to poor band conditions and QRM. Westlink number was again busy. Telephoned the ARRL and got the recording of orbital passes. Was pleased to see additional passes added to the list of pre-mission info. Also learned that NASA had extended the mission one extra day. It started to look somewhat better!

Finished building turnstile antenna with tuned reflectors. Swr of 1.06 to 1 with the antenna mounted on the back-porch railing using a clamp and a bracket method of mounting.

December 4: Orbit 99, 6:23-6:32 am using IC-290H/turnstile and reflectors. Negative results. Participated in teleconference call number 2, 4:00-5:30 pm. Much valuable info was shared among all participants. Also the fact that W5LFL should be on the air much of Wednesday and Thursday. I was hoping that this meant that Hawaii would somehow be included in the activity! Orbit 106, 6:50-7:02 pm. Negative results.

December 5: Orbit 120, 3:41-3:52 pm, negative results but now keeping better records—separate log sheets for each orbital pass plus a note as to starting the magnetic recorders. Yes, I wasn't about to miss any possible activity with just one recorder! Orbit 121, 5:09-5:20 pm. Negative results. Orbit 122, 6:38-6:50 pm. Results negative.

December 6: Orbit 137, 7:28-7:36 am. Negative results. Orbit 132, 9:00-9:12 am. I didn't take part in this one. This was an active orbit scheduled for Canada. Learned via Juan KH6JJC that KH6ENC club station manned by KH6F was thought to have completed a 2-way with W5LFL. This was not confirmed as reception of *Columbia* was very marginal at best as it was practically on or beyond the horizon. Orbit 137, 4:58-5:08 pm. Negative results. Orbit 138, 6:27-6:38 pm. Also negative results. On these two attempts, used 7290 kHz as sort of an intercom (outer-com?) with Juan KH6JJC on Kauai and Larry AH6EQ on Oahu to compare and exchange notes.

December 7: Orbit 147, 7:19-7:28 am. Negative results. Orbit 148, 8:47-8:55 am. I did not monitor the orbit as it was during working hours for me. Also learned ahead of time that this pass would not be a good one for us. This info via KH6JJC and apparently coming from the NASA Tracking Station at Kokee, Kauai, Hawaii. This was the pass over Hawaii that W5LFL was heard calling KH6HA several times. According to the stations reporting the incident, it sounded like a scheduled event. This could have been confirmation of perhaps yet another 2-way in the Hawaiian Islands! Orbit 153, 4:43-4:52 pm. Negative results on perhaps the last of the good orbital passes over the islands. Orbit 154, 6:17-6:24 pm. Last chance even though the pass was very low to the horizon. I used the Isopole antenna instead of the turnstile to get the signal down towards the horizon. Again, negative results. Compared results and notes with KH6CC, KH6S, and KH6IJC on 7290 kHz. It was noted on several occasions that there was visual contact with the *Columbia* with a corresponding negative radio QSO! The experience was great, and with such experience, perhaps the next attempt will be fruitful! Aloha from the 50th state, Hawaii!

Dean Manley is a 51-year-old Extra-class licensee who resides in Hilo, Hawaii, with his wife and two daughters. He is a machinist-technician, International Typographical Union, with the Hawaii Tribune-Herald, *and also is self-employed as a consultant in broadcast radio, FCC applications, etc. Dean has owned radio stations in Michigan, New Mexico, and Hawaii, and also is a published writer (his "Putting the HW-12 on 160" appeared in 73 many years ago).*

KH6HHM

Emil D. Bruner KH6HHM
45-626 Mahinui Rd
Kaneohe HI 96744

The shuttle flight is over but not forgotten. We were unsuccessful in making contact with Owen Garriott as he passed McKinley High School and the island of Oahu in the Pacific, but the excitement and anticipation of the possible QSO with W5LFL was felt by all the members of McKinley High School's Amateur Radio Club (KH6NF) and by other students on campus. For the students handling the equipment and those responsible for tracking the shuttle using the Apple computer, this was especially true. Everyone felt confident that they were doing their jobs correctly as several dry runs had been performed and it looked A-OK. As the shuttle passed by the islands time after time, it was a letdown for the students not to be successful in making contact after all of their hard work and dreams.

Back in September, at the start of the school year, when the club members heard about the shuttle and the possibility of having a QSO with W5LFL, everyone wanted to give it a try. It would be a new experience for everyone, as no one thought he would ever have a chance to talk to an astronaut.

Everyone started gathering as much information about the shuttle flight as they could find and also information about the antenna system needed to reach the shuttle. We had an Apple computer to use, so part of our research was to find a way of using it for tracking the shuttle and perhaps even controlling our antenna as the shuttle passed overhead.

Gathering the materials for the antenna system wasn't hard once

the decision was made that we would try our luck using a quad. In fact, just for luck, we would build a 2-element quad and if we needed a little more gain, a 4-element quad would be built and placed side by side. Afterwards, we could always put them to use, and building the antennas, tuning, and comparing their performance would be a learning experience for everyone.

We decided to use our old 32-foot Tri-Ex crank-up tower that a few years ago became a 16-footer during a windstorm. It was still in good shape after it made a trip to the metal shop to get a few spots welded and a new base plate made. For antenna control, we had available two light-duty rotors, one for bearing and the other mounted horizontally for vertical control.

Material for the quads would be PVC pipe and wooden dowels for spacers, with copper wire for the elements. Building the antennas went smoothly as we used plans and measurements from the *ARRL Antenna Book*. We had some problems getting the swr down to 1 to 1, and we had to unsolder the elements, replace them, and tune them one by one to keep the swr low.

Once that problem was solved, we looked at the best method of mounting them to our boom. This gave us our biggest headache because our antennas were of different size and weight. We also weren't sure if our rotor could handle the weight for our vertical control. This turned out to be our problem. Because the two antennas were of different size and weight, there existed an unbalance and our small light-weight rotor couldn't handle the difference in weight. We had control for only a few degrees and couldn't get the antenna to point directly overhead.

So it was back to the drawing board for a new design and equal distribution of weight on the rotor. After a few hours of experimenting, we solved the weight problem by making both antennas the same weight and mounting them as if they were both 4-element quads. We made the 2-element quad heavier by extending the PVC pipe behind the reflector and balancing it with an iron rod from the metal shop. Once the antennas were balanced, our problems were solved and they worked perfectly.

While the antenna problems were being solved, another group of students was in the process of getting the Apple computer to track the shuttle. This was completed at about the same time the antenna was completed and everyone felt they were ready, willing, and able for their first QSO with outer space. Our idea of using the Apple for control of the antenna had to be postponed for a later project due to time and availability of components, but it's just a matter of time and money.

It is hoped that the next flight of the shuttle will have a beacon so that at least the students will be able to hear it and know that they are doing something right. It is also hoped that Hawaii will be on the schedule of future flights where it will be possible to have a QSO with the shuttle. It's not too encouraging to know that perhaps a contact will be possible if there's any extra operating time.

The students were disappointed that no contact was made with the shuttle, but all felt the effort was worthwhile and all are looking towards the next opportunity for the Radio Club at McKinley High School (KH6NF) to have a QSO with a being in outer space.

Allan Chun WH6AVH and Dean Takamatsu make final adjustments on the shuttle/satellite antenna system located on the roof of the electronics and club station.

Chun Kit (Vincent) Lui putting the finishing touches on the tracking program using an Apple II+ computer.

SOME FINAL THOUGHTS...

Each of the foregoing diaries is a story in itself. On behalf of the staff and management of *73*, I wish to express to each writer our appreciation for taking on the added burden of documenting his own personal story as it unfolded. It's rare that people like this are brought together in such a way; each is well worthy of special praise.

While in the area of giving thanks, there are a number of others who must be mentioned. First, Owen Garriott W5LFL himself, the man who had the dream, worked at making it a reality, and then lived it with and for us.

Then, our good friend, NBC News Correspondent Roy Neal K6DUE. Someday the whole story of Roy's involvement will be told, but for now, it's safe to say that were it not for K6DUE, the STS-9 ham-in-space operation might never have gotten off the ground. Roy did far more than document the flight in "Amateur Radio's Newest Frontier" and file reports for NBC. For over a decade he lived Owen's dream with him and helped W5LFL become the world's first astro-ham.

To Peter O'Dell KB1N of the ARRL, there is no way to express our gratitude. Most of you are not aware that Peter regularly held teleconference meetings with every publisher in the amateur-radio field interested in reporting STS-9 ham-in-space events. Peter insisted that everyone have the same information as the ARRL was given—and have it quickly. For the past few months, KB1N was STS-9 at ARRL headquarters. He literally lived on a telephone 10 to 15 hours a day, flew to meetings in Houston, and spent the flight at Mission Control away from his family. Peter O'Dell is a dedicated and warm human being who deserves our collective thanks for keeping the needed information flow going at all times and keeping it as accurate and up-to-date as possible.

A word here also about NASA's Administrator, General James Abrahamson. He's not a ham . . . not yet, anyway. But General Abrahamson did recognize the value of experimenting with amateur radio from the shuttle and was the man who signed the papers welcoming amateur radio on the orbiter.

Finally, League President Victor C. Clark W4KFC. In our book, Vic was one of the best things ever to happen to the ARRL. He brought new meaning to that organization and was the person responsible for bringing the League into Owen's corner when he most needed its assistance. Vic's eyes would literally light up with pride every time he talked about STS-9, Owen Garriott W5LFL, and the ham-in-space operation. Sadly, Vic suffered a massive heart attack and died less than 2 days before STS-9 blasted into orbit from launch pad 39 at the Kennedy Space Center. He never lived to see or hear the dream of Owen Garriott—the dream he shared with Owen and countless others—become reality. Victor C. Clark W4KFC lived for and loved amateur radio. He lived and worked to better it worldwide. Vic was the "ham's ham," and it is to his loving memory that we have all dedicated this special report.—WA6ITF.■

Switch Tricks

Ever had trouble setting up switching? No more. The Minnetonka Master makes it easy.

Here are two no-nonsense approaches to switch-circuit design that anyone can use to advantage. With these methods, you will be able to draw a practical switch-circuit diagram for almost any switch-based idea you can dream up. The first is called the "Floating Circuits" method because parts of the circuit are disconnected and are floating free when they are not in use. The second is called the "Common Bus" method because in the early stages of the design process a bus (a set of connection strips or tie-points) is used.

Let's take a practical example of a switching-circuit design problem and solve it by both methods. I recently purchased a nice set of high-impedance headphones without cord or plug from a manufacturer's surplus store. To decide on what sort of plug and cord should be wired in, I looked over the various pieces of equipment where my new bargain could be put to use. It was obvious from the variety that I really needed several configurations of cord and plug, not just one.

It occurred to me then that it would be handy to be able to change the wiring of the phone cord from a stereo to a monophonic configuration without having to rewire or use an adapter. Moreover, it would be even handier to be able to transpose left and right when in the stereo mode and to change from parallel to series when in the monophonic mode. If one could just *switch* between these four functions, it would permit the use of the same pair of phones in several different applications. If all this complex switching could be done with just one switch, I'd have a foxy piece of equipment. How many times have you found yourself in this situation, but were stymied by your inability to convert your wiring concept into an electronic circuit?

This is a typical switching problem and one that lends itself well to solution by the Floating Circuits and the Common Bus approaches. With a little patience and practice, you can be designing fairly complex switching circuits simply by following a few easy steps.

1) Find a quiet spot where you can think with no interruptions. Arm yourself with a few pencils, a pad of paper, and an eraser. (There are old-timers who claim that after the brain, the eraser is the circuit designer's most important tool.)

2) So that you can have a convenient overview for reference and comparison, sketch, on a single page of paper, the circuits of each of the functions to be included in the new device. In our headphone example, there are (A) Stereo Normal, (B) Stereo Reversed, (C) Mono Parallel, and (D) Mono Series. Draw these circuits as if they were hard-wired for a single function, as in Fig. 1. Our goal will be to interconnect these four circuits with a single multi-pole, multi-throw switch.

3) Take a fresh page and, using the whole page to provide plenty of working room, sketch in the components to be worked with. In this case, the components are: the right earphone, the left earphone, the three-wire phone cord, and the phone plug. Since the switching obviously is to occur between the ends of the three-wire cord as the input terminals and the four connections to the two earphones as the output terminals, a fair amount of blank space should be left between input and output for circuit development. (See Fig. 2.)

4) Now two simple rules for adding the switching can be applied:

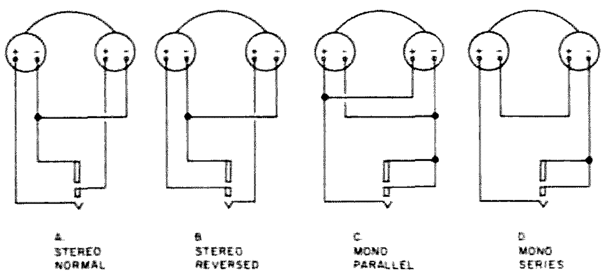

Fig. 1. Sketches of all circuits desired.

(a) Always connect each input terminal and each output terminal to the movable arm (called the wiper, blade, or pole) of a switch symbol, and give each a number for convenience of location. (The example has seven such terminals, numbered from 1 through 7.)

(b) For each switch arm, sketch in as many contacts (throws) as there are functions desired, and identify each with the letter corresponding to the function circuits you drew in your Fig. 1. Keep the same sequence from left to right in each switch set. (The example has four functions, so each switch assembly will have contacts A, B, C, and D.)

When you have gotten this far, your sketch will resemble Fig. 3 and you are ready to start drawing in the function circuits of Fig. 1. To familiarize you with the techniques, these circuits will be "wired" to the proper switch contacts first by the Floating Circuits method and then by the Common Bus method since often it is possible to gain additional advantages by evaluating both approaches.

5) In the Floating Circuit method, a single circuit and a single set of contacts are dealt with at a time until all four circuits have been connected. Begin with the circuit for function A and each switch assembly's contact A. Start with the input connections. Sketch in circuit A, connecting the input contacts 5A, 6A, and 7A to the appropriate inputs of the circuit, and then sketch in the output connections to 1A, 2A, 3A, and 4A. When this is done and checked, sketch in circuit B, making the proper connections to all seven contact Bs. Do the same for circuits C and D. With all four circuits drawn in, it will resemble Fig. 4.

Note that when all seven switch arms are swung to contact A simultaneously, circuit A alone connects input to output. When all seven switch arms are swung to contact B simultaneously, circuit B alone connects input to output, and so forth. Switches whose arms are connected mechanically so that they all may be swung simultaneously to a specific set of contacts are said to be "ganged." This is usually represented in a diagram by a dotted line. In the switching diagram you have just designed, every circuit except the one in use floats completely free of electrical connection to the working circuit. In certain rf applications (such as bandswitch circuits), this can be a desirable characteristic.

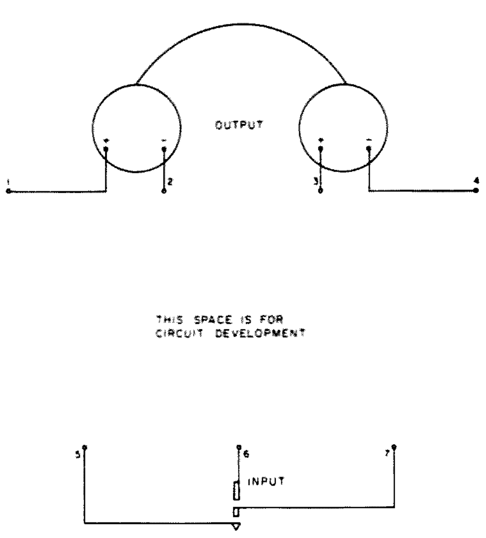

Fig. 2. Sketch of components needed for circuits.

6) The Common Bus method will now be applied to solve the same problem in hopes of obtaining some simplification advantages. Taking a fresh page of paper, redraw Fig. 3 leaving plenty of room for circuit development. Sketch in a horizontal bus whose number of parallel elements is equal to the largest number of terminals in either the input or output. The example has a three-terminal input and a four-terminal output, so the bus will have 4 parallel elements. These are represented schematically as four parallel lines. Your sketch should look like Fig. 5.

7) Sketch function A's circuit between the contact As of all seven switch assemblies. (Such circuits are made easy to sketch by thinking of the bus elements as a convenient set of tie points.) Starting at the end of the circuit with the least terminals, in this example the input, connect each input switch contact A (5A, 6A, 7A) to a separate element of the bus. To complete the circuit, it is necessary only to connect the output contact As each to the proper bus. Check the work against A in Fig. 1 to ensure correctness.

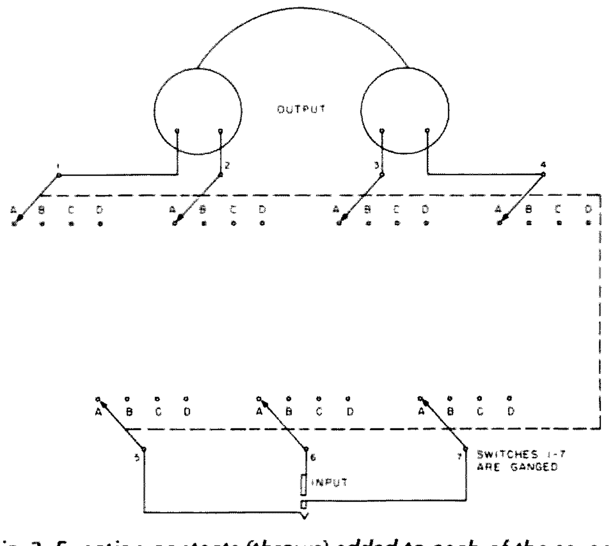

Fig. 3. Function contacts (throws) added to each of the seven terminals.

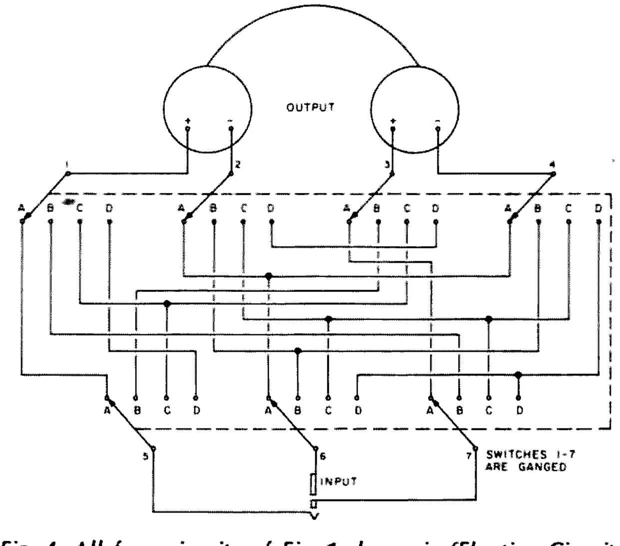

Fig. 4. All four circuits of Fig. 1 drawn in (Floating Circuits method).

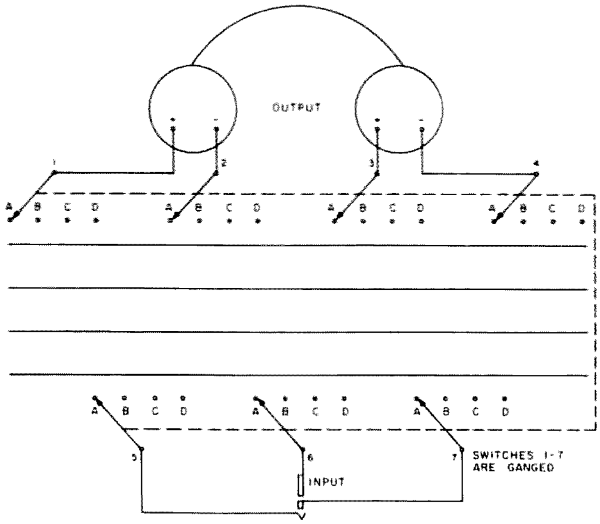

Fig. 5. Bus bars added to Fig. 3 sketch.

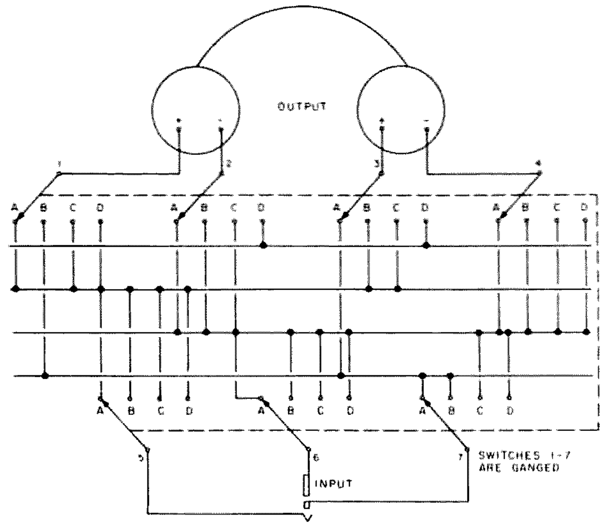

Fig. 6. All four circuits of Fig. 1 are drawn in (Common Bus method).

8) Now take your eraser and erase all seven switch arms that connect to contact A. Redraw them, this time connecting them with contact B. This may seem childish, and you may believe you'll remember that you're working with Bs instead of As, but as switching complexity builds, use every design aid that helps to keep you from getting mixed up.

9) Circuit B now can be sketched between the contact Bs of all seven switches. Looking at the input first, we see that all three input Bs can be connected to the bus elements as before. To complete circuit B, it again is necessary only to connect the output terminal contact Bs to the proper bus, using B in Fig. 1 as a guide. Both stereo functions are now designed in. Check your work carefully.

10) After erasing the switch arms on all seven switches and redrawing them all in the C position, circuit C can be sketched between the contact Cs. As usual, we start at the input end and connect the contact Cs to the bus. This time, however, it can be seen from the circuit diagram that while input terminals 5 and 6 connect to the bus as before, terminal 7 must connect with terminal 6. This is easily done using the proper bus element as the tie point. Whenever possible, all circuit connections are made via the bus elements. To complete circuit C, one now simply connects the output terminal contact Cs to the proper bus elements, according to C in Fig. 1. Checking this new addition requires care since one must be certain that no unwanted pathways are possible through parts of the circuit that are not in use.

11) Putting the eraser to good use once more, the switch arms are all transferred to contact D. Circuit D can be added now, checking it carefully against D in Fig. 1. The input terminal contact Ds are connected as they were for function C. To complete circuit D, the bus elements are used as tie points for output connections 1D and 4D as before, and in addition, it is now necessary to use the fourth bus element as a jumper between contacts 2D and 3D to complete the circuit. Your switching circuit should now look like Fig. 6.

This completes the functional design but it doesn't complete the circuit diagram. Multi-pole, multi-throw switches are not the cheapest of components, so one wants to keep them to as few sections as possible. Moreover, the more poles they have, the bigger they must be. Additionally, a good circuit becomes a better circuit if it can be simplified: There are fewer connections to be made and therefore fewer chances for mistakes; there are fewer components to fail, and there is less of a headache to treat when servicing. For these reasons, we must include two more steps in the design of our prototype switching circuit to provide analysis and simplification.

12) It's at this point that you will appreciate having chosen an area for work where you can be free to think without interruption. Look closely at your version of Fig. 6, noting carefully the connections made to each switch assembly, with an eye to simplification. Observe what has happened: The contacts of switch 4 all connect to the same bus element as do the contacts of switch 5 and switch 6 respectively. If all contacts of a switch connect to the same point electrically, it provides no function and generally can be eliminated and replaced by a single connection. This allows the elimination of switch assemblies 4, 5, and 6 and more than two dozen connections. You'll appreciate this

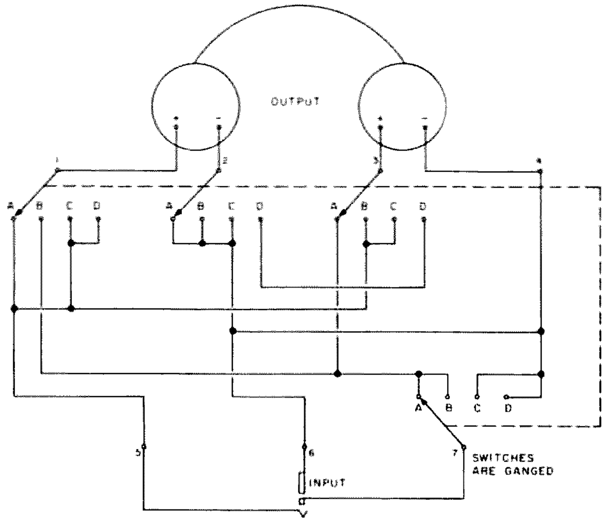

Fig. 7. The simplified system.

when the time comes for purchasing the switch and wiring it in.

13) The last step is a refinement of the previous one. Wherever the "artwork" in your circuit diagram can be simplified or clarified without sacrifice of function, do so. Replace redundant pathways with a single one; remove nonfunctional blind ends from the bus elements (the bus may disappear entirely in some designs); use short interconnections instead of long ones; minimize the number of crossovers wherever you can. When you are done, your prototype circuit will look like Fig. 7 and any of the four functions can be selected with a single 4-pole, 4-throw switch. In my prototype headphone set there was room to mount a midget 4-pole, 4-throw rotary switch in one of the phones, giving a good professional appearance.

A few words of advice: While the methods outlined above are good tools for helping the beginner solve complex switching problems, they are not the only ones and they do not substitute for good old-fashioned common sense. There may be times when the problem is solved best by a combination of methods or by one of the many other ones available. Many complex commercial design problems in switching are now solved by computer, for example. But by whatever means you derive a switching circuit, it must be checked and rechecked to ensure freedom from unwanted pathways lurking in the wiring, quite unsuspected.

When used with reasonable diligence, the methods described here provide the beginner with an excellent starting point and often the complete solution for most switching design problems.■

LEDs You've Never Seen

What are these little lights? What do they do? This is the book.

Calvin R. Graf W5LFM
207 Zornia
San Antonio TX 78213

The light-emitting diode (LED) is indeed an amazing solid-state light. Its development, application in the electronics and electrical world, and acceptance by the consumer, housewife, student, and everyday person are as amazing as those of the transistor. In fact, the LED is a very close kin of the transistor—they both are solid-state devices, have junctions of P and N material, use very little power, and generally operate for a lifetime. In this article, we will detail the history, theory of operation, types, and functions of the LED, describe some applications, and take a look into the future of the LED.

History

As with many inventions and innovations in science and technology, the origin of the LED goes back many years. It was in 1907 that Henry J. Round, an electrical engineer, touched two wires connected to a battery to a piece of crystal of silicon carbide that had been found near Niagara Falls, New York. Using a potential of 10 volts dc, he connected the two wires across the two points on the crystal and found that the crystal gave out a yellowish light. Again, as with many great discoveries, he could not possibly have known of the terrific impact his "flashes of yellow light" would have on our daily lives some 60 years later. For additional details on the LED, consult the book *Light-Emitting Diodes* by Forrest M. Mims III (Howard W. Sams and Co., Indianapolis, Indiana).

It is interesting to note that the first light emitted by an LED was yellow, as this color was to be one of those produced later in commercial quantities, red being the only color developed cheaply enough at first to be used in great quantities. Red LEDs were followed by green LEDs and then the orange or orange-red color came along. Blue LEDs are still expensive and are not readily available to the popular experimenter.

The LED is a source of cold light, much like the fluorescent lamp which is gaining so much popularity as a means of conserving energy, as it generates little heat and is much more efficient than an incandescent lamp. If Mr. Round had kept his yellow flashes of light burning continuously all this time, there would still be about 30 years to go before he would notice his light decreasing slightly in intensity. Because the lifetime of an LED is so long—100 years—its lifetime is measured by its intensity or light output. When it is half as bright as it was, about 100 years will have gone by. Assuming linearity, when it is one-fourth as bright, 200 years will have gone by! The LED is indeed a Star Trek timing device for traveling to far galaxies. When it is completely out, 1000 years will have gone by! Contrast that to the 75-Watt incandescent light bulb which lasts an average of 750 hours (4½ weeks continuously) before it goes "poof" in a flash of no light.

Theory of Operation

Let's take a close look at the LED to see how it produces light. In Fig. 1, we see a PN junction which is the building block for all solid-state devices such as LEDs, diodes, transistors, and other current-controlled devices. Following electron theory that like charges repel and unlike charges attract, the anode of the PN junction of the diode will attract electrons, while the

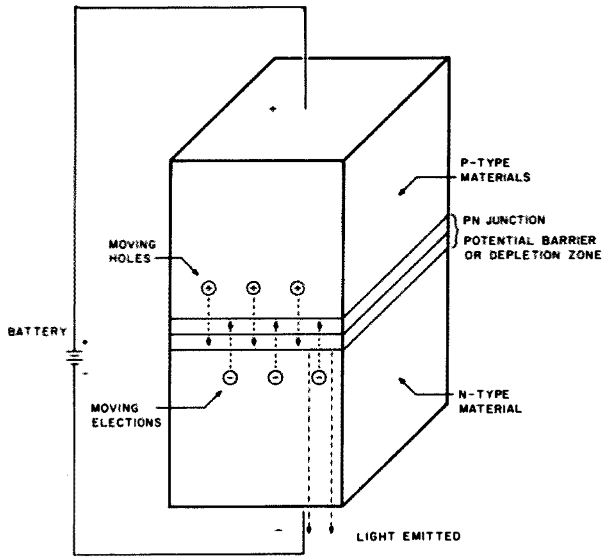

Fig. 1. Forward-biased PN junction emits light when excited electrons return to rest state.

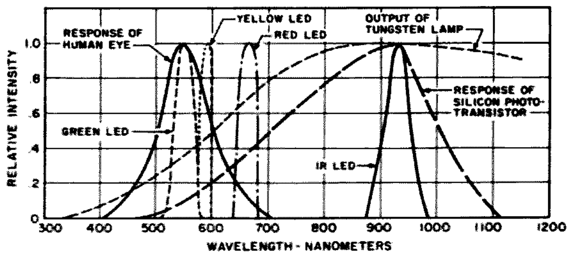

Fig. 2. Wavelength plotted against radiant energy output from green, yellow, red, and infrared LEDs.

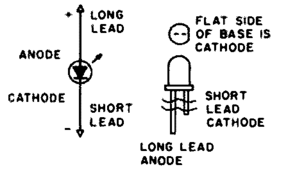

Fig. 3. Basic single-color LED.

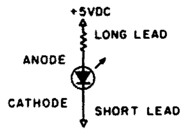

Fig. 4. LED with current-limiting resistor in same case.

cathode (negative) of the diode will attract positive "holes" (an atom missing an electron). This movement of electrons and holes constitutes a current flow and will continue as long as the voltage polarity is as shown in Fig. 1. The diode is forward-biased (anode positive) at this time and causes current (electron) flow. When the polarity is reversed (anode negative), the diode is said to be back-biased and almost no current flows. The electrons move across the PN junction to fill holes and the holes move across the junction to occupy spaces (holes) vacated by the electrons.

Light is generated when an excited electron returns to its normal state of equilibrium by combining with a hole in the valence band, its state of rest in the atomic structure. The PN junction diode is the device for raising a number of electrons into the excited state so that they can fall back into a state of equilibrium and produce light while doing it. The N side of an LED junction absorbs much less light than the P side, so the N side is usually employed as the main light-emitting region of the LED. They are usually made so the light generated at the PN junction has to travel just a short distance before being emitted into space where we see it as light. When you hold a lighted LED up close to the eye, you can see the cat's-whisker-type wire terminal connection going over to the PN junction from whence cometh the light.

Wavelength of Operation

The wavelength of operation for each of the colored LEDs is shown in Fig. 2. Note that the green LED is at a wavelength of 555 nanometers (10^{-9} meters), the maximum sensitivity of the human eye, while the red LED is at 660 nanometers where the eye "sees" only 5% to 10% of the total radiant energy from the red LED. And, of course, the infrared LED energy output is at the long wavelength of 900 nanometers which we can't see at all.

Types and Functions of LEDs

The pocket calculator and quartz crystal wristwatch really introduced LEDs to the general public. These were in the form of seven-segment numerals used for the display where each segment of the numeral was made up of one or more LED strips or a matrix of dots. There is little doubt that the pocket calculator was made possible by the development of the LED display, as all other types of displays were too large or required large amounts of electrical power. The liquid crystal display (LCD) which has become popular in wristwatches and pocket calculators was not perfected until a number of years had gone by. The original LCDs were affected by operating temperature and bright sunlight so that they had to be replaced by a jeweler every several years. In the section below, we will discuss the types of LEDs which have been developed to date and which have specific functions. We will then take a closer look at how these types may be applied to specific and general applications.

LED. The basic LED is a single-color, on-off device. Fig. 3 shows the symbol for the basic LED which can be obtained in colors of orange, green, yellow, and red. They are always used in conjunction with a current-limiting resistor. This simple LED is used as an on-off indicator, as a segment or dot matrix for numeral displays, the transmitter for optical couplers, and the like. The voltage drop across the LED itself is 1.6 V dc for red and a nominal 2 volts for green.

LED with Current-Limiting Resistor. An LED must always be operated with a current-limiting resistor in series. Fig. 4 shows a symbol for an LED with a series resistor packaged within the epoxy case. These units are designed for operation at 5 V dc TTL logic level and are available for other operating voltages.

LED with Resistor and Diode. When an LED is operated off an ac voltage, it must be provided with reverse-voltage protection as the reverse-voltage breakdown is a nominal 3 to 10 volts. This protection must be in the form of a diode or another LED in reverse polarity parallel with the LED. The average signal diode can withstand 50 to 100 volts peak inverse voltage (piv), but the average LED is limited to a nominal 3 V dc piv. Fig. 5 shows an LED complete with series dropping resistor and a reverse-protection diode, all in one package. Even though there

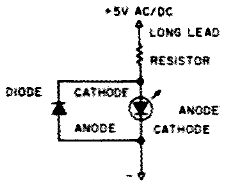

Fig. 5. LED with combined current-limiting resistor and reverse-protection diode in one package.

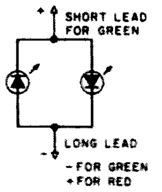

Fig. 6. Tri-color LED is achieved through reverse-parallel connection of 2-color LED chips.

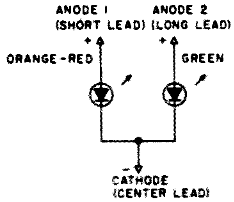

Fig. 7. The dual-color LED has 3 pins and is mounted in a single epoxy package.

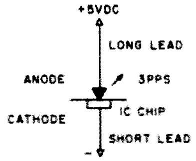

Fig. 8. Proposed graphic symbol for flasher LED. The IC chip is molded into the plastic case.

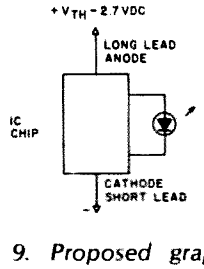

Fig. 9. Proposed graphic symbol for a voltage-sensing LED. The LED turns on within 10 mV of the threshold voltage, V_{TH}.

are 3 electrical components in the package, they are available for about 36¢ in quantities of 1000. A 5-volt source can be used to drive these type LEDs directly; they are also available to interface with a 12-volt source, ac or dc.

Tri-Color LED. The tri-color LED is really a two-color LED connected in reverse polarity paralleled in a single package as shown in Fig. 6. Two LED chips of different colors (red and green) are packaged in the same epoxy case. The characteristics of the chips are chosen so that when the red LED is on it appears as bright as the green LED when it is on. The red is at a wavelength of 697 nanometers while the green is at a wavelength of 565 nanometers, close to the maximum sensitivity of the human eye. These LEDs have a typical light output of about 2 millicandelas (2 thousandths of a candle power) at a current flow of 10 mA. As the LEDs provide reverse-polarity protection to each other, the unit can be operated on an ac voltage (with suitable dropping resistor). When operated on 60-Hz current, one LED will be on when the voltage is positive and the other LED will be on when the voltage is negative. To the eye, the LEDs will appear to be yellow or yellow-orange since the eye will integrate the discrete flashes of red and green and turn them into a yellow-orange. We will discuss the effect further under Applications of the LED.

Dual-Color LED. Once again we have two LED chips mounted in one package to simplify circuit design. However, the dual-color LED has two separate anodes and a single cathode connection as we see in Fig. 7. This LED package has 3 pins since the two anodes have separate pins while a common cathode connection is used. This type of LED is useful as it replaces 2 separate panel indicators, with the 2 color leads simultaneously available. The unit is suitable for dynamic color multiplexing and is ideal for an active visual indication of binary and trinary electronic states (orange-red—on or off, green—on or off, both—on or off).

The Flasher LED. This LED does not wear a raincoat which it "flashes" 3 times per second, as its name might imply. It does, however, have a built-in IC chip which acts as a timer so that current pulses through the LED, flashing its red light 3 times per second. As there is no standard graphic symbol for the flasher LED, the symbol shown in Fig. 8 is proposed and has appeared in several magazines.

The IC chip which is molded in with the LED in an epoxy case is usually visible through the red plastic case as a small black square dot about the size of a letter *n* of the print in this magazine. Considering the size of the chip, it is amazing to think that it is able to not only time the flash rate but also control the passage of 20 mA at 5 volts through the LED. Try doing that with discrete RC components the size of a pinhead! The red light output is 1.2 millicandelas at 5 V dc. No external parts are required, and it will operate directly off 5 V dc TTL logic level. The typical flash rate is 3 flashes per second at 5 V dc with a peak emission in the red spectrum at a wavelength of 650 nanometers.

Voltage-Sensing LED. This LED also makes use of an integrated circuit to perform its function of sensing the voltage level applied across its terminals. When the input voltage exceeds the threshold voltage, V_{TH}, the LED turns on. In fact, it "snaps on" within 10 mV of a nominal 2.7 V dc and will stay on as the voltage continues to increase up to a maximum of 5 V dc. This LED can be used as a push-to-test battery voltage tester, VU meter, etc. Fig. 9 shows the graphic symbol for the voltage-sensing LED, and again the symbol shown is proposed. Within the IC chip is a temperature-compensated reference voltage and a high-gain comparator which provides an unambiguous indication by the LED turn-on of the input voltage with respect to the threshold voltage. Through use of an external resistor, diode, or zener in series with the LED chip, the threshold voltage may be increased to any desired voltage. When a resistor is placed in parallel with the LED chip, the LED may be used as a current-sensing device. Refer to the Applications section for additional details.

Infrared LED. In appearance the infrared LED looks like any ordinary LED, whether it is housed in a red or clear epoxy case. The only thing is that the human eye cannot see the IR energy, so you can't tell whether it is on, off, good, or bad. The IR LED is used as a transmitter in intrusion devices, as the send end of a communications line (fiber optic or line-of-sight), as an object counter in conveyer belts, and for automatic flushing of urinals. Fig. 10 shows the graphic symbol for the IR LED. Note that it is identical to the visual LED except that IR has been added to the arrow light symbols. In the Applications section, we will discuss how you can easily tell if the IR LED is operating properly.

Applications of the LED

In this section we will discuss some applications of the various types of LEDs. Other applications will come to mind as you become more familiar with the capabilities of this really marvelous solid-state light.

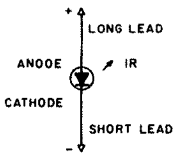

Fig. 10. The IR LED looks identical to the visible LED except its wavelength is longer and the eye cannot see its emission.

USE 1/2 WATT RESISTORS

Fig. 11. Circuit for red LED drawing 20 mA at voltages shown.

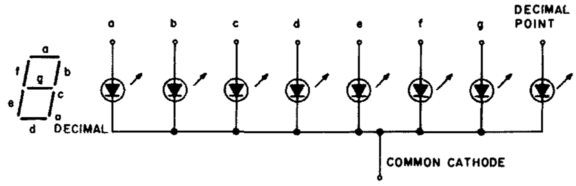

Fig. 12. Seven-segment numeral display with common cathode.

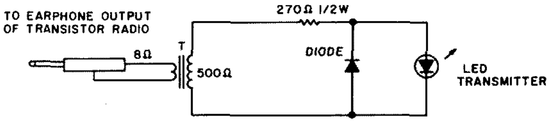

Fig. 13. An LED transmitter modulated by a transistor radio earphone output.

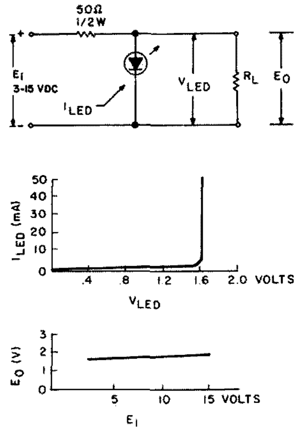

Fig. 14. The LED can serve as a voltage regulator for low current needs.

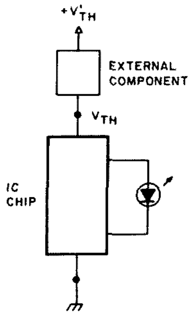
Indicators. In their simplest form, the LED is used as an indicator of the presence of a voltage or current—a pilot light. But it will never burn out in your lifetime. Always use a current-limiting resistor to limit the current to 5 to 20 mA depending on the LED. Fig. 11 shows a circuit for LED operation at 20 mA for 3 V dc, 5 V dc, 12 V dc, and 24 V dc. The voltage drop across the red LED is 1.6 V dc and the green LED is a nominal 2.1 V dc.

Displays. Alphanumeric displays were the first to take advantage of the low power consumption of the LED, the first of these being the 7-segment numeral so widely used as pocket calculator displays. These numerals usually have a common cathode or anode as shown in Fig. 12. The 7 segments are lettered a through g for identification. A separate dropping resistor is used for each segment. A binary-coded-decimal (BCD) decoder and driver are used to turn on the various segments to form a numeral or digit.

Communications. When used as a source of energy for light-beam communications systems, the LED is modulated in some manner by turning it on and off by intensity modulation (which the eye cannot observe much above about 12 Hz) or pulse position modulation. In Fig. 13, we see the circuit of an LED being modulated by the audio output from a transistor radio. The audio from this intensity-modulated light beam can be recovered by connecting a silicon or selenium solar cell across the audio input of a phono amplifier or any audio amplifier. This simple transmitting and receiving system will demonstrate the basics of light-beam communications. For many interesting details and experiments on light-beam communications, including historical details on Alexander Graham Bell's Photophone communication system using a sunbeam, see *Light-Beam Communications* by Forrest M. Mims III (Howard W. Sams, 1975).

Voltage Regulator. The voltage drop across an LED is rather constant, even with greatly increasing current through the LED. In Fig. 14, we see a circuit which uses an LED as a voltage regulator. The accompanying curve of current through the LED vs. the voltage drop across the LED shows how constant the drop is at



EXTERNAL COMPONENT	V'_{TH}
V'_{TH} — + – — V_{TH} SCHOTTKY DIODE	V_{TH}+0.45V
V'_{TH} — — V_{TH} DIODE IN914	V_{TH}+0.75V
V'_{TH} — — V_{TH} RED LED	V_{TH}+1.6V
V'_{TH} — — V_{TH} ZENER DIODE	$V_{TH}+V_Z$

Fig. 15. The threshold turn-on voltage can be increased by using an external component with the voltage-sensing LED.

1.6 volts for a red LED. The voltage input range can be increased by placing a number of LEDs in series or the output current capacity of the LED regulator can be increased by paralleling several LEDs. The circuit is especially handy where the load current is not great; at the same time, the light LEDs will indicate circuit operation.

Voltage-Sensing. The nominal 2.7-V-dc threshold voltage of the voltage-sensing LED can be increased in several ways by applying in series with the LED other devices that have known fixed voltage drops. In Fig. 15, we see how these various external components such as an LED, a diode, etc., are placed in series with the sensor to increase the turn-on voltage level.

Stroboscopic Light Source. LEDs can be turned on and off in a matter of nanoseconds. Because of this capability, they can be used as a stroboscopic light source. The most common application of such a light source is the home music record turntable. They ordinarily use a neon bulb with an orange glow to indicate when the turntable is running at the desired speed. The neon bulb will flash at the rate of 120 flashes per second when operated off 60-Hz power as the neon gas ionizes on either polarity of the line voltage. A single LED, however, will flash at a 60-Hz rate when configured as in Fig. 5. Two red or green LEDs can be made to flash at 120 flashes per second when connected in reverse polarity parallel as shown in Fig. 6.

Light Flashers Light Source. The light output of LEDs has been increased over the years by manufacturers as new materials and techniques have become available. Today, the light out-

put from an LED can be as bright at 5 mA as it used to be at 50 mA. Early LED light intensity output was 1 to 5 millicandelas, but now they are available with outputs around 100 millicandelas in the green spectrum. One bright green LED readily available is the Xciton XC-5549-G24 which puts out 24 millicandelas at 10 mA. This LED is bright enough to cast a green spot 3 feet away and can be ganged (paralleled) to make a solid-state flashlighter that can be placed in series with a common dropping resistor. Remember, the green LED has a nominal operating voltage of 2.4 to 2.7 V dc depending on the type of material used in manufacture.

A circuit for flashing the LED is shown in Fig. 16. This circuit uses a 3909 LED flasher-oscillator IC chip (National LM 3909 or Radio Shack 276-1705) to pulse the current through the LED. With the circuit values shown, the LED will flash once each second for about a year using 2 C-cells. The unit can be packaged in a spray-can top and will serve as an attention-getter placed in a window to indicate to all that can see it "that the intrusion warning device is on and armed"; it also makes a great conversation piece for your desk. The 3909 IC chip is available for about $1.00 at local electronics stores.

The flasher LED which operates at 5 V dc and flashes 3 times per second has an internal IC chip which is sensitive to light. This phenomenon can be used to change the flash rate of the LED. Certain flasher LEDs can be used as sensors to tell the difference between a cloudless, sunlit sky and a cloud passing in front of the sun. Try several flashers until you find one that shows this effect best. In Fig. 17, we see a cross-section of a flasher LED by AEG-Telefunken (CQX-21); in Fig. 18, we see a block diagram of the electronics that is inside the IC chip.

In Fig. 19(a), we see a green LED placed in series with a red flasher LED, both of them across a 9-volt battery so that they flash in unison. A piezo sounder can also be placed across the green LED to pulse each time the green LED flashes. There is no current drawn from the battery during the off-duty cycle. The piezo sounder is available from Radio Shack as RS 273-060.

Fig. 19(b) shows 2 flashers placed in series with a green LED; now we find that the LEDs pulse in series so that they go "blink-blink, blink-blink," while the piezo sounder goes "beep-beep, beep-beep." The flash rate and current drawn from the 9-volt battery are also shown in Fig. 19. The circuit should flash for several years off a type-F (6-volt) battery.

Linear Indicator Display Meter. Because the LED can respond instantaneously to applied voltage, use of the light-bar voltage or signal-amplitude linear vertical or horizontal meter has become popular. These light-bar meters are especially popular in the audio and music entertainment field as the moving display is rather dynamic in operation. They will be used more and more in the future because the linear scale can be observed from a distance considerably further away than can an ordinary meter with moving needle.

Visual AND, OR, and NOR Gate Indicators. The dual-color LED can actually display 3 color conditions plus off to indicate the logic AND state (red *and* green on), OR state (red on *or* green on), and NOR state (neither red *nor* green on; both off). With the red and green on at the same time, the color will appear yellow or orange to the eye. The tri-color reverse-parallel-connected LED will indicate red, green, or yellow in color. These will indicate the logic states as described above but can also be used to ascertain a voltage polarity state such as green for a positive voltage, red for a negative voltage (or current reversed from the green or positive voltage), or yellow for an ac voltage.

Light Detector or Sensor. All semiconductor junction devices possess some degree of light sensitivity. Glass-encased diodes, LEDs, and transistors are all light-sensitive. An LED is in effect a bi-directional photovoltaic device. That is, voltage applied to the LED causes it to emit light. But shine a light on the LED and it will produce a small voltage across its terminals. Fig. 20 shows an LED being driven by a transistor radio output; a few inches away, an LED acts as a light pick-up feeding an audio amplifier. With this simple arrangement, you will be able to demonstrate this light fantastic of the LED. In-

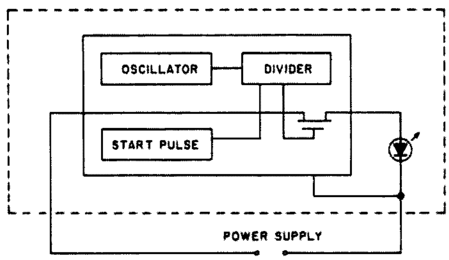


Fig. 18. Block diagram of the electronics within the IC chip of the CQX-21 Blink-LED.

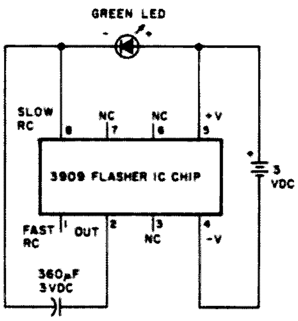

Fig. 16. This IC chip circuit will flash an LED once per second for about a year on 2 C-cells.

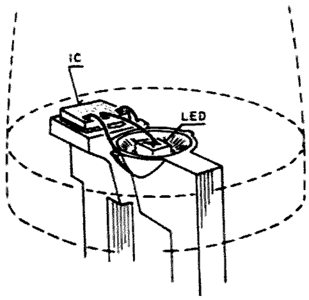

Fig. 17. Cross-section of the construction of the AEG-Telefunken CQX-21 Blink-LED.

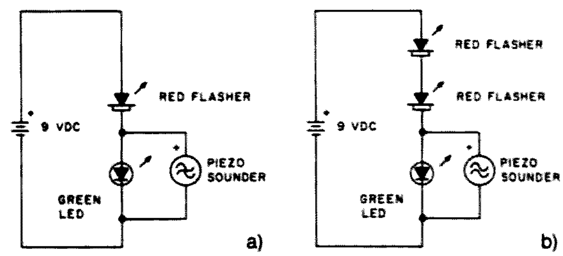

Flashers	Flashes	Current
1	30/minute	15 mA
2	40 pair/minute	5 mA

Fig. 19.(a) Red flasher LED connected in series with a green LED. (b) Two red flashers connected in series with a green LED.

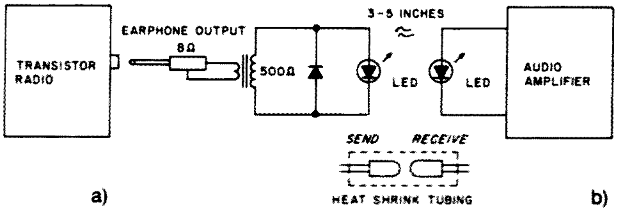

Fig. 20. The LED used as a transmitter and detector of light energy. Transmission through space is shown in (a), while (b) depicts the use of the LED as an optical coupler.

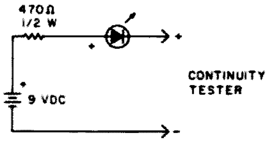

Fig. 21. The LED used as a continuity tester by adding a battery and resistor.

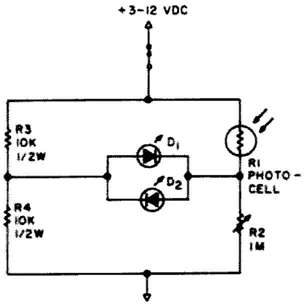

Fig. 22. A light-sensitive Wheatstone bridge which uses two LEDs to indicate when the bridge is balanced.

frared LEDs have greater sensitivity to light than do visual LEDs.

As a further demonstration of the light effect of a diode, take a glass-encased diode and connect it across the input to your audio amplifier. With the overhead lights on, you should be able to hear a 120-Hz hum with the audio gain turned up. Cover up the LED with your hand and the hum will go away.

You can make an LED optical coupler by using two LEDs head-to-head and held together by heat-shrink tubing which has been shrunk around the two LEDs. Either end of the coupler can be the send or receive link.

Intrusion Detector Light Source. As described earlier, the IR LED can be used as a transmitter for an intrusion device which bounces an invisible beam around a room. Through the use of mirrors, a room can be criss-crossed with the invisible beam light. When the beam is interrupted by anyone, an alarm is sounded. In the next section we'll discuss how you can tell if an IR LED is "alive and well" even though you can't see its radiation.

Continuity Tester. The LED can be used as an inexpensive continuity tester by connecting it as shown in Fig. 21. Use two AA cells to provide 3 V dc or use a 9-volt transistor battery that has been discarded as it will provide many months of additional service. You can build the unit in a discarded plastic top from a spray can or a plastic medicine pill bottle. The LED will be brightest when the probes are shorted together (zero Ohms) and really dim for a high resistance (10k to 20k).

Voltage Tester. In Fig. 22, we see the circuit diagram for a voltage tester using an LED as the indicator of voltage level. With the values shown, the tester will operate over a voltage range from 1 to about 30 volts ac or dc. The LED will be dim at 1 V and bright at 30 V. The voltage tester will operate off ac or dc because of the reverse-polarity LEDs. In addition, because either LED will light up on an ac or dc voltage, it is not necessary to observe polarity of the probes before placing them across the circuit to be tested.

Wheatstone Bridge. The direction of current flow is indicated by 2 LEDs that are connected in reverse polarity paralleled as we have discussed before. Because of this indication, the LEDs can be used to take the place of a galvanometer in a Wheatstone bridge. The circuit is shown in Fig. 22 and the two separate LEDs or dual-color single plastic package can be used. A photocell is used to set a light level and a potentiometer is used to null the LEDs so they both go out or are equally dim. Then, as the light level is increased or decreased, by changing the light level or moving to or from the source, one or the other LEDs will become equally dim or almost out. In this manner, the same light level can be set by a room dimmer or walking toward or away from the light source.

The LED in Motion. As discussed earlier, the LED will flash on each time its anode goes positive with respect to its cathode. When an ac or pulsating dc voltage is applied to its terminals, the LED will flash on and off. If the flash rate is from about 12 to 16 flashes per second, the LED will appear to be on all the time because the human eye cannot observe the individual flashes. Most LEDs are stationary in use and we cannot observe the effect unless we can move the LED fast enough. In order to observe that a pocket calculator LED display is being turned on and off, that is, being multiplexed, move the lighted display rapidly in an arc at arms length. You will observe individual numerals or segments being multiplexed. In the section that follows, a means of flashing or pulsing the LED is described, but for additional details on the moving LED, see *One-Evening Electronic Projects* by the author (published by Howard W. Sams, 1980).

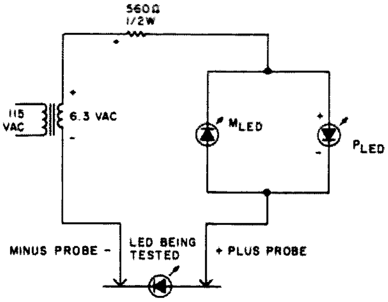

Fig. 23. This short-proof LED power supply and tester will work with any color or voltage LED.

An LED Power Supply and Tester

A question to be asked about any LED that you are going to use in a circuit concerns the condition of the LED and its connections if it is a numeral display. Also, how do you tell if an IR LED is OK to use in a circuit you are building? Fig. 23 shows a simple circuit that you can use to test any LED, diode, or transistor. You can use it to test any LED for proper operation, identify the anode and cathode in case the leads have been cut off, and identify the segments of any of the numeral digit displays. You'll be able to tell which LED is the brightest you have and separate them out by color before you install them in a circuit.

Looking at the circuit diagram you'll see that the probes have been labeled as Plus probe and Minus probe, and that the associated LED is also labeled P and M. Use a red or bright-colored lead for plus and a black or dark

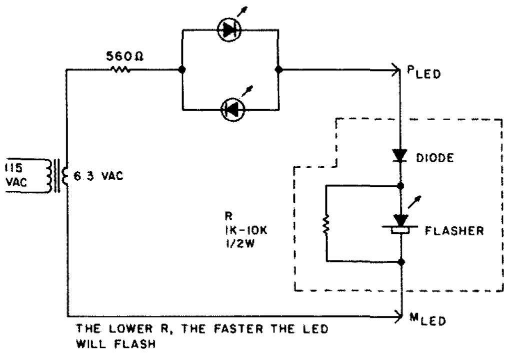

Fig. 24. By adding the components shown in the dotted lines, a flasher LED can be tested with the power supply.

lead for minus. When you short the test probes together, both of the tester LEDs will light as current is able to blow through the circuit in both directions because of the ac voltage. When you place an LED across the test probes, one or the other tester LEDs will light as well as the LED being tested. If the P LED is lit, the red probe is connected to the anode under test (and the black probe to the cathode of the LED under test). However, if the M LED is lit, the Plus probe is connected to the cathode of the LED being tested (and the Minus probe to the anode).

An IR LED can be tested in the following manner, which is the same test for any LED or diode. Let's use the diode for reference and look at the 3 conditions of that device. When a diode is good it will conduct in one direction and not the other. So on our LED power supply and tester, one LED will be on and one LED will be off. With a diode across the probes, either LED can be lit as it doesn't make any difference as long as only one is lit. The condition for a shorted diode is that it will conduct in both directions, so both LEDs would be on, just the same as when the test probes are shorted together. The remaining test, or circuit condition, for a diode is that it is open. On the LED tester, with the probes connected across an open diode, neither of the LEDs would be lit as there is no current flow through the LEDs due to the open circuit.

So now when we place an IR LED across the tester, we can tell whether it is operating properly, is shorted or open, even though we can't observe its radiation. There is no way it can be operating properly and not provide the correct symptoms of operation. And remember—you can test the LEDs in this tester without having to use a current-limiting resistor or concerning yourself about shorting the power supply leads as the supply is short-circuit-proof.

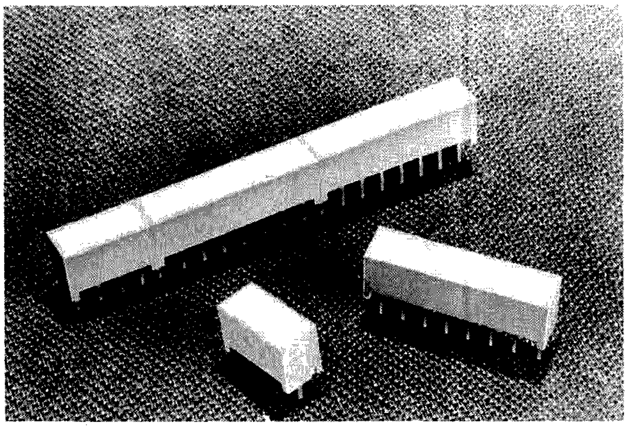

Fig. 26. A new Hewlett-Packard family of light-emitting diode light-bar modules is designed for use as back-lighting sources for display panels. (Photo courtesy of Hewlett-Packard)

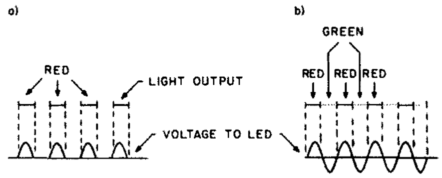

Fig. 25. A single-color LED strokes out a dashed line when moved (a), while a bi-color LED strobes out the two colors of the LED (b).

A flasher LED can be tested using the LED power supply by using several other components connected as shown in Fig. 24. The diode will provide a pulsating dc voltage to the flasher LED while the resistor across the IC chip will cause the flash rate to vary. The lower the resistance, the faster the LED will flash.

Strobing the LED

When we connect an LED to the power supply and move the LED back and forth in a short arc, the LED will be seen to strobe out a series of lines as shown in Fig. 25(a). This is due to the fact that the LED will be on only when the anode is positive with respect to the cathode. However, when we place a tri-color LED (red and green) across the probes and hold it stationary, it will appear yellow or orange to the eye. The eye will sum the two colors and see a third color. If we now move the LED back and forth, we see that the fixed orange color changes to dashes of red and green, as shown in Fig. 25(b). The dashes are the on and off periods of each of the colors. Since we are using 60-Hz power, each of the dashes lasts for 1/120 of a second, or 1/60 of a second for a complete red-green cycle.

What the Future Holds

In the game of electronics, it is sometimes difficult to project where a certain product or process will go or how far it will go. The pocket calculator would not have been possible without the LED display and the calculator itself wouldn't have worked without the invention of the IC chip. The pocket radio would not have been possible without the transistor, but without the development of the small ferrite loopstick antenna, the whole pocket radio would not have been possible. So one development depends on another. The Dick Tracy wrist TV transmitter will one day be here, but in the meantime, more realistic developments will arrive on the scene. Some items on the scene, or almost in sight, are discussed below.

Barlights and Odd Shapes

In Fig. 26, we see a barlight available from Hewlett-Packard in colors of red, yellow, and green. These barlights are about ½ inch wide and 1 inch long and the whole surface is made to glow evenly. They can be placed end-to-end to form a long column or used in any arrangement that a designer might want in order to display numerals, play light music of different colors when operated off a stereo music amplifier, or make a large, cool-light mosaic display. In Fig. 27, we see a number of

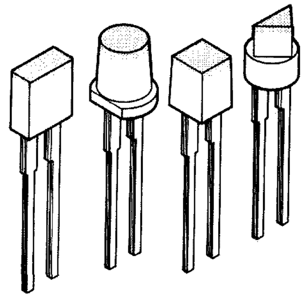

Fig. 27. Unusual LED shapes available from AEG-Telefunken.

LEDs available from AEG-Telefunken shaped as circles, squares, and triangles which can be arranged to form other figures such as arrows, rectangles, dots, dashes, and colons.

Flat-Screen Color TV. A dream of the TV industry is to make a flat-screen TV set. The CRT is also the most expensive component in the TV set and its lifetime is limited due to filament aging. So if the CRT would be replaced with a solid-state video light source such as the LED, the TV set could indeed be all solid state and would actually last a lifetime. Such a development that could lead to a flat-screen TV is an announcement by Sanyo that it has developed a multicolored LED which emits colors from red through green, including the in-between hues. This LED is made from phosphorized gallium and will have a long lifetime. Sanyo's goal is to develop an LED that is capable of emitting the three primary colors necessary in a TV receiver—red, green, and blue.

Three-color LED. Before we get to the three magic colors of the TV set—red, green, and blue—we must be willing to take what technology has to offer us at the time. It was announced recently that Roza Luksemburg Electric Lamps Manufacturing Works of Warsaw, Poland, has developed and produced a three-color LED. Each LED has three structures, two GaAsP semiconductors which emit red and yellow light and a third structure of GaP which emits green light. These structures are all contained in a single plastic housing and are connected by a common cathode. Separate anode terminals exist for each of the 3 colors so that it is a 4-terminal LED. It is the common cathode which acts as the light color radiator. By means of symmetric spacing of the structures in a common deep reflector, uniform illumination of the light-emitting surface occurs. This type of LED can be used in a radio tuner where the 3 colors could indicate high tuning, low tuning, and on frequency. They could also be used as gauges to indicate above value, below value, and set on desired value.

Remote Reading of Utility Meters. For the past 100 years or so, electrical, natural gas, and water utility meters were read up close visually or, where possible, from a distance by means of a telescope. Various utility companies have been investigating means of doing the reading of the utility meter by some rapid and accurate method. Energy Optics, Inc., of Las Cruces, New Mexico, has installed a remote infrared meter access system to allow electric utility personnel to read meters from a moving vehicle using light-beam communications. The present installations can be read at ranges of up to 200 feet with a vehicle speed of about 15 mph. Infrared light pulses are generated by an LED or low-power laser diode. Later installations will be installed which will allow reading ranges of up to 1000 feet using a fast-moving van or low-flying aircraft. The diode laser power is extremely low but transmits the meter account number, an eight-digit meter reading, and other test data.

LED Types and Sources

Various types of LEDs have been described in this article. Most of them are readily available in small quantities of interest to an electronics experimenter or innovator. Some of the sources for some of the types of LEDs are shown in Tables 1 and 2. Consult the advertisements in this magazine for additional sources of supply and pricing information. ■

Type LED	Source
Single color Red, Yellow, Green	Hewlett-Packard, Dialight, Xciton, AEG-Telefunken, Industrial Devices, Inc., Radio Shack, Litronix, Texas Instruments, others
Single color with resistor	H-P 5082-4860 (red)
Single color with resistor and diode	H-P HLMP-3105 (red), HLMP-3680 (green)
Tri-color LED	Radio Shack RS-276-035 (red-green-yellow), IDI 4301H1/5 (red-green)
Dual-color LED	AEG-Telefunken CQ X95 (orange red-green), Opcoa LST-710 (red-green)
Flasher LED	Radio Shack 276-036 (red) Litronix FRL-4403 (red)
Voltage-sensing LED	H-P 5082-4732 (red)
IR LED	Radio Shack 276-141 (IR) TI TIL32
Rectangular LED	General Instruments CM4-65 H-P HLMP-2300 (red)

Table 1. LED types and sources.

Radio Shack	Neighborhood stores
H-P	Hewlett-Packard 1501 Page Mill Road Palo Alto CA 94304

SOCIAL EVENTS

Listings in this column are provided free of charge on a space-available basis. The following information should be included in every announcement: sponsor, event, date, time, place, city, state, admission charge (if any), features, talk-in frequencies, and the name of whom to contact for further information. Announcements must be received by 73 Magazine *by the first of the month, two months prior to the month in which the event takes place. Mail to Editorial Offices,* 73 Magazine, *Pine St., Peterborough NH 03458.*

JENSEN BEACH FL
FEB 25

The Martin County Amateur Radio Association will hold its annual free outdoor hamfest and swapmeet on Saturday, February 25, 1984, from 8:00 am to 4:00 pm, at Langford Park, Route 707, Jensen Beach FL. Bring your own table; swap-table and tailgate space will be available. There will be food, drinks, and desserts available throughout the day, and a playground for the kids, so bring the family. Talk-in on 147.06, down 600. For further information, write MCARA, PO Box 1901, Stuart FL 33495.

CINCINNATI OH
FEB 25-26

Cincinnati ARRL '84, the fourth annual Ohio state convention and flea market, will be held on February 25-26, 1984, at the Great Oaks Vocational Campus, 3254 East Kemper Road, Sharonville, Cincinnati OH. Registration is $5.00 and flea-market space is $4.00 for two days (ham and electronic items only). Activities will include forums, meetings, vendors, Wouff Hong, women's programs, a banquet, and a hospitality suite on Friday and Saturday nights. For more information, write Cincinnati ARRL '84, POB 11300, Cincinnati OH 45211, or telephone (513)-825-8234.

DAVENPORT IA
FEB 26

The Davenport Radio Amateur Club, Inc., will hold its 13th annual hamfest on Sunday, February 26, 1984, from 8:00 am to 4:00 pm, at the Davenport Masonic Temple, Highway 61 (Brady Street) and 7th Street, Davenport IA. Tickets are $2.00 in advance and $3.00 at the door. Table rentals are $7.00 each, with a $2.00 charge for an electrical hookup. Talk-in on .28/.88 (WØBXR repeater). For table reservations and advance tickets, write Dave Johannsen WBØFBP, 2131 Myrtle Street, Davenport IA 52804.

LAPORTE IN
FEB 26

The LaPorte Amateur Radio Club, Inc., will hold its Winter Hamfest on Sunday, February 26, 1984, beginning at 7:00 am (Chicago time), at the Civic Auditorium, LaPorte IN (45 miles SE of Chicago on I-80). Admission is $2.50 per person. There will be 180 8-foot tables for $2.00 each by reservation. Food and drinks will be available. Sellers will receive help unloading. Talk-in on .52 simplex. For tables, tickets, or more information, send an SASE to LPARC, PO Box 30, LaPorte IN 46350.

MORRIS PLAINS NJ
MAR 2

The Split Rock Amateur Radio Association will hold its annual auction on Friday, March 2, 1984, at the VFW Post, Mt. Tabor Road, Rt. 53 (between the train station and Warner-Lambert), Morris Plains NJ. The doors will open at 7:00 pm and the auction will begin at 8:00 pm. A cash bar will be available. Talk-in on .385/.985 and .52.

CIRCLEVILLE OH
MAR 4

The Teays ARC will hold its seventh annual King of the Pumpkin Hamfest on Sunday, March 4, 1984, from 8:00 am to 4:00 pm, at the new location, the K of C Building, 2489 N. Court Street. Tickets are $2.00 in advance and $3.00 at the door; tables are $4.00 in advance and $5.00 at the door. Food and plenty of parking will be available. For more information, write Dan Grant W8UCF, 22150 Hulse Road, Circleville OH 43113, or phone (614)-474-3026.

LIVONIA MI
MAR 4

The Livonia Amateur Radio Club will hold its 14th annual LARC Swap 'n' Shop on Sunday, March 4, 1984, from 8:00 am to 4:00 pm, at Churchill High School in Livonia MI. There will be plenty of tables, refreshments, and free parking. Talk-in on 144.75/5.35 and .52. Reserved table space with a 12-foot minimum is available. For further information, send an SASE (4 × 9) to Neil Coffin WA8GWL, c/o The Livonia Amateur Radio Club, PO Box 2111, Livonia MI 48151.

NORTH AMERICAN TELECONFERENCE RADIO NET
MAR 8

The Honeywell Amateur Radio Clubs will present the North American Teleconference Radio Net (TRN) at 7:30 pm CST on Thursday, March 8, 1984. Featured speakers will be attorneys Chris Imlay N3AKD, Jim O'Connell W9WU, Joe Merdler N6AHU, and Bob Benson QC VE2VW, who will be discussing the legal aspects of amateur radio. For a list of stations providing a gateway into TRN, check the Compuserve "Hamnet" X10 Database or send an SASE to net manager WØTN, 4749 Diane Drive, Minnetonka MN 55343.

EGG HARBOR CITY NJ
MAR 10

The Shore Points Amateur Radio Club, Inc., will hold the Springfest '84 on Saturday, March 10, 1984, from 9:00 am to 4:00 pm, at the Atlantic County 4-H Center, Egg Harbor City NJ (approximately 15 miles west of Atlantic City). Admission for buyers is $2.50 in advance and $3.00 at the door; sellers' space is $5.00 (bring your own table). There will be 8,000 square feet of heated indoor selling space, and covered tailgating will be available, weather permitting. For more information, write SPARC, PO Box 142, Absecon NJ 08201.

WINCHESTER IN
MAR 11

The Randolph Amateur Radio Association will hold its 5th hamfest on Sunday, March 11, 1984, from 8:00 am to 5:00 pm, in the National Guard Armory, Winchester IN. Ticket donation is $3.00 and children under 12 years old will be admitted free. Table space (by reservation only) is $5.00 with a table and $2.50 without. There will be a flea market, dealers, programs, food, and drink. Setups will be on Saturday from 6:00 pm to 8:00 pm and on Sunday from 6:00 am to 8:00 am. Talk-in on 147.90/.30, 224.90/223.30, and 146.50. For reservations and more information, contact RARA, Box 203, Winchester IN 47394, or phone Jake Life W9VJX at (317)-584-9361.

INDIANAPOLIS IN
MAR 11

The Morgan County Repeater Association Club will hold the Martinsville Hamfest on March 11, 1984, indoors at the Indiana State Fairgrounds Pavilion Building, Indianapolis IN. Admission is $4.00 at the door. Premium tables are $30.00 each, flea-market tables are $8.00 each, and flea-market space without a table is $1.00. All tables must be reserved in advance and setup will be Saturday, March 10, from 1:00 pm to 9:00 pm. Space setup will be Sunday, March 11, from 6:00 am to 8:00 am. There will be free paved parking. Talk-in on 147.21 and 146.52 simplex. For more information or table reservations, send an SASE to Aileen Scales KC9YA, 3142 Market Place, Bloomington IN 47401 before March 1.

HUDSON NH
MAR 17

The annual Interstate Repeater Society Flea Market will be held on March 17, 1984, at the Hudson Lions Club, Lions Avenue, Hudson NH. The doors will open at 8:00 am and the flea-market hours will be 9:00 am to 4:00 pm. Admission is $1.00 and tables are $7.00 each. Coffee, donuts, hot dogs, hamburgers, and drinks will be available for sale. Talk-in on 146.85 and 146.52. For more information, phone Herman Haberman WA1NYS at (603)-882-6859, or write Interstate Repeater Society, PO Box 693, Derry NH 03038.

CANTON OH
MAR 17

The Canton Amateur Radio Club will hold its annual auction on March 17, 1984, beginning at 5:00 pm, at the Nimishillen Grange, Easton Street NE. General admission is $2.00 in advance and $3.00 at the gate. An 8-foot flea-market table is $1.00 (supply is limited). Refreshments will be available. Talk-in on .72/.12. For advance tickets, send an SASE to Arthur E. Schermerhorn W8FEC, 505 E. Mohawk Drive, Malvern OH 44644, or for more information, call Scott Duncan KK8D evenings at (216)-484-6722.

MIDLAND TX
MAR 17-18

The Midland Amateur Radio Club will hold its annual St. Patrick's Swapfest on Saturday and Sunday, March 17-18, 1984, at the Midland County Exhibit Building, east of Midland TX on the north side of Highway 80. The hours on Saturday are from 10:00 am to 6:00 pm and on Sunday from 8:00 am to 2:30 pm. Registration is $5.00 in advance and $6.00 at the door; tables are $6.00 each. Refreshments will be available. Talk-in on .16/.76 and .33/.93. For further information and reservations, please contact Midland Amateur Radio Club, PO Box 4401, Midland TX 79704.

73 INTERNATIONAL

Each month, 73 brings you ham radio news from around the world. In this collection of reports from our foreign correspondents, we present the latest news in DX, contests, and events, as well as keep you abreast of the technical achievements of hams in other countries.

If you would like to contribute to your country's column, write to your country's correspondent or to 73: Amateur Radio's Technical Journal, *Pine Street, Peterborough NH 03458, USA, Attn: Jack Burnett.*

VK8—WEST AUSTRALIA

West Australia is the home of America's Cup—and with the eventual win by the West Australian syndicate and worldwide attention focused on this area of Australia, it became evident that not many people throughout the world have much idea about this vast state.

We have eight call areas on the mainland, of which VK6, with a land area of 975,101 square miles and a coastline of 7,768 miles, is the largest. It is indeed a vast area, with a very sparse population in the areas away from the major towns, with a total population for the whole state of 1,300,000, most of whom live in Perth and the larger towns scattered around the southern half of the state. The total amateur-radio population is 1,226, which means one amateur to every 795 square miles.

Albany, in the south of the state, was a port in the 1900s for those hardy whaling ships, one of which was the same *Cheynes II* that refueled there on its way down to Heard Island with the Jim Smith DXpedition. Between Albany and Perth, further north up the coast, is an area of beautiful tall forests with perhaps the best area of native Australian wild flowers in the state. Perth itself is a city very isolated from the eastern states by a large desert extending for 1,000 miles.

Perth, where the 1987 America's Cup will be contested, is located a short distance from the deep blue Indian Ocean. It has a lot of amateur activity, and with the ease of reciprocal licensing between Australia and the States, it would pay you to bring a 2-meter FM rig as it is easy to access the 2-meter repeaters with a hand-held and meet many of these friendly West Australian amateurs.

Perth also has an amateur award called The Black Swan—this bird being the state emblem. Also, if you are looking for a QSL card for VK8-Willis Island, VK6YL has all the logs for this operation; she is the QSL manager for all the Willis Island operations of latter years.

Kalgoorlie is the largest inland town, situated 350 miles east of Perth in a very dry desert area; the water for this city is piped in from near Perth. There is an interesting story appertaining to the pipeline. The engineer who built it predicted that the water, after being turned on at Perth, would arrive the next morning at 11 am. The townspeople had bands and festivities scheduled for this gala occasion, but the water had not arrived even by that night, so, in shame, the engineer shot himself. It was premature, for the water started to flow the *next* morning, 24 hours later. And it has kept flowing ever since.

There are many amateurs scattered throughout the vast desert spaces of this area. If you go visiting, take a metal detector, for the area is rich in minerals, with gold and nickel predominating. Many people have made a year's wages in a week by detecting the alluvial gold at this location. A lot, also, have found nothing.

Going east from Perth, you pass through a large grain-growing area near the coast, and then you enter sheep and cattle properties trying to survive in a harsh environment with temperatures going up to and over 120 degrees Fahrenheit. Some of these properties cover well over 1,000,000 acres, and amateur radio is a good standby in this area, not only for emergencies, where their nearest neighbor could be at least a hundred miles away, but also for those infrequent idle hours to relieve the isolation.

The northern part of the state (The Kimberleys, as it is called) is perhaps the most ruggedly beautiful area. It has large deposits of iron ore and towns fully air-conditioned by the companies extracting the mineral for export all over the world. It also is not unusual to hear a typical American voice using a VK6 callsign operating from this area, as there is a joint Australian and American communications base at a place called North West Cape.

Further inland are Australia's largest diamond deposits, located in a diamond pipe similar to the famous diamond pipes in South Africa.

One very active amateur from this remote area is Ian VK6IH, who acts as net controller for the Caribbean DX Net on 14.128 at 1000Z.

The northernmost part of the state was first discovered in the early fifteenth century by Dutch explorers, 200 years before Captain Cook first landed on the east coast of Australia and claimed the land for England. This area was, in the early 19th century, the main pearling center of Southeast Asia, with the main port being Broome, a seaport with tides that rise and fall up to 35 feel at a time. There is an active YL operator in this area, Trisha VK6KI, located in a small community offshore on Koolen Island.

Some of the early operators had to travel up to 1,000 miles just to sit for their amateur license, with no local radio club to help with their training, so if you do work one of these outback VK6 operators, you know that they have earned their right to be on the amateur bands the hard way.

If you plan to come to VK8 for the Cup Challenge, the address to write for a reciprocal license is The State Manager, Radio Frequency Management, Operators Branch, PO Box 8189, Perth 6000, West Australia.

VK2—LORD HOWE ISLAND

First discovered in 1788, Lord Howe Island is located 700 km east of the coast of New South Wales (VK2) and is part of that state.

Being so far off the coast of Australia, it is classed as a separate country for DXCC.

The first successful settlement of this island was in the 1830s by an American whaler named Nathan Thompson, who brought with him a princess whom he had saved from an arranged marriage in the Gilbert Islands. They later married, and their graves are on the island. Many of the island people are their direct descendants.

There are a couple of amateurs active on the island, with many visiting operators using portable Lord Howe. There is usually one type of DXpedition from this island each year; this year there will be approximately 10 operators on all bands, including 160 meters, from October 23rd until November 2nd. As you can see, this is not one of our rarer islands—not like the next piece of sand:

VK9—MELLISH REEF

This "country," to use the term loosely (I don't know how anybody could class Mellish Reef as a country), is only a coral sand cay 300 meters long by 60 meters wide, located at 17° 25' longitude, 155° 51' East latitude, and only 2 meters above sea level at normal high tide. With the many cyclones that go through the area each summer, however, if planning an expedition to this spot during the cyclone season, one of the main items of gear to pack would be a face mask and snorkel. This is why I question the status of "country" for places like Mellish Reef.

WIA EXTENDS MEMBERSHIPS

The Wireless Institute of Australia, which is the world's oldest radio society, has opened its membership to those living outside Australia.

Already a number of radio amateurs in the US, UK, and Oceania have joined the WIA—which celebrates its 75th anniversary in 1985 with some special events planned.

Overseas members are entitled to qualify for WIA awards, including the Australian DXCC, and have unlimited use of the free QSL bureau run by the WIA in VK3.

All members receive a copy of the WIA's monthly magazine, *Amateur Radio*, which is in its 51st year of publication.

Annual membership during 1984 is $35 (Australian), which should be sent to the Secretary, Wireless Institute of Australia, Victorian Division, 412 Brunswick Street, Fitzroy 3065, Australia.

While some of the members of the party still were at sea, one of the lucky 13 was being hoisted to shore.

MALPELO ISLAND, 1983 DXPEDITION

"We both feel that this was one of the best operations in the history of amateur radio. We have never heard such excellent control, rapid operating, and fine CW."—Stuart WA2MOE, Ben JA3GM.

"Congratulations on the 50th anniversary of the LCRA and the Malpelo DXpedition. I was delighted for having realized such a difficult and priceless QSO. Your QSL will be my treasure."—Ben JA3GM.

Countless congratulatory letters, messages, articles, and TV and broadcast programs' comments poured in after the Malpelo Island DXpedition took place. Meanwhile, Beto Rojas HK3DDD, on an almost round-the-clock task, helped by his XYL Luisa and two children, systematically and tirelessly keeps processing and mailing thousands and thousands of QSL cards from/to all over the amateur world.

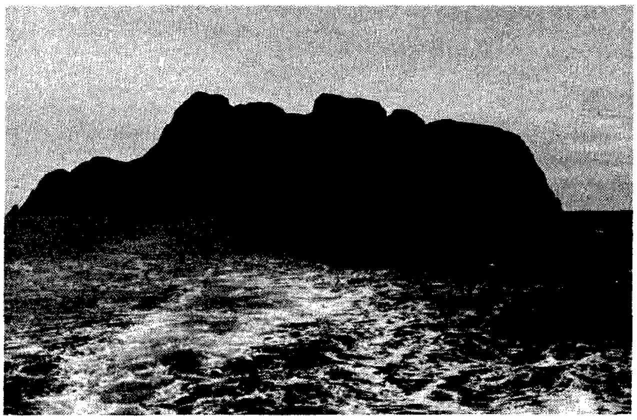
The two voice and one CW stations manned by thirteen operators, accompanied by one TV man and three Colombian Navy sailors (for the expedition's logistic support), managed to log 20,535 voice and 8,389 CW QSOs. They worked a hundred hours from dawn well into the night, until propagation conditions were inexorably closing the bands.

The three generators, two in operation and one on standby, worked perfectly, as did the Kenwood TS-930S transceivers (supplied free of charge for the expedition), keeping well abreast with the over-demanding operating conditions.

The camp base was installed at 160 meters above sea level on the barren volcanic surface of the island. The site was constantly swept by almost gale-force winds which frequently knocked down the tents and dangerously twisted the antennas. The expedition had rainy weather from landing till the minute it left.

As a rare coincidence with the previous Colombian Islands DXpeditions, the radio ham in charge of the health and sanitary backup arrangements, this time OM O

The world was listening to HK0TU.



Good-bye, Malpelo, see you again in 1990.

Campillo HK4DUM, had a fall on landing, was subsequently struck by a wave, and sustained injuries to his right leg. Fortunately, it was nothing serious, and he was taken care of by his colleagues.

The help and assistance given to the DXpedition by the Colombian Navy, with the *CNSS Providencia* from its QTN in Buenaventura Port to Malpelo Island and back, were continuous and flawless. Since there are no docking facilities at Malpelo, the 13 operators, the TV cameraman, Luis Fernando Castrillon, the three sailors, and all the equipment had to be lowered to the shore of the island by means of a crane—and picked up the same way. Since the sea was rough at both times, certainly it was not a very easy-to-forget experience for all of them.

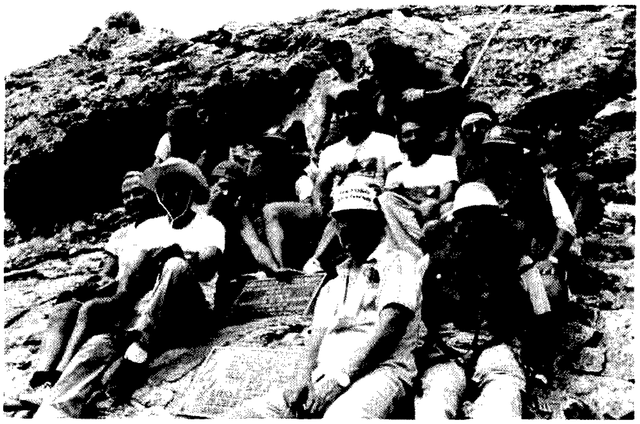
Once the party was back in Buenaventura, a Colombian Air Force transport plane flew them back to Bogota, where the National Police Band received them with full honors.

Tired, suntanned, but deeply proud and satisfied with their accomplishment, they were warmly greeted by relatives, colleagues, and friends and started going back home full of souvenirs and unforgettable experiences. They left in a rock at Malpelo Island a commemorative plaque saying: "Republic of Colombia, Colombian Radio Amateur League, HK0TU, Commemorative DXpedition of the 50th anniversary of the League, with the cooperation of the Colombian Navy, Malpelo, October 12, 1983."

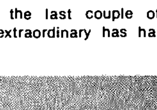
Mr. Belisario Betancourt, the Colombian President, sent the Malpelo expeditionary party a congratulatory message saying: "It is very encouraging to see a group of Colombian radio amateurs who are moved only by the wish of serving fellow men, reaffirming through their hard work and devotion the Colombian sovereignty over the Malpelo Island territory, thanks to the cooperation given by the Colombian Navy and the Colombian Radio Amateur League. . . Through investigation and radio experimentation we wish to confirm our desire to bring together our nation with itself and the rest of the world.

"I wish they will have plenty of DXs and that on their way back they will bring us all a better knowledge of the Malpelo Island, thanks to them now closer to our heart."

When the *CNSS Providencia*, bringing the Malpelo DXpedition back to the continent, was deep into Pacific Ocean waters and the island was getting smaller and more diffused, one of the excited young expeditioners loudly said: "Good-bye, Malpelo, we'll see you again in 1990."



The DXpedition party had just landed. Top to bottom: O. Campillo HK4DUM, G. Cuartas HK4COK, A. Afanador HK3BED, B. Aguilar HK1AMW, Beto Rojas HK3DDD, J. Restrepo HK2YO, E. Bernal HK3BAV, E. Londono HK4BHC, A. Carrisoza HK3BAE, J. Uribe HK5LA, A. Gonzalez HK1DBO, H. Olarte HK1QQ, C. Alvarez HK8BYG.



CYPRUS

Aris Kaponides 5B4JE
PO Box 1723
Limassol
Cyprus

NEWS FROM CYPRUS

During the last couple of months, nothing extraordinary has happened in the sphere of ham radio in Cyprus; however, it should be noted that as far as I know, we had at least one participant in the *CQ* WW Phone Contest. He was 5B4LP, who made a total of 86 countries, 31 Zones, and 521,118 points. 5B4LP is a promising young man aged 15 years, and he is very enthusiastic and a regular operator on the 10m, 15m, 20m, 40m, 80m, and 2m bands. He can be heard also on the 10m FM mode chatting with Europeans or Americans via repeaters.

Also during the last month, elections were held for the regional committees of the Cyprus Amateur Radio Society in the districts of Limassol, Paphos, and Larnaca. The clubs in Nicosia, Larnaca, Limassol, and Paphos have been reactivated and operate one day per week.

The ZC4s are also quite active, especially from their club station in Episcopi, ZC4EPI, where they are using a couple of V-wire beams 329 feet long beaming towards Europe and the Pacific. Regular operators there are Andy ZC4HA, Steve ZC4SM, Jim ZC4JE, and Gregg ZC4GH.

On 160m, the only operator at this time is 5B4JE who is QRV most evenings on 1,835 MHz around 2100 UTC.

The Cyprus Amateur Radio Society has decided to buy a UHF repeater and members of the society will shortly make expeditions to find the most suitable location up on the mountains.

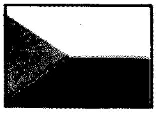
VISITORS' LICENSES

Holiday makers in Cyprus who are holding a radio amateur's license in any country of the EEC, any British Commonwealth country, or the United States of America can be issued with a temporary license free of charge if they send a photocopy of their license with a letter of application to: Chief Telecommunications Officer, Ministry of Communications and Works, Nicosia, Cyprus. it is advisable to apply at least three months before the

The 1983 DXpedition commemorative plaque.

Andreas 5B4LP operating during the CQ WW Phone Contest.

time of arrival. Visitors can use their own callsign with /5B4 at the end. A regular 5B4 license can be issued to foreign hams from the above countries if they are working or have their permanent residence in Cyprus.



CZECHOSLOVAKIA

Joachim Miroslav OK1WI
Bocni I. 23
141 00 Praha 4-Sporilov
Czechoslovakia

According to the 1983 *Radio Amateur Callbook* census, the number of amateur radio stations in Czechoslovakia is 3279. As many of the stations are collective (club) stations, the number of operators may be estimated as being at least 10,000.

Two amateur journals are published monthly in OK-land: *Amaterske Radio*, with about 100,000 copies monthly, bringing technical and operational information on amateur radio, general electronics, and computer techniques, and *Radioamatersky Zpravodaj* (*Radio Amateur, A Messenger*), with much lower circulation, bringing technical and operational information on amateur radio. For example, the December, 1983, issue of *Amaterske Radio* brings a description of the newly-developed HF transceiver "Labe," made by Radiotechnika in Hradec Kralove (60 W, all bands, including all WARC 79 bands). On the other hand, the October, 1983, issue of *Radioamatersky Zpravodaj* brings a description of the hand-held, two-meter transceiver "Mazak," showing that even with limited possibilities of homemade work, it is possible to have a two-meter contact of good quality.

Fox-hunting, or amateur-radio DF, is very popular with younger amateurs in OK-land.

Experienced radio amateurs participate in almost all the big amateur-radio competitions and are always among high scorers. Club stations participating in world competitions often use special callsigns, the most esteemed being OK5MIR (OK5PEACE), showing the hopes of OK amateurs and the whole people of Czechoslovakia for world peace.

Czechoslovak amateurs participating in technical-cooperation missions often bring their equipment to developing countries. Some very rare prefixes are in this way made available to the whole amateur-radio community.

In daily, regular contacts, OK amateurs strive for friendly relations with all countries. The month of November was reserved for the Soviet-Czechoslovak competition during which friendly messages were exchanged between OK-land and UA-land operators.

RFI

Almost everyone has had his experiences with broadcast/television interference and with its reduction or complete elimination. But I suggest also looking at interference to ham radio which arises from leaking TV sets, noisy computers, insufficiently-filtered dimmers, and other sources. Recant experiences in this field got me interested in the broader aspects of RFI. Fortunately, I found that a rather systematic approach to the problem exists, at least in our country.

First, there is the German FCC, and one of its offices issues the so-called FTZ number. This number is awarded to communications equipment, domestic or imported, if it meets certain specifications regarding noise immunity against external sources, as well as low emission of signals which might cause interference with other sets. These specifications have been tightened more and more in the past, and without going into their details, I will give you an example of their real-life effects.

Having my ham-radio and TV antennas mounted on the same mast with a separation of only 2 meters, 100 Watts of transmitter output caused a complete loss of the TV picture and sound with a TV set produced around 1980 which had the (old) FTZ number Z385C. Furthermore, this TV set generated hash noise on 20 meters on the order of 25 microvolts at 50 Ohms (S8 on the meter). This was apparently caused by its switching power supply and occurred even when the TV set was in standby mode. Newer TV sets can be awarded the FTZ number 22/585/SE-VT, for example, if they meet the much tighter BCI/TVI specifications of today.

The replacement of the old TV set by a new one with a current FTZ number resulted in no or negligible TVI for the same arrangement of TV and ham-radio antennas and in a reduction of hash noise on 20 meters far below the S1 mark. Because radio and TV sets with lower-grade RFI specifications still can be sold, it is worthwhile to inform your neighbors and others about the up-to-date FTZ numbers (or similar designations in your country) before they procure a new set. In every case, it is to their advantage because our FCC, for example, does not pursue RFI cases if equipment with outdated FTZ numbers is involved.

Next, there is the RFI-filter industry. They are offering excellent antenna filters, line filters, and loudspeaker filters for the consumer products experiencing interference. Plug-in high-pass filters for TV sets with a stop-band attenuation of more than 50 dB and with an insertion loss of less than 1.5 dB are very efficient and popular. Sometimes, however, common-mode voltage problems (i.e., identical phase of the ham transmitter signal on the shield and the inner conductor of the TV coaxial cable) can render their application useless. Therefore, common-mode rejection transformers also are offered which are installed ahead of the high-pass filter so it can operate as designed.

One of my neighbors took my advice, bought two high-quality commercial high-pass filters, installed them ahead of his old VHF/UHF antenna amplifier, and cured the TVI problem completely for a total cost of 35 dollars. The FCC, by the way, investigated the case but did not pursue it because the antenna amplifier had no current FTZ number.

Information on RFI suppression products can be obtained from the Auth Company (distributor: Fritz Hoahne DJ4FT, 4830 Bochum-Hiltrop, Weg am Koetterberg 3) or from Karl E. Schertler DJ0AV, Hoehenkirchener Weg 5, 8127 Iffeldorf, Federal Republic of Germany. The latter supplies also the common-mode rejection transformer.

Furthermore, the national amateur-radio association (DARC) is providing a special service for its members. In addition to technical advice, it has procured at least one set of industrial RFI filters/transformers to be stationed in each state of Germany. Members of the DARC can borrow this set for a moderate fee in order to determine the most efficient way to eliminate RFI. This has the additional advantage that one needs to purchase afterwards only what is really required. I think this idea is applicable everywhere a larger group of hams can share a seldom-used piece of test equipment.

The next challenge, which is already with us, is from noisy computers and video games. Many of them are not state-of-the-art regarding their RFI properties. But rather than putting much effort in quieting often already-obsolete computers, I consider it more efficient to purchase new products without RFI problems. The Commodore CBM 64 personal computer is one example. Tests showed that it did not produce any RFI standing next to shortwave and 2-meter radio equipment and that it was immune to transmitter signals, too.

I am not considering the shielding and filtering at the ham transmitter site because I feel that state-of-the-art ham-radio equipment does not produce stray emissions which are significant in this context. In most cases, it is the (sometimes high-power) fundamental emission of our transmitter which causes interference in consumer products. These are designed at low cost and therefore often lack appropriate measures against RFI. Therefore, a great deal of our RFI reduction effort must be invested here.

In summary: In dealing with RFI problems, I think we are in a fortunate situation. We have a competent and respected FCC defining and upgrading RFI standards, an industry which offers a broad line of RFI-suppression products, an amateur-radio organization providing tools for the investigation of RFI cases, and an almost unlimited choice of consumer products like computers, radio/TV sets, video games, electronic organs, etc., with often similar performance but sometimes different RFI characteristics. It is up to us to make the best use of it. In the long run, it will be most efficient to promote the purchase of consumer products known to be RFI-resistant and noise-free in the private as well as in the business sphere. Nevertheless, the RFI-filter industry still will have bread and butter for years to come.

THE UK SCENE

The impending arrival of cable television in the UK may not cause the interference problems to radio amateurs that have been the case in the United States, with leaky cables and poor joints radiating in the 2-meter and other bands.

The guidelines for prospective CATV franchise holders published recently by the Home Office specified a number of prohibited frequencies and others with strictly limited radiation levels. The prohibitions apply only to military allocations; however, the 145-MHz (2-meter) and 430-MHz (70-cm) amateur bands are specified for a maximum emission from CATV systems of −26 dBmV.

Systems conforming to this are unlikely to cause too many problems to amateur stations. But for once, the news is better. BICC, the multinational cable-making and construction group with extensive interests in the development of cable television, has proposed a spectrum plan that recommends no signals of any level be propagated in either the 4m, 2m, or 70-cm bands—this even though 4m (70 MHz) is not a restricted zone.

The use of the 10-meter band for local or mobile FM is to be encouraged if only as a means of keeping this band occupied during the period of minimum sunspot activity and poor propagation. For some time, activity has concentrated around the de facto simplex calling channel (there are no 28-MHz repeaters in the UK) of 29.600 MHz.

However, the situation shows signs of generating problems for other longer-established 10-meter users. CB rigs covering 27.6–28 MHz (and using the UK modulation requirement of FM) are readily available and readily convertible to cover a large portion of the 28-MHz band in 10-kHz steps (they also provide a path to 10-meter FM that is cheaper by several orders of magnitude than purchasing a custom ham kit).

The problem arises when the rigs are modified to cover 29.3–29.7 MHz, which includes the downlink for mode-A satellite working. Not only are signals from space usually quite weak, but being sideband or CW, they are difficult (usually impossible) to resolve on an FM rig. I have experienced an FM signal preventing the completion of a QSO via RS8, and with my limited power, only high overhead passes are really workable. I have tried waiting for the satellite to pass and then calling the FM station directly, but my SSB or CW signal is just regarded as interference!

An internationally-agreed recommendation for an FM subband (simplex and repeater) needs to be introduced before the situation gets out of hand.

I have mentioned previously my interest in RTTY. One aspect of RTTY listening that occupies a lot of shack time is the printing of meteorological bulletins (it really is amazing just how much information is transmitted around the world day and night). I even have a license to receive such transmissions, together with meteorological facsimile for which I am also equipped. And all for the princely sum of $7.00 *for life!*

I discovered only yesterday that the UK Meteorological Office transmitting from Bracknell includes, amongst reams of synoptic reports, some very accurate information relating to NOAA 7 and 8 orbits. I am currently seeking details for the decoding of this info which, unfortunately, is not given in the Meteorological Office "blue book," which is the basic decoding reference.

ARDF IN GREECE

ARDF in Greece is something unknown. So you might start wondering why I picked this subject for this month's column. Well, here is why, and I hope you will enjoy the story.

About one and a half years ago, Athens had only one VHF repeater (R1) and you can imagine how important it was for us. The repeater was working fine until the evening of August 15, 1982. The 15th and 16th of August were holidays, so everybody was out and the city was almost empty. On that evening, a steady carrier appeared on the repeater's input frequency and, of course, after three minutes the timer forced the transmitter to drop off. That was it. Athens' repeater was blocked.

It took us quite a while to understand what was going on, because on the one hand, the signal in the input wasn't that strong really, and on the other hand, such a thing had never happened before. With the darkness, there was nothing we could do.

Next morning, the repeater was still off, and after some phone calls, a group gathered at the area the signal was coming from—on the very same mountain the repeater is on. So SV1EM, SV1GH, SV1JZ, SV1OE, and SV1PH started searching for the intruder. In about one hour's time, they found it. It was a crystal-controlled oscillator on a small PC board with 8 C batteries, a stabilizing IC for the power supply, and a 1/4-wave whip for the antenna. The unit was very close to the main road leading to the repeater's site, behind a big stone.

This was the first taste of ARDF for Greek radio amateurs. Although there were many thoughts about the event, no more attention was paid to it until September 9, 1982.

On that day, R1 was in trouble again. This time the smart boys were even smarter. The carrier was on for 1/2 second every 3 seconds. R1 was on all the time. Imagine how it was to monitor the repeater waiting for a call, listening to the darned thing making like a machine gun. After our first surprise, we started turning the beams to locate the carrier, but there was nothing we could hear. The next day, a team consisting of SV1DC, SV1DS, SV1EX, SV1GH, SV1IW, and SV1KA were on top of the mountain again. If there was a place where you could hear the carrier, it was the repeater site itself. A 9-element beam was brought, and the direction of the carrier was marked on a map.

It was obvious that the signal was coming from outside Athens, but how far? We decided to cover as many areas as we could before dark. SV1AN and SV1AS were soon with us for a common effort. For three or four hours we were searching every place we could go, either driving or walking where driving was impossible.

With a big amount of luck, just a little while before dark we found the area of the beacon (within a square mile) some 10 miles outside Athens, and the next morning SV1AN, SV1DS, SV1GH, and SV1PA, along with two police officers, were in the area again. It took a little while to discover the device, which was hidden in a bush. This time the transmitter was commercial (the transmitting board of a Kenwood 2200 G portable transceiver). There was also a timer determining the on-and-off state of the unit. For the power supply, they had a truck battery with 145-Ah capacity! The whole thing except the antenna and battery was in an ice cream box.

If you think that was all, you are wrong! Although for some time there were no problems, suddenly one day we heard again something feeding into the repeater's input. But, hmmm! This time it was a moving problem!

From that day, the signal was on almost daily, one time for one hour, some other times for two or three hours. Of course, R1 was off after the first three minutes. Our beams were useless since in Athens there is nothing you can do with all the buildings and the deflections on them. We had to find something else. So, we decided that every time there was a positive indication about a particular direction, a team with as many people as possible from nearby areas would search for the car with the beacon on. We chose some channels on the UHF band as links between the people who would be searching and the officials of RAAG, just in case some directions had to be given back and forth. If immediate action was needed, then the telephone was recommended.

As the days passed by, ten times we were close to finding the car, but always at the last minute the bird had flown. We were getting nowhere, when all of a sudden one evening I received a phone call from Gus SV1DC: "Come quick to the Glyfada's police station!" (The place is near the airport of Athens.) The next minute I was on my way.

Arriving at the police station, I found Gus waiting for me, and he explained shortly the situation. Earlier the same evening, Gus had been near the area for a job when he noticed the carrier at the repeater's input. So did SV1LA, who was very close to the area, and they started searching. Quite soon they located the source of the signal, which was not on a car but . . . on a motorcycle! At a glance I saw a 50cc Honda in the yard of the police station. A closer examination revealed some more details. The antenna was a small wire, almost invisible, coming through the windshield. The radio, a KDK 2050, was in a small box behind the driver's seat, and a small cable was transferring the PPT very close to the accelerator. Now it was clear why we couldn't locate the car. There wasn't any car to locate!

Now you are probably convinced that SV radio amateurs have a lot of experience in ARDF. Who knows, maybe there will be another chance to improve our experience in the future!

NEWS FROM INDIA

During the three months of January, February, and March, 1984, a station with the commemorative callsign AT9A will be operative from the Antarctic. QSL info via Dr. Ashutosh Singh VU2IF, DXCC, PO Box 4015, New Delhi 017, India. Presently, "Ashu" VU2IF is on board the ship *Fin Polaris* (callsign OIGW), operating as VU2IF/MM on SSB around 14150 kHz.

Permission to operate commemorative callsign VU7WCY during December, 1983, was granted by our authorities, applicable to any VU station. Each station was to issue his OSL info upon reaching the Laccadive Islands. (Similar permission for the Andaman Islands operation has not been received, so far.)

ITALY'S ERE RIGS

Many of us could believe that the only producers of equipment for amateur use in the world are Japan and the United States. That's not right! In Italy, a small but very technically-advanced firm, ERE (Equipaggiamenti Radio Elettronici) produces state-of-the-art radio equipment for commercial, military, and amateur use.

The first ERE jewel is a rig called HF200, an HF transceiver for amateurs which boasts design ingenuities and on-the-air performance equal to many rigs made in Japan or in the US. This lightweight (6 kg) and compact (268mm W, 117mm H, 290mm D) transceiver is suitable for mobile or base-station use, and its price is really affordable.

The HF200 is completely solid state and may be completed with options like the AL-S/200 external power supply and speaker, the VFO 200E, and a solid-state 1000-W power amplifier, LHF-100ST.

The most interesting feature of the receiver is a revolutionary tuning system developed by ERE: The main tuning knob has a limited turning range clockwise and counterclockwise, and within this range it acts as a spread-band tuning knob. At the right and left end of the ranges the knob activates two microswitches which start an up or down frequency scanning, whose speed is selected through a slow-fast on-the-panel selector. The tuning frequency is read on a big digital display. The receiver is a single-conversion superhet, and the 9-MHz i-f is equipped with two eight-pole filters. The front end boasts very good overload resistance with the use of a high-collector-current rf transistor amplifier and Schottky-diode balanced mixer. The receiver is equipped also with af filters for CW and SSB and has an optional adjustable-level noise blanker.

The transmitter is also solid state, and the power-output keydown is 100 W.

This dynamic Italian firm produces also a very updated three-band (144, 432, and 1290 MHz) transceiver, the Kontact, which will be described in a future column, and a complete line of amateur-band antennas ranging from three- and four-band yagis and dipoles to an outstanding seven-element log periodic for 10- to 30-MHz frequencies.

For more information, you may write to Equipaggiamenti Radio Elettronici, Via Garibaldi, 115, 27049 Stradella, Italy.

HF200 SPECIFICATIONS

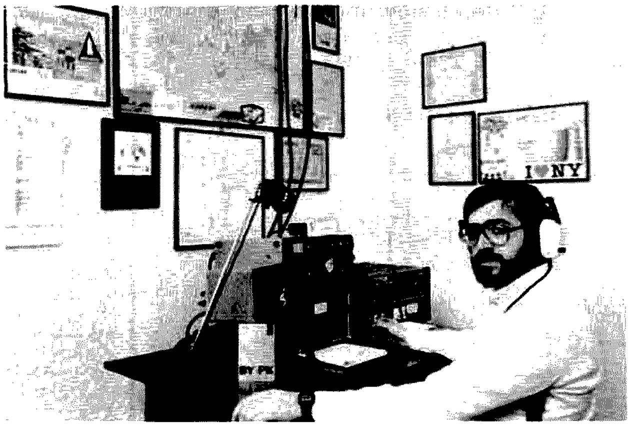
Frequency coverage	5 bands: 3.5–29 MHz (The latest models have provision for the new WARC bands.)
Receiver sensitivity	0.3 uV, 10 dB S + N/N
Receiver selectivity	SSB 2.4 kHz/ – 6 dB, CW 500 Hz/ – 6 dB with CW filter
Image attenuation	100 dB
I-f attenuation	100 dB
Intercept point	+ 2 dB at max sensitivity
Transmitter input power	200 W input K.d.
Carrier suppression	50 dB
Unwanted S-band supp.	50 dB

HAM RADIO IN SAN MARINO

The first active ham from the Republic of San Marino was the late M1A, Prof. Corrado Francini, who was followed by Mario Graziani M1B. Mario, in the post-WWII days, was active mainly on 7-MHz phone.

Following inquiries by amateurs in the United States, your columnist, who then had more hairs on his own head and held the call I1PL, together with his friend Stelio I1HR, made the first DXpedition in S. Marino and put for the first time the M1 call on the DX map. The expedition was a great success and made happy a big bunch of DXers. The number of QSOs was not astonishing, but we were in 1948 and we ran 60 Watts input into a random-wire antenna! "Never before has so much rf been pumped in one direction on one frequency in the 14-Mc band," had to remark *QST* in its 1948 October issue, reporting the great happening!

The tiny republic, 38 square miles, about 20,000 inhabitants, atop Mt. Titano in central Italy, claims to be the oldest republic in Europe, being established since 1231. Despite the fact that every stone and every mountaintop there recalls old stories of savage wars, knights, and lovely mistresses, the Republic of S. Marino has today an advanced economy with industries and commercial traffic, due to the initiative of its dynamic citizens. There is also a noticeable tourist



T77C (ex-M1C) in his shack.

traffic there; thousands of people come to visit the ancient monuments and to enjoy the wide vistas to the Adriatic Sea.

Amateur radio is also very active on Mt. Titano: it's ruled by the Telecommunications Department in the person of the Department Deputy himself, and by the Director of the Post Office. Just recently a proposal for official rules has been issued, which will be ratified soon.

Some years ago, the S. Marino hams founded the ARRSM (Associazione Radioamatori Repubblica S. Marino), which became a member of IARU January 30, 1981. The ARRSM president is the senior radioamateur of the group, Mario Graziani T77B (formerly M1B), and Tony Ceccoli T77C is the dynamic secretary.

(The old and unofficial prefix, M1, became the official T7 in April, 1983.)

Actually, there are 10 licensed amateurs in S. Marino, but there is also an eleventh station, the official radio club's T7ØA, dedicated to the memory of Corrado Francini M1A. This station will be active only once per year for some time and eventually, guest operators will be admitted only on an invitation basis.

The well known DX man Tony T77C (formerly M1C) is the most active HF operator from there. He is likely to raise tremendous pileups when his husky signal appears on the bands. Tony has been active for 10 years, and his log sports more than 82,000 QSOs, an average of 8.2K QSOs per year! That's not bad for a rare country like S. Marino!

Tony holds a 5BDXCC, a WAZ, and a WAS award; he needs only one card to be elected in that DX Olympus called Honor Roll. Everybody who has met him was delighted, finding a very friendly and modest boy. He is a real CW enthusiast, and his effort giving a new country to as many hams as possible around the world is confirmed by the fantastic number of 15,000 QSOs made in 1982!

L to R: T77B (ex-M1B), T77I (ex-M1I), T77Y (ex-M1Y), T77J (ex-M1J), and T77W (ex-M1W).

The T77C rig is a TS-820S followed by a kW home-brew amplifier, and the antenna is a rotary two-element delta loop for 10, 15, and 20 meters. He uses some dipoles for the LF bands and has started to experiment with the 160-meter band. Boys, keep your ears open for a very rare one on the top band!

Another very active ham from S. Marino is Peter T77V, who started his activity on the HF bands three years ago. He runs a TS-830S to a three-element tribander yagi and has also a 7-MHz loop and a 3.5-MHz inverted vee.

Two stations which are active on 144 MHz from Mt. Titano are T77J and T72ZR. Look for them, as their signals should have a very long span from those heights.

QSL cards for the S. Marino crew should be sent to the Radio Club S. Marino, Post Box n. 1, 47031 S. Marino Citta, Repubblica di S. Marino.

The addresses of the most active HF stations are: Antonio "Tony" Ceccoli T77C, Via Carrare, 67 Pennicciola, 47031 Repubblica di S. Marino, and Piergiovanni "Peter" Volpinari T77V, Via G. Giacomini 507/54, 47031 Repubblica di S. Marino.

Should you happen to travel in the neighborhood of Mt. Titano, please don't miss meeting the T77 boys. You will have a friendly welcome, and atop there you will enjoy ancient atmospheres, great sights, and last but not least, a great white wine together with fantastic Italian foods.

de IØXXR

BLUE TEAM DXPEDITION

It all started at the end of 1982 when the group of Italian DXers that founded the DX Blue Team under the presidency of Sergio I2JQ decided to organize a couple of expeditions: one for UHF and SHF and one for HF enthusiasts.

For the first choice, it was very easy to convince IØSNY to organize it. In fact, he went to North Africa and managed to get the world record on 1.2 GHz and on 10 GHz. On top of it, he gave to many Europeans a new one from EA9, and from CN on 432 and 1.2 GHz.

More problems were found where HF was concerned. It was difficult to find a place not too difficult, from a logistical point of view, and interesting enough for the DX community. We managed to choose three countries and started to work on getting the authorizations to work from there. The BV authorities replied to us granting permission for a 10-day operation from Taipei and offering us the assistance of the CRA.

BV represents a really good target for many DXers, and we happily started to work on it. The story of the preparation of the trip is long and not too interesting, but at the end of it we were on a plane that was landing in Taiwan.

Custom problems didn't allow us to clear the goods immediately so we left the equipment in a bonded warehouse and met for the first time Tim Chen BV2A/B at the Taipei international airport. It was Sunday afternoon, September 18, and Tim's warm welcome was a prelude to all the assistance that he was ready to give us, and he really did it.

At the hotel another surprise: a group of members of the China Radio Association was waiting for us. It was our idea that Tim was the only ham in BV—not only the only active one, but also the only one interested in radio! That was not true. We had the opportunity to meet a few oldtimers and a few young fellows waiting for the local authorities to release more licenses.

On Monday, September 20, after getting all the papers to clear the rigs and be allowed to operate, we were able to put up a 12AVQ and start operations. The propagation was not too good up to midnight, local time, when the band opened to Europe, and we had the opportunity to work a few hundred stations.

On the 21st, I was in charge of the operations and, after putting up a 2-element tribander, I started to work Japan on 15. In the afternoon, the band was starting to be very good on 20. I had a good opening with VK and ZL and later on with South America. It was like being able to see the grey line moving from the South Pacific to the lowest part of the American continent and then up to the Caribbean area.

After that the first signal from the United States, Bill K1MM calling me. I worked him and a few others, but not too many Ws were on frequency. Bill called me again and told me that he was passing the message on the local repeaters, so it was just a matter of a few minutes to get a

Take the Two-Tone Challenge

*Does your transmitter put out a clean signal?
Build this two-tone audio generator and find out.*

A "Two-Tone Test" is generally acknowledged to be the most convenient and accurate method of checking the adjustment and operation of an amateur SSB transmitter. Improper bias, nonlinearity, overload, and spurious oscillations are all revealed by this method. Two-tone testing also has the advantage of testing the whole system from microphone to antenna. If there is no frequency instability, a transmitter showing a good two-tone test is almost certain to radiate a high-quality signal.

A two-tone test signal can be produced with a single audio tone by inserting the proper amount of carrier to provide the beating frequency. This arrangement is somewhat awkward at best, and many transmitters have no convenient provision for inserting specific amounts of carrier in the SSB mode. An audio generator that will produce two audio tones and can be plugged into the microphone jack is an excellent method of setting up for this test. Such a generator is not complicated or expensive; it can be constructed in an evening or two, and every part and piece is available at your local Radio Shack store.

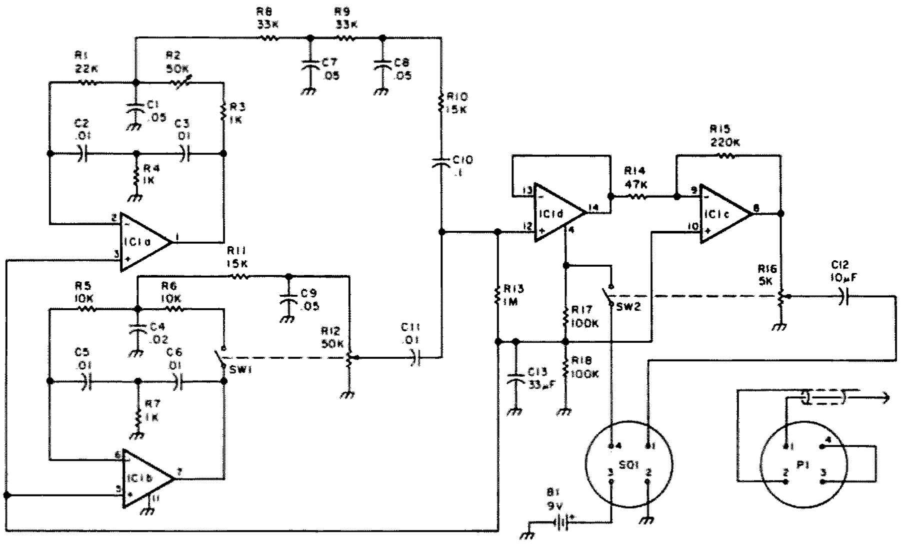

Fig. 1. A versatile two-tone generator.

Circuit Details

The only active circuit element in the generator is IC1, an LM324 quad op amp. One section of the chip (IC1A) is connected as a twin-tee audio oscillator. This is a very simple circuit, the basic oscillator consisting of the op-amp section, three capacitors, and three resistors. The 50k potentiometer, R2, is used to vary the frequency of this oscillator over the range of 440-1750 Hz. The 1k resistor, R3, places a lower limit on the effective resistance of R2. This ensures that the oscillator will run at all settings of R2.

This rudimentary method of changing the frequency of the oscillator by varying only one resistor results in the oscillator output increasing in amplitude as the frequency is increased. Ad-

vantage is taken of this characteristic in the double-section RC filter following the oscillator. The filter cleans up what distortion is present at the oscillator output, and the increasing attenuation of the filter at the higher frequencies compensates for differences in oscillator level. The result is a nice sine wave of nearly constant level at the output of the filter.

The second section of the chip (IC1B) repeats the circuit of the oscillator just described but without the variable frequency feature and with circuit values selected to give a fixed frequency of 1775 Hz. A single-section RC filter is used for this oscillator. This results in less attenuation, ensuring that the signal level on the balance potentiometer, R12, is always greater than that of the first oscillator. R12 is used to set the amplitude of the second oscillator to equal exactly that of the first oscillator.

The signal from both oscillators is now applied to the noninverting input of op-amp section IC1D. This section is connected as a voltage follower. It provides no gain but has a very high-input impedance. The voltage follower is followed by an amplifier stage (IC1C) to raise the level to the output connector.

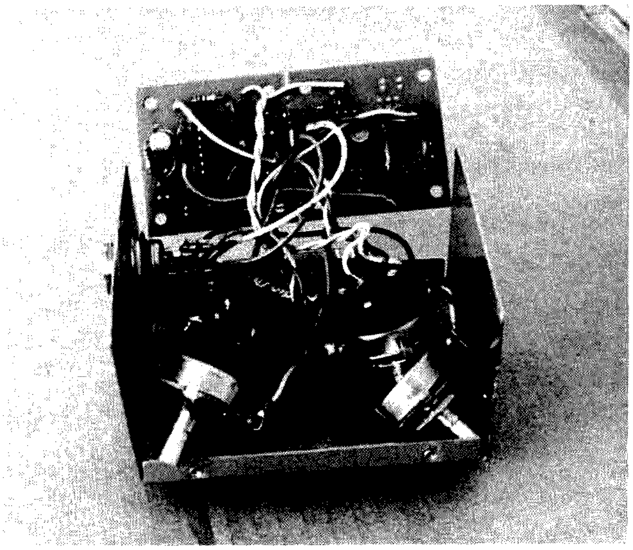
The second oscillator has a switch, SW1, ganged to the balance control. When the balance control is turned fully to the off position, opening SW1, the second oscillator is disabled while the first oscillator output is still available at the output connector. It now functions as a normal audio generator over its frequency range. This additional feature is quite useful as the waveform is good, with a maximum output level of 400 mV peak-to-peak.

Construction

The generator was constructed on a printed circuit board available at Radio Shack stores. (They list it as a "Dual IC board"; see Parts List.) Since this board is very slightly too long to fit properly in the housing specified, it is suggested that about 1/32" or so be filed from each end of the board before construction is begun and the board fitted to the housing.

At these frequencies, layout is not critical. The board has provision for two 20-pin integrated circuits. As we are using only one 14-pin chip, there are plenty of tie points to which to run component leads. I found it convenient to mount the socket and position the chip so that pins 1 through 7 were toward the center of the board. As the two oscillator sections have the greatest component density, this positioning allowed the oscillator components to spill over to the otherwise-unused section of the board. There are enough pads and holes to give each component lead a home, and with a little planning ahead, a neat layout can be achieved.

A few words for the inexperienced: In planning the layout, make an effort to have the physical components follow the layout of the schematic as well as you can. This makes troubleshooting less confusing. Although it is nice to see all resistors lying flat on the board, do not be afraid to mount them vertically if it is convenient or will improve the layout. With discretion, bare-wire jumpers may be used on the solder side of the board. For example, a wire jumper from pin 5 to pin 10 on the solder side of the board saves going all around the chip. I dedicated one of the center traces as a ground bus. Stranded wire is needed for the runs to the controls. The holes around the edge of the board are larger than the holes for components. Try to arrange to have the stranded wire to



Component side of board, ready for assembly.

the controls go to these larger holes. Don't be ashamed of a few jumpers to get from here to there. When using an all-purpose board like this, a few jumpers are hard to avoid.

After all the soldering is done, there will be a considerable accumulation of rosin on the board. I scrape the heavier portions away with a small screwdriver and then spray the board with Rosin Flux Remover from Radio Shack (RS 64-2324). I use an old toothbrush to scrub away the remaining rosin and wipe the board dry with a cloth. You will be surprised at how much better the board looks. It is also much easier to spot solder bridges and poorly soldered connections when you have a nice clean board.

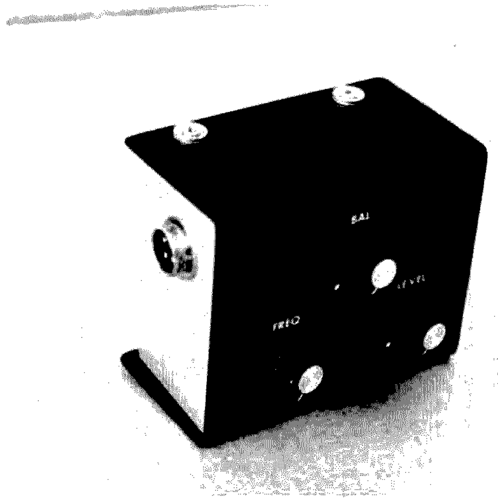
The physical construction requires little explanation. I used only two of the mounting holes on opposite corners of the board to mount it. I tapped the holes in the bottom of the housing and mounted the board on spacers, cutting the 6-32 screws to length so that they would not protrude more than a couple of threads through the bottom. If you use the potentiometers specified from Radio Shack, note that the mounting bushing is only 5/16" instead of our standard 3/8".

With the connector I used, there is no automatic grounding of the chassis. This allowed hum pickup, particularly while testing, when the chassis was separated. To alleviate this, I ran a wire ground to a lug on the screw holding the battery-clamp to ground the bottom section, and a short bare wire from the ground lug on a potentiometer, soldered to the shell of the potentiometer, to ground the top, or panel, portion.

The board specified is a very nice board. It solders well and seems quite rugged. With reasonable care, it is possible to remove and reposition components several times without any tendency for the copper to separate from the board.

Checkout

After the soldering has been completed and the board has been cleaned, the usual physical inspection for solder bridges and poor connections can be made. Before installing the battery, an ohmmeter check for a short on the supply rail is a wise precaution. With the battery installed, a voltage check on the IC socket will confirm proper supply polarity. Note that as the cir-



The finished product.

cuit is drawn, no power will be supplied to the board unless P1 is in place.

The IC can now be installed. With the level control full on and the balance control fully counterclockwise, a sine wave should appear on the output connector. If no scope is available, a pair of headphones may be used to confirm output. The tone should sound "smooth" and relatively low-pitched at one extreme of the frequency control, rising to a much higher pitch with the frequency control at the other extreme.

Advancing the balance control will cause the signal to become louder and change in character. If a scope is being used, the presence of both tones will be noted. Advancing the balance control to maximum should cause the scope pattern to more than double in height.

Should the generator fail to work, some troubleshooting is in order. The LM324 is a nice chip to troubleshoot since the output of each section is on the corner of the chip. A dc-voltage measurement should show the active pins of each amplifier section near half the supply voltage. A pair of high-impedance headphones with a capacitor of .1 μF or so in series with one of the leads makes a fine poor-man's signal tracer. There is nothing fussy about the circuit; it will work if there are no wiring errors or defective components.

Using It

A two-tone test is quite simple to set up. Use the monitor scope or service scope coupled to the output of the transmitter. Adjust the scope pattern for a convenient height while transmitting full-carrier. Now plug the generator into the microphone jack and key up the transmitter in the SSB mode. With the microphone gain at its usual setting, advance the level control on the generator to produce a scope display somewhat less than that obtained with the full carrier. With the balance control about mid-position, adjust the scope sweep or the generator-frequency control for a steady display. Adjust the balance control to achieve a sharp crossover between the individual cycles of the wave. Advancing the generator-level control will increase the height of the pattern until the tips of the waves just reach the height obtained when the carrier had been sent. Further increasing the level control should show flat-topping of the tips of the waves.

A scope will not synchronize as solidly on a two-tone test as it will on less complex waveforms. A change in level often will result in the pattern "running." As the audio generator is usually close at hand while the scope may be several

feet away, it is convenient to adjust the frequency control on the generator to stabilize the pattern. Running the frequency control over its range will result in a number of patterns on the scope. They are all equally useful except when the two tones are harmonically related.

There is sufficient output from the generator to severely overload most microphone amplifiers. It is good practice to leave the microphone gain control set where it is normally used and to use the level control on the generator to set the level.

For those not familiar with two-tone test patterns and their interpretation, a page of pictures and a description of the test procedure is given in *The Radio Amateur's Handbook*. You should obtain a textbook pattern. Any departure from the proper display should be investigated.

As mentioned earlier, the generator can be used as a sine-wave audio source by turning the balance control fully counterclockwise. This feature can be quite useful to the ham who cannot justify the cost of an audio generator but who finds occasional need for an audio source. The frequency range, though restricted, does cover the range of frequencies most commonly used.

In Conclusion

I am quite pleased with the operation of this generator. I had gotten tired of rigging two audio oscillators to make checks on my homebrew SSB rig. Setting up for a test is now a snap! I also find that the ability to steady the scope pattern with the frequency control is very handy since my monitor scope is several feet from the rig. Add to this the economy of only 1-mA current drain and a total parts cost of under $25.00, and you have a useful gadget at a very attractive price. ■

Build the NASA Beeper

Space-wise communicators use this device for one good reason: clarity.

Nicholas Van de Sande KQ4C
18 Spring Valley Drive
Arden NC 28704

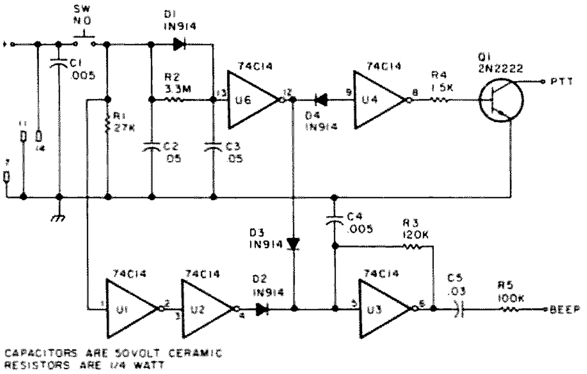

Fig. 1. Beeper schematic.

About three years ago, a friend sent me a circuit for a beeper that was being used in the Netherlands and by some of the ex-PA hams in the western hemisphere. It is used to insert a short tone at the end of a phone transmission, much as that used in communications with the astronauts. It was called the "Apollo Beep."

With the QRM we have on our crowded bands today, it is sometimes difficult to know when the other op has turned it over to you, and a beep can help. This beeper modulates fully, to the same level as a CW dash, and it stands out like the well-known sore thumb.

After constructing the beeper, I found that it worked quite well and accomplished its design purpose. I found this version rather cumbersome, however. It used six transistors, quite a few resistors and capacitors, plus a large capacitor across the transceiver-transfer relay to hold the carrier on until the tone had been transmitted. In some cases, a separate relay on the beeper board was used for this purpose, but the same objections still applied.

In the October, 1979, issue of *Ham Radio*, there appeared a circuit for a "K generator," designed by G8KGV. It inserted the letter K at the end of transmission. Shortly thereafter I built and installed that circuit, and it worked very well.

After some use, however, it seemed to me that this was gilding the lily. It seemed overdone. Also, several times the other op said to me, "I think there is a CW breaker in there!" Then it dawned on me that he thought my K was coming from elsewhere!

Back to the drawing board! After some head scratching and circuit-book consultation, the circuit shown here evolved. It requires only one IC (74C14), one transistor, 4 diodes, five resistors, and five capacitors.

Let's see how the circuit

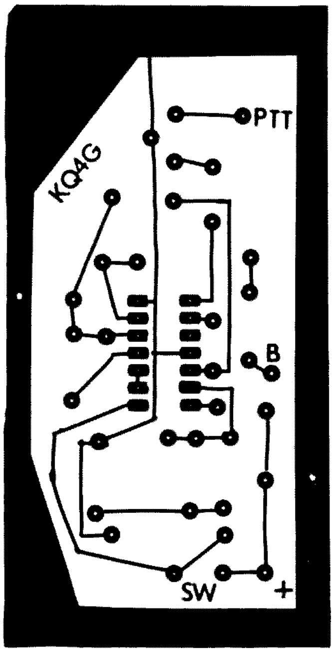

Fig. 2. Circuit board.

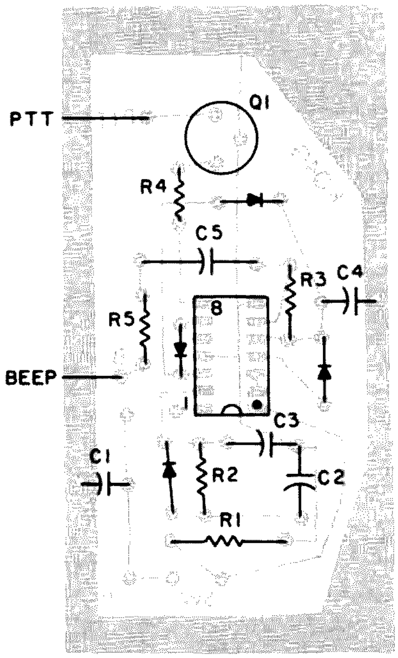

Fig. 3. Parts placement.

works. When the switch is closed, positive voltage immediately is applied through diode D1 to U6, pin 13, and C3. U6 output goes low, U4 output high, and Q1 conducts, turning on the transmitter via the PTT line. At the same time U1 output goes low, U2 output goes high. U3, a relaxation oscillator, will not operate unless both D2 and D3 inputs are low. Therefore, at turn-on no tone will be generated.

When the switch is opened C3 discharges slowly through the 3.3-megohm resistor, R2, thus holding U6 and D3 low for a short time. Simultaneously, U2 output goes low and U3 oscillates for approximately one-half second, at which time C3 has discharged sufficiently to allow U6 output to go high and U4 output low, and Q1 shuts down and we are back in receive mode.

The use of the 74C14, a CMOS hex-inverting Schmitt trigger IC, allows the use of almost any supply voltage between 5 and 15 volts. Mine operates from a separate 10-volt supply that feeds several other auxiliary units such as an audio filter, electronic keyer, preamp, etc. The voltage can probably be taken from the transceiver. R5 may need to be changed to meet your audio-input level.

I feed the tone into the "phone patch in" on my TS-820. It can be fed into the normal mike input in parallel with your mike.

The circuit board is small and can probably be mounted in the transceiver. Bypass the switch leads with .01 capacitors to prevent rf causing erratic operation—although I have had no such problem.

This unit has worked without fail since installation and has been a pleasure to use. Questions will be answered if accompanied by an SASE. I'll be beeping you! ■

Sky Power

If you're a meteor-shower expert, don't read this. Otherwise, learn.

It's mid-August and two in the morning. With work only six hours away, the amateur radio operator creeps into the radio shack and begins flipping the switches that turn night into day inside the tiny room. Slowly the receiver is tuned to the agreed-upon frequency, the transmitter is adjusted, and the time is checked with WWV. Then the ham listens.

Nothing is heard, so he transmits during the allotted time; then he listens. Again nothing heard—but wait... out of the receiver comes a quick burst of CW: *de N4* ...The amateur carefully tunes the signal and again he hears CW: *de N4ABY/7*... With this rapid burst of radio energy, the receiving amateur springs to life; all thoughts of the time and the coming workday dissolve as he embarks on a meteor-scatter contact on two meters.

This is a typical scene at the homes of many VHF operators throughout the world during the annual Perseid meteor shower. I believe, however, that this scene should take place many more times during the year. As many of you may not be aware, there are several other opportunities each year to bounce your 50-MHz, 144-MHz, 220-MHz, and even 430-MHz signals off the trails left by meteors.

As a matter of fact, it was not even the Perseid shower that produced the very first 144-MHz meteor-scatter contact. Paul Wilson W4HHK reports that he made that very first two-way with W2UK 30 years ago. Wilson said, "In August we had a so-so contact, but it was not counted. Then in October, on one of the lesser showers, we did make a satisfactory two-way contact."

In all probability, this lesser shower that Wilson speaks of was the Orionid meteor stream.

Since meteor scatter can be a very productive form of long-distance VHF communication, you may wonder why it rarely takes place except during the Perseids. The answer to this question is quite simple: This shower is considered the best of the year in terms of the number of meteors occurring each hour and it provides the highest chance of a successful contact. However, there are a number of other showers almost up to the standards of the Perseids.

Meteor showers occur at a variety of times throughout the year. In fact, there are some 600 showers or streams known to exist. However, not all of the events are of use to radio amateurs. To be useful, the date of the shower peak should be known and the number of meteors occurring each hour should be rather high. After all, there is no point in trying to work meteor scatter when there are no meteors.

So we find that the Perseids are just one of many showers taking place each year. These showers occur when the Earth encounters chunks of nickel-iron and rock that are orbiting the sun. When one of these pieces of material (called a meteoroid while still in space) strikes the atmosphere of the Earth, friction between the meteoroid and the air causes the material to heat up and bum.

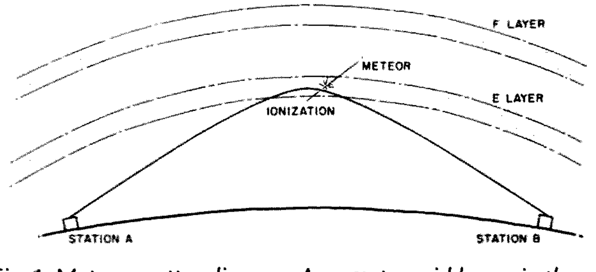

Fig. 1. Meteor-scatter diagram: As a meteoroid burns in the atmosphere of Earth, it leaves an ionized patch in its wake. If the ionization is intense enough, it may be capable of reflecting VHF signals, as shown here.

For the skywatcher, it is the tiny pieces of glowing material that are of interest since they are what produce the "falling stars" seen at night. But to the ham, it is the aftereffect of the meteor that causes the excitement.

As the meteoroid penetrates the Earth's atmosphere, it leaves behind an ionized trail that is sometimes capable of reflecting VHF radio signals. By bouncing signals off these trails, amateurs succeed in making meteor-scatter contacts. When attempting these contacts, hams should remember an important point: The frequency of the signal a trail is capable of reflecting is directly related to the density of the ionization.

Unfortunately for VHFers, it takes quite a meteor to produce enough ionization to reflect signals on 144 MHz and above. This is why attempts at meteor contacts occur during times when large numbers of meteoroids are entering the Earth's atmosphere—in other words, during a meteor shower. Fortunately, though, there are several chances each year to try to make these exotic contacts.

Of the 600 or so meteor showers that take place each year, there are seven events which may be of value to the VHF operator. While some of these showers are marginal, all should be capable of producing at least some contacts, and if you only need that "one more state," it may be worth your time to make a schedule on one of the dates mentioned.

During January of each year, the Quadrantid shower peaks on the 4th day of the month. This is a very short-lived shower, with the rise, peak, and drop-off taking less than one day. This very quick peak means you will have to be at the right place at the right time to take advantage of these meteors; however, of a more positive nature is the fact that this event produces about 40 meteor trails each hour.

The months of February, March, and April are relatively dull so far as meteor showers are concerned, but May takes a turn for the better. On the 4th of this month, the Eta Aquarid shower reaches its peak. Considered the best shower of spring, the peak varies slightly in time and the wise operator will schedule contacts for the 3rd and 4th. The point of origin of these meteors will be on the horizon at about 2:30 am, and there should be about 20 shower trails appearing each hour.

In June, there is a meteor shower that is not of much interest to astronomers but is potentially of great interest to amateur radio operators. The Beta Taurids, which peak on June 29th, produce a daytime meteor shower. This means that it is impossible to see the peak of the shower, but it is possible to utilize the peak for VHF communications. The best chance for catching these objects will be between 7:00 am and 12:00 pm local time. During these hours, the radiant of the shower will be rising in the east and moving to a point high in the southern sky.

After the Beta Taurids, it is almost exactly one month before the next good opportunity for meteor-scatter contacts comes along. This next chance is with the Delta Aquarid shower which peaks on July 28th. This shower should be considered seriously for meteor schedules since normally about 25 meteors occur each hour during the height of the event. In addition, contacts may be made one day before or after this shower's maximum since it is not sharply peaked.

The granddaddy of all meteor showers, the Perseids, takes place during August, and all meteor-scatter enthusiasts should be poised at their rigs ready to make contacts. The Perseids peak on the 11th, and between 50 and 60 meteors fall each hour. Like the Delta Aquarid shower but on a much grander scale, this is a rather long-lived event, and contacts should be possible one or two days before and after, maximum.

After the Perseids, nature takes a short break before it provides another really good shower. This comes in October, which offers a meteor stream that is notable for at least two reasons. First, this is the shower used initially for a two-meter meteor-scatter contact, and second, the meteors seen during this shower originate in the famous Halley's Comet. On October 20th, the night the Orionid shower peaks, VHFers can expect about 30 meteors each hour as the radiant rises in the southeastern sky.

Finally, December will provide the last big meteor shower of the year, but fortunately the year does go out with a flash. The Geminid meteor stream reaches maximum on December 14th, and it is always quite a spectacle for interested skywatchers. Since the shower produces almost 60 meteors each hour, it should also prove quite spectacular from a communications viewpoint. So, while the astronomers cool their heels watching for the meteors in the cold December weather, amateur radio operators should be able to make a few contacts in the warmth of their finals.

It is apparent, then, that there are many opportunities during the year to make a number of meteor-scatter contacts, and for the experienced operator, all that is necessary is to make schedules with other amateurs. But what if you have never made a meteor contact or don't even know what one sounds like?

The best approach is to find some ham who is making schedules and see if you can be in on some of the contacts. However, if no one in your area is active on meteor scatter, the next best bet is to find someone through one of the VHF-oriented publications or columns and make a schedule of your own. If the person you contact is an experienced operator, you should be able to get all the necessary information regarding proper procedures and techniques.

It should be apparent by now that meteor scatter can and should be a year-round activity. Those who have tried this mode of long-distance communication have found it to be quite exciting and very challenging, and for these amateurs, I hope the information provided will allow them more operating opportunities during the year.

For the beginner, I hope the knowledge that meteor scatter is not a one-time-a-year operation will provide the motivation to actually get on the air and make contacts. But remember, don't blame me for sleepless nights and rough days at work; blame Mother Nature for providing all the meteors! ■

Shower	Date	Remarks
Quadrantid	January 4	Very short-lived shower
Eta Aquarid	May 4	20 meteors each hour
Beta Taurid	June 29	Daytime shower
Delta Aquarid	July 28	Contacts possible ± 1 day
Perseid	August 11	Best shower of the year
Orionid	October 20	Originated in Halley's Comet
Geminid	December 14	Nearly as good as Perseid

Table 1. Shown here are the names of meteor showers of interest to amateur radio operators, the dates the showers peak, and comments concerning them.

Wet Battery Quiz

And you thought you knew it all.

There is not much to ordinary wet batteries, is there? I mean, doesn't everyone know that all you do is charge them and discharge them? So you won't find this quiz a challenge? Right, so let's see how you do.

Here are ten statements. All refer to automotive-type storage batteries. Mostly they refer to batteries powering light loads—such as electronic equipment. Answer yes or no.

1. The best way of establishing state-of-charge of a battery is with a hydrometer.
2. An inactive battery should be kept on trickle charge.
3. A 100-Ampere-hour battery can be discharged at 10 Amperes for 10 hours.
4. You cannot tell the state-of-charge of a battery by measuring its terminal voltage.
5. Batteries stored on concrete floors will be damaged.
6. Initial voltage and open-circuit voltage are the same thing.
7. If the specific gravity of an older battery is low, add battery acid to bring it up to 1.300.
8. Only "marine" batteries should be used on boats.
9. Connecting two batteries in parallel will double the power available.
10. Impregnated felt washers on battery terminals will prevent battery corrosion.

Nothing to it, right? Want to try your answers against mine? Read on.

Batteries are interesting, even fascinating, perhaps because so little is known about them—or maybe because so much is "known." Every writer has his own rules and opinions. In a situation like this, it is wise to balance theory against practical experience. So that is what these answers are based on—a synthesis of "book larnin" and practical experience.

1. Hydrometers. Most books have this old chestnut—and it is true as long as you are talking about new batteries. However, as a battery ages, it loses its ability to raise its specific gravity, no matter how long it is charged. This does not mean that the battery will no longer serve its purpose. In addition, the hydrometer is a hazardous nuisance.

Battery acid is highly corrosive and its corrosive power lasts a long time. The better way of identifying level-of-charge is by combining battery voltage and current readings.

If either voltage or current can be regulated—that is, kept constant—then the second factor will indicate full charge when it reaches a constant value for one hour.

As a practical example, an ordinary 6-Amp unregulated charger will have fully charged the battery when terminal voltage reaches about 14½ volts.

Another indication of full charge is the amount of bubbling (gassing) you can hear from the battery. Stop the charge when bubbling becomes obvious.

2. Inactive batteries. Before the day of "dry-charged" batteries, ready-for-sale batteries in stores were kept under constant trickle charge. Some authorities today are against trickle charging on the grounds that it causes "sulphation." In other words, battery capacity will decline due to formation of inactive material on the plates.

My own experience is that as little as ½ Ampere will cause the electrolyte to boil away in a couple of months. We have to qualify this theory with the experience of North American telephone companies. The telephone companies have more batteries in service than any other user. Most of their batteries are on constant-voltage trickle charge continuously. They use two main types of batteries, low specific gravity and high:

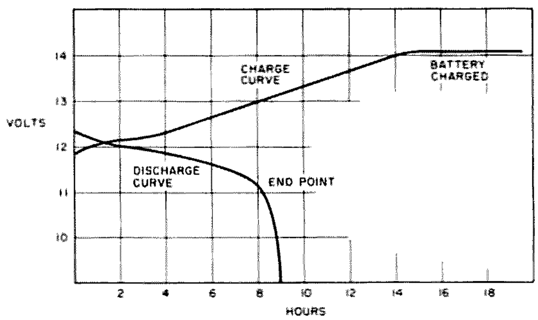

Fig. 1. Charge/discharge graph.

● Low SG type: floated at 2.17 + or − .01 volts per cell, which would be 13.02 volts for a 12-volt battery.

● High SG type: floated at 2.25 + or − .01 volts per cell, which would be 13.5 volts for 12 volts.

Batteries used in this way will last 10 to 20 years when properly maintained. Unfortunately, we cannot accept this experience as absolute because telephone batteries are commercial or industrial grade and use different alloys than are used in car batteries.

3. Ampere-hour capacity. We can be specific on this one. A 100-Ampere-hour battery will seldom, if ever, deliver 10 Amperes for 10 hours. First of all, battery output will depend on rate of discharge.

A 100-Ampere-hour battery might provide 1 Ampere for 120 hours or 25 Amperes for 2 hours. A further factor is battery age, and how it has been treated. If a car battery is discharged below 11 volts even once, its capacity will be greatly reduced. A loss of 10 to 25 percent would not be surprising.

A car battery is engineered for short, very heavy discharge followed by immediate heavy recharge. Used in this way, a good battery will last 5 years or more. In light-drain, light-recharge conditions, the battery will show serious loss of capacity in one year.

Most batteries these days are not rated in Ampere-hour capacity. Instead, they are rated in direct time and current. For example, one Gould battery was rated as follows:

Amps	Hours
2.5	41.
5.0	19.
10	8.5
15	5.3
20	3.8
25	3.0

4. Terminal Voltage: Whether this statement is true or not depends on the qualifications. If you mean open-circuit voltage, then the value of the voltage reading is doubtful. We can tell quite a bit from battery terminal voltage if the battery is placed under either charge or discharge conditions during measurement. (See graph of charge/discharge; this is the action of a car battery at about its half-life point.)

On discharge, voltage quickly drops to about 12 volts, then remains fairly constant until it reaches about 11 volts. Then it drops off quite rapidly. This is known as the "end point." Assuming that the equipment connected to the battery will still function at 11 volts, I would recommend 11 volts as the end point. Some authorities recommend 10.8 volts. Get the battery back on charge as soon as possible after reaching end-point voltage. An accurate voltmeter is essential.

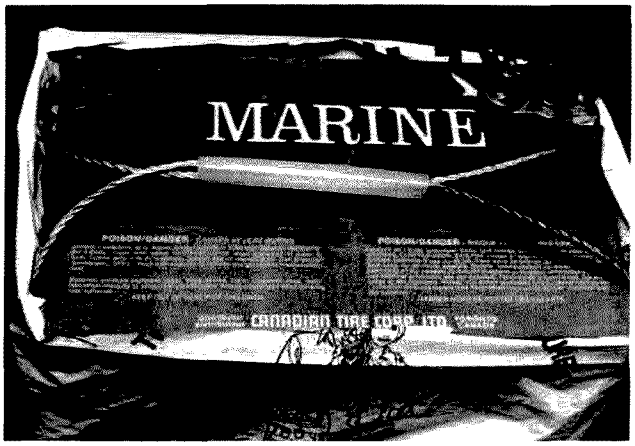
Now look at the charge curve. Notice that terminal voltage rises quite rapidly at first, then levels off, and thereafter it rises quite linearly. When it reaches the flat portion of the curve, the battery is charged.

The shape of the charge curve will vary depending on the current and voltage outputs of the charger as the battery charge condition changes. Not all battery chargers are the same.

For instance, a few years ago Heathkit put out two battery chargers. One was rated at 15 Amperes and had an automatic shutoff at 14.5 volts. Its charge rate was 15 Amperes tapering to 2 Amperes.

The second charger was rated at 10 Amperes and its charge rate decline to "the leakage rate of the battery" on output voltage of 13.2 to 13.6 volts. Note that this procedure is similar to telephone company practice. (See answer to question 2.)

If you are using an ordinary charger such as the 15-Ampere model above, then we can assume that if charge current is around 2 Amperes and voltage is about 14.5 and fairly constant, then the battery is charged.



A marine battery encased in plastic.

5. Concrete floors. This one is weird, and yet appears in several books and magazine articles. Ask the question: How could the concrete floor get through the acid-impervious case? My answer—it can't. Even if concrete were a conductor, there would have to be a leak from both terminals to the concrete to provide a path. And if there is battery leakage, why wouldn't it short directly across the top of the battery?

My explanation for this one is to consider the *occasion* for which the battery is on the concrete floor. Most likely the battery is out of service. Therefore deterioration is due to idleness, not the material it rests on.

Before we leave this one, answer this for me. Battery acid is a conductor. An acid path across the top of the battery will cause current leakage. Agreed? Then how come the acid inside the case does not cause current leakage?

6. Initial voltage is the voltage at the battery terminals immediately after the load is applied. Open-circuit voltage—see answer 4.

7. Adding battery acid. All sources agree that adding battery acid will not improve battery performance. Our experiments agree with this. However, if you are buying a new battery, it's a good idea to insist on similar specific gravity in each cell. Adding acid is sometimes done locally and is subject to error. The best advice re battery acid is: Leave it alone.

8. Marine batteries. I have talked to two different companies about this. Here is the answer I was given:

A marine battery has the same construction as a car battery with these exceptions:

● An automobile battery used in a boat is guaranteed for 6 months. In a car, it may be 42 months. A marine battery is guaranteed for 12 months.

● A marine battery has a polypropylene handle to assist in lifting it out.

● A marine battery will have screw-type terminal lugs.

● A marine battery will have a picture of a boat on it.

More recently, a new type of battery has become available. These are deep cycle (or Recreational Vehicle) batteries, designed for light-discharge, periodic-recharge service. Their internal construction is quite different. If they are as good as claimed,

they are well worth the premium price.

9. Paralleling batteries. One recommendation re paralleling storage batteries: DON'T! The weaker one inevitably will discharge the stronger. If you do want the added capacity of a second battery, use a battery isolator. These are obtainable from marine and trailer supply stores. Basically, it consists of two diodes arranged so that both batteries are charged from one source. The load is split in two and each part is separately fed from its own battery.

10. Battery terminal corrosion. Usually noticed as green grass growing on the battery cables. The idea of the oil-impregnated felt washers is a good one. Unfortunately, battery acid is creepy stuff. Once it gets out of the battery case, it's almost impossible to stop it from reaching the battery holder and, worse yet, the copper cables. The classic cure is to keep the top of the battery clean, thus preventing the acid from doing any harm. Some other steps you can take are:

- Encase the battery in a plastic bag, leaving the top open. This will contain the acid if it leaks down the sides.
- In a car, it is a good idea to pull the battery out about once a year and examine the battery holder. Any white deposits should be neutralized with diluted household ammonia. Rinse well with plain water. Put on a coat of car undercoating to help prevent recurrence. Neutralize the battery cable ends as well. Grease them lightly before reconnecting.

So that is it. Batteries: our best friends most of the time; dangerous enemies if mistreated. A few precautions and a little tender loving care and your battery is a friend for life.■

HAM HELP

We are happy to provide Ham Help listings free, on a space-available basis. We are not happy when we have to take time from other duties to decipher cryptic notes scrawled illegibly on dog-eared postcards and odd-sized scraps of paper. Please type or print your request (neatly!), double spaced, on an 8½" x 11" sheet of paper and use upper- and lowercase letters where appropriate. Also, please make a "1" look like a "1," not an "l," which could be an "el" or an "eye." and so on. Hard as it may be to believe, we are not familiar with every piece of equipment manufactured on Earth for the last 50 years! Thanks for your cooperation.

Wanted: instruction sheets/manual or crystalling instructions for an E. F. Johnson Co. hi-lo band scanner, model 241-0390, 30-50 MHz and 150-174 MHz.

Mick McDaniel W6FGE
90 Temple St.
San Diego CA 92106

Can anybody help me get a schematic diagram for a Sonar Radio Corp. Model BR-2906 mobile linear amplifier? I will pay for copying and postage.

Bruce Brockway
257 S. Royal Poinciana Blvd. 106
Miami Springs FL 33166

I need the schematic or manual for a Madison Labs (Div. of Hallicrafters) FRR-71 receiver.

G. K. Barber
PO Box 31654
Aurora CO 80041

Does anyone know what improvements and updates are made by Drake when a TR7 is returned to the factory? Any information concerning mods or changes to the TR7 or TR7A would be appreciated. Are there any TR7 clubs or on-the-air nets?

Marvin Moss W4UXJ
Box 28601
Atlanta GA 30358

I am looking for a supplier of or a circuit suitable for a linear amplifier of about 10 Watts output for the 2300-MHz band that would work for A5 ATV.

Henry R. Anderson VE6LK
2226-18 Avenue South
Lethbridge, Alberta
Canada T1K 1C8

I have been running into trouble with spikes from the 110-V-ac power line and/or my outside antenna. I am looking for information concerning protectors for 2m FM.

Robert H. Saviers WA3YCA
2101 Stackhouse Dr.
Yardley PA 19067

Help! I have a home-brew RTTY and CW TU. I have connected it to my computer's serial port but have no software to run it. Having limited funds, I cannot afford commercial software. Does anyone have an Apple-/Franklin-compatible program that he would be willing to give me a copy of? I'd be more than happy to pay for it or send a disk and pay shipping costs.

Alan Jovanovich KA7DAT
So. 1165 Grand
#86
Pullman WA 99163

I am interested in obtaining the VOX relay that plugs into the back of the Swan 700 transceiver. I would appreciate hearing from someone who may have one of these lying around that they don't have any future use for.

Augustus B. Wells
PO Box 50
Tunica LA 70782

I am looking for a copy of the instruction booklet for the Knight KG670 R/C tester made by Allied Radio. I will pay the costs for copying and mailing or for the original manual.

Lionel Roach KD5VO
3033 Teakwood
Garland TX 75042

Wanted: Collins 70E-7A PTO (permeability-tuned oscillator) for a Collins 75A1 receiver. This PTO covers 2-3 MHz and is used to tune the receiver.

Harold Smith W2GKE
26 Linden St.
Bayonne NJ 07002
(201)-436-1405

I am using the VIC-20 as a RTTY terminal with Kantronics interface and software. Can anyone help me with information on building an adapter which would let me use Atari cartridges on the VIC-20?

Robert F. Cann W4GBB
1606 Lochwood Dr.
Richmond VA 23233

I would appreciate receiving a copy of the schematic for an NCX-3 SSB/CW transceiver by National. I have the owner's manual already. I will gladly reimburse for costs.

Jeffry M. Blackmon W2YI
2107 Turnbull Road
Beavercreek OH 45431

I need the schematic for the Emergency Beacon Corporation model EBC-144 Jr. two-meter transceiver; and does anybody know where the company is located?

Bruce Stevenson WA6DUE
PO Box 7
Tecopa CA 92389

I need technical information on converting a Midland 13-863 CB to ten meters. Also, can anyone tell me the frequencies of any amateur astronomy nets I could check into?

Michael J. O'Neil KA2FIR
43 Spring Garden St.
Valley Stream NY 11580

I need a schematic and/or parts layout for a Bearcat Model BC-210. I will copy and return.

Frans F. Pauli WB6VYV
3526 North Cascade, B2
Colorado Springs CO 80907

I am looking for any information or schematics for a variable power supply (0-to-60-volt, 0-to-9-Amp), model number CH 60-9, serial number 15807-1, manufactured by NJE Corporation of Kenilworth, New Jersey. All efforts will be greatly appreciated; copying costs will be paid if requested.

Don Hanson N1AZH
RFD #2, Box 3678
Greene ME 04236

I need schematics and alignment procedures for the Icom IC-22A. I will pay mailing/copying charges.

Michael S. Greene KC7FN/VE7FSJ
Code 80412 NUWES
Keyport WA 98345

Help! The Kennehoochie Amateur Radio Club is badly in need of a relay for a KLM PA 30-150 amplifier (relay designation KY1). The relay is manufactured by GE (part number 3SAF1121). The coil is equal to 125 Ohms. The relay is no longer available from the equipment or parts manufacturer.

Carol Shrader WI4K
4065 Ophie Drive
Marietta GA 30066

I need a manual for a Swan 400 transceiver equipped with a Swan 420 vfo. I will copy and return your original or reimburse your copying and shipping costs.

Rod Robbins WA7IRY
22435 Bents Road
Aurora OR 97002

I need a schematic for an antique radio. It is a Sonora, using an 80, 47, 24-a, and 35 tube set. I would appreciate any info and will pay any expenses.

John Watzke K8OXI
9910 Shore Dr.
Pigeon MI 48755

Anyone have technical specs on the CV 278/GR RTTY TU—tube-type, scope, meter, size, etc?

H. S. Robb AF0W
Box 17
Bird Island MN 55310

I'm looking for a schematic for a Lavoie oscilloscope, model no. LA265A. I will pay for copying and mailing costs.

Another Antenna Approach

This Timex/Sinclair program goes to great lengths.

In 1983, *Time* magazine selected the personal computer as the "Man of the Year." This is perfectly understandable since microcomputers are now priced low enough to allow virtually anyone to become involved in home-computer operations.

The least expensive computer on the market (as I write this) is the Sinclair-Timex 1000 which retails for less than $100. This is not a toy; it can be expanded to a 64K memory and has many of the features of much more expensive machines.

After purchasing a ZX-81, the predecessor of the Timex 1000, I began to look for ham-radio applications. The computer is now situated on one end of my operating bench and, as time goes on, I hope to use it for computerized CW and RTTY applications.

The program presented in this article is designed to compute the dimensions of

Sample screens.

a dipole and a vertical antenna for a given frequency. The program requests the center frequency of the desired band and presents the data in feet and meters. The program is written in Sinclair Basic, but can easily be transposed to any other machine.

Before attempting to load the program, the program notes should be reviewed. Further, the illustrations show the computer monitor presentation of an actual run. With very little effort, the program can be modified to provide either more or less data. For example, the metric dimensions can be deleted or the decimal feet can be expressed as feet and inches through simple program changes.

In conclusion, we all can benefit from computerized operations in ham-radio applications. Computers are not just useful tools but are critical elements of everyday life. Everyone should develop some degree of computer literacy in order to cope with future demands. The Sinclair-Timex is an excellent introduction to computer logic and programming. I hope to see a flood of ZX-81 applications in the near future.■

Sample output.

PROGRAM NOTES

1. Lines 20-160 set up the screen, provide directions, and accept the center frequency.
2. Lines 170-240 compute the variables.
3. Lines 250-260 are a timing loop. They hold the display and are only for graphic effect. They can be eliminated if desired.
4. Lines 280-470 control the output.
5. Lines 480-500 are a decision-making set. These allow input of additional frequencies.
6. The antenna calculations can be found in any ARRL handbook. They are:
   Dipole length in feet = 492/Freq. in MHz
   Dipole length in meters = 150/Freq. in MHz
   Vertical element in feet = 234/Freq. in MHz
   Vertical element in meters = 71.3/Freq. in MHz
   Radials are 2.5% longer than the vertical members
7. In order to provide results that are rounded to 2 significant decimal places, each INT function utilizes a number multiplied by 100. The result is then divided by 100 to give 2 decimal places. See lines 170-240.

STERLING IL
MAR 18

The Sterling-Rock Falls Amateur Radio Society will hold its 24th annual hamfest on Sunday, March 18, 1984, beginning at 7:30 am, at the Sterling High School Fieldhouse, 1608 4th Avenue, Sterling IL. Tickets are $2.00 in advance and $3.00 at the door. There will be commercial distributors, dealers, a large flea market, a concession stand, and lots of free parking, including space to accommodate self-contained campers overnight. Flea-market tables requiring electricity and all commercial tables are $5.00; all other tables are $3.00. Setup hours will be Saturday from 6:00 pm to 9:00 pm and Sunday morning. Talk-in on 146.25/.85 (W9MEP). For advance tickets and tables, send a check, payable to Sterling-Rock Falls Amateur Radio Society (SRFARS), to Sue Peters KA9GNR, PO Box 521, Sterling IL 61081, or call (815)-625-9262.

MAUMEE OH
MAR 18

The Toledo Mobile Radio Association, Inc., will hold its 29th annual Ham/Computer Fest and Auction on Sunday, March 18, 1984, from 8:00 am to 5:00 pm, at the Lucas County Recreation Center, Key Street, Maumee OH. Tickets are $2.50 in advance and $3.00 at the door. The auction starts at 10:00 am. Other features will include commercial exhibitors, ladies' programs, ample free parking all day and overnight, and refreshments. Flea-market tables are available and displays are limited to electronic, ham, and computer gear only. Talk-in on .52, .01/.61, .19/.79, .34/.94, .87/.27, .975/.375, and 447/442. For further information, write Elmer Clark KR8U, 5520 Edgewater Drive, Toledo OH 43611.

MAUMEE OH
MAR 18

The annual meeting of the American Signaling Society is scheduled for March 18, 1984. The meeting will begin promptly at 0100 hours UTC. Members and guests will convene in the Main Exhibit Hall of the Lucas County Recreation Center, 2901 Key Street, Maumee OH. Activities will include the election of officers, the ever-popular forum on Modern Signaling (chaired by Mr. Alan Pike), and a Century Club confab. For additional information, please send an SASE to The American Signaling Society, 4015 Windermere Road, Columbus OH 43220.

JEFFERSON WI
MAR 18

The Tri-County Amateur Radio Club will hold its annual hamfest on March 18, 1984, from 8:00 am to 3:00 pm, at the Jefferson County Fairgrounds, Jefferson WI. Tickets are $2.50 in advance and $3.00 at the door; tables are $3.00 in advance and $4.00 at the door. There will be plenty of food and free parking. Doors will open at 7:00 for sellers only. Talk-in on 146.52, 146.22/.82, and 144.89/145.49. For more information or advance tickets and tables, send an SASE to Bob Barker K9RIJ, 724 Burdick, Milton WI 53563.

CHELSEA MA
MAR 20

The 19/79 Amateur Radio Association will sponsor classes for the prospective Novice and Tech/General, beginning March 20, 1984, from 7:00 pm to 9:00 pm, at Chelsea High School, Clark Avenue, Chelsea MA. The only charge will be the cost of the material. For more information or to register, write 19/79 Amateur Radio Association, c/o Frank Masucci K1BPN, PO Box 171, Chelsea MA 02150.

MARSHALL MI
MAR 24

The Southern Michigan Amateur Radio Society and the Marshall High School Photo-Electronics Club will sponsor the 23rd annual Michigan Crossroads Hamfest on Saturday, March 24, 1984, from 8:00 am to 3:00 pm, at the Marshall High School, Marshall MI. Setups for sellers will be at 7:00 am with plenty of free parking and carry-in help. Tickets are $1.50 in advance and $2.00 at the door. Table space is 50¢ per foot (4-foot minimum) and it will be reserved until 8:00 am. There will be a snack bar and full food service. Talk-in on 146.52 and 146.07/.67. For reservations, send an SASE to SMARS, PO Box 934, Battle Creek MI 49016, or call Wes Chaney N8BDM at (616)-979-3433.

UPPER SADDLE RIVER NJ
MAR 24

The Chestnut Ridge Radio Club will sponsor the Ham Radio Flea Market on Saturday, March 24, 1984, at the Education Building, Saddle River Reformed Church, East Saddle River Road and Weiss Road, Upper Saddle River NJ. There is no admission fee. Tables are $10.00 for the first and $5.00 for each additional table; tailgating is $5.00. Food and soda will be available. For more information, call Jack Meagher W2EHD at (201)-768-8360 or Roger Soderman KW2U at (201)-666-2430.

MADISON OH
MAR 25

The Lake County Amateur Radio Association will present its fifth annual Lake County Hamfest and Computer Fest on Sunday, March 25, 1984, from 8:00 am to 4:00 pm, at Madison High School, Madison OH (just 40 miles east of Cleveland). Admission is $3.00 in advance and $3.50 at the door; table and display space is $5.00 for a 6-foot table and $6.50 for an 8-foot table. All display space is indoors and doors will open at 5:30 am for exhibitors. Plenty of free parking will be available. Talk-in on 147.81/.21. For reservations or more information, send an SASE to Lake County Hamfest Committee, PO Box 150, Mentor OH 44061, or phone (216)-953-9784.

GRAYSLAKE IL
MAR 25

The Libertyville and Mundelein Amateur Radio Society will hold LAMARSFEST 1984 on Sunday, March 25, 1984, starting at 8:00 am, at the Lake County Fairgrounds, Routes 45 and 120, Grayslake IL. Tickets are $2.00 in advance and $3.00 at the door. There are plenty of 8-foot swapfest-area tables available at $5.00 each. Commercial exhibitors should contact LAMARS for more information and reservations. Setups begin at 6:00 am. Food and free parking will be available. Talk-in on 147.63/.03 and 146.94 simplex. For advance tickets and table reservations, send an SASE to LAMARS, PO Box 751, Libertyville IL 60048.

OMRO WI
MAR 25

The Oshkosh Amateur Radio Club will sponsor the 4th annual OARC Auction on March 25, 1984, from 11:00 am to 4:00 pm, at a new, larger location (no stairs), Winro Hall, Omro WI. Auction items must have a $15 minimum value and OARC will charge a 10% commission on all sales. Setup starts at 9:00 am. Tickets are $2.00 in advance and $3.00 at the door. There will be a professional auctioneer and food, drink, and free parking will be available. Talk-in on 147.945/.345. For advance tickets, send an SASE and $2.00 per ticket to Tickets, K9WWW, 1646 Michigan, Oshkosh WI 54901. Deadline is March 11, 1984, and orders without SASEs will be held at the door at the buyer's risk.

GRAND JUNCTION CO
MAR 31

The Grand Mesa Repeater Society will hold the fifth annual Western Slope Hamfest on Saturday, March 31, 1984, from 10:00 am to 4:00 pm, at the Plumbers and Steamfitters Union Hall, 2384 Highway 6 & 50, Grand Junction CO. Admission is free and swap tables are $5.00 each. Features will include an indoor swapfest, Novice exams, an auction, a talk by Lys Carey KØPGM, Director of the ARRL Rocky Mountain Division, and a session on repeaters and remote bases with Ted Wetzel WBØPDU. There will be refreshments. Talk-in on 146.82 and 449.20. For further information or to reserve a swap table, send an SASE to Larry Brooks WBØECV, 3185 Bunting Avenue, Grand Junction CO 81504, or call (303)-434-5603.

FRAMINGHAM MA
APR 1

The Framingham ARA, Inc., will hold its annual spring flea market on Sunday, April 1, 1984, beginning at 10:00 am at the Framingham Civic League Building, 214 Concord Street (Rte. 126), downtown Framingham. Admission is $2.00 and tables are $10.00 (pre-registration required). Sellers may begin setups at 8:30 am. There will be radio equipment, computer gear, and food in-house. Talk-in on 147.75/.15 and .52. For more information, contact Jon Weiner K1VVC, 52 Overlook Drive, Framingham MA 01701, or phone (617)-877-7166.

TRENTON NJ
APR 1

The Delaware Valley Radio Association will hold its 12th annual flea market and computer show on Sunday, April 1, 1984, from 8:00 am to 4:00 pm, at the New Jersey National Guard 112th Field Artillery Armory, Eggerts Crossing Road, Lawrence Township, Trenton NJ. There will be an indoor and outdoor flea-market area, commercial dealers, and refreshments. Sellers are asked to bring their own tables. Talk-in on 146.52 and 146.07/.67. For advance tickets and space reservations, please send an SASE to Walter L. Sharpe KB2ZY, 140 Susan Drive, Trenton NJ 08638.

SAN ANTONIO TX
APR 7

The San Antonio Area Radio Club will hold its first annual Swapfest and Bar-B-Q on April 7, 1984, from 7:00 am to 5:00 pm, at Comanche Park. Talk-In on 147.36 MHz. For more details, write Melvin Anderson, 8932 Saddle Trail, San Antonio TX 78255.

ROCHESTER MN
APR 7

The Rochester Amateur Radio Club and the Rochester Repeater Society will sponsor the 7th annual Rochester Area Hamfest on Saturday, April 7, 1984, beginning at 8:30 am, at John Adams Junior High School, 2535 NW 31 Street, Rochester MN. There will be a large indoor flea market for radio and electronic items, refreshments, and plenty of free parking. Talk-in on 146.22/.82 MHz. For further information, contact RARC, c/o W. C. McGurk WBØYEE, 2253 Nordic Court NW, Rochester MN 55901.

FLEMINGTON NJ
APR 7

The Cherryville Repeater Association will sponsor the annual Flemington NJ Hamfest on Saturday, April 7, 1984, from 8:00 am to 3:00 pm, at the Hunterdon County High School Field House on Route 31. General admission is $3.00. For early birds, breakfast will be available on site from 6:30 am. Talk-in on 147.375, 147.015, 146.52, 224.12, and 444.85. For additional information or table reservations, write Bill Inkrote K2NJ, RD 10, Box 294, Quakertown-Croton Road, Flemington NJ 08822, or call (201)-788-4080.

GREENCASTLE IN
APR 7

The Putnam County Amateur Radio Club will hold its second Amateur Radio and Electronics Auction on April 7, 1984, at the Putnam County Fairgrounds, US 231, north of Greencastle IN. Admission is $1.00, sales commission is 5%, and there will be a $1.00 service charge on buy-backs. Doors will open at 8:00 am and the auction will start at 10:00 am. Bring your equipment to be sold on consignment. All activities will be inside and food will be available. Talk-in on 147.93/.33. For more information or a flyer, contact John Underwood K9IIB, RFD 1, Box 10, Fillmore IN 46128.

KANSAS CITY MO
APR 7-8

The PHD Amateur Radio Association, Inc., will sponsor the 1984 Missouri State ARRL Convention on Saturday and Sunday, April 7-8, 1984, from 10:00 am to 5:30 pm (both days), at the Trade Mart Building, at the downtown Kansas City MO airport. For both days, registration is $4.00 and swap tables are $10.00, which includes one registration with each table. Commercial exhibitors may set up from 7:00 pm to 9:00 pm on Friday or 7:00 am to 10:00 am on Saturday; swappers may set up at 9:00 on Saturday. The Saturday-night banquet at the world-famous Gold Buffet is $10.50. Those desiring banquet tickets and swap tables are urged to order in advance. Other features will be a complete program of forums, commercial booths, a large flea market, a home-brew contest, Missouri-Kansas Amateur-of-the-Year and CW Contest awards, and on Sunday, a Missouri-Kansas Repeater Council meeting, as well as QCWA and YL luncheons. Unlimited free parking, including RV space (no hookups), will be available.

Talk-in on 146.34/.94. For more information and registrations, write PHD Amateur Radio Association, Inc., Liberty MO 64068-0011, or call (816)-781-7313 or 452-9321. All pre-registrations will be held at the door.

AMBOY IL
APR 8

The 19th annual Rock River ARC Hamfest will be held on Sunday, April 8, 1984, beginning at 8:00 am, at the Lee County 4-H Center, one mile east of the junction of 52 and 30. Ticket donations are $2.00 each in advance and $3.00 at the gate; 8-foot tables are $5.00 each. Camping space will be available for a nominal charge and breakfast and lunch will be served. There will be an auction of amateur-related gear. Talk-in on .37/.97 repeater. For more information or advance tickets (available until April 1, 1984) and tables, write to Shirley Webb KA9HGZ, 618 Orchard Street, Dixon IL 61021, or phone (815)-284-3811.

MADISON WI
APR 8

The Madison Area Repeater Association, Inc. (MARA), will hold its 12th annual Madison Swapfest on Sunday, April 8, 1984, at the Dane County Exposition Center Forum Building in Madison WI. Admission is $2.50 per person in advance and $3.00 at the door. Children twelve and under will be admitted free. Flea-market tables are $4.00 each in advance and $5.00 at the door. Doors will open at 5:00 am for commercial exhibitors, 8:00 am for flea-market sellers, and 9:00 am for the general public. Features will include commercial exhibitors, a flea market, an all-you-can-eat pancake breakfast, and a barbecue lunch. Plenty of parking space and nearby hotel accommodations are available. Talk-in on 146.16/.76 (WB9AER/R). For reservations (early ones are advised) or more information, write to MARA, PO Box 3403, Madison WI 53704.

MUSKEGON MI
APR 14

The Muskegon Area Amateur Radio Council will hold the ARRL Michigan State Convention and Muskegon Hamfest on April 14, 1984, at the L. C. Walker Arena, 4th at Western, Muskegon MI. Features will include Friday-evening hospitality rooms, programs covering areas of amateur radio interest, ladies' activities, and Saturday-evening convention dinner program. Setups for manufacturers and dealers will begin at 2:00 pm on April 13th. For more information, write Muskegon Area Amateur Radio Council, PO Box 691, Muskegon MI 49443.

JACKSON MS
APR 14-15

The Jackson Amateur Radio Club will host the Capital City Hamfest and 1984 ARRL Mississippi State Convention on Saturday and Sunday, April 14-15, 1984, at the Communications Workers of America Building, I-220 at Country Club Drive. Hours on Saturday are 9:00 am to 5:00 pm and on Sunday, 8:00 am to 1:30 pm. Admission is free and flea-market tables are $5.00 each. Attractions include commercial dealer exhibits, a large indoor flea market, concessions, forums, and free parking (including self-contained RVs). For special hamfest rates, contact the Holiday Inn Southwest directly. Talk-in on 146.16/.76. For further information, contact Carol Kemp NA5Y, 3581 Beaumont Drive, Pearl MS 39208, or phone (601)-939-7612.

RALEIGH NC
APR 15

The Raleigh Amateur Radio Society will hold its 12th annual hamfest and flea market (all under cover) on Sunday, April 15, 1984, beginning at 8:00 am, at the Crabtree Valley Shopping Mall, located at the intersection of US 70 west and US 1 and 64. Admission is $4.00 at the gate, with no extra charge for tailgaters. Tables will be available for rent. Features will include a CW contest, a homebrew contest, and special-interest meetings. Talk-in will be on 146.04/146.64 (W4DW) and 146.28/146.88 (K4ITL). For more information, contact Pete Thacher N4HQZ at (919)-876-4073 or Jim Bradley WA4AOO at (919)-851-2437 from 6:00 pm to 8:00 pm weekdays or on weekends, or write RARS, PO 19127, Raleigh NC 27619.

DAYTON OH
APR 27-29

The Dayton Amateur Radio Association, Inc., will sponsor the Dayton Hamvention on April 27-29, 1984, at the Hara Arena and Exhibition Center, Dayton OH. Admission, valid for all three days, is $7.50 in advance and $10.00 at the door. The Saturday evening Grand Banquet and Entertainment is $14.00 in advance and $16.00 at the door. Harry Dannals W2HD, past president of the ARRL, will be the featured speaker. Because seating is limited, early reservations are requested. There will be a giant flea market starting at noon on Friday and continuing all day Saturday and Sunday. Flea-market space is $15.00 for all three days and will be sold in advance only. Entrance for setups will be available starting Wednesday and the special flea-market telephone is (513)-223-0923. Other features will include forums, awards, and exhibits. For special motel rates and reservations, write Hamvention Housing, Box 1288, Dayton OH 45402; no telephone reservations will be accepted. Address all other inquiries to Box 44, Dayton OH 45401, or phone (513)-433-7720. Please send advance registration checks to Dayton Hamvention, Box 2205, Dayton OH 45401.

DAYTON OH
APR 27

The 15th annual B*A*S*H will be held on Friday night, April 27, 1984, at the Dayton Hamvention at the Convention Center, Main and Fifth Streets, Dayton OH. Admission is free and parking is available in the adjacent city garage. There will be sandwiches, snacks, and a COD bar, as well as live entertainment. For further information, contact the Miami Valley FM Association, PO Box 263, Dayton OH 45401.

DAYTON OH
APR 27-29

The 1984 Dayton Hamvention's International VHF/UHF Conference will be held concurrently with the Hamvention from Friday through Sunday, April 27-29, 1984, at the Hara Arena and Exhibition Center, Dayton OH. There will be technical forums by acknowledged experts; noise-figure, dynamic-range, and antenna-range measurement contests; and a hospitality suite with refreshments. Technical papers and presentations on VHF/UHF topics of interest are being solicited for consideration. Potential speakers should submit their requests immediately. For further information, contact Jim Stilt WA8ONQ, VHF/UHF Conference Moderator, 4126 Crest Manor, Hamilton OH 45011.

BRAINTREE MA
APR 29

The South Shore Amateur Radio Club of Braintree MA will celebrate its 53rd year in amateur radio by holding an indoor flea market on Sunday, April 29, 1984, rain or shine, from 11:00 am to 4:00 pm, at the Viking Club, 410 Quincy Avenue, Braintree MA. The entrance fee is $1.00 and 8-foot tables are $10.00 (which includes 1 free admission per table). Vendors will be admitted at 9:30 am and plenty of parking will be available. For advance table reservations, send a check payable to the South Shore Amateur Radio Club to Ed Doherty W1MPT, 236 Wildwood Avenue, Braintree MA 02184. A confirmation of check receipt will be sent and there will be no cancellation refunds after April 25. For more information, call Ed at (617)-843-4431, evenings.

ST. DAVID AZ
MAY 4-6

The Cochise Amateur Radio Association, Inc., will hold a hamfest (upgraded from a swapmeet) on May 4-6, 1984, in St. David AZ. There will be a flea market and all tailgaters are welcome. Tours planned to Tombstone, the Bisbee Lavender Pit, and other places of interest. Talk-in on .16/.76 and .52 simplex. For more details, contact CARA, Attention: Bob Clay KB7HB, PO Box 1855, Sierra Vista AZ 85636.

COLUMBIA MO
MAY 5-6

The Central Missouri Radio Association will hold Columbia Hamfest '84 on May 5-6, 1984, at the Hilton Inn, I-70 and Stadium Boulevard, Columbia MO. Features will include forums, a hospitality room, a Saturday-night banquet, a hard-surfaced flea market, display tables, and shuttle-bus service to parking areas and shopping centers. Talk-in on .16/.76 or 220.42/.02. For banquet tickets, reservations for hotels, flea-market spaces, or dealer tables, and more information, contact Ben Smith K0PCK, Route 1, Prairie Home MO 85068, or phone (816)-427-5319.

GREENVILLE SC
MAY 5-6

The Blue Ridge Amateur Radio Society will sponsor the Greenville SC Hamfest on Saturday and Sunday, May 5-6, 1984, at the American Legion Fairgrounds, White Horse Road, ½ mile north of I-85, Greenville SC. Admission is $3.00 in advance and $4.00 at the door. Talk-in on 146.01/.61. For advance tickets, write Mrs. Sue Chism N4ENX, Rte. 6, 203 Lanewood Drive, Greenville SC 29607. For further information, write Phil Mullins WD4KTG, Hamfest Chairman, PO Box 99, Simpsonville SC 29681.

CEDARBURG WI
MAY 5

The Ozaukee Radio Club will sponsor its 6th annual swapfest on Saturday, May 5, 1984, from 8:00 am to 1:00 pm, at the Circle B Recreation Center, Highway 60, Cedarburg WI (located 20 miles north of Milwaukee). Admission is $2.00 in advance and $3.00 at the door. Six-foot tables are $2.00 and eight-foot tables are $3.00. Food and refreshments will be available. Sellers will be admitted at 7:00 am for table setups. For tickets, tables, maps, or more information, send a business-size SASE to 1984 Ozaukee Radio Club Swapfest, PO Box 13, Port Washington WI 53074.

CENTRALIA IL
MAY 6

The Centralia Wireless Association, Inc., will hold its annual hamfest on Sunday, May 6, 1984, at the Kaskaskia College Gymnasium, 3 miles northwest of Centralia IL. Admission to the hamfest is free and there will be no charge for the flea-market and exhibit space (a limited number of tables will be issued on a first-come, first-serve basis). Doors will open at 7:00 am for flea-market and exhibit setups. Food and refreshments will be available, as well as plenty of free parking. Talk-in on 147.27/.87 and 146.52. For further information, contact Bud King WB9QEG at (618)-532-6606 or Lou Hodges W9IL at (618)-533-4724, or write to CWA, Inc., PO Box 1166, Centralia IL 62801.

PARAMUS NJ
MAY 6

The Bergen ARA will hold a Ham Swap 'n' Sell on May 6, 1984, from 8:00 am to 4:00 pm, at Bergen Community College, 400 Paramus Road, Paramus NJ. There will be tailgating only and admission for sellers is $4.00 (bring your own table). Buyers will be admitted free. Talk-in on .79/.19 and .52. For more information, contact Jim Greer KK2U, 444 Berkshire Road, Ridgewood NJ 07450, or phone (201)-445-2855.

DURHAM NC
MAY 12

The Durham FM Association will hold the Durham Hamfest on May 12, 1984, at the South Square Mall, Durham NC. Talk-in on 147.225. For more information, write Milan R. Burger, President, DFMA, 5711 Spruce Drive, Durham NC 27712.

Atco NJ 08004

IARS/CHC INTERNATIONAL CONTEST
CW—0000 GMT March 10 to 2400 GMT March 11
SSB—0000 GMT March 17 to 2400 GMT March 18

This is a semiannual contest sponsored by the International Amateur Radio Society and Certificate Hunters Club. Work stations once per band, no repeaters or crossmode contacts allowed. Look for stations calling "CQ CHC."

EXCHANGE:

RS(T), IARS and/or CHC number, and state, province, or country.

FREQUENCIES:

CW—70 kHz from the bottom of the band.
SSB—3960, 7260, 14300, 21360, 28600.

SCORING:

Multiply QSOs times the number of countries worked, times the number of IARS/CHC members worked. Any member of both divisions counts as two multipliers!

AWARDS:

Engraved plaque to the highest overall score. Certificates to the highest score per band and top 10 runners-up.

ENTRIES:

Logs must show date and time in GMT, station worked, exchanges sent and received, QSO points claimed, and final claimed score. All entries with 100 or more QSOs must also include a check sheet. Entries must be mailed by June 1st to Ted Melinosky K1BV, 525 Foster Street, South Windsor CT 06074. Include a large SASE for a copy of the results.

VIRGINIA QSO PARTY
Starts: 1800 GMT March 10
Ends: 0200 GMT March 12

The 1984 QSO party is again sponsored by the Sterling Park Amateur Radio Club of Sterling Park, Virginia. The same station may be worked on each band, on both CW and SSB modes. Virginia stations may contact in-state stations for QSO and multiplier credit. Virginia mobile stations may be worked in each new county they operate from for new QSO and multiplier credit regardless whether or not previously worked on the same band and mode in another county. Stations on county borders count for only one QSO. QRP stations must run 5 Watts or less for their entire operating time.

EXCHANGE:

QSO number starting with 001 and QTH consisting of state, province, DX country, or Virginia county. Viriginia stations note that the reference for valid counties is the *CQ* magazine *Counties Award Record Book* which lists a total of 95 counties.

FREQUENCIES:

Phone—3930, 7230, 14285, 21375, 28575, and anywhere on 160-meter band except in DX windows.

CW—60 kHz up from the low end of each HF band and anywhere in 10- and 160-meter bands or Novice subbands.

SCORING:

Count one point per SSB QSO, two points per CW QSO. Virginia stations multiply total QSOs by the sum of states, Canadian provinces, DX countries, and Virginia counties worked. Others multiply QSOs by the number of Virginia counties worked.

AWARDS:

Engraved plaques to the top-scoring stations in the following categories: High Virginia single operator (fixed location); High Virginia CW-only station; High Virginia mobile; High out-of-state (including DX) station; High Virginia QRP station (if 5 or more QRP entries are received). Certificates awarded winners of Virginia counties, states, provinces, and DX countries.

ENTRIES:

Follow ARRL standard contest guidelines for logs. Indicate each new multiplier as worked. Include a summary sheet with your log and an SASE for a copy of the results. Indicate on summary sheet if mobile or QRP. Entries are due April 15th and should be addressed to: Virginia QSO Party, c/o Ken Harrigan KB2LT, 2 Darus Court, Sterling Park VA 22170.

WISCONSIN QSO PARTY
Starts: 1800 GMT March 11
Ends: 0100 GMT March 12

Use both CW and phone, stations may be worked once per mode on each band. Mobiles may be worked again when changing counties. No repeater QSOs!

EXCHANGE:

RS(T) and state, province, or Wisconsin county.

FREQUENCIES:

Phone—3990, 7290, 14290.
CW—3560, 7050, 14060.

SCORING:

Phone contacts count 1 QSO point while CW contacts count 2 QSO points. Wisconsin stations multiply QSO points by total number of states, provinces, and Wisconsin counties. DX countries count for QSO points but not multipliers. Non-Wisconsin stations multiply QSO points by number of Wisconsin counties (72 max.). As a bonus, Wisconsin mobiles add 500 points for each county contacted from outside your home county with a minimum of 15 QSOs per county to qualify.

AWARDS:

Awards will be presented to the highest scores in each state and province, and to the highest aggregate club score.

ENTRIES:

All entries must contain a log consisting of: time in GMT, call, RS(T), state, Wisconsin county, mode, and a score summary. Logs containing more than 100 QSOs must be accompanied by a dupe sheet. Entries must be postmarked by April 15th and sent to: Wisconsin QSO Party, c/o West Allis Radio Amateur Club, PO Box 1072, Milwaukee WI 53201.

BERMUDA AMATEUR RADIO CONTEST
Starts: 0001 GMT March 17
Ends: 2400 GMT March 18

The 26th Bermuda Amateur Radio Contest is again sponsored by the Radio Society of Bermuda. The contest is open to all licensed amateurs in Canada, USA, United Kingdom, and the Federal Republic of Germany. Of the 48-hour contest period, your total operating time cannot exceed 36 hours; off periods must be clearly logged. Each off period must not be less than three consecutive hours. All stations must be single operator only and must operate from their own private residence of property. Use all bands, 80 through 10 meters. No crossband or crossmode contacts are permitted. Additionally, no phone contacts are allowed between W and G or West Germany on 40 meters.

EXCHANGE:

All stations will send RS(T) reports and give the following: Canadians add province, UK stations add county, US stations add state, West German stations add DOK#, Bermuda stations add parish. US and Canadian stations may exchange reports with West German, UK, and Bermuda stations only. UK and West German stations may exchange reports with US, Canadian, and Bermuda stations only.

SCORING:

Each completed contact on each band counts 5 points. A phone and a CW contact with the same station on the same band will count if they are made at least 30 minutes apart. For all stations outside Bermuda the multiplier is the total number of VP9s worked on each band. For Bermuda stations the multiplier is the total number of states, provinces, counties, and DOK#s worked on each band.

AWARDS:

Printed awards to the top score in each state, province, county, and DOK area. The top score in Canada, US, UK, and West Germany shall receive a trophy to be awarded at the society's annual dinner held in October of each year. Round-trip air transportation plus accommodation will be provided to overseas winners to enable them to receive their awards. Top winners for the 1979 through 1983 contest shall be eligible for the area awards only.

ENTRIES:

Logs must show all dates and times in GMT. A separate sheet must be used for each band. All contestants to compute their own scores and check for duplicate contacts. Dupe sheets must be submitted with logs to cover each band where more than 200 contacts are logged. For every duplicate contact for which points are claimed, a penalty of three contacts will be deducted by the contest committee. An excess of claimed duplicates may mean disqualification. No penalty will be exacted against duplicates for which no points are claimed. Each page must be clearly numbered and marked with contestant's call, year, and band to which it refers. All contestants must sign a statement that they have complied with the

Ham Rag

NEWSLETTER OF THE MONTH

The Rockford Amateur Radio Association's *Ham Rag* really does the job. Their December issue, for example, featured President's Log, Micro/Digital Corner, Secretary's Log, Tech Topics, Elmer Patrol (Novice class news), New Product Review, Potpourri, and Ham Mart. And this is all in a slick little package which includes photos! Congratulations to Editor Sharon Harlan WB9SFT, Circulation Manager Alice Davidson, and the whole crew.

To enter your club's newsletter in *73*'s Newsletter of the Month Contest, send it to *73*, Pine Street, Peterborough NH 03458, Attn: Newsletter of the Month.

rules and terms of their license. All logs must be received by the Contest Committee, Radio Society of Bermuda, Box 275, Hamilton 5, Bermuda, no later than May 31st. Overseas contestants are recommended to forward their logs via air mail. All decisions of the contest committee are final.

Bermuda parish abbreviations are as follows: SAN—Sandys, PEM—Pembroke, SOU—Southampton, HAM—Hamilton, STG—St. George, DEV—Devonshire, WAR—Warwick, SMI—Smiths, PAG—Paget.

TENNESSEE QSO PARTY
2100 GMT March 17 to 0500 GMT March 18 and 1400 to 2200 GMT March 18

This is the 14th annual QSO party sponsored by the Tennessee Council of Amateur Radio Clubs. You may work the same station on different bands, modes, or counties. Repeater contacts are not allowed. Mobiles compete against mobiles, portables against portables. Single-transmitter entries only. No county-line operations allowed for multiple contacts. Portable stations must set up per Field Day rules. No "list" operations are allowed. No CW contacts in phone bands.

EXCHANGE:

Signal report and state, province, country, or Tennessee county.

SCORING:

Score one point per phone QSO; 1.5 points per CW QSO. Combine phone and CW score as one contest, unless you wish to compete for phone-only or CW-only awards. Tennessee stations multiply QSO points by sum of number of different states (50), Tennessee counties (95), and VO and VE1-7 (7). DX stations count only for points, not as multipliers. Each portable or mobile station working outside their home Tennessee county scores 500 bonus points for each county outside of home county with a minimum of 10 QSOs. All others multiply QSO points by the number of different Tennessee counties worked (95 max.).

FREQUENCIES:

Phone—1860, 3980, 7280, 14280, 21380, 28580.

Novice—3725, 7125, 21125, 28125.

CW—1815 and approximately 50 kHz up from bottom of each band.

Note, you must log a minimum operating time of 10 minutes for each change of band or mode.

AWARDS:

Plaque to highest-scoring Tennessee fixed, mobile, and portable, plus out of state. First-place certificates to highest-scoring station in each state, Canada, DX country, Tennessee Novice/Technician, out-of-state Novice/Technician, Tennessee phone only, and Tennessee CW only. Participation certificates to every station sending in logs with at least 25 contacts.

ENTRIES:

Logs must show date/time in GMT, station worked, band, mode, exchange, and score. Submit a cross-check sheet similar to ARRL CD77 for each band and mode with 100 or more contacts. Logs must be legible to avoid disqualification. Logs must be postmarked by May 1st and sent to: Oak Ridge ARC, Attn: Mel Wardell K4PJ, Oak Ridge TN 37830. Please include a business-sized SASE with your logs for complete results, any certificates earned, or for return of logs (if desired).

KENTUCKY QSO PARTY
2100 March 17 to 0700 March 18
1400 to 2200 March 18

This is the second annual Kentucky QSO Party sponsored by the Western Kentucky DX Association. Stations may work the same station on different bands, modes, or counties. Mobiles compete against mobiles, portables against portables, and fixed against fixed. No county-line operation for the purpose of multiple contacts. Portable stations must set up per Field Day rules. Single-transmitter entries only, but single or multi-operators OK. Repeater contacts not allowed. No list operations permitted.

EXCHANGE:

RS(T) and state, province, country, or Kentucky county.

FREQUENCIES:

Phone—1840, 3985, 7285, 14285, 21385, 28585.

Novice—3725, 7125, 21125, 28125.

CW—1815 and approximately 60 kHz from bottom of each band.

Kentucky stations must operate a minimum of 10 minutes for each change of band or mode.

SCORING:

Count 2 points for each 160-meter QSO, phone or CW; 2 points per CW QSO on all other bands; 1 point per phone QSO on 80 and 40 meters; 1.5 points per phone QSO on 10, 15, and 20 meters. Combine phone and CW score as one contest.

Kentucky stations multiply QSO points by the sum of the number of states (50), Kentucky counties (120), plus VO, VE1-7, and VY1/VE8 (9). DX stations count only in point totals, not as multipliers. Non-Kentucky stations multiply QSO points by the total number of Kentucky counties worked (120 max.).

Portable and mobile Kentucky stations add to total score a bonus of 1000 points for each county operated outside of home county. A minimum of 25 contacts must be made in each county to qualify for the bonus.

AWARDS:

Plaques to the highest-scoring Kentucky fixed, Kentucky mobile, Kentucky portable, and out-of-state station. First-place certificates to highest score for each state, Novice, Canadian, DX station, all phone, all CW. Participation certificates to all stations submitting logs with at least 25 contacts.

ENTRIES:

Logs should show date/time in GMT, station worked, band, mode, exchange, and score. A sample log sheet is available if you send an SASE. Logs must be legible and neat to avoid disqualification. Submit a cross-check sheet (similar to ARRL form CD77) for each band and mode with over 50 contacts. Kentucky stations must show counties they worked from as part of their log entry. Logs must be postmarked no later than May 5th to be eligible for award consideration. Send a large (9" by 12") SASE with $.35 postage to ensure receiving complete contest results plus any awards you may win. No logs will be returned.

CONNECTICUT QSO PARTY
Starts: 2000 GMT March 31
Ends: 0200 GMT April 2

Sponsored by the Candlewood Amateur Radio Association (CARA). There is a rest period from 0500 to 1200 GMT. This contest is normally run in December and will reappear back in its regular slot, the first weekend in December.

EXCHANGE:

Send RS(T), serial QSO number, and ARRL section or Connecticut county.

SCORING:

Club station W1QI counts 5 points per band/mode. Novice QSOs count 2 points, OSCAR QSOs 3 points. Out-of-state stations multiply QSO points by the number

of Connecticut counties worked (8 max.). Connecticut stations multiply QSO points by the sum of ARRL sections worked. Additional DX contacts count for QSO points but only one DX multiplier overall is allowed.

FREQUENCIES:

CW—40 kHz up from the bottom of each band.

SSB—3927, 7250, 14295, 21370, 28540.

Novice—3725, 7125, 21125, 28125.

ENTRIES AND AWARDS:

Logs must show category, date/time (GMT), stations, numbers, bands, QSO points, and claimed scores. Enclose a large SASE for results. Logs must be postmarked by April 30th and sent to: CARA, c/o R. Dillon N2EFA, Box 954, Danbury CT 06810.

QRP ACTIVITY WEEKENDS

The various QRP Activity Weekends throughout the year are sponsored by the G-QRP-Club in England. They are intended to promote QRP activity on the times and frequencies suggested. Members from other QRP clubs throughout the world and all amateurs interested in QRP are invited to join in. QRP clubs are requested to publicize the activity periods in their club magazines.

The following times and frequencies will be used for the Spring QRP CW Activity Weekend on March 17-18, the Late Summer QRP CW Activity Weekend on September 22-23, and the QRP Winter Sports on CW, December 26 through January 1st:

0900-1000 GMT	14060
1000-1100	21060/28060
1100-1200	7030
1200-1300	3560
1300-1400	10106
1400-1500	3560
1500-1730	21060/28060
1730-2000	14060
2000-2100	7030/10106
2100-2200	3580
2200-2300	14060

In addition to the above events, members of the G-QRP-Club have weekly activity periods on Sundays between 1100 and 1230 and again from 1400 to 1530 on the International QRP frequencies (mentioned above) and on Wednesdays on 3560 from 2000 local time (for amateurs in the UK and Western Europe).

Full details of membership of G-QRP-Club from the Membership Secretary, Fred Garratt G4HOM, 47 Tilshed Close, Druids Heath, Birmingham, B14 5LT, England.

REVIEW

REVIEW OF A GLUE

Do you sometimes have the need for a good, strong, easy-to-use plastic glue—something a little better than model-airplane cement and more versatile than "super glue"? If so, you should give "Plast-i-Pair" a try.

"Plast-i-Pair" is a two-part "repair kit," mainly for plastics, but also excellent for bonding most anything to anything else.

"Plast-i-Pair" is just dandy for fixing up most of the non-electronic computer things that tend to break, crack, snap, and otherwise fall apart. It can be used to repair computer cases, broken key tops, cracked circuit card guides, broken switches, and joysticks. If you've ever broken an impossible-to-replace knob on a television or other piece of electronic gear, you will certainly appreciate this glue's ability to repair knobs!

In addition to the usual "glue" application of sticking broken things back together, "Plast-i-Pair" can be used to mold things...plugs and sockets, for example. (Ever break a weird computer or radio plug and have the metal parts still intact but the plastic all disintegrated?) It's just fine when you need to custom-build a special plug for some project, too. With just a little care, you can mold and repair fairly large sections of a broken cabinet. This works well, for example, in filling a gaping hole in the case of a $10 used video monitor!

The glue is easy to use. It does, however, require a couple of exotic materials...a mixing container and a mixing stick. For most small jobs, a baby-food-jar lid is just right for the mixing container. A tongue depressor (or Popsicle stick!) makes an excellent mixing device.

One component of "Plast-i-Pair" is a white powder, the other is a clear liquid. To use the material, merely dump a small amount of the white powder into the mixing container and add a few drops of the clear liquid. Stir until the components are well mixed. If the mixture looks grainy, you need a little more liquid. When you have it mixed (without grains), you're all set...unless, that is, you want the glue to be thicker. In that case, you just sit back and wait a few more seconds (maybe even a minute or so) until the mixture is the desired consistency. Then, apply it. Clamping is rarely needed...and even in the cases when clamping is necessary, it doesn't have to be done for very long.

For some plastic-to-plastic repairs, the liquid solvent can be used by itself as a glue. It works at least as well as most regular plastic-solvent-type adhesives.

Lest you think that this material is all fun and games, however, we should mention one tiny drawback that could get you to run out of the house: "Plast-i-Pair" smells absolutely terrible! Imagine a skunk's odor combined with a little alcohol and some acetone and you will have a rough idea of how this material smells. If you must use it indoors, an open window or an exhaust fan will be extremely useful!

In addition to its obvious computer and electronics applications, "Plast-i-Pair" is very handy for repairing kids' toys and eyeglass frames. My most recent use, incidentally, was in repairing a bird feeder. "Plast-i-Pair" was used to glue two leather straps to a piece of transparent plastic. And it held!

The smallest size kit of "Plast-i-Pair" consists of 90 cc of liquid and 3 ounces of powder. It's sold as "No. 175" and costs $5.50 plus shipping.

While you're waiting for the "Plast-i-Pair" to arrive, start saving up (or scrounging) baby-food-jar lids and Popsicle sticks!

For more information, contact the *Rawn Company, Inc., PO Box 9, Spooner WI 54801.* Reader Service number 477.

B & W MODEL AC 1.8-30 CONTINUOUS-COVERAGE ANTENNA

Surely there are many of us who would like to operate on some band(s) in the 1.8-to-30-MHz region but who cannot, for some reason, erect a full-sized, high-efficiency antenna for same. To abandon the band(s) altogether is foolish and unnecessary, especially in light of some of the recent market offerings of multipurpose antenna systems which cover all seven popular HF bands without the requirement of external tuners or sprawling rural lots.

The Barker & Williamson model AC 1.8-30 is such a multipurpose antenna system. There is no question that the efficiency of such a system is relatively low when compared with well-elevated single-band resonant arrays. I do not believe the AC 1.8-30, or any other multiband nonresonant antenna system will work as well as individually-tuned half-wave dipoles installed the requisite half wave above ground; however, this is no reason to avoid these multipurpose systems, especially if you simply do not have unlimited space. Even an antenna with −20 dB gain (i.e., 20 dB loss compared with a half-wave dipole) can be used to make many enjoyable contacts. After all, 20 dB below a 40/S9 signal is still pretty strong.

The B & W model AC 1.8-30 is advertised as a "continuous-coverage antenna," offering some degree of efficient radiation from 1.8 through 30 MHz with a single feedline and no adjustments. Both because I wanted an antenna for 160 meters and to prove or disprove B & W's rather fantastic claims for this product, I ordered one from a franchised distributor and received it about a week later.

Inspection

Inspecting the AC 1.8-30, I found a completely pre-assembled antenna consisting of two bulky weatherproofed assemblies and 110' of stranded copperweld wire, a coil of about 100' of similar stranded copperweld wire to use as an optional counterpoise, and three heavy-duty antenna insulators. The quality of all component parts appears to be excellent. The antenna feedline, not supplied, connects to what B & W calls an rf transformer having an appearance and bulk similar to a heavy-duty wideband balun. At the opposite end of the antenna radiating wire is another bulky component which B & W calls a balancing network: This is similar in size and weight to the rf transformer and is a two-terminal device which connects between the radiating wire and ground. The balancing network is a potted assembly which appears very weatherproof and strong.

The instruction sheet supplied with the antenna is a simple two-sided photocopy which does not attempt to describe the theory of the antenna (see Theory section later in this review). It does state that the antenna will exhibit a maximum swr of 2:1 from 1.8 through 30 MHz (referenced to 50 Ohms), that the power rating of the product is 1.5 kW ICAS (intermittent commercial/amateur service), and that the antenna should be installed as an inverted "V" with the center twenty-five to thirty feet higher than the ends, making the overall antenna length about eighty feet end to end at the base. The instructions also recommend connecting the two ground terminals, one each on the rf transformer and the balancing network, directly to ground rods. Assuming this meant that I should install the antenna with the two ends nearly on the ground and the center elevated about thirty feet above the ends, I proceeded to install the AC 1.8-30 exactly in that manner.

Installation

My property measures 140' deep by 250' wide, slightly over three-quarters of an acre, and is probably typical of a suburban lot. While my lot is wide enough to accommodate a full-sized half-wave dipole for 160 meters, the trees are not in the right places to support a dipole at a sufficient height to make it work well. A half-wave dipole really should be installed a half wave above ground to work like an ideal dipole, and at 1.8 MHz this is over 200' high. If I lived in a redwood forest with 400' trees all around, I could probably work this out, but I don't, and I really couldn't see installing two 250' towers to support a $10 dipole. So, I decided to try a compromise (short, and less than 200' high) antenna for 160; thus, the AC 1.8-30.

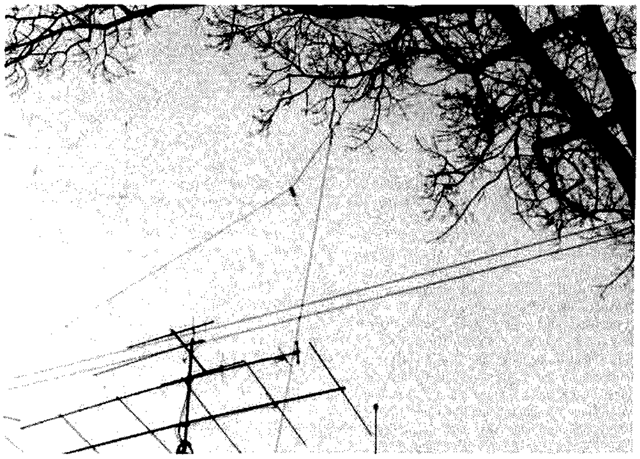
To install the B & W antenna, I first ran a rope from a limb of an oak tree in my backyard to the top of a mast strapped to my chimney on the roof of my house. This made the rope about sixty feet long, with each end support about forty feet above ground. This rope was to be used to support the center of the B & W AC 1.8-30 at a height of about thirty feet. I figured, correctly, that the rope would stretch and sag a bit with the weight of the antenna hanging from it.

Next, with the help of my friend KT2B, I installed the antenna so that the dimensional center of the antenna wire is supported by the rope and the two ends of the antenna wire come down to the ground about eighty feet apart, just like the sketch in the B & W instruction sheet. At each end of the antenna, we drove a four foot ground rod into the earth, and then we stretched the antenna straight and connected the ground wire supplied at each end of the antenna assembly (this is pre-wired) to the two ground rods, making the ground wires quite short. This means the rf transformer and the balancing network are supported in midair by the radiating antenna and ground wires, only about a foot above ground at each end.

We were sure to install the antenna so that it makes a perfect inverted "V" and the entire antenna is in line; that is, viewed from directly above or below the antenna, it would look like a straight line. B & W doesn't mention if this is important

WHAT DO *YOU* THINK?

Have you recently purchased a new product that has been reviewed in *73*? If you have, write and tell us what *you* think about it. *73* will publish your comments so you can share them with other hams, as part of our continuing effort to bring you the best in new product information and reviews. Send your thoughts to Review Editor, *73: Amateur Radio's Technical Journal*, Peterborough NH 03458.



The AC 1.8-30 shown near its center, which is hanging from a horizontal support rope. The vertical rope to the right of the antenna is used for positioning the support rope.

The feedpoint rf transformer against a backdrop of New Jersey chestnut leaves. The transformer hangs between the antenna wire and a ground stake just above ground level.

but I guessed it might be, and it wasn't any extra effort to do it this way.

Measurements and Tests

We then connected a 50-Ohm feedline (at first, random lengths of RG-8/U and RG-11/U in series; later, a single length of RG-8/X), ran the cable in the house, and started making measurements. I should state that the very first band we tried out was 160 meters and I was pleasantly surprised to find that the antenna loaded well, with a measured vswr of 1.5:1 *across the whole band.* This made me kind of suspicious. The only thing I owned which was flat across any whole band was a dummy load, and I began to suspect that maybe the B & W antenna is a big dummy load. Tuning across the band, I found that the antenna is certainly no dummy, because it was receiving loud signals all across 160 meters at about 4 o'clock in the afternoon. I immediately made a few quick contacts, using my Kenwood TS-520S at about 100 Watts PEP, to determine that the contraption actually works!

Pete KT2B and I next proceeded to measure the antenna impedance using an old GE rf impedance bridge with an internal tunable oscillator; we found the impedance to be about 70 Ohms all across 160 meters and about the same all across 40 meters, but much higher on the other HF ham bands. On 80, 20, 15, and 10 meters, the impedance measured between 100 and 200 Ohms, which would have produced swr readings of 2:1 to 4:1. However, the test was premature because I had spliced together a quick feedline of RG-8/U in series with RG-11/U (75-Ohm cable), random lengths of each, and this probably had some detrimental effect on the antenna's impedance/frequency relationship.

The next day I disconnected the RG-8/U to RG-11/U system and ran an RG-8/X 50-Ohm "minifoam" coax feedline, about sixty feet long, from the antenna rf transformer to my Kenwood. Using my Bird model 43 directional coupler/wattmeter and a 100-Watt HF band element, I measured vswr vs. frequency over the six ham bands covered by my Kenwood, and this information is shown in Table 1.

The eighteen readings of Table 1 are all that are really required because it is obvious that the antenna is quite broadband and the swr within any given band doesn't change much. The "100" readings indicate immeasurably low reflected power using my most sensitive Bird element. The swr is probably never quite 1.00:1, but when I cannot detect any reflected power at all, I round the swr value to 1. When the swr is relatively high, as on 20 meters, the impedance of the antenna is higher than 50 Ohms, not lower; e.g., at 14.2 MHz, the complex impedance is about 120 Ohms.

Based on my measurements, the B & W antenna doesn't quite make the "less than 2:1 swr across 1.8-30 MHz" they claim, but it comes impressively close. Note that I did *not* install the counterpoise wire which B & W states might improve performance in some installations.

Performance

Of course, what good is a low swr if you can't get out? Not much. So I spent the entire contest weekend (November Sweepstakes) following my installation of the AC 1.8-30 antenna switching back and forth between the B & W antenna and some standards for my station: On 80 meters, I normally use a half-wave double-bazooka coaxial dipole installed as an inverted "V" with the center up sixty feet; on 40 meters, I normally use a conventional half-wave dipole at forty feet; on 20-15-10 meters, I use either a 4-element trap triband yagi (Cushcraft ATB-34, 18' boom, 8-9 dB gain/band) or a half-wave vertical (Cushcraft R-3). The triband yagi is tower-mounted at about twenty-five feet, and it should be noted that I have a hilltop location with rocky (and probably not very conductive) soil. With a total of five antennas to switch from, and I do have all the feedlines brought to a coaxial switch, I could easily compare the B & W antenna to the others listed.

Frequency, MHz	Vswr, measured
1.80	1.65:1
1.85	1.50
1.90	1.50
3.50	1.80
3.75	2.00
4.00	1.85
7.00	1.05
7.15	1.00
7.30	1.00
14.00	2.20
14.20	2.40
14.35	2.30
21.00	1.80
21.20	1.70
21.45	1.70
28.00	2.10
28.50	2.20
29.00	2.00

Table 1.

Basically, the B & W continuous-coverage antenna works fairly well. It does not compare with my beam on 14, 21, or 28 MHz, but I didn't expect that it would. It also does not compare with the R-3 half-wave vertical on those three bands. But it does hear pretty well, and it does get out. On twenty meters, I switched to the B & W antenna in the middle of a few contacts and the contacts were completed with no trouble. One of these contacts was with Hawaii, some 5500 miles distant. I guess this proves that 20 dB down from an S9 signal is still easily readable!

On forty meters, the B & W antenna really shines and performed almost as well as my half-wave monoband dipole at forty feet under most conditions. On 80 meters, the antenna works, but it is no match for my inverted "V" double bazooka, typically producing signals about three "S" units down from the bazooka standard. On 160 meters, I do not have a standard antenna with which to compare the B & W; however, I can say that the AC 1.8-30 has produced many enjoyable 160-meter QSOs at various distances from a few miles to a few thousand miles. I am running only 100 Watts PEP output on 160 and have received several complimentary reports from lots of stations who seem to "live" on that band. Clearly, the antenna works.

Theory

Intrigued by the AC 1.8-30, I made some measurements on both component parts and the completed, installed assembly to reason why or how this antenna works. The balancing network is really just a 600-Ohm dummy load (resistive termination) of rather significant proportions; I assume this is probably rated at a few hundred Watts in free air. The rf transformer is exactly that and has an impedance ratio which varies somewhat with frequency and power but averages about 12:1 (secondary:primary). I checked this by removing the transformer from the antenna circuit and performing bench tests using a Bird 43 wattmeter installed in the 50-Ohm primary side and connecting various terminating resistances across the secondary. The vswr dropped to a very low value when the transformer was terminated with 500 to 600 Ohms, yielding my estimated design ratio of about 12:1.

Based on the above findings, I surmise that the AC 1.8-30 is a "traveling-wave" antenna which need not be resonant to perform with reasonable efficiency. The antenna system looks like a terminated wire of high impedance (600 Ohms), and the rf transformer is used to match this load to its low-impedance unbalanced transmission line (50-Ohm coax). Although I didn't try it, I believe that if the antenna radiating wire were replaced with 600-Ohm open-wire transmission line hung in free space, the entire system would then become one big 600-Ohm dummy load which would hardly radiate at all; however, because in actual practice the conductor from line to load is neither shielded nor balanced, it radiates, rather

The balancing network hangs between the antenna wire and a ground stake just above the lightly snow-covered lawn.

than conducts, most of the power applied to it.

Conclusion

I guess the summary results of my tests thus far indicate that the AC 1.8-30 is ideal for anyone who only has room for or can afford just one antenna to cover all the popular HF bands. I regret I could not try it out on 30 meters, but I don't have anything on this new band (yet). On 160 meters, it is one of the few antennas which actually works and fits on a suburban lot; on the bands above 160, the B & W antenna appears to work, but not as well as single-band dedicated dipoles. For less than $150, it's not a bad deal; I'll use it just on 160 for that price and be happy about it.

[PR Docket No. 83-28; FCC 83-584]

Establishment of a Class of Amateur Operator License Not Requiring a Demonstration of Proficiency in the International Morse Code; Withdrawal of Proposed Rule

AGENCY: Federal Communications Commission.

ACTION: Withdrawal of proposed rules: Report and Order.

SUMMARY: This document withdraws two alternative sets of proposed rules set forth in a *Notice of Proposed Rule Making*, 48 FR 4655 (February 3, 1983). These roles would have established an amateur radio operator license class which an individual could have obtained without first demonstrating a proficiency in the international Morse code. These rules are being withdrawn because: (1) The requirement for Morse code proficiency is not a significant barrier for those who want to get an amateur operator license; and (2) it is in the public interest to maintain a skilled pool of amateur operators for the safety of life and property and public emergencies and for the national defense.

FOR FURTHER INFORMATION CONTACT: John Borkowski, Private Radio Bureau, Washington, D.C. 20554 (202) 632-4964.

Report and Order

In the matter of establishment of a class of amateur Operator License not requiring a demonstration of proficiency in the International Morse Code; PR Docket No. 83-28.

Adopted: December 14, 1983.
Released: December 23, 1983.
By the Commission.

Introduction

1. In the *Notice of Proposed Rule Making*, 48 FR 4655 (February 3, 1983) in this proceeding, we proposed to establish an amateur radio operator license which an individual could obtain without first demonstrating a proficiency in the international Morse code. The proposal was intended to attract intelligent, disciplined persons to the Amateur Radio Service who could make a valuable contribution to the service without such a proficiency. It sought to remove any barrier the code requirement might place in the path of computer-oriented or handicapped individuals otherwise qualified to be amateur operators but for the code requirement.

2. The *Notice* proposed establishment of one of two kinds of "codeless" operator license classes. One proposal was to eliminate the five word-per-minute Morse code examination element (Element 1(A)) from the existing Technician class operator licensing requirements, with all authorized amateur privileges above 50 MHz. The alternative proposal involved creation of an entirely new license class with qualifications akin to those for the Canadian Digital Amateur Class Certificate.

Background

3. The issue of a codeless amateur operator license has been addressed in past Commission proceedings. In a *Notice of Proposed Rule Making* in Docket No. 20282, 39 FR 44042 (December 20, 1974), we noted that the Morse code requirement might be a significant barrier to Amateur Radio Service (ARS) entry. In a *Notice of Inquiry* in General Docket No. 78-250, 43 FR 37729 (August 24, 1978), we considered, among other possible improvements in administering Morse code examinations to handicapped applicants, creating a new class of amateur operator license without a Morse code proficiency requirement and with eligibility restricted to handicapped applicants. In the *Third Report and Order* in Docket No. 20282, 44 FR 16460 (March 19, 1979), we stated we would like to get fresh comments on the issue and would initiate a new proceeding to do so. The *Report and Order* terminating General Docket No. 78-250, 47 FR 14197 (April 2, 1982), also discussed the possibility of a class of amateur radio operator license without telegraphy requirements.

Comments

4. Almost 5,000 comments and reply comments were received.[1] The comments were overwhelmingly opposed to the establishment of any class of amateur operator license not requiring a demonstration of proficiency in the international Morse code. There were approximately twenty comments opposed to a codeless operator class for every comment in favor of such a class.[2]

5. Comments and reply comments in favor of some form of amateur license not requiring proficiency in the international Morse code included those of the Amateur Radio Research and Development Corporation (AMRAD), the Amecom Amateur Radio Club, the Capitol Hill Amateur Radio Society (CHARS), the Centralia Wireless Association, the Emerson Electric Amateur Radio Club (Emerson), the Garden State Amateur Radio Association, the Northern Illinois DX Association, the Okaw Valley Amateur Radio Club, the Southern Michigan Amateur Radio Team, the Sterling Park Amateur Radio Club, the Tennessee Council of Amateur Radio Clubs and the Willamette Valley DX Club.

6. Comments and reply comments opposed to any form of amateur license not requiring proficiency in the international Morse code included those of the Amateur Radio Association of the Tonawandas, Amateur Radio Post 380 (American Legion, Department of California), the Amateur Radio Transmitting Society of Louisville, the American Radio Relay League, Inc. (ARRL), the Athens Amateur Radio Club, the Bay Area Two-Twenty Group, the Bell Amateur Radio Club, the Beloit Amateur Radio Club, Inc., the Bemidji Amateur Radio Club, the Black Diamond Amateur Radio Club, the Brandon Amateur Radio Society, the Buffalo Amateur Radio Repeater Association, the Butte Amateur Radio Club, the Capeway Amateur Radio Club of Massachusetts, the Central Carolina Amateur Radio Society, the Cleveland Wireless Association, the Concord Brasspounders Amateur Radio Club, the East Bay Amateur Radio Club, the Eastern Shore Amateur Radio Club, the Elmore County Amateur Radio Club, the Emporia Amateur Radio Society, the Estero Amateur Radio Club, the Everglades Chapter of the Quarter Century Wireless Association (QCWA), the Fairfield Amateur Radio Association, the Falmouth Amateur Radio Association, Inc., the Findlay Radio Club, the Flathead Valley Amateur Radio Club, the Grande Ronde Radio Amateurs, the Great Circle Shortwave Society, the Greater Milwaukee DX Association, the Greater Toledo Amateur Radio Association, the Green Fox Amateur Radio Club, the Grumman Amateur Radio Club, Hancock Emergency Amateur Radio Services, Inc., the Hendricks County Ham Club, the Hoodview Amateur Radio Club, the Houston Echo Society, the Idaho Society of Radio Amateurs (Magic Valley Chapter), the Inter-City Amateur Radio Club, the Irwin Area Amateur Radio Association, the ITT Gilfillan Amateur Radio Club, the Jackson Amateur Radio Club, Inc., the Jefferson Amateur Radio Club, the Kettle Moraine Radio Amateur Club, the Lac Qui Parle Amateur Radio Club, the Lebanon Valley Society of Amateur Radio Club, the Liverpool Amateur Repeater Club, the McHenry County Wireless Association, the McMinnville Amateur Radio Club, the Madison Amateur Radio Club, the Metropolitan Amateur Radio Club, the Metuchen Amateur Radio Club, the Mid-Oklahoma Repeator, Inc., the Mike and Key Radio Club, the Milton Academy Amateur Radio Club, the Milwaukee Radio Amateur's Club, Inc., the Milwaukee School of Engineering Amateur Radio Club, the Monongalia Wireless Association, the Murray State University Amateur Radio Club, the Nashua Area Radio Club, Inc., NBS-Brass, the North Alta Loma Repeater Club, the Northrup Radio Club, the Old Post Amateur Society, Inc., the Old Pueblo Radio Club, Inc., the Ole Virginia Ham Amateur Radio Club, the Owensboro Amateur Radio Club, the Pentagon Amateur Radio Club, the Pentucket Radio Association, Inc., Pike Amateur Radio Emergency Services, the Port City Amateur Radio Club, the Portage Amateur Radio Club, the Potomac Valley Radio Club, QCWA, the Radio Amateur Teletypists Society of Minneapolis, the Radio Club of Tacoma, Inc., the Rock River Radio Club, the St. Barnabas Amateur Radio Club, the St. Cloud Amateur Radio Club, the St. Lawrence Valley Repeater Association, the San Antonio Repeater Organization, the Santa Rosa Amateur Radio Association, the Schenectady Amateur Radio Association, Inc., the Sharon Amateur Radio Association, the Shiawassee Amateur Radio Association, the Sierra Nevada Amateur Radio Society, Inc., the Sioux Falls Amateur Radio Club, Inc., Sonoma County Radio Amateurs, Inc., the South Georgia Amateur Radio Club, the South Texas Amateur Radio Society, Inc., the South Texas Amateur Repeater Club, Inc., the South Towns Amateur Radio Society, the Southeastern DX Club, the Southern California 220 Spectrum Management Association, the Southern California Repeater and Remote Base Association (SCRRBA), the Southern Oregon Amateur Radio Club, the Steubenville-Weirton Amateur Radio Club, the Story County Amateur Radio Club, the Suburban Amateur Repeater Association, Inc., the Texas DX Society, the Texas VHF-FM Society, the Thibodaux Amateur Radio Club, the Thumb Amateur Radio Club, the University of Minnesota Amateur Radio Club, the Valley Amateur Radio Association, the Valley of the Moon Amateur Radio Club, the Viking Amateur Radio Society, the West Valley Amateur Radio Association, the Western Piedmont Amateur Radio Club, the Wood County Amateur Radio Club, the Worthington Amateur Radio Club and the York Radio Club.[3]

[1] The motion of the Capitol Hill Amateur Radio Society (CHARS) to accept its late-filed (August 1, 1983) reply comments is granted. The motion of the American Radio Relay League, Inc. (ARRL) for leave to submit supplemental reply comments on CHARS' late-filed reply comments is also granted.

[2] Many comments, such as those of Donald L. Stoner, which included "a proposal for the creation of a computer hobbyist license class," were alternative suggestions for the type of codeless license to be adopted should we decide to proceed with some sort of codeless license. We are treating these as comments on the proposal rather than as separate petitions for rule making. In view of the result reached herein, we would entertain future proposals for allocating spectrum separate and apart from amateur radio frequencies for a new computer hobbyist radio service.

Summary of Decision

7. For the reasons set forth in the discussion below, we have determined that it would not be in the public interest, convenience or necessity for the Commission to establish a class of amateur operator license not requiring a demonstration of proficiency in the international Morse code.[4] We reach this determination on the basis that: (1) A five word-per-minute (wpm) code requirement does not constitute a significant ARS entry barrier; (2) knowledge of the Morse code continues to be relevant to everyday usage in the ARS; and (3) a Morse code requirement for every license class is important to maintaining the traditional public service role of the ARS in emergencies involving public safety and the national defense.

Discussion

I. Morse code as an entry barrier.

A. *The general public.* 8. We received many comments from persons who indicated that the Morse code was a barrier for them in joining the ARS. For instance:

> I am not a licensed amateur radio operator. I have a technicians degree from the Cleveland Institute of Electronics and a Batchelor of Science degree in Electrical Engineering from the University of Tennessee. I know that I can pass the technical exams for amateur licensing. At this time the Morse code is the major obstacle between me and my amateur license. Comments of John D. Triplett.

Some commenters alleged personal learning barriers. Others indicated that they cannot find the time to learn the code.

9. To the extent a "code barrier" exists, it appears to be an attitudinal one. M. Hoshiko, faculty advisor and trustee of the Southern Illinois University Amateur Radio Club, said that very few electronics students are willing to study the code to become hams. The unwillingness to study Morse code may reflect a perception that it is an outmoded form of communication. Edward Novak commented that most individuals who will not study the code

[3] Donald B. Nowakoski's Petition to Cancel or, in the alternative, Amend is denied as an invalid petition under § 1.773 of the Commission's Rules (this is not a petition for suspension or rejection of a new tariff filing). However, this petition will be treated as a comment in opposition to the proposed rule making.

[4] As a result of this determination, we do not reach the question of which type of "codeless" license would be most appropriate.

are refusing to submit to what they perceive as an obsolete "ritual" requirement that they feel will have no application for them beyond gaining them their ham licenses. (See paragraphs 24–28, *infra*.)

10. Sometimes, a lack of willingness to study Morse code appears to be related to fear of its difficulty. One Morse code instructor stated that he has ". . . observed an initial apprehension of learing the international Morse code which usually accompanies the thought of learning something like an abstract foreign language." Comments of Gary L. Crown.

11. Those who do study Morse code appear to have few problems with the five wpm requirement. Instructors of code and theory commenting in this proceeding agreed that anyone can, with study, establish Morse code 5 wpm proficiency. Several instructors told us that no successful electronics students in their classes who really wanted an amateur license had failed to learn and pass the code test.

12. Significantly, instructors of code and theory also agreed that younger students have little or no difficulty in mastering Morse code. John B. Mollan stated that younger students have difficulty with the "theory" rather than the code requirements. John C. Hallyburton, Sr. indicated that he has experienced no difficulty in training both Cub and Boy Scouts in Morse code. And Francis J. D'Auria said that his average student learns the code with fifteen hours of study and practice, and some youngsters learn the code in eight to ten hours.[5] Melvin C. Vye, an associate professor of electronic technology at the University of Akron, indicated that young people with an interest in computers—one of the groups targeted as a basis for the *Notice* in this proceeding—have the least problem of any group in mastering Morse code.

13. Many commenters hastened to point out that a Morse code requirement cannot be much of a barrier to ARS entry, because ". . . [s]everal hundred thousand licensed Amateurs have learned Morse code and successfully passed code examinations in order to achieve a license." Comments of Richard A. Stiern. Martin D. Shapiro correctly pointed out in his comments that over the past 50 years the number of licensed amateur operators has increased from 30,000 to in excess of 400,000, or roughly 1300%.

14. In disputing the *Notice's* reliance upon a 1971 study referred to in Docket No. 20282, the Pentucket Radio Association, Inc. stated that from 1976 to 1980 the number of ARS licensees grew by 35%, adding over 100,000 persons to the Service. The Radio Operators Association of New Bedford pointed to the growth in numbers of Licensed Amateurs between 1973 and 1980 of nearly 200% Novice, 27% Technician, 30% General, 38% Advanced and 100% Amateur Extra Class licensees as evidence that Morse code requirements are not deterring ARS expansion.

15. The most recent Commission statistics showed continued increase in the number of amateur operators in fiscal year (FY) 1983. In FY 1983, the total number of amateur operators grew to 410,767 for a net gain of 4,339 operators (20,940 new operators balanced against a loss of 16,601 operators). We conclude that the Amateur Radio Service is a healthy, growing service which has attracted large numbers of new licensees over the past decade. its growth is continuing. The Morse code requirement does not appear to have critically affected the entry of new licensees into the Amateur Radio Service.

16. We conclude that a five wpm requirement for proficiency in the international Morse code is not an unreasonable burden upon license applicants. Members of the general public, particularly younger students with developing interests in electronic technology, radio and computers, are capable of learning the international Morse code at a proficiency of five wpm without undue difficulty. We conclude that to the extent a Morse code requirement acts as a bar to ARS entry for some, it is a necessary trade-off for the present nature of the Amateur Radio Service.

B. *Computer interests and the ARS.* 17. Bash Educational Services, Inc. (Bash) expressed the view that the implementation of a codeless Technician Class license would not greatly increase the ranks of amateur radio operators but would enhance the Service with the input from the more technically oriented youth in the United States. On the other hand, the Emerson Electric Amateur Radio Club (Emerson) acknowledged the affinity between home or personal (hobby) computing and amateur radio, as evidenced by packet radio, AMTOR, microprocessor RTTY, keyboard keyers, and code readers. But Emerson stated that the development of a body of pseudo-communicators who are little more than "appliance operators" would not be a sigificant step in merging the two interests.

18. Some commenters, such as William M. Pasternak (Pasternak), executive producer of Westlink Radio News, felt that while amateur radio and computer interests may overlap, most young computer users have no interest in amateur radio. Instead they pursue information retrieval and exchange through the use of modems interconnected with the public switched telephone network to access commercial computer networking organizations such as "The Source" and "Compunet."

19. After reviewing the comments, we conclude, as the ARRL stated, that:

> there is no evidence that younger, school-aged individuals whose primary interest is in computer technology will be attracted to amateur radio through the medium of such a license . . . . an interest in computer operation by no means connotes an interest in radio communications.

C. *Handicapped applicants.* 20. The vast majority of comments opposed implementation of a codeless license on the basis of a need to accommodate handicapped applicants. The only comments favoring any sort of special codeless license for the handicapped were the comments of some who, while generally opposed to a codeless license, acknowledged that they did not want to bar entry to the ARS on the basis of a person's handicap.

21. Comments from handicapped people themselves and from people who assist them in learning code and theory in order to successfully complete amateur operator examinations strongly opposed a codeless license for the handicapped. The Pentucket Radio Association, Inc. pointed out that in responding to PR Docket No. 78-250, handicapped Amateurs were not asking for a special license or elimination of requirements but instead sought acknowledgement of an individual's handicap and permission to use special techniques so that they may take the same examination as everyone else. Reo DePew expressed the view of a majority of handicapped amateurs when he stated that a "no-code" license would be unfair to them and rob them of some of their pride of accomplishment.

22. Perhaps the most telling and persuasive comments of all on this subject are those of the Courage HANDI-HAM System, an international non-profit service organization which provides amateur radio educational services, equipment and fraternity to people with physical, sight, speech and/or hearing handicaps. They stated:

> We must strenuously object to the argument that people with physical handicaps are prevented from being able to successfully complete a Morse code examination. Extensive experience in training over 5,000 severely handicapped people proves otherwise. In only six cases over the past 16 years have we encountered a situation where a *physical* (as opposed to mentel) disability has absolutely prevented an individual from learning the code at the prescribed speeds! The Courage HANDI-HAM System has developed learning methods and transcription techniques which bring the International Morse code well within the abilities of severely handicaped persons.
>
> Of perhaps even greater significance is the reason WHY so many severely handicapped Radio Amateurs put forth tremendous effort to learn the code at speeds which permit fast and reliable on-the-air communications: for many, the Morse code is the ONLY means of communications available to them. You must realize that the very person who is so severely handicapped that he has a great deal of difficulty transcribing the code is precisely the person who, by reason of severe speech involvement with his physical handicap, NEEDS the code to communicate. Comments of the Courage HANDI-HAN System.

23. We conclude that physical disability, in other than extremely rare and exceptional circumstances, does not prevent handicapped persons from learning the Morse code and successfully completing Morse code examinations. We have made every effort to accommodate the handicapped in commission—administered amateur operator examinations. We have promulgated rules to assure that the handicapped will be similarly accommodated under the new amateur volunteer examiner program. *See e.g.* 47 CFR 97.28(g). Generally, the handicapped go to extraordinary lengths and are extremely resourceful in designing methods to achieve code proficiency. Handicapped applicants are justifiably proud when they master the Morse code. They wish to be treated as co-equals in the Amateur Radio Service; not as a special group needing a special license. Thus, considerations for handicapped applicants do not appear to warrant creation of a codeless license.

II. Relevance of Morse Code

24. Comments supporting the proposals in the *Notice* claimed that knowledge of the international Morse code is irrelevant in today's ARS. In its Reply Comments, CHARS stated that it is not even necessary to have any Morse code skills to utilize the code because inexpensive home computers interconnected with radio transmitters and receivers are generally capable of transmitting and receiving Morse code at speeds between 1 and 99 words per minute. Harold A. Wilson commented that with current technology almost all communication above 50 MHz on the amateur bands is FM. David A. Miller stated that at the Technician level "99% of UHF and VHF communication is voice communication."

25. The comments on this subject are conflicting, with a large preponderance of comments of the opposite view. Alfred G. Conte, Jr., stated that the proposal for a codeless license equates with a proposal to do away with the instruction of arithmetic in elementary schools due to the prevalence of inexpensive pocket calculators. Many commenters, like Charles E. Daum, pointed to the survey conducted by Florida State University's Institute for Social Research, cited in the *Notice*, in which 83% of the amateur operators responding said that a Morse code requirement is either essential or important for operator privileges below 30 MHz, and 94% said that such a requirement is essential or important for operator privileges above 30 MHz.

26. Emil Pacock commented that Morse code has many applications today above 50 MHz. He said that it is used for weak-signal communications, which is an important and widely pursued art in the VHF and UHF bands. Edgar Herbert Callaway, Jr., further explained that such weak signal work included:

> the use of low-noise transistors, power amplifiers, high gain antennas, stable narrow-band receivers, etc. . . . The first amateur EME (moonboence) contact was made using Morse code. Also the first meteor-scatter contacts on 144, 220, and 432 MHz. The pioneering California-to-Hawaii 144 and 220 MHz contacts by W6NLZ and KH6UK (2540 miles, discovering truly long-hanl tropospheric ducting in the tropics) were made via Morse code. . . . Most of these contributions to the amateur radio service and the radio art in general were made by operators with ability, yes, state-of-the-art equipment, yes, but they all *required* Morse code. The contemporary equipment did not allow for the extra 3- to 10-dB of signal strength needed for another mode. There would have been no breakthroughs without Morse. Comments of Edgar Herbert Callaway, Jr.

27. There is also much evidence that Morse code is used frequently above 144 MHz. Matthew V. Ellsworth commented that it is often used in the two-meter and 440 MHz bands for communications with earth-orbiting satellites. He also stated that most automatic repeating stations identify by using a code generating device. Geoffrey H. Krauss said that even recent VHF contests reflect substantial Morse code usage. Richard A. Stiern commented that the Morse Code is still used extensively by the Armed Forces and the Merchant Marine because of its reliability under any circumstances. Joseph M. Rice stated in his comment that 99% of the present OSCAR satellite work is done using Morse code.

28. We conclude that Morse code still occupies a significant place in day-to-day amateur operation, particularly in the HF bands. The Morse code is used normally on VHF and UHF frequencies in conjunction with weak signal communications. The Morse code is relied upon heavily for experimentation and the development of new technological advances. The Morse code, rather than being irrelevant or obsolete, continues to be an integral part of amateur radio.

III. Use of Morse Code in Civil Emergencies and for National Defense

29. In extensive comments, Donald Godward set forth the basic philosophy of those commenters who believe that Morse code is no longer needed for amateur responsiveness in civil or military emergencies. He stated that the advent of all solid state SSB transceivers, VHF-FM gear, and RTTY equipment has essentially eliminated the need for CW in emergency operations. He said that modern SSB/FM/RTTY equipment is so small and light that it is highly portable and its power requirements are so compatible with modern batteries and portable power generators that there is no longer any real advantage to CW in emergency operations, even in terms of being able to "get through." The Mississippi Emergency Management Agency said that modern digital techniques are preferable to code for getting a message through. CHARS stated that most emergency communications in fact utilize voice, either sideband or FM.

30. However, most individuals and groups involved in amateur emergency communications urged retention of a code requirement for all amateur operator licenses. Many amateur operators brought our attention to specific instances of emergency communications that were possible only with the use of Morse code, such as this year's tornado and floods in Southeast Missouri, life threatening emergencies at sea handled by the Maritime Mobile Service Net, the rescue of the crew of the *Jala Morari*, and the rescue of the crew of a sinking ship in the Straits of Juan de Fuca. Al Uvietta, Communications Support Group Coordinator for the City of San Antonio, Office of Emergency Management, and

[5] Daniel and Claire Rosenbaum referred to the Department of the Army Technical Manual TM 11-59 and the Department of the Air Force Technical Order TO 31-3-16, entitled *International Morse Code (Instructions)*. According to this joint publication an average person can learn to send and receive Morse code with 15–22 hours of study. Based on sending and receiving proficiencies tested for one continuous mistake-free minute.

Hancock Emergency Amateur Radio Services, Inc., a group of about twenty-five amateur operators banded together by the need for emergency communications during tornadoes, floods and other disasters, commented that Morse code is more effective in getting through when communications are affected by weather, poor propagation and interference. Most commenters still view Morse code as the communications mode of last resort for the worst conditions. See, e.g., Comments of Ralph V. Anderson; Comments of James W. Partin.

31. Many commenters, including the Southern California Repeater and Remote Base Association (SCRRBA), were concerned that the anticipated growth of the ARS if we adopt a codeless license would adversely impact already-crowded repeater operation in large urban areas, with resultant detrimental effect upon emergency communications capability. The Story County Amateur Radio Club pointed out that a Morse code requirement for every amateur operator license assures maintenance of a pool of skilled amateur operators available to provide communications for the public in emergencies.

32. Several years ago, the U.S. military services "de-emphasized" the use of Morse code as a modern communications tool. Now there is a major push in the U.S. military services to re-train their radio operators in the proficient use of Morse code. In the Air Force, for example, all ground radio operators must be proficient at five words per minute before March 1, 1984. They have two years to reach ten words per minute and three years to reach 15 wpm. See the Comments of Gen. Kremin. Henry M. Wymbs, an Army Signal School graduate and former member of the Second Signal Service Battalion in World War II commented that amateurs having a knowledge of the international Morse code have always formed a trained cadre of communicators upon which the military has always depended.

33. A letter to the ARRL from Mr. Oscar A. Goldfarb, acting Deputy Assistant Secretary for Logistics and Communications, U.S. Air Force, stated that "[s]hould the Commission adopt the 'No-Code' proposal, we would establish a requirement for Morse code proficiency as a condition for becoming an Air Force MARS member." See the Reply Comments of the American Radio Relay League. The Central Intelligence Agency (CIA), in a full-page advertisement for Electronic Technicians, Communicators and Radio Operators published in the June 1983 issue of Signal Magazine and appended to the comments of Philip B. Petersen stated that "Morse code ability at 12 gpm [wpm] is preferred; other applicants will be tested for Morse aptitude."

34. We conclude that a proficiency in the international Morse code is still very useful for amateur responsiveness in civil and military emergencies. In such emergencies, it is the principal communications mode of last resort in the face of uncertain propagation characteristics or severe interference. Due to international language barriers, it is sometimes the only effective communications mode. It is in the public interest, convenience and necessity to maintain a pool of skilled amateur operators available to provide emergency communications for the public during disasters and for the national defense. Continuance of a requirement for proficiency in the international Morse code will contribute to continued maintenance of such a pool. Clearly, Morse code is a fundamental communications skill critical to the nature of the ARS.[6]

35. *Foreign Codeless Experience.* Many commenters, including Edward C. Simmons, stated that Canada has very few codeless class licensees because of a much more difficult examination than we proposed for either alternative U.S. codeless class license. On the other hand, a large number of commenters attributed the substantial growth of Japan's amateur radio service (from 70,000 licensees in 1965 to over 1,000,000 licenses in 1982) directly to Japan's easy-to-get codeless class license.[7] Our proposals fell somewhere between Canada's and Japan's codeless licenses. Neither country's experience appears directly applicable.

36. *Impact of a Codeless License Upon ARS Compliance.* Many comments opposing the proposal feared that a codeless amateur operator license would really be no more than another Citizens Band Radio Service, with what they perceived to be all its attendant problems. The Ozaukee Radio Club and the Inter-County Amateur Radio Club expressed concern that the amateur radio spectrum not be abused, as in Citizens Band. Pasternak commented that investigations by him and his news service reveal that such a license will initially be looked upon as an extension of Citizens Band Radio, to be mass marketed to the general public in a way similar to the way Citizens Band Radio was in the 1970's.

37. Coupled with this fear is a belief held by many commenters that rule compliance and dedication to public service in the ARS is a function of the time and effort a person must expend in obtaining a license. See, e.g., Comments of H. T. Hunt; Comments of the American Radio Relay League, Inc. The Honorable Lee H. Hamilton, U.S. House of Representatives, stated that the praiseworthy performance of ham operators during emergencies and their dedication to radio demonstrates a level of discipline which may be damaged by any relaxation of standards.

38. A contrary minority view, expressed in the comments of Frederick J. Glenn, is that the present written examination requires a sufficient demonstrated effort at learning. Corwin D. Moore expressed sentiments similar to those of Charles E. Cohn, who stated:

> Code lovers threaten us with CB-type chaos and insanity if the code requirement is dropped or loosened. The flaw in that argument can be readily seen if you note that a good many of the hams that have been disciplined for malicious interference have been Extra Class licensees, and thus have demonstrated code mastery, not just at 13 wpm, but at 20 wpm! Comments of Charles E. Cohn.

39. Nonetheless, the majority of commenters anticipated a large influx of undisciplined licensees as a result of either proposal in the *Notice*. The Pentagon Amateur Radio Club and others said that "weak signal" experimenters, such as those engaged in experimenting with extended range terrestrial modes of VHF/UHF communications and those involved in earth-moon-earth (EME) or "moonbounce" modes, and amateurs using satellites as relay platforms are justifiably concerned that a larger and potentially less well disciplined population of amateurs may not respect the up-to-now voluntarily imposed frequency management procedures necessary for these experiments to be conducted.

40. We are not persuaded that there is a relationship between the time and effort expended to successfully complete Element 1(A) (the Morse code 5 wpm examination) and the rule compliance or dedication to public service of a particular applicant. We believe it is not possible to predict reliably the behavior of prospective codeless licensees. Accordingly, we do not find this issue significant to our resolution of this proceeding.

Conclusion

41. The five word-per-minute slow speed Morse code requirement for the present entry-level Novice and Technician class licenses in the ARS does not appear to constitute a significant function barrier to potential applicants. The amateur ranks are growing by thousands of licensees every year with the code requirement in effect. To the extent the Morse code requirement poses a barrier for a few, we are willing to accept that "trade-off" in light of the very substantial benefits it produces both for licensees and the public.

42. The five word-per-minute Morse code requirement poses no unacceptable burden for handicapped applicants. Ingenious devices, alternative methods of examination administration, and the laudable dedication and perseverance of handicapped applicants in combination usually result in successfully completion of the Morse code examination. Licensees in the ARS who are handicapped are proud of their achievement in mastering Morse code, and generally do not seek special treatment.

43. There is still substantial everyday use of the Morse code in the ARS. The international Morse code is essential to many aspects of technical advance and experimentation in the ARS today. It is a fundamental communications skill critical to the nature of the ARS.

44. A requirement for proficiency in the international Morse code is necessary in order to insure maintenance of a trained pool of amateur operators for emergencies involving the safety of life or property or for the national defense. Dropping this requirement for an entry-level license would adversely affect amateur emergency communications capabilities, which would adversely affect the public.

45. It is unusual to receive the volume of comments we have received in this proceeding. Almost five thousand people and organizations responded to the *Notice*. They were mostly people licensed in the ARS who use their privileges on a regular basis. They were people who, by a margin of roughly twenty to one, expressed an overwhelming sentiment to maintain the current nature and makeup of the service. They felt that Morse code is an integral feature of the ARS. These commenters are the people who have made the ARS what it is today—a service that is a model of public responsiveness in times of emergency and distress, and a service that is a model of self-enforcement and volunteerism. The strong sentiment they expressed in this docket about the nature of such a service is a critical factor in weighing the proposals.

46. For all the above reasons, we have decided to reject each of the proposals set forth in the *Notice* and to retain the present licensing structure of the Amateur Radio Service.

Procedural Matters

47. In the *Notice of Proposed Rule Making, supra*, in this proceeding, we previously determined that Sections 603 and 604 of the Regulatory Flexibility Act of 1900 (Pub. L. 96–354) do not apply to this rule making proceeding since this proposal would only have amended the operator license class structure of the Amateur Radio Service. There would have been no significant impact on small businesses, small organizations or small governmental jurisdictions. Of course, since we are terminating this proceeding without action, there is no impact at all.

48. It is further ordered that the Petition to Cancel or, in the alternative, Amend filed by Donald B. Nowakoski is denied.

49. It is further ordered that the Motion for Leave to File Reply Comments filed by the Capitol Hill Amateur Radio Society is granted.

50. It is further ordered that the Motion for Leave to Submit Supplemental Reply Comments filed by the American Radio Relay League, Inc., is granted.

51. It is further ordered that this proceeding is terminated.

52. It is further ordered that the Secretary shall cause a copy of this *Report and Order* to be served upon the Chief Counsel for Advocacy of the Small Business Administration and that the Secretary shall also cause a copy of this *Report and Order* to be published in the Federal Register.

53. For further information on this proceeding, contact John J. Borkowski, Federal Communications Commission, Private Radio Bureau, Washington, D.C. 20554, (202) 632–4964.

Federal Communications Commission.
William J. Tricarico,
Secretary.

[6] In the Marine Radio Service we have granted an exemption from radiotelegraph requirements to large cargo vessels operating on U.S. coastwise voyages where such vessels carry an array of alternative communications equipment including a satellite ship earth station. *Report and Order*, PR Docket No. 79–336 (FCC 82–75), February 14, 1982. ARS operators, on the other hand, generally provide emergency assistance to people in situations where other methods of communication are not available.

[7] Emerson commented that 95% of the Japanese amateur operators hold Telephony class (codeless) licenses. They also commented that one-third of England's amateur operators and 40% of Germany's amateur operators hold codeless licenses.

HAM HELP

I need a schematic or any other available documentation on the JFD Model 600 B and W TV camera. I'll pay any reasonable charges.

Tom Workman K6TW
Rt. 9, Box 686
Tucson AZ 85743

Manual needed for a Solar Capacitor Analyzer Model CE 1-60. Lacking a manual, it would help to talk to someone who has operated one of these testers.

Homer Lawrence W8DIH
16 So. Garden St.
Norwalk OH 44857

I need the broadband couplers for 10 and 15 meters for the Central Electronics 200V or information on how to fabricate them.

Maj. Howard M. Mills
HHC 440 SIG BN
APO NY 09175

I am interested in books about switcher-type electronic power supplies: push-pull, PWM, and regulated. I would like to know their titles, authors, copyright dates, number of pages, and prices.

S. Hachikian
837 N. 64 St.
Philadelphia PA 19151

I would like the schematics, operation manual, and any pertinent information concerning the Lafayette Priva-Com 3C.

Calvin Smith, Jr.
PO Box 236
Wenonah NJ 08090

I am looking for a service manual or power-transformer output voltages for a Tennelec MPC-1 scanner. I would also like a service manual for a Tennelec MS-2.

Peter J. St. Arnaud
PO Box 8066
Lowell MA 01853

TR-22—$60; 186E—$25; HP 417A, 20-500 MHz, FM detector—$15; 4.4-W Motorola audio chip, 10.7-MHz filters, mix or match—3/$5; tape switch—$10; SP-600 oscillator and crystal deck, new—$7.50. All, plus shipping. J. Lisaius, 116 Orton Road, W. Caldwell NJ 07006; (201)-226-7943. BNB075

KQ6P NOVICE EXAM KIT.™ FCC no longer supplies written test! The Novice Exam Kit provides everything you need to give the Novice exam including. . . 3 multiple-choice written exams. . . 6 code tests on cassette (3 tests using 5-wpm characters and 3 tests using 13-wpm characters). . . all FCC forms (610 and PR1035A) . . . plus "Instructions and Helps for the Examiner." Only $5.95 (plus $1.00 shipping) from Spirit Publications, 2200 El Camino Real Suite 107, Redwood City CA 94063. Discount to clubs! BNB076

NEW PRODUCTS

NEW ANTENNA ROTATOR FOR BLIND HAMS

Telex/Hy-Gain has introduced the HAM-SP rotator designed for visually-impaired amateur-radio operators.

The control unit functions are marked in both braille and conventional lettering. The unit also emits a high-frequency tone to indicate rotator action. Since the brake release as well as delayed brake engagement is automatic, operation of the rotator is a simple one-hand, one-touch operation to aid the blind.

When mounted inside a tower, the new HAM-SP rotator is designed to operate large antenna arrays up to 15 square feet ($1.4m^2$) wind-load area. The HAM-SP (Catalog No. 307) is available at amateur-radio dealers.

For more information, contact *Telex Communications, Inc., 9600 Aldrich Ave. So., Minneapolis MN 55420, (612)-884-4051.*

FT-757GX LINE COMPUTER-AIDED TRANSCEIVER

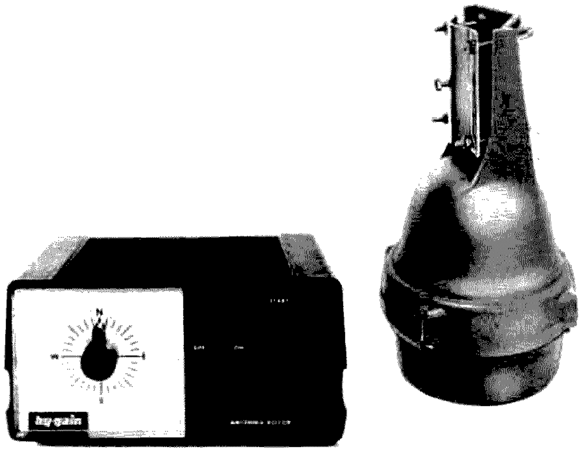
Yaesu Electronics Corporation has introduced the FT-757GX Line, the latest generation of CAT (computer-aided transceiver) technology from the engineers at Yaesu Musen Company, Ltd.

Controlled by three 8-bit microprocessors, the FT-757GX is a full QSK synthesized transceiver offering general coverage on receive and ham-band transmit capability, with expanded coverage available for MARS operators. The transmitter section is specified for up to thirty minutes of continuous operation at a nominal output of 100 Watts. For maximum operating flexibility, the FT-757GX performance package includes dual vfo's, eight memories, all-mode squelch, and a variety of scanning features. A 600-Hz CW filter, electronic keyer module, af speech processor, and FM capability are all included in the purchase price.

The Yaesu FT-757GX CAT.

Among the high-performance options for the FT-757GX Line are the FC-757AT automatic antenna tuner with band/antenna memory, the FP-757GX compact switching regulator power supply, the FP-757HD heavy-duty power supply (for continuous duty applications), the FP-700 standard power supply, and the FTV-700 transverter.

For further information on the FT-757GX Line or other Yaesu transceivers designed for computer interface, contact *Yaesu Electronics Corporation, PO Box 49, Paramount CA 90723.* Reader Service number 482.



HAM-SP antenna rotator for the visually handicapped.

EQ300 MICROPHONE EQUALIZER FROM HEIL

The new EQ300 from Heil, Ltd., is an improved version of its EQ200. The EQ300 has an output-level control on the front panel so that one model can be used to drive either mike-level inputs (Kenwood, Yaesu, etc.) or line-level inputs used with the new Icom series transceivers.

The EQ300 uses an internal mike gain trimpot for initial setting with your mike. The front-panel Output control provides a variable level up to +2.0 volts out, sufficient to drive any transceiver microphone input, including the new Icom series. Simply adjust to .10 V out (11 o'clock) for Kenwood, Yaesu, etc., and 1.5 V (3 o'clock) for Icom.

Just two models are offered, The EQ300-4 and the EQ300-8. Both use two active filters, the low centered at 490 Hz and the high at 2200 Hz, with plus or minus 18 dB of boost and cut. The only difference in the two models is the connectors. Order either 4 or 8 pins to match your rig. A two-tone generator used for tuning linear amplifiers with an oscilloscope is also available for either model.

The new EQ300 has a power adapter circuit built in so it can be operated from a 9-volt battery or from a good 12-volt dc supply, and excellent RFI suppression has been installed for use in heavy rf environments.

The EQ300, as all of the 1984 Heil products, will be housed in their new beige and chocolate enclosures. All Heil products now feature the same two-color control knobs and switches used on their famous recording studio equipment.

For more information, contact *Heil Ltd., Box 68, Marissa IL 62257, (618)-295-3000.* Reader Service number 484.

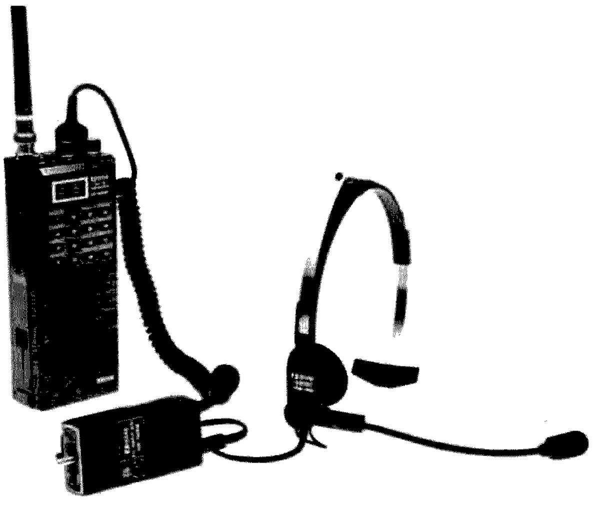
NEW PRODUCTS FROM ICOM

Icom has introduced the IC-HS10 Headset and IC-HS10SB PTT Switch Box which can be used with all Icom hand-held transceivers: the IC-2A and 2AT; IC-3A and 3AT; IC-4A and 4AT; IC-02A and 02AT; and IC-04A and 04AT. The easy-to-use system has the following features:

IC-HS10 Headset

- Crystal-clear reception
- Pivoting microphone
- Light weight
- Adjustable boom
- Folds up for safe and compact storage

EQ300 microphone equalizer from Heil.



New headset and switch box from Icom.

- Adjustable for comfortable fit

IC-HS10SB PTT Switch Box

- Compact size: 3" H x 1.5" W x .75" D
- Belt clip
- Provides transmit-receive switching control
- Mike gain control
- Molded plastic connector for speaker/mike connection to hand-held

The IC-HS10 Headset and IC-HS10SB PTT Switch Box may be purchased separately.

For more information, contact *Icom America, Inc., 2112 116th Ave. NE, Bellevue WA 98004, (206)-454-8155.*

MORSE-CODE TUTOR

Tutorcode is an instructional software release which can establish your Morse-code proficiency from 3 to 25 words per minute in an exciting, enjoyable game-type atmosphere. Tutorcode is written in machine language for any TRS-80 16K or larger Color Computer system. Extended Basic is not required. Sound flash cards are easily accessible from the menu-driven program. A string of up to 255 characters may be input from the keyboard and the equivalent Morse code will be output at any selected code speed on command.

Tutorcode is available on cassette only from *Rabbitt Ware, Inc., Rt. 1 Bascomb Road, Jackson TN 38305, (901)-668-8816.* Reader Service number 478.

ICM ALIGNMENT OSCILLATORS

International Crystal Manufacturing Company has introduced the FOT-12 and FOT-12 LOW alignment oscillators. They provide a convenient stationary or portable signal source for alignment purposes, convenient for alignment of first i-f frequencies in pagers and other receivers.

Six crystal positions permit the user to choose any one of six frequencies. The FOT-12 LOW covers the frequency range 250 kHz to 4.0 MHz, and the FOT-12 covers the range 4.0 MHz to 24.0 MHz.

Front-panel controls include a six-position switch for selecting the frequency, a BNC-type connector for rf output, and a power switch with an indicator lamp for internal or external power.

The internal battery permits operation away from the test bench. Jacks are provided on the rear panel for an external dc power source.

Following is a list of specifications.

- Rf output—1 V across 470 Ohms
- Power requirements— 9 to 15 V dc @ 0 mA maximum
- Frequency adjustment—trimmer provided at each crystal socket for adjustment to nominal frequency
- Operating temperature— −10° C to +60° C
- Stability—maximum change of ±25 ppm (−10° C to +60° C, referenced to 25° C)
- Dimensions—5" W x 2¾" H x 6" D overall

These units are available direct from the manufacturer. For more information, contact *International Crystal Manufacturing Company, Inc., PO Box 26330, Oklahoma City OK 73126, (405)-236-3741.* Reader Service number 480.

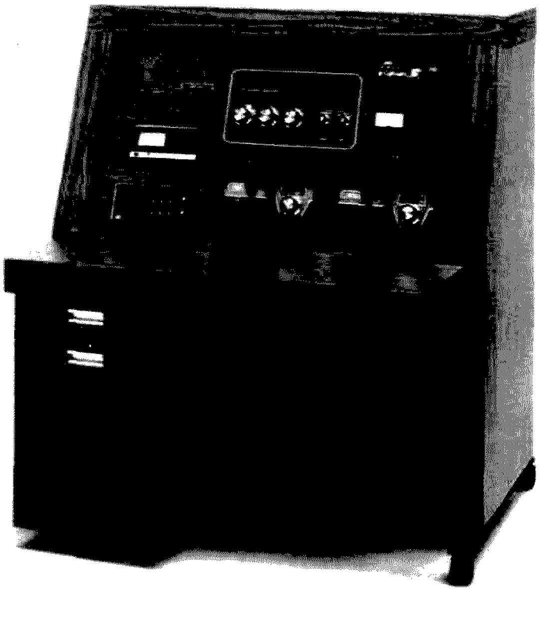
BREAK CONSOLES

Break Communications Systems has introduced 4'-, 6'-, and 8'-wide wood/mica communications consoles. The replaceable front panel is bolted in with steel clamps for easy low-cost station updates over the years. Front-panel holes are precisely cut by computerized X-Y wood-cutting table, and hole/equipment gaps are less than 1/32"!

The purchase price includes: front panel cut for your station, hidden accessory shelf for power supplies (dummy loads, etc.), pre-assembled rear equipment support system (rigging), teak mica, casters, multiple tap station ground bus, one set of puppets of your equipment, and ½-scale front-panel grids for station layout and design assistance. Corner units are available to integrate standard width consoles into "L" and "U" circular configurations.

Options include: 1000 different micas to match your decor, drawer/bookshelf combination, pencil drawer in desk's front edge, keyboard cut-out in desk top, shelf under desk, desk-top extension into the front panel, dolly for floor-standing amplifiers, temperature-controlled fan cooling system, wire duct, labels, ties, etc. Custom work makes the basic console just right for your station.

For additional information, contact Larry Kushner WA6BKC/4 at *Break Communications Systems, Inc., 5817 SW 21st Street, Hollywood FL 33023, (305)-989-2371.* Reader Service number 479.



Wood/mica communications console from Break.

SOLID-STATE DIP METER FROM CAYWOOD

A solid-state dip meter for testing radio frequencies, antennas, oscillators, rf chokes, and similar devices, formerly manufactured by Millen, is available from Caywood Electronics, Inc., of Malden, Massachusetts.

The Millen Solid-State Dipper is a portable oscillating frequency meter that determines the resonant frequency of de-energized resonant circuits with an accuracy of ±2%. Covering a range from 1.65 to 310 MHz with 7 plug-in coils, it also features an absorption-type wavemeter with the oscillating circuit acting as a Q multiplier amplifier to enhance tuning response and dip sensitivity.

Weighing only 2½ pounds, the 7¼" D x 3½" W x 3¾" H Millen Solid-State Dipper provides a calibrated 205° drum dial with 7 direct reading scales and a universal scale. The rugged copper-plated steel unit and coils store in a handy 11¾" D x 5¼" W x 4" H carrying case. An optional tube-type dipper with 5 additional coils for frequencies down to 165 kHz is also offered.

For more information, contact Wade Caywood KA1UP, *Caywood Electronics, Inc., PO Drawer U, Malden MA 02148.* Reader Service number 481.

MFJ-1423 ENHANCER/STABILIZER

Enhancement and stabilization are basic necessities for even the beginning videophile. That's just what the MFJ-1423 offers: all the controlled, detailed sharpness and picture clarity of an enhancer combined with a stabilizer to remove picture roll and override copyguard.

The enhancer allows you to control the picture by defining, clarifying, and sharpening the fine details of the picture to the desired degree. The enhancer features an exclusive new light-enhancer mode that enhances light areas only, which yields reduced snow in the dark areas of the picture. The enhancer has 2 adjustment features that let you control the picture: (1) The Enhancement control lets you decide the degree of sharpness and clarity you want, and (2) the Noise Cancel control helps eliminate snow which is sometimes brought on by increased enhancement. An Enhancer Bypass switch also gives you the added convenience of being able to make a quick, clean, definite comparison between the unenhanced and the enhanced picture just by the touch of a button.

The stabilizer removes picture roll

The FOT-12 alignment oscillator from ICM.

Caywood's solid-state dipper.

caused by copyguard. It features a Stabilizer Bypass switch, including an LED for on-off identification at a glance, and a stabilizer control knob that is non-critical to adjust. Just turn the knob until the picture locks in, then sit back and enjoy the picture.

The enhancer/stabilizer features a Power On-Off Bypass switch so you won't be bothered with reconnecting at times when the enhancer/stabilizer is not needed. The front panel has an LED Power On-Off indicator and is operated by high-quality aluminum knobs and switches to make tuning and adjusting feel as smooth as silk.

The back-panel controls include the following:

(1) a Channel 3/4 Selection Switch corresponds to channel 3 or 4 on the television.

(2) The RF Out consists of a built-in rf modulator which allows listening and viewing on any standard television. It outputs a signal that connects directly to the VHF of the television.

(3) An Audio In jack connects the audio signal from the source (VCR, video disk, camera, etc.).

(4) Two Video Out and one Video Out/Bypass jacks output the enhanced/stabilized video signal. The Video Out/Bypass allows you to bypass the MFJ-1423 when in the Off position. A built-in distribution amplifier allows three copies to be made or viewed simultaneously.

(5) The Video In is where the video signal from the source is connected.

(6) The PWR jack is where the ac adapter is connected. The MFJ-1423 operates on 110 V ac or on 112 V dc as a portable (possibly for camera use). All connections on the back panel are RCA jacks. Three cables for hook-up are included.

The unit is housed in a rugged black aluminum cabinet with an attractive brushed aluminum front and measures 7" × 2" × 6" overall.

MFJ offers a 30-day money-back trial period on all direct purchases. If you are not satisfied, return the unit and get a full refund (less shipping). MFJ also offers a one-year unconditional guarantee on all MFJ products.

For more information, contact *MFJ Enterprises, Inc., PO Box 494, Mississippi State MS 39762.* Reader Service number 483.

INTERNATIONAL DX CONVENTION

The 1984 International DX Convention is coming to Visalia, California, April 13-15. Will you be there? This top-notch convention attracts DXers and DX operators from around the world and includes seminars featuring many of the DXpeditioners of the past year.

Sponsorship alternates between the Northern and Southern California DX Clubs. 1984 is a Southern Cal year. The convention location remains the same—the Holiday Inn in Visalia. Pre-registration, including the banquet and Sunday breakfast, costs $38 ($42 after March 15, 1984). Send your check to Westcoast DX Convention 1984, c/o Treasurer Nick Winter WB6DXU, 1426 North Avon St., Burbank CA 91505.

4U1VIC—THE VIENNA INTERNATIONAL AMATEUR-RADIO CLUB

When is a country not a country? When it is the Vienna International Amateur Radio Club! This station, the third one to use the United Nations 4U1 prefix, counts as a separate country for the DARC-sponsored Worked All Europe award, but not for the ARRL-run DXCC program.

The original 4U1 station was set up in Geneva, Switzerland, at the headquarters of the International Telecommunications Union (ITU). Back in the days when DXing was a gentlemanly activity, the amateur-radio club at the ITU headquarters asked for and received separate-country status, based on the fact that the station was located on United Nations property, and not in Switzerland proper. For years 4U1 meant 4U1ITU. The station has been a gathering point for numerous international visitors and the showcase amateur station for telecommunications officials attending conferences in Geneva. Amateur radio greatly benefitted from the existence of 4U1ITU.

Then, in the 1970s, some enterprising amateurs in New York City convinced United Nations authorities to permit a similar station in a UN building (on UN land; the US gave the land to the UN years ago) in downtown Manhattan. K2UN operated quietly for a while, until it dropped its bombshell: the station applied for separate-country status under the then-current DXCC rules. The ARRL's DX organization was faced with a nasty dilemma: either authorize a new "country" in the middle of downtown New York City or throw out the well respected and very useful 4U1ITU.

Since the League was facing the upcoming World Administrative Radio Conference (WARC), throwing out 4U1ITU was not even considered, and 4U1UN gained status as a separate country. This obvious absurdity, along with the approval of such nonsense "countries" as St. Paul Island and Sable Island off Nova Scotia and Desecheo off Puerto Rico, led to the League's throwing out the "separate-administration" provision for a new country.

Which brings us back to 4U1VIC. In 1979 all United Nations organizations in the Vienna, Austria, area were consolidated into a single-building complex on the banks of the Danube River. As with the United Nations complexes in Geneva and New York, the adjacent land becomes part of the UN, not Austria. The region is now known as Vienna International Centre (VIC) or UNO City.

Among the many amateur-radio operators on the staff of the various UN organizations in Vienna were Tom Gabbert K3TG/OE1ZGA and Horst Eisenlohr DL9OL/OE3OLW. They paved the way for the formation of the Vienna International Amateur Radio Club and convinced UN Headquarters to grant them the callsign 4U1VIC. The station began operation last fall.

The operators of the station include hams from many different countries, since membership in the VIARC is restricted to staff and accredited diplomatic staff. The club members loan equipment to the station and feed a triband vertical on the roof of the 350-foot-high UN building. During contest operation, the club members string temporary dipoles for the lower bands.

The combination of antenna restrictions and the time limitations of the operators makes 4U1VIC a challenge for the DXer. The best times to watch for the station are local lunchtime, early evenings, and weekends, especially during contests. The station was on the air during most of the *CQ* WW SSB test last fall. Try 1130-1300 UTC and after 1630 UTC, around 14030 or 21030 CW and 14200 or 21300 SSB.

As with other club stations, the QSL chores fall on the operator making the contacts. Your best bet for a confirmation is to include the name of the operator on the card. The QSL address is VIARC, Box 200, A-1000 Vienna, Austria. Two IRCs with your self-addressed envelope will bring a direct response with UN stamps. Or you can send the card via the well-run Austrian QSL bureau, which handles the cards as a courtesy for the VIARC.

Why is 4U1VIC considered a country at all, if DXCC rules don't permit separate-country status? The DXCC is not the only game in the DX community, although it is the most respected award program. The German national amateur-radio organization, the DARC, also sponsors a prestigious award for working all the countries of Europe, and their country list is slightly different from the League's DXCC country list. Specifically, the Shetland Islands off the Scottish coast and the island of Sicily (IT9) are "separate countries" for the DARC award program.

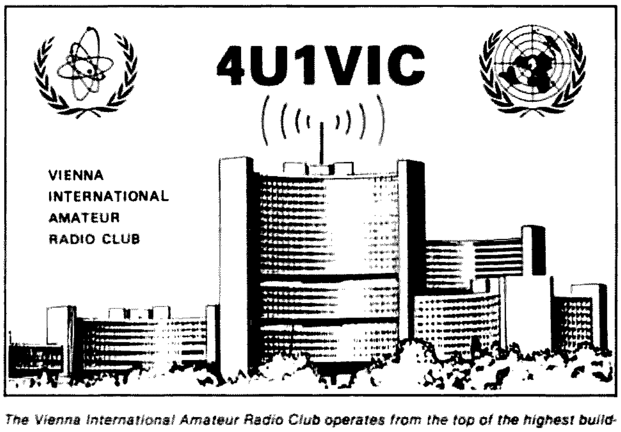
This is of interest to radio contesters, because both the DARC-sponsored Worked All Europe contest in the fall and the *CQ* WW test use the DARC country list for multipliers. This means that the Shetland Islands, Sicily, and now 4U1VIC count as separate multipliers for these contests, but not for the ARRL DX test in the spring, which uses the DXCC list.

DX FOLLOW-UP

Several members of the International DX Foundation traveled to the tiny country of St. Kitts in the Caribbean last summer to hand out DX contacts on all bands from 160 meters through 2. The four amateurs (see Photo A) hauled a Yaesu FT-901ZD, a Kenwood TS-130S, and VHF gear to the island, which is about 200 miles east of Puerto Rico. Antennas included a triband beam, a long six-meter yagi, dipoles, and a vertical (see Photo B).

The group made several thousand contacts in more than 100 different countries during the stay, including 10 countries on 6 meters! If you worked any of the four different callsigns used (VP2KBH-KBK), send your QSL card to Andy Anderson K8EFS, 4300 South Cochran, Charlotte MI 46813.

As promised (see this column, October, 1983), the Colombian amateur-radio organization mounted an impressive DXpedition to Malpelo this past fall. Thirteen



The Vienna International Amateur Radio Club operates from the top of the highest building in the United Nations complex on the Danube.

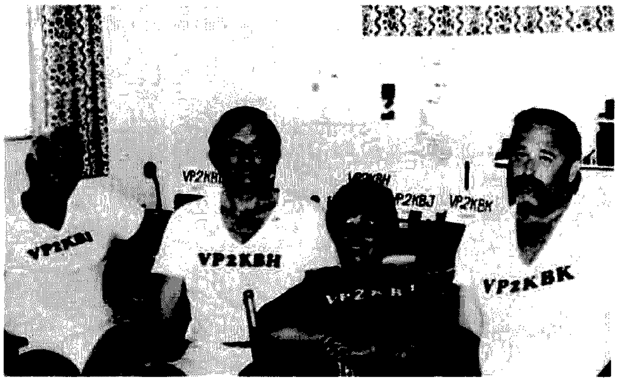


Photo A. The St. Kitts DXpedition crew relaxes in front of their operating position: (left to right) Kaye VP2KBI/N8AKY, Don VP2KBH/WB8BKC, Donna VP2KBJ/KA8LDO, and Andy VP2KBK/K8EFS.

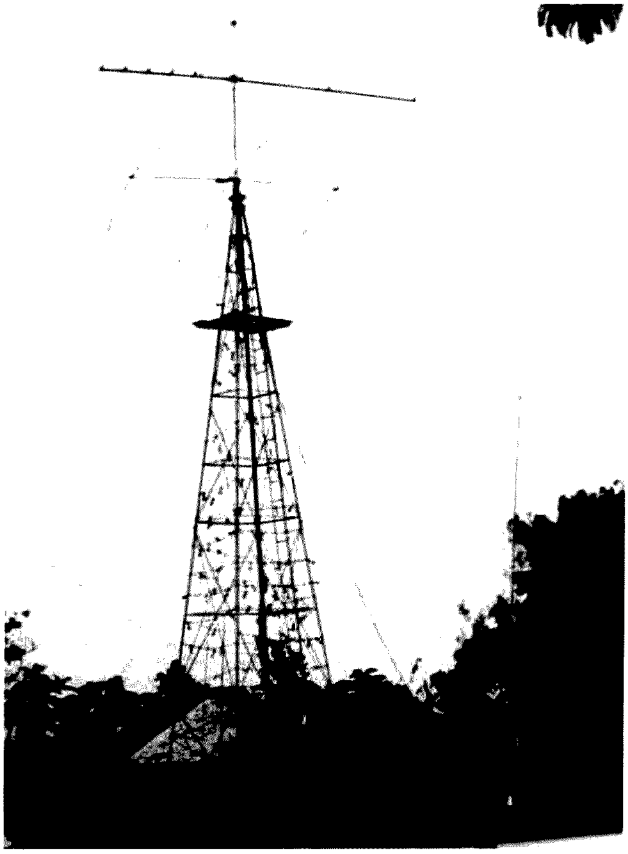

Photo B. The St. Kitts antenna farm included an 8-element 6-meter beam, tribander, dipoles, and a vertical.

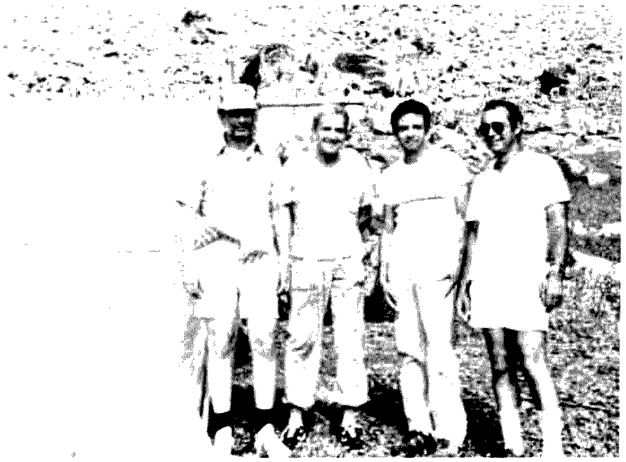

Photo C. The CW operating team at HKØTU in front of the "Malpelo Hilton." From left: HK1DBO, HK1QQ, HK1AMW, and HK3BAE.

Colombian amateurs formed the operating team at HKØTU, which finally landed on Malpelo on October 12 for a four-day stay. The group set up four stations, 3 on SSB and one on CW. The CW team of HK1DBO, HK1QQ, HK1AMW, and HK3BAE (see Photo C) made about 7600 contacts of the 20,000-plus total of the DXpedition. The CW operating position (a tarp thrown over some poles) prominently displayed a sign which read, "Malpelo Hilton. VIPs only. No phonepatchers allowed!"

The composite photograph taken from he top of the 1000-foot cliff overlooking he landing site gives some idea of the ugged nature of the island. Lacking the ssistance of military helicopters, the operators were forced to set up all their staons on the eastern side of the island, so ne US West Coast and Japanese amateurs once again found Malpelo a difficult ontact. The Colombian hams scouted ut the rest of the island during breaks in neir operating schedule; they located a ossible site on the western side of the land for a future DXpedition, which nould please W6 hams. Don't hold your eath, however; the next Malpelo trip is ntatively scheduled for 1990!

That's it for now. Coming up: the wonous WWV!

ARGENTINA INVADES ANTARCTICA

No, not another Falklands/Malvinas nooting-type war. DX contacts are the ajor weapon in this battle of internaonal diplomacy. Specifically, AZ5ZA ed a shot in favor of the Argentine's aim to the polar regions by operating ring the month of January (middle of summer) from the South Orkney Islands group, between South America and Antarctica.

With the kind assistance of the Argentine Navy, two amateurs traveled to Laurie Island to activate AZ5ZA (which is a legitimate Argentine callsign). Carlos Poffo LU9EIE and Art Gargarella LU6ETB braved the elements and the prospect of Christmas in one of the worst climates in the world to put this island on the air.

While the action might not be quite as exciting (nor as deadly) as the ill-fated attack on the Falklands, this DXpedition is really another skirmish in the long-standing disagreement between the United Kingdom and Argentina over the ownership of vast amounts of Antarctic real estate and (more importantly) ocean-fishing and mining rights.

At stake in such apparently innocent DXpeditions is the 200-mile limit which most countries recognize as "territorial waters." Argentina has always taken its claim to the nearby islands and a slice of the Antarctic continent very seriously. Maps of the country printed in Argentina always show a huge slice of Antarctica and the surrounding islands as part of Argentina. If Argentina can win international support for its claim to these disputed regions, the country stands to gain fishing, drilling, and undersea-mining rights to an enormous area, potentially worth many billions of dollars.

The Argentines have pursued their claims to this region through international courts as well as on the battlefield and have never acknowledged the United Kingdom's claims to the same territory. Since one of the bases for international recognition of the territorial claims is inhabitation and development, the Argentine Navy "shows the flag" in this region as often as the nasty weather permits. This year it's South Orkney. Meanwhile, a small community of British subjects stays on the next island to the south, Signy Island, also part of the South Orkney group. Listen for VP8s AOD, AOH, and ALD.

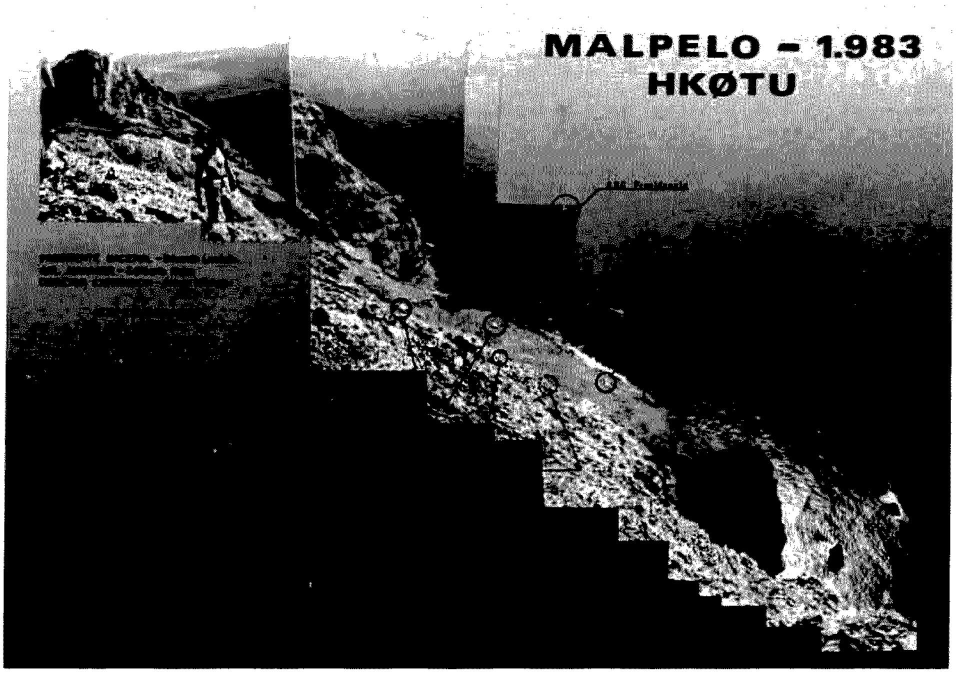

Photo D. The HKØTU operation as seen from the top of the cliff high above the stations. "Fonia" indicates a phone station, while "telegrafia" indicates a CW position.

Fortunately for DXers, the international ramifications of these disputes do not (yet) affect the DX status of the "country." South Orkney is a new one for hams, regardless of whether the contact is with a VP8 or LU (AZ) operation. But don't try to confirm your AZ5ZA contact through the United Kingdom! The Radio Club of Argentina, one of the sponsors of the DXpedition, advises that the QSL route for AZ5ZA is via LU2A, Box 100, 1428 Buenos Aires, Argentina.

While it is unfortunate that amateur radio is being used as a pawn in the difficult game of international law, at least the DX community gains some major DXpeditions to otherwise inaccessible spots, financed by the respective governments. Let's hope that all shots fired are in the form of "CQ DX."

FUN!

DXING AND DXPEDITIONS

I have many wonderful dreams and desires. Most of them I can't describe in a magazine that caters to readers of all ages, but one great dream I can write about is my wish to travel on a real, honest-to-goodness, 100-percent-genuine DXpedition.

During my youth, while other kids were drooling over pictures of Corvettes and ten-speeds, I used to fantasize about packing up my station (a Heathkit Sixer and a Trick Stick) and setting off on a journey to the highest peaks of the Swiss Alps, there to work the world on 50-MHz AM. Okay, I know six meters isn't legal in HB-land, but remember, this was a dream.

Today, my goals aren't quite so lofty. I no longer dream of giving a new country to tens of thousands of eager amateurs. Instead, I would happily settle for a journey to any reasonably remote destination. All I ask is that this place be warm, have relatively decent propagation characteristics, and feature a hospitable populace (no gunfire, please).

Will I ever achieve this goal? Who knows? So far, my total DX operating experience consists of an Icom IC-2A that I secretly slipped into 4U1-land (4U1-block?). Unbeknownst to the dozens of surrounding security guards, I actually kerchunked K2KLN/RPT from foreign territory. (Well, the ARRL says it's a foreign country. I call it East 42nd Street.)

So there you have it—a ham and his dreams. I'm open to offers.

ELEMENT 1
MULTIPLE CHOICE

1) On 160 meters, the DX window is:
   1) 1975-2000 kHz
   2) 1100-1560 kHz
   3) 1875-1900 kHz
   4) 1825-1830 kHz

2) Soldiers of which nationality fired at DXers during the recent Spratly Island fiasco?
   1) North Korean
   2) Vietnamese
   3) Cambodian
   4) Laotian

3) Which of the following groups *does not* sponsor DXpeditions:
   1) Yasme Foundation
   2) Private individuals and radio clubs
   3) Northern California DX Foundation
   4) ARRL Foundation

4) Back in the 1950s, FCC Form 405A was used for:
   1) Amateur-license renewals
   2) TVI complaints
   3) Amateur-license revocations
   4) CB-license applications

5) Which of the following *is not* a time and frequency station:
   1) CHU
   2) JJY
   3) ZUO
   4) IBE

ELEMENT 2
MATCHING

Match the renowned DX operators in Column A with their calls in Column B.

Column A	Column B
1) Father Michael Moran	A) XY1W
2) Martti Laine	B) 4S7PB
3) Tim Chen	C) W6AM
4) Paddy Gunasekera	D) VP2ML
5) K. Venkataramanan "Venkat"	E) BV2A
6) Don Wallace	F) OH2BH
7) Tom Christian	G) ON4UN
8) Johan "John" Devoldere	H) VU2KV
9) Chod Harris	I) 9N1MM
10) Lloyd Colvin	J) VR6TC
	K) W6KG

ELEMENT 3
TRUE-FALSE

	True	False
1) A 1-land station that works Western Europe with an antenna pointed east is working the short path.	____	____
2) Over-driving your transmitter is called flat-topping.	____	____
3) The 75-meter phone allocation for USSR amateurs ranges from 3.9 to 4.0 MHz.	____	____
4) The first two-way, transatlantic QSO took place in 1912.	____	____
5) Most RTTY DX is found around 14.090 to 14.100 MHz.	____	____
6) The highest altitude DXpedition was one that took place on top of California's Mt. Whitney (14,495 feet).	____	____
7) The Worked All Continents award is sponsored by the ARRL.	____	____
8) The Africana Net meets on 10 meters.	____	____
9) If a DX station on CW sends "U5," it means "stand by for five minutes."	____	____
10) As of 1978, DXpeditioners Lloyd and Iris Colvin had traveled to over 133 countries and worked over half of the active amateurs in the world.	____	____

ELEMENT 4
FILL IN THE BLANK

1) To ______ is to call a DX station at the same time another operator is signing off.
2) Very long distance DX is often called ______ operation.
3) The ham who relays a list of station calls to the DX operator is often called the ______.
4) An ______ is a document that may be converted into postage in another country.
5) To ______ is to adjust your transmitter to the same frequency as the DX station.

THE ANSWERS

Element 1:
1—4, 2—2, 3—4, 4—1, 5—4.

Element 2:
1—I, 2—F, 3—E, 4—B, 5—H, 6—C, 7—J, 8—G, 9—D, 10—K.

Element 3:

1—False	Only if using a broken compass.
2—True	Of course, only contesters are guilty of this—never DXers.
3—False	3.6 to 3.65 MHz.
4—False	No, 1923.
5—True	When the CW guys aren't trying to kill the signals.
6—False	I think W5LFL broke that record.
7—False	Technically, it's an International Amateur Radio Union certificate.
8—False	On 15 meters.
9—False	You should go up five kHz.
10—True	That adds up to a half-million QSOs.

Element 4:
1—tail-end
2—long-haul
3—master of ceremonies (MC)
4—international reply coupon (IRC)
5—zero beat

SCORING

Element 1:
Five points for each correct answer.
Element 2:
Two and one-half points for each correct match.
Element 3:
Two and one-half points for each correct answer.
Element 4:
Five points for each word correctly filled in.

Are you a ham of the world?

1-20 points—Repeater fan
21-40 points—Armchair DXpeditioner
41-60 points—Half-way through the DXCC ranks
61-80 points—Honor Roll material
81-100 points—DXCC in countries visited

RTTY LOOP

Marc I. Leavey, M.D. WA3AJR
6 Jenny Lane
Pikesville MD 21208

March blows in like a lion, and so did a letter I received this month from John Gist KD6LP/Ø in Hazelwood, Missouri. John's letter takes the "tell-it-like-it-is" award, for taking me to task on the selection of the VIC-20 as the computer end of Microlog's AIR-1 RTTY system.

Without reprinting John's four-page letter, I will relate that he is totally satisfied with his VIC-AIR combo and feels that he is missing nothing with the setup. He notes that large letters are not a decrement if your vision is poor. As an aside, the earlier Microlog equipment featured such large type for those with poor acuity or to allow the screen to be read across the room. The price is right, the features appear to be good, and the users are happy; what more can I say?

Now, the flip side of it is the wish that, since the VIC uses the same 6502 that several other "low-end" computers use, Microlog would consider producing versions for those systems as well. Also, since the stand-alone Microlog units have always used 6800-series microprocessors, why not cross-assemble one for the CoCo? The 16K cassette-based bottom line CoCo is quite a bargain, and when you upgrade it... but more about that later.

Thanks for the note, John; I think we have given this one enough AIR, don't you?

A close runner-up for the "t-i-i-i" award is a card I received from Eark Morris from Midland, Michigan, regarding the RCA offer to sell ASR-33s for $300. He states, "These machines are selling around here for $50 to $75. Why spend $300 for an old Teletype when for $400 you can buy a new dot matrix printer? Most people who purchased 33s for computer use are now trying to sell them since they have purchased a real printer. Now, Model 1[illegible] Teletypes are a different story. Those yo[illegible] can't even give away anymore! Everyon[illegible] has been buying VIC-20s." I wonder if Ear[illegible] has been talking to John? Oh, well...

Hams on the frontier of technology co[illegible]tinue to fill us all in on the techniques an[illegible] nuances of some of the newer RTT[illegible] modes. With AMTOR, particularly, indivi[illegible]ual observations tend to provide a lot of i[illegible]formation. For instance, Carty Ellis KA2[illegible] writes of his and his son's (KS2Z) activi[illegible] on both RTTY and AMTOR for the past fe[illegible] months. Their station includes a VIC-[illegible] with the Kantronics HAMTEXT and A[illegible]TORSOFT programs, and AEA CP-1 inte[illegible]face, and a barefoot eighty- through te[illegible] meter transceiver.

"Let me share some observations [illegible] equipment, documentation, assistanc[illegible] and on-the-air experiences. We original[illegible]

wanted to try using our Atari 400 computer on the air. A local amateur was kind enough to loan us his Kantronics interface unit and the HAMSOFT program for the Atari. We were pleasantly surprised at how easy it was to get on RTTY. One comment we had heard on the Kantronics Interface was somewhat negative, (that) the received signal had to be S9 or better for reliable copy. We did find this to be true in our case. For that reason, as well as a desire to be able to hook up an oscilloscope to aid in tuning. . .(we ordered) the CP-1. I can do nothing but rave about the CP-1! It is very selective, far easier to tune without a scope. . .and it will copy signals that I can barely hear through the speaker. I can really be proud of that selection.

"As far as the Kantronics software—I have to give them a solid A on that. The only rap on the knuckles for the software is two documentation problems. On both HAMTEXT and AMTORSOFT they do not explain why you need to affirm that you are using their software with their interface or with someone else's. This 'game' results in your RTTY or AMTOR signal being 'upside-down' if you didn't make the right choice. This is your *transmitted* signal, not the one you are receiving—(I haven't discovered if the situation is an inverter in the Kantronics AFSK generator or actual program logic; however, I suspect the prior—so watch it on your first RTTY and AMTOR QSOs (or lack of QSOs). And for those of you who say, 'Why didn't he try the reverse switch on the interface?'—a) that only affects the received signal, which is OK, and b) properly written software does not require user experimentation for proper use.

"The problem with AMTORSOFT is more one of interpretation; AMTOR is a new mode—procedural protocol is still changing, some of the techniques are really exotic (very impressive is a better phrase)—and it all takes a lot of learning. The technique of establishing a raw, unscheduled contact on AMTOR is not real life—it would work, just nobody does it that way. And there is a feature of AMTOR which makes it a bit like OSK CW—you can actually break into the other station while he is sending to you—try that on RTTY. And last but not least—one 'lid' thing can happen to you—you can be trying to find the SELCAL being used, and if you forget to tell the computer NOT to respond—you may find yourself actually screwing up the link between two stations who are in QSO—that really gets embarrassing for the new ham doing it and frustrating for the two stations who are otherwise in 100% perfect copy situations."

My sincere thanks to Carty for a meaty letter, which I am sure many hams toying with the idea of getting on AMTOR appreciate.

Now, a short tale of two computers. Many of you have dropped me notes telling me of your use of the VIC, Atari, or other personal computers on RTTY. I noted in these pages some months back of my acquisition of an Atari 400, with the hopes of putting it on RTTY. Well, now you may note that I am talking about a TRS-80C Color Computer® with the same lines. My computer history goes back to the 6800 school, as faithful readers of this column know, and it is from that school that the 6809 used in the CoCo comes. After looking at several systems and spending quite a bit of money, not all of it wisely, I have come to the conclusion, at least for now, that the 6809 is the way to go. Points in its favor include ease of programming, a wide range of system software, and a wide range of hardware which retains compatibility. There are at least three or four disk operating systems, each of which fills a different niche, and hardware systems which range in complexity from Color Basic CoCos, selling for a little over one hundred dollars, to GIMIX OS9 systems and Cheftains, selling for thousands. This is no toy, the 6809, but that does not mean you can't play games. For a three-year-old version of CoCo RTTY, look at Clay Abrams' article on page 58 of the September, 1983, issue of *73*. We will present more here, as it develops!

As I reread the above paragraph, I see I mentioned one thing that, if not explained, leaves unsaid why I feel the 6809 is so powerful. Those of you who read any of the computer magazines have read about the "big" system operating systems, like Unix or Xenix. These multi-user operating systems allow several users to share a central CPU and disk, with only a remote terminal. Except for certain high-use times, such users are typically unaware of other users' existence. That is what OS9 is, a multi-user, multi-tasking operating system for the 6809 CPU. Two users can run my CoCo with a "background task," say printing out a listing, all going at the same time. Because of hardware design, there is a bottleneck with simultaneous input and output, but other tasks can run at the same time. The bottleneck is caused by the use of a parallel port PIA as a serial port, through use of a software UART. This was used in early 6800 systems and has been used here as one way to interface RTTY with a computer. It does tie down the CPU, though, and when a true serial port, ACIA, is implemented, it will help. But in the meantime, a CoCo running OS9 runs rings around other systems. Check it out.

You are a vocal lot, RTTYers. I enjoy reading your comments, views, and opinions, and so do your cohorts. Let me hear from you, and I'll pass along what I can, filter some more, and add what's needed. The product? Next month's RTTY Loop.

FCC

ssuance of Ten Year Amateur Radio icenses

GENCY: Federal Communications ommission.

CTION: Issuance of licenses.

UMMARY: The Commission has ommenced issuing new, modified and enewal amateur radio station and perator licenses for ten year terms. The nger-term licenses were authorized in le amendments previously adopted in is proceeding. Issuance of ten year censes was delayed so that necessary anges could be made in licensing ograms. The Public Notice is cessary so that licensees will know at we are now issuing ten year censes. The effect of this Public Notice the creation of an informed public and reduction in the number of telephone quiries concerning license terms.

DRESS: Federal Communications mmission, Washington, D.C. 20554.

R FURTHER INFORMATION CONTACT: aurice J. DePont, Private Radio reau, Special Services Division (202) 2-4964.

PPLEMENTARY INFORMATION: The port and Order in this matter was blished on October 28, 1983 at 48 FR 861.

The Commission has commenced uing new, modified and renewal ateur radio station and operator enses for ten year terms. The longer-m licenses were authorized in rule endments adopted by the mmission on October 6, 1983. Before rules were changed, an amateur ense was issued for a five year period. uance of ten year licenses was layed so that necessary changes could made in licensing programs. (PR Dkt. -337).

There will be a two year grace period expired ten year station and operator enses.

The Commission emphasizes that the ten year license term is not a blanket extension of existing station and operator licenses. An amateur license that specifies less than a ten year term will show a ten year term on the face of the license when it is either modified or renewed.

William J. Tricarico
Secretary, Federal Communications Commission.

Amendment of the Commission's Rules To Make Additional Frequencies Available for Repeater Operation

AGENCY: Federal Communications Commission.

ACTION: Withdrawal of proposed rule.

SUMMARY: This document withdraws an earlier proposal which sought to make additional frequencies in the 10 meter band available for repeater operation. Making such frequencies available to users would have an adverse impact on amateur satellite communcations in that band. Further, it was determined that there is no compelling need for repeater subband expansion in the 10 meter band at this time.

ADDRESS: Federal Communication Commission, Washington, D.C. 20554.

Order; Proceeding Terminated

In the Matter of Amendment of the Amateur Radio Service Rules, Part 97, to make additional frequencies available for repeater operation. PR Docket No. 83-485; RM-4231.

Adopted: October 31, 1983.
Released: November 2, 1983.
By the Commission.

1. On May 12, 1983, the Commission adopted a Notice of Proposed Rule Making (48 FR 24954; June 3, 1983) proposing to amend the Amateur Radio Service Rules to authorize the frequencies between 29.0 and 29.5 MHz for repeater operation. Current frequencies available for repeater operation in the 10 meter band are between 29.5 and 29.7 MHz. Comments in the proceeding were due July 25, 1983, and reply comments were due August 24, 1983.

2. The Commission's proposal stemmed from a petition for rule making (RM-4231), filed October 13, 1982, by Beryl Gosney of Oak Harbor, Washington. Mr. Gosney requested that frequencies in the 10 meter band now available for repeater operation be expanded to include frequencies between 29.0 and 29.5 MHz. In his petition, Mr. Gosney said that the present number of 10 meter band frequencies was inadequate and that severe frequency congestion was taking place. He attributed the congestion to the recent increase in FM communications that has taken place on 10 meters, but offered no data to support his claim. In our proposal, we noted that there might be merit in the petitioner's request and invited comments on the need for additional repeater frequencies. We also asked for comments on the impact that additional 10 meter frequencies would have on present and future repeater and non-repeater operations.

3. Commentors in favor of the proposal said there was a great need for the additional repeater frequencies. For example, the Southern California Repeater and Remote Base Association (SCRRBA) said that it was unable to coordinate additional repeaters, even though there are operators in that area who want to construct and operate new stations. SCRRBA acknowledged that there are satellite operations in the 29.3–29.5 MHz portion of the 10 meter band, but anticipated that sharing arrangements with Amateur-Satellite Service users could be worked out within the amateur community. Carl E. Bollinger stated that there is a great need for these additional frequency allocations on FM. According to Mr. Bollinger, under favorable propagation conditions, there is extreme crowding and interference on both the repeater and simplex frequencies.

4. Commentors opposed to the proposal mentioned the disruption that would occur to amateur satellite communications if repeaters were permitted between 29.3 MHz and 29.5 MHz. The Radio Amateur Satellite Corporation (AMSAT) said that FM repeater operation in that frequency segment would worsen an already difficult situation. The American Radio Relay League, Inc. (ARRL) concurred. In addition, the ARRL said it had no evidence of overcrowding in the existing 10-meter repeater subband. The ARRL noted that its latest Repeater Directory listed only 43 repeaters in the 10 meter band for the entire United States, and only one repeater in the State of Washington, where the petitioner resides.

5. After considering the comments on both sides of the issue of additional 10 meter repeater frequencies, we are persuaded, for two reasons, that we should terminate this proceeding without adopting the proposed rules. First, providing additional repeater frequencies in the 10 meter band would have an adverse effect on amateur satellite communications, including beacon transmissions, robot operations, telemetry signals and transponder downlinks. Second, we conclude that there is no compelling need for repeater subband expansion in the 10 meter band at this time. Comments referring to congestion on repeater frequencies appear to represent local conditions. Amateur satellite communications, on the other hand, transcend local areas. Hence, the adverse impact on amateur satellite communications that would occur if the subband were expanded, outweighs any frequency congestion that local repeaters may be experiencing.

6. In view of the foregoing, it is ordered, That the petition of Beryl Gosney, RM-4231, is denied.

7. It is further ordered, That this proceeding IS TERMINATED.

8. Information in this matter may be obtained by contacting Maurice J. DePont (202) 632-4964, Private Radio Bureau, Federal Communications Commission, Washington, D.C. 20554.

Federal Communications Commission.
William J. Tricarico,
Secretary.

Cedarhurst NY 11516

I have a tendency to get carried away. When someone asks me what is thought to be a simple question, that person is usually sorry he asked; I tend to give lengthy replies. This was the case the other day when a friend asked me about a certain programming technique.

My friend was working on a net-control management program and wanted to know how to have a "first-in-first-out" sequence for the data. Obviously, after the check-ins are noted, the net control must respond to them in the order that they checked in. One solution is to store the check-ins in an array. This, however, presents a number of problems. One must know the maximum number of check-ins that can "pile up" before the net control can get to them. Also, there is the problem of how to handle the situation where a new station checks in before all the previous check-ins have been taken care of—if the first check-in of the initial group is in array element #1, the only way would be to move all the other elements up one space. Clearly this is a waste of time; on a microcomputer with a slow Basic, this can take a few seconds.

Since we were discussing programming languages last month, I'll use this problem to show how a programming problem that is hard to code in Basic is almost trivial in a different language.

Programming Language

A number of years ago, a committee from IBM decided to invent a new programming language (well, maybe the decision was made and then the committee was formed, but let's not pick nits). After a long period of heated debates, they came up with PL/I. This language took the best features of FORTRAN, COBOL, and ALGOL as well as a bunch of other stuff never before seen in a programming language and integrated them into one huge language. In its present form (PL/I-F), it includes practically every feature one can imagine: concurrent subroutines, exception processing, modular programming, and the ability to communicate with other languages. There are even forms of the language that will try to correct syntax errors.

The problem with PL/I was that is was *too* big. In order to deal with this, another committee (ANSI) sat down and removed all the redundant and seldom-used features of the language and produced PL/I subset G. This was done primarily to meet the needs of minicomputer users. When subset G was designed, memory pieces were still high and minicomputers didn't have much more memory than some of today's microcomputers.

It wasn't long before some other committee decided to trim some more fat off PL/I and make it fit on microcomputers. This was done by Digital Research (the company that markets CP/M) in 1980. Their product was called PL/I-80 (the 80 refers to the fact that it runs on an 8080 or Z-80 based computer). Because I am a PL/I fanatic, I obtained a copy of PL/I-80 as soon as it came out and have had a love/hate relationship with it ever since.

The "love" is because I feel it is one of the best microcomputer languages around. The "hate" is because of the subtle differences between PL/I-80 and "real" PL/I. I have a great deal of difficulty transferring programs between PL/I-80 and DEC PL/I, even though both are called "subset G." Still, I have no reservations recommending PL/I-80. It is available for any system that can run CP/M-80 (even Apple computers with a Z-80 card).

Queues

The way to handle the "first-in-first-out" net-control problem is with the data structure know as a "queue." A queue simply means a line, and this provides a useful analogy. When one goes to see a movie, one generally waits in a line. New people can only enter the line from the rear (we'll assume we live in a perfect world and nobody cuts), and a person can only get off the line from the front. This is exactly the type of organization we need for the net-control program—new check-ins get on the rear of the line while the net control handles the people on the front of the line.

Listing 1 shows the PL/I program to handle this. It allocates blocks of memory, called "nodes," for each person who checks in. Associated with each node is a pointer called "next" which points to the next person on line. There are also two other pointers called "front" and "rear" which point to the front and rear of the queue. Subroutines are provided to add a new node at the rear of the queue, to remove a node from the front of the queue, and to see if the queue is empty. Following is a line-by-line description of the program.

Line 1 is the standard way to begin a PL/I program. This identifies the program name as QUEUE and tells the computer that this is the main program, as opposed to a subprogram.

The form of each node is specified with lines 8 through 9. The DCL stands for "declare." Each node is to consist of an 8-character callsign field and a pointer to the next node. Note that this declaration does not actually reserve any memory for the node. It simply serves as a template to indicate the structure of each node. Line 7 says "BASED (Q)." This specifies that the variable Q will be used to hold the memory address of the queue's location.

Other variables that will be used in the program are specified in lines 12 through 16. Line 12 means that Q is a "pointer" variable; it is used to hold a memory address. The declaration in line 13 tells the computer to reserve 8 memory locations for character data and reference this location by the name "INFO." A "fixed" variable (line 14) can contain integer data between the values of −32768 to +32767. Finally, the variables that will hold the addresses for the front and rear of the queue are specified in line 16.

PL/I programs are generally divided into smaller units called "procedures." These are similar to Basic subroutines. The procedures or subroutines for this program start at line 18. The first one is called INIT-QUEUE. All this does is initialize the queue; the pointers to either end of the queue are set equal to NULL, which is a built-in system variable used to indicate an invalid memory location. The queue can be checked to see if it is empty by determining if the pointer is equal to this null value.

We start to get to the more interesting part of the program at line 23. This procedure, called ADD-REAR, is used to add a new callsign to the end of the queue. The ALLOCATE statement (line 26) reserves enough memory for one node and sets the variable Q equal to the address of this

Listing 1. This program demonstrates the use of a queue for a net-control management problem.

75:       PUT SKIP LIST (INFO);
76:      END;
77:     END;
78:   END MAINLP;
79:  END QUEUE;
```

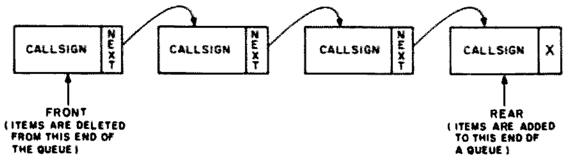

Fig. 1. What a queue looks like. Each rectangle represents a node.

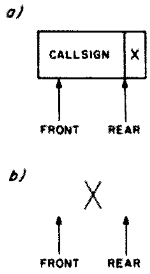

Fig. 2. (a) A queue containing only one node. (b) A queue containing no nodes and both front and rear point to NULL, represented here with an X.

memory. It then takes the callsign field of the node and inserts the proper information into it. The node is then linked to the rest of the chain of nodes by taking the "next" field of the existing rear node and setting it equal to the address of the new rear node. The value of the REAR variable is then updated to reflect this change. (See Fig. 1 for a diagram of what queue looks like.)

The other operation we need, that of removing a callsign from the front of the queue, starts at line 36. If the queue is empty, this subroutine prints an error message. If not, it removes the front element of the queue and saves the callsign information. The FRONT variable is then updated to point to the next element on the list (line 45), and the old FRONT node is discarded (line 47). The statement on line 47 frees the memory that was used for the node so that it can be used again. It would be helpful to think of memory as being a pool of nodes; the ALLOCATE statement takes a node from the pool, and the FREE statement dumps a node back into the pool.

In order to see if the queue is empty, the procedure starting at line 52 checks to see if the FRONT pointer is equal to the null value. An empty queue is shown in Fig. 2(b). Both the front and rear pointers point to the null value, represented by an "X". Also, note that a queue can have one element—Fig. 2(a). In this case, the front and rear pointers both point to the same element.

The main program starts at line 56. After the queue is initialized, it gives the user a choice of adding a call to the end of the list or removing a call from the front of it. If option 1 is selected, the program asks for the callsign and calls the ADD-REAR procedure. If option 2 is selected, the program calls the REMOVE-FRONT procedure and prints the callsign on the display. See Listing 2 for a printout of a program run.

Obviously, this is far from being a complete net-management program. After the check-ins are acknowledged, it would be useful to put them on another form of a list. A circular list might be a useful structure to use. This can be created by having a queue where the rear element points to the front element. With the calls in a circle, one can keep going around the list, thus periodically seeing if the stations are still there.

As you can see, PL/I is very different from Basic. The block structure of a PL/I program, as well as the ability to declare structures of data and refer to them by addresses (pointers), makes it easier to use for many programming projects. It does, however, have its disadvantages. The programs have to be compiled and linked before they can be executed—a process that can sometimes take up to two minutes, depending on the speed of the disk drives and the length of the program. If there is an error in the program, it has to be fixed using a text editor and recompiled before it can be run. This can be a slow process. However, it does encourage a programmer to get his program logic worked out *before* he starts to write the program; the user of an interpreted language is often tempted to work out the program logic as he is writing it!

Next month, I'll go into some other languages. It is hoped that this will provide you with an adequate sample of the various languages available for microcomputer users and will be helpful when you are deciding which language compiler to buy.

LETTERS

FRESH AIR

Just picked up the November issue of *73* and I couldn't help but comment on a letter sent you by the gentleman who has refused for over fifty years to have his mind "cluttered . . . with code just to pass some test."

I can certainly remember the challenge I had as a youngster of twelve in earning that General ticket. The difficulty at the time, though, was understanding that electronic theory. As I recall, I couldn't quite understand why I was required to know all that theory when an understanding of telecommunications operation should suffice.

Fortunately, for some, the FCC has provided a portion of the radio spectrum for those of us who have not the inclination to clutter our minds with code or theory. Ten-four, good buddy?

Thanks for a refreshing breath of fresh air called *73* and best wishes for another prosperous year.

CBer claims to hear voice from space

By David Foster
STANDARD-TIMES STAFF WRITER

ACUSHNET — John Worthington was driving down Route 24 in Raynham Saturday night when his citizens band radio suddenly crackled with what seemed to be the voice of orbiting Spacelab Commander John Young.

Officials at Space Center in Houston were doubtful today that the conversation could have taken place, but said they would "check it out."

Worthington, of 339 Main St., said he talked to Young, who is orbiting the Earth in the space shuttle Columbia, for about a minute at 9:47 p.m. Saturday.

He recalled the voice as saying, "Spaceship Colombia, we are currently entering the east coast of the United States, broadcasting on 27.4 meghertz, channel 19. Does anyone between the states of New Jersey, New York, Connecticut and Massachusetts have the copy on us?"

Worthington, 44, a garage supervisor for The Standard-Times, said he acknowledge the transmission, but got no response at first. Young rebroadcast the entire message, and Worthington repeated his response, Worthington said today.

"At that point, he received me loud and clear. He asked me for my location, my call letters, which I gave him."

They conversed briefly, he said.

"He tried to get back to me again, but he started to fade out," Worthington said. "He said, 'Traveling at 12,000 miles an hour, I guess it's impossible for us to carry on a very long conversation.' And then he was gone."

"The thrill went down my spine like you wouldn't believe. You can dial the phone any time you want, but how often can you call outer space?" Worthington said.

A NASA spokesman said the agency couldn't be sure that Young didn't talk to Worthington, but said they would check it out. A spokesman for the American Radio Relay League, which represents ham radio operators, said it was impossible for a CB radio operator to talk to Spacelab.

"There's just simply no way," said Wayne Yoshida, from the league's office at Space Center.

Yoshida said ham operators are communicating with Spacelab, but that is on a completely different frequency.

For his part, Worthington is "99.9 percent sure" it was Young he talked to, and not an earth-bound hoaxer. "Hey, who can tell anything? I just know that if it was a ground station, he wouldn't have faded out."

Worthington said he plans to write a letter to Young to confirm the conversation.

CUCKOO'S NEST

I have hesitated to write this until both my blood pressure and NASA STS-9 were back to ground level. Many of us, including yours truly, were shocked, discouraged, and dismayed by the operational procedures of some hams during Owen Garriott's history-making flight aboard the *Columbia*.

Though there had been months of preparation regarding the operating frequencies to be used by Garriott and earthbound stations, dozens of hams insisted on calling W5LFL on his dedicated transmit frequency. As if that wasn't bad enough, all of the self-appointed "policemen" monitoring 145.55 MHz got on to chastise the offenders. All of which resulted in chaos on the frequency.

Some of the language heard during this period was downright embarrassing to listeners, both hams and SWLs. I heard of one ham who had gathered some non-ham friends around his rig in hopes that they would hear W5LFL on one of his passes. Instead he was embarrassed to hear language and behavior which would make channel 19 seem tame.

I, for one, am totally disgusted with the level of operation on the ham bands and on 2 meters in particular. It seems that we traded in our common sense, self-respect and basic intelligence when we received our ham licenses at the FCC office.

Maybe it is my past training in the US Army Signal Corps which causes me to be extra sensitive to careless operation. I was taught that if you don't know how to oper

ate your equipment properly on the correct frequency, you don't operate. Also, if you don't have anything intelligent to say, you maintain radio silence.

Now, don't go saying that I'm dragging the ham community down in the mud. There are thousands of dedicated men and women on the bands that do operate in a sensible fashion. To those people, I tip my hat!

Let's keep the bands free of the cuckoos. Maybe next time Owen flies over, he'll find more ham-ers than jammers.

Bill Shaughnessy KB1DY

GRENADA CONNECTION

Wednesday, October 26, *The Boston Globe* front-page headline read: "US-Led Forces In Grenada...Two GIs Dead, 23 Wounded." *The Herald*, Boston's second daily paper, had this headline: "Two US Troops Die In Swoop on Grenada."

The news media was "tongue-tied!" No reporters were allowed on the island so nothing was coming out, and to prove it, both papers carried almost identical headlines. This is by no means a vendetta against the press, but throughout the years, with all the great technical advancements, the ham-radio operator is still the front line of communications to the outside world when a crisis breaks.

The key to the entire situation was the safety of the one thousand or more American students attending the two medical colleges on the island, St. George's and the American Medical School.

My vigil began on the 25th when I monitored an emergency frequency, 14.302 MHz, designated by the FCC to handle health and welfare traffic. The True Blue Campus at St. George's was the "hot spot" for the four pieces of traffic I received from concerned parents, which I passed to net control.

The following morning, 26 October, at 1245 zulu (8:45 am EDST), things began to really pop. Still monitoring the same emergency frequency, I could feel the crescendo building as more and more people became involved, when suddenly I heard an almost whispered message: "QSY to 350.9, QSL?" Roger. The point 9 caught my curiosity. That's a no-no; it's outside the regular band. Something must be cooking. Although I wasn't invited, I followed the two mysterious hams to their clandestine rendezvous. Bingo! I hit pay dirt.

"This frequency is operating by the authority of the FCC and the use of this frequency by any persons other than those designated by the FCC is prohibited and risks the penalties of illegal operations." This warning was repeated throughout the day.

I was not permitted to transmit on this frequency, but there is no law saying I cannot tape the information that was being passed between those who had the authority.

Mark KA2ORK was the Grenada connection. He was a student at the American Medical School and he did a tremendous job. Cool, absolutely cool. Hour after hour he went on handling all kinds of traffic: "The Marine Commandant is aware that your food and water supply is running low," "the four students you were concerned about who live off campus were contacted and are OK," "we received, though we think it's corny, from the State Department, 'Cavalry is coming up through the Canyon'—we will pass it along anyhow."

My tape recorder was getting "red hot," so I called the ABC TV affiliate station for the Boston area and played a short blast for the news manager. Within twenty-five minutes, 1505 zulu (11:05 EDST), one of their top reporters and a two-time Pulitzer-Prize-winning photographer were sitting in my shack, glued to my receiver and tape recorder. Mark was really feeding us like a gang of kids waiting for the ice-cream man!

There was a phone patch between John Copycinski, a staff member at St. George's Medical School, and his wife, Rose, in Newark, New Jersey, coming over the air while the lights and camera were being set up in the shack. "Hi, honey, I am doing fine and everyone here is doing a great job. I'm coming home soon. Right now we are waiting for the Marines to land on the beach and there has been some fighting. All the students are safe and OK. They will probably evacuate us soon. Don't you worry, now. Give that little Polish princess, Stephanie, a great big kiss for me. Don't worry, you will soon see my smiling face coming through the door. I love you and miss you. Over."

During their three-hour stint, Jim Boyd, the reporter, kept in close touch with his station, while Stanley Foreman did his lights, action, and camera bit, including a one-on-one interview between Jim and me.

All of which resulted in a five-minute lead-in segment on their TV station (Channel 5) 6:00 pm news program. I was told the President of the US does not get that kind of coverage.

The Boston Herald asked for my tapes and did a two-column story on the following morning. And local radio station WEEI called and did a phone interview with me.

So, the hams were "cooking" while the media was "stewing." Thank you very much, Mark Barettella KA2ORK of Ridgefield, New Jersey, my Grenada connection. 73.

MASSACHUSETTS GOVERNOR PROCLAIMS HAM RADIO WEEK

Declaring that hams all over the world are always in the front lines of communications during every crisis (Grenada) as well as devote themselves daily to the safety, health, and welfare of the general public, Massachusetts Governor Michael S. Dukakis signed a proclamation designating November 7-12 as Ham Radio Week.

Shown (left to right) are Dick Lindzen KA1SA, Irv Geller K1ON, Bill Sidell WA1HXO, Paul Dumais W1LJO, Tony Ruggelo K1CET, and Neal Lipson K1NDF, all members of the Middlesex Radio Club of Newton, Massachusetts.

QTH SWAP

During the period between the beginning of July and the end of October, 1984, my wife and I intended to revisit the western states of the USA which we toured extensively in 1981. On this occasion, however, we would like to exchange our home, car, and station for a period of about three months with a ham living somewhere not too far from the west coast of the US. What we would like from the exchange would be the use of a modest but well and suitably equipped motor home to permit touring around the western states.

The Isle of Man is a very beautiful island which is green and lush at all seasons. It is unspoilt by industrial developments with a much slower pace to life than on the English mainland. We do not, however, achieve southern California temperatures, even in high summer, being nowhere more than six or seven miles from the sea.

I would like to hear from anyone interested in the above offer of an exchange of QTHs, and of course will reply to all who may wish to enter into further detailed discussion.

W2NSD/1
NEVER SAY DIE
editorial by Wayne Green

from page 6

Some would key the rig, most wouldn't. None would both key and modulate. Eventually I found the KLM mike—worked fine, once I'd found it. Now why is it so difficult to have some standardization on mike connectors? Come *ON*, you manufacturers.

Okay. Receive on 145.55—no problem. I decided to use the tunable vfo for the receiver and the synthesizer for transmitting so I could switch between 144.91-.93-.95-.97-.99- 145.01-.03-.05-.07-.09 quickly. My HT on 145.55 zeroed in the receiver and I was ready to roll.

The rig seemed to be working fine, with all sorts of guys chirping in on the .55 channel before the expected orbit, complete with others telling 'em to get the hell off the downlink channel and others testily demanding call-letter identification by everyone breaking in. The usual crapola.

About five minutes before the orbit, the uplink channels began to fill with callers. It sounded just like a DX pileup on 20m. I checked all of the ten uplink channels and found all ten piled high with signals. Having operated from planes many times over the years, I doubt if LFL could sort anything out of that mess. Even at two or three miles up, the channels turn to garbage as several stations try to use the channel at once.

Some ops, confused by the complexity of having to transmit on one channel and receive on another, got the two mixed up, filling the uplink channel much of the time with alternating calls and put-downs. I don't know if anyone else waited to hear LFL before calling (it didn't sound like it on the uplink channels), but I held my peace, waiting to hear if *Columbia* was even going to be on on this orbit. Silence from above.

The chorus kept up for the twenty minutes of the orbit, plus about five minutes on either end just in case. What a jungle.

1984 *CALLBOOK*

Despite the ARRL trying to put the venerable *Callbook* out of business, the new edition came out. I don't know why the *Callbook* seems to be so much more up to date than the ARRL version, but it sure does. At any rate, the 1984 *Callbooks* arrived ($19 each for the US and foreign editions), so after making sure that I am still alive, I checked out the US ham census figures to see how many new hams we have.

It's easy to see why most of the ham dealers have gone broke and why we have so few American ham manufacturers these days—hardly any new hams. The overall increase was about 2.6% over 1983—pitiful. Novices are up 9.4% this year. Techs are up 0.5%. Generals are down 0.7%. Advanceds are up 1.3%. Extra class is up 7.2%. That's awful!

In the heyday of amateur radio (1946-63), we grew at 11% per year steadily. Since 1963, the average growth has been the same as this last year—2.6%—and that's for twenty years now. Indeed, if we had not stopped our growth short in 1963, we would today have over two million US hams—just double the Japanese ham population, which makes sense when you figure that they have almost exactly half our total population.

Would we have lost one after another of our consumer electronics industries if we'd kept up supplying our country with career high-tech people via amateur radio? I think not. I've written about this for several years now, but I haven't seen any signs of anyone really giving a damn. I am bringing it up again because I've seen some magazines poo-pooing this with claims that we're back into a much higher ham growth. Well, we aren't. Nothing has been done to improve matters yet.

FOREIGN HAM SUBSCRIPTIONS

A couple months ago, I wrote mentioning that many hams in many foreign countries have currency restrictions which make it almost impossible for them to get *73*. Hundreds of readers have been kind enough to send in gift subscriptions to help these DX hams and I've been getting copies of the letters of thanks which have been forthcoming. It's almost sad to see how appreciative these lucky chaps are of your thoughtfulness. Try it and see for yourself. The regular DX subscription is $45, but if you send $25, I'll go the other $20 and we'll let more DX hams know that we Americans are the good guys.

73 INTERNATIONAL

from page 78

lot of customers. Waiting for the pileup, I told Bill it was my birthday (40 years). I spent the following two hours receiving reports and greetings. When the propagation changed, I turned the beam to Europe and received reports of 20 over S9. It was really a nice present. Friends from my home QTH told me that the XYL was listening to my transmitting frequency and that she was passing a lot of 68. When I went back, she told me she will apply for a license to be able to talk to me when I am away.

In fact, our group is planning other expeditions for next year, and you can bet they will be to some of the top-wanted DX countries. For the moment we do not intend to give more details; in these days it's very easy to hear people saying they are planning to go here and there, to listen for them next week from the moon, but nothing comes out of it! We will advise all DX bulletins a few weeks in advance, but only if everything will be 100% sure. But let's go back to Taiwan.

We did not work too much during the nights as the bands were dead and we had no authorization to operate on 40 and 80, but I spent some time listening and can give you assurance that it will be no problem to work BV from W6; even with the 12AVQ I was in the position to copy W6 on 40 and 80. It was evident that JA signals were well above S9 and VK/ZL on a 5 level.

The propagation from BV was not too good during our stay. We had only two good openings on 20 and three on 15. More or less the same situation for Europe, but with longer opportunities. In total we had 3329 contacts on SSB and 2050 on CW. 341 stations worked on 20 meters from US SSB, 317 on 15, 138 on 20 CW, and 201 on 15 CW. All this thanks to the beautiful job done by Tim and his group. Without their help and assistance, it would not have been possible to do anything.

Apart from the radio activity, we had the opportunity to visit Taiwan and spend some time with the local people. Taiwan is a 13,800-square-mile island with a subtropical climate situated 700 miles south of Japan and 100 miles from the mainland. The standard of living is very high and the number of cars, television sets, and air conditioners is unbelievable.

The philosophy of Chinese hospitality is based on what Confucius said 2500 years ago: "There is no pleasure to surpass the greeting of friends coming from afar." I can assure you that this is still valid. We had the opportunity to meet the local authorities, including directors of the Ministry of Communications and others, and had a wonderful party organized for us by the CRA.

It is difficult for me to express my feelings in a language that is not mine; it's difficult even in Italian! I can only repeat a few words Tim said to me when we left: "It is the end of a short adventure, my friend; it can be the start of a long friendship. Long life to you my friend."

Thank you, Tim!

de I2MQP

Left to right, I2MQP, BV2A/B, I2BVS, and I2NYN.

The party: I2MQP and I2BVS (standing) present an honorary membership on the DX Blue Team to Tim Chen BV2A/B. On the left of I2MQP is Mr. Pong, Deputy Director, Ministry of Telecom.

LIBERIA

Brother "Don" Donard Steffes, C.S.C.
EL2AL/WB8HFY
Brothers of the Holy Cross
St. Patrick High School
Monrovia
Republic of Liberia

Amateurs around the world are helping the lepers in Liberia. In the August, 1983, issue of *73*, the Liberia column gave in some detail the effort of the amateurs of Liberia to come to the help of the lepers at Ganta. The response to their "A8" special prefix (this is Echo-Lima-land) has been one-hundred-percent positive. Even beyond that, many of the amateurs volunteer the comment that they are happy some of their numbers are involved in a project that is so worthwhile.

At the date of this writing (11/23/83), the Ganta Leprosy Center has received a total of $2,243.02 from the contributions of amateurs in various parts of the world, and even as these funds were coming in, two of the mud huts in which the lepers are living literally collapsed. They are being rebuilt with the money received from the amateurs, and without that money there would probably have been no rebuilding at this time. There is another month of "Alpha 8 calling," and we hope that during this time we can do better.

Presently, the Center is directed by Dr. (Sister) M. Chambers, who is assisted by Theresa Hicks (a religious of another order). In the area of medicines, they are funded by the German Leprosy Relief Association and the government of Liberia. They have four hundred and forty patients. One hundred twenty of these patients are totally dependent, another one hundred twenty are ambulatory, and two hundred are outpatients (off campus).

There is a new medication in use in the form of Rifampicin capsules. With Dapsone daily and Rifampicin monthly, non-infectious leprosy can be cured in six months. Infectious leprosy can be cured in two years with Dapsone administered daily, Lamprene three times per week, and Rifampicin monthly. With the previous medicines, the cure took up to five years.

The immediate need at the Center is funding for new houses. Those presently in use are so dilapidated that large pieces of wall and or roof are breaking loose and falling down in rough weather. The mud in the walls has become washed out so that the walls are porous and house bugs and rodents. The remaining part of the story is not pleasant even to think about. In other areas, there is always need of bandaging, gauze dressings, medical adhesive tape, and cotton wool.

When the amateurs of Liberia began this project, they had visions of making sixty-thousand contacts, and with a small contribution from only a majority of these contacts, the houses could have been built. As it works out, it is evident that such a goal was a bit ambitious. On the other hand, a few of the amateurs contacted made sizeable contributions and a few others have taken upon themselves the job of doing a little fund-raising of their own and have then sent in the money. As a result, the total at this date is not unmeaningful.

Reports are now coming in from people who have received the Alpha 8 QSL card, and they are very pleased. The word is that the card is oversize, that it has pictures, and that it is very beautifully done. We, here in Monrovia, have not seen the card yet, but we are gratified to know that they are being received and that they are a bit more than the ordinary.

Should anyone wish to contact the Leprosy Control Center directly, address: Dr. Margaret Chambers, Ganta Leprosy Center, Box 1010, Monrovia, Liberia, West Africa.

For me, personally, this program has been a grand experience. Aside from the fact that we are helping the lepers, I have a new appreciation of amateur radio and its amateurs. The response from all over the world has been positive and courteous. I have received nothing but praise and good wishes. The greater the need or the greater the emergency, the more sure you can be that the amateurs will be there.

MONROVIA'S NEW REPEATER

Big news! The brand-new (second-hand and rebuilt) repeater is twenty Watts. With a good antenna location, it should cover the city of Monrovia and we, the local amateurs, should have HT communications over the greater part of the city!

That part is all true and it is fine, but what about the amateurs who do not live in greater Monrovia? The situation in Liberia is different from that in the States. In the States, there are many repeaters and amateur operators have a wide choice. They even have scanners. More important than that, they have other types of communications available. Here in Liberia, amateurs who find themselves in outlying areas are almost totally dependent on their radio.

Until now, there has been one repeater in operation. It is at Bong Mines, which is an excellent location. They have skilled technicians who maintain it and make changes when it is necessary. It covers most of Liberia, but when an amateur finds hmself 120 miles "up country," he has problems and cannot always make the repeater. For a very interesting story concerning this situation, read the Liberia column and the story of Mark H. Munson, M.D., EL5G, *73*, September, 1983.

Monrovia itself is about 65 miles from the Bong Mines repeater, so the little HT has a bit more than it can handle, and even home sets with their higher power and better antennas will not make the repeater unless everything is working well. The new Monrovia repeater will solve this

problem nicely. While we are solving our problem, we are, however, cutting out the amateurs outside.

Can our repeaters be made to talk to each other? The experts around here say "yes." In view of the fact that there will be only two repeaters in Liberia, they expect no interference and they think it can be done. No one has presented a feasible plan yet, although it must be added that until now the question has been quite remote.

Whatever happens it is evident that we will either find a way or go back to the one-repeater operation. We cannot cut out our amateur friends on the outside.

THE NETHERLANDS

The Netherlands

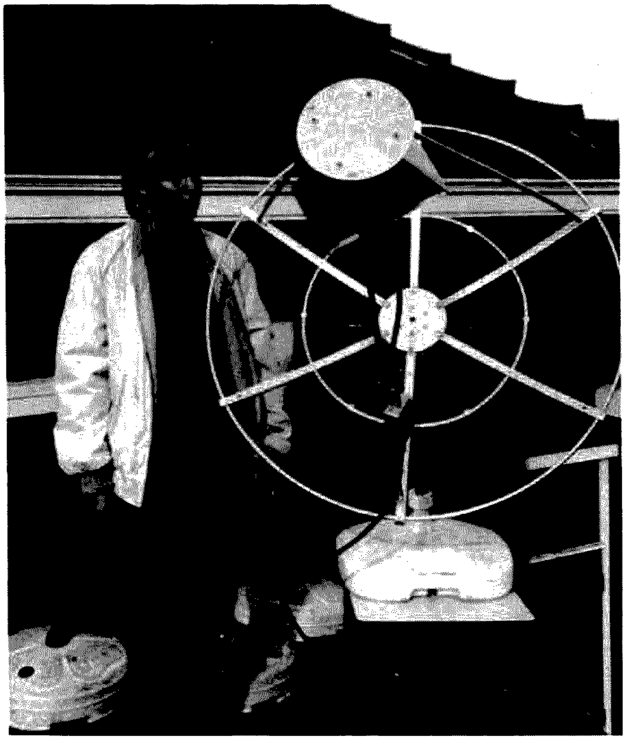
B.A.W. Aries PA3BWQ
Schuberthof 3
2742 BT Waddinxveen
Holland

Finally, after several weeks of postal and transport strikes over the whole country, I am able to write another column for *73*. Everybody is relieved that life has taken its normal way again. It was impossible to send a letter or a parcel to someone; also, the national finance was completely out of order.

Nevertheless, we had some extremely good conditions this season on VHF. Some hams worked as far away as Iceland on two meters with FM mode and simple beam antennas. Yours truly had to miss all of the fun because of a serious antenna breakdown.

Last year, the youngest of our three Dutch Radiosocieties, the NCV, celebrated 10 years of existence with a party for all members. There also was held an open day for the public, during which they were active with their club station, P14HLM, on HF, CW on all bands. A complete amateur TV station on 70 cm also was on the air, which made contact with a mobile ATV station.

The mobile unit made some stops to give some demonstrations to the public. Furthermore, they had an operational weather-satellite station receiving Meteosat 2 (1.6 GHz). A dish was placed on the roof of the club building with a converter from 1.6 GHz to 137 MHz. To get a satellite picture on a monitor, an FX-655 Vraase Fax memory unit was used.



PD0DDV's YL and the antenna used to receive Meteosat II.

SIX METERS IN HOLLAND

Although 50 MHz is not an amateur band in Holland, there are a few amateurs with a special license who operate on that band. They are allowed to do experimental transmissions on the following frequencies: 53.875 MHz, 53.925 MHz, and 53.975 MHz in CW only. The maximum power they use is 25 Watts. Many hams hope that this band will become a ham band in the future, although the license conditions are not very clear. There are some rumors that it will be assigned to the land mobile service, so let's keep our fingers crossed.

I'd like to end this column by writing about the Veron PACC (PA Century Club) Award. To earn this well-known Dutch award, you have to work at least 100 different Dutch amateur stations and have proof of it by means of a QSL card or another written confirmation. Only contacts made after the first of June, 1945, are valid for this award. There are stamps available for 200 to 900 different worked stations, so the certificate can be expanded in the future when you work more Dutch stations.

de PD0DDV

UIVER MEMORIAL AWARD

It is fifty years ago that the legendary London-Melbourne Race, organized by the Australian chocolate manufacturer McPherson Robertson was held. KLM Royal Dutch Airlines participated in that race with the then brand-new, all-metal, low-wing standard airliner Douglas DC-2 in a field of other aircraft mainly built for speed. This famous aircraft, named *Uiver* (stork), won the first prize in the handicap section and came in second in the speed section. Most remarkable was the fact that KLM conducted this flight as if it were a regular airline flight, carrying three paying passengers in all possible comfort and some 500 pounds of mail.

To commemorate this famous event, the Netherlands Broadcasting Corporation NOS conceived the idea to make a documentary of this flight which will be shown serially on television in October, 1984, the month in which the Melbourne Race took place 50 years ago. The idea was born to have this flight repeated, not with a modern Boeing 747 airliner, but with a Douglas DC-2. The apparently last airworthy DC-2 in the world was found in the United States, bearing registration NC39165 and owned by Colgate W. Darden.

The total costs for the entire *Uiver* project, including the film production, are tremendous, and in order to raise these costs, the *Uiver* Memorial Foundation was established. The funds for the commemoration flight were sought from major sponsors and the public.

The aircraft arrived at Schiphol and was given the new equipment necessary to conduct the flight in the modern aviation world. The aircraft carried exactly the same paint scheme, registration PH-AJU, name *Uiver*, and contest number 44 as the original aircraft. The flight schedule took this aircraft across a route from Amsterdam to Melbourne as close as possible to the route followed by the *Uiver* in 1934. That flight took 90 hours, 17 minutes, but the memorial flight lasted from December, 1983, until February, 1984.

Amongst Dutch radio amateurs, it was suggested that an award could be issued, and profits gained by the issuance of this award could be made available to the Foundation as a contribution of radio amateurs to this event.

the Radio Inspectors Branch in each of the 17 Post Office Engineering Districts throughout the country.

The Novice license is available for one year *only*. It cannot be renewed, only upgraded. The basic requirements to pass the Novice exam are:

- a simple written examination in elementary principles of electricity and radio communications,
- a written examination on the Radio Regulations as they pertain to the Amateur Service, and
- a Morse test, sending and receiving 6 words a minute of each for 3 minutes; the receiving test has to be written.

A full pass in all three sections above entitles the Novice (callsigns with the first suffix letter N, e.g., NAA, NAB, etc.) to operate CW and AM, including SSB, on the bands 3525-3575 kHz and 28.10-28.60 MHz, with the restricted power of 10 W input to the final stage.

The next level, the Grade III license, requires a written paper on the theory of electricity and radio communications as well as the paper on Radio Regulations, but no Morse test. The Grade III licensee may operate on all amateur bands above 51 MHz only, on all modes except CW. The callsign issued to a Grade III licensee has the first suffix letter a T or U, identifying him as a VHF operator.

To progress to Grade II, the Grade III operator needs only to pass a Morse test, both sending and receiving, at 12 wpm, each for 3 minutes, the receiving test to be written. A pass to Grade II brings the allocation of a full callsign, either a two-letter (if one is available) or a three-letter one, which the amateur will hold for life whilst licensed within ZL. Previously, ZL amateurs changed callsigns when they changed their residential address to another ZL District, e.g., 1, 2, 3, or 4. But since 1980, callsigns have been allotted on a life basis, and as long as the amateur pays the license fee, no matter where he resides, he retains the original call issued. The only requirement is to notify the regulatory body of any change of address.

The Grade II operator is entitled to operate on the bands 1800-1950 kHz, 3.5-3.9 MHz, 28-29 MHz, 50-51.15 MHz, and all bands above 51 MHz, on all modes, CW included on the VHF bands.

Grade I is the top grade of amateur license in ZL; to obtain this license, it is necessary for the Grade II operator to have operated on the 3.5-3.9-MHz band under a Grade II license for a period of 12 months and to have had more than 50 contacts on that band. In addition to the operating qualification, it is necessary to show, by a further Morse test, that he/she is still capable of sending and receiving 12 wpm under the same test conditions as before. Applicants satisfying these requirements are granted a Grade I Certificate which entitles them to operate all bands and all modes allocated to ZL amateurs.

The theory examinations are conducted by the New Zealand Post Office in various examination centers throughout the country, twice each year, on the first Wednesdays in March and September, between 1:30 pm and 4:30 pm. The Morse test can be arranged anytime during the year by making an appointment with the Radio Inspector's Office in your local area and paying the examination fee of $NZ6.00. The fee for the theory examinations are $NZ13.00.

VHF IN ZL-LAND

The VHF scene in ZL is very much alive. Amateurs are active in operating and experimentation on all bands, as can be seen from the ZL Amateur Radio Records Chart in the box. ZL amateurs are doing their thing with VHF/SHF experimentation; as can be seen from the Record Chart, ZLs hold at least three world records for three different frequencies. ZL VHFers are also active in satellite work, moonbounce, ATV, packet radio, etc., and many are members of AMSAT. I shall cover some of these special areas in another column.

Under the ZL licensing structure, there is a non-Morse license available as outlined previously in this column. These T calls, so-named after the first letter of the suffix of the original calls issued to non-Morse licensees, are able to operate the bands form 51 MHz upwards on all modes except CW. Approximately 33% of the ZL amateurs are T calls, and these, plus the VHF enthusiasts from Grade II and I operators, make the VHF fraternity quite large in comparison with the total amateur population in New Zealand.

The most popular of the VHF bands are 8m, 2m, and the fast-growing 70 cm; all the other VHF/SHF bands are attracting the VHF experimenters who are keen to see what can be built and operated on these higher bands. Six meters is, of course, the VHFer's DX band and has been made available only to the Grade III operators in recent years. Previously, they were confined to 2m upwards, but an amendment to the licensing structure a year or so ago enabled the Grade III licensee to use a small part of the 6m band also.

Two meters is very popular, there being a very efficient network of 2m repeaters throughout the country, giving excellent coverage for most areas. There are at present 30 repeaters in the North Island and 16 in the South Island, providing extensive coverage. The repeater offset is 600 kHz plus or minus, negative below 147 MHz and positive above 147.05 MHz. (See box for the 2m repeater and simplex frequencies.) ZL repeaters, unlike those in North America, do not have a CW identification or timers built into their installations.

70 cm is in its infancy in ZL. However, there are 6 repeaters in the North Island and 3 in the South, located mainly in the main metropolitan centers with a couple of exceptions. This frequency is becoming very popular where it is available and will spread further afield in due course (see box).

VHF beacons also are operated by the various clubs (Branches) throughout the country, ranging from three on 6m to two on 10.25 GHz and one on 24.20 GHz. In all, there are 32 VHF beacons, including one lonely 10m beacon on 28.230 MHz located at Upper Hutt, near Wellington.

Other VHF activities scattered through the year's program include VHF/SHF contests; 2m, 6m, and other specific frequency contests; VHF/SHF Field Days; VHF/SHF DX Weekends; and probably the highlight of the VHF year, the VHF Convention held on Easter weekend (in a different city each year, where VHF enthusiasts gather to "Nog and Nosh", dine and dance, socialize, attend technical lectures and demonstrations, participate in transmitter hunts (fox hunts) with various twists, e.g., blindfolded, pedestrian, talk-in, a Mobile Rally, various other social and VHF-associated activities, and, of course, the usual trade displays and the inevitable "Trading Tables." Last year's convention at Christchurch attracted VHFers from Cook Islands (ZK) in the North to Queenstown (ZL4) in the South.

This year's convention is at Auckland with the theme, "Space Communications"; it has a full program of technical lectures on the convention theme supported by working demonstrations and lectures on amateur satellite and moonbounce techniques, as well as the usual round of social activities.

BITS 'N' PIECES

More members of the ZL Old-Timers

AMATEUR RADIO RECORDS

March 1983

It is well known that amateur-radio operators can talk all over the world. However, there are amateur bands in the Very High Frequency (VHF) spectrum—above 30 MHz—which require special efforts to cover distances beyond the horizon. Also, the higher the frequency used, the more difficult communications become. The following are VHF records held by New Zealand amateur-radio operators. The callsign in parenthesis is the current callsign held, and /P indicates portable operation.

Band	Record	Stations	Date	Distance (km)
6 Meters (52-MHz band)	Overseas	ZL3NE to VE1AVX (Canada)	11/16/80	15,555
2 Meters (144-MHz band)	Internal	ZL2ARW/P to ZL1BJP/P	2/3/82	1,069
2 Meters (144-MHz band)	Overseas	ZL2HP to VK5BC (Australia)	12/23/65	3,195
2 Meters (144-MHz band)	Moonbounce	ZL1AZR (ZL2AZS) to SM7BAE (Sweden)	3/4/69	18,298 (World Record)
70 cm (432-MHz band)	Internal	ZL2ARW/P to ZL1BJP/P	2/3/82	1,069
70 cm (432-MHz band)	Overseas	ZL2TGZ to VK2RU (Australia)	2/8/82	2,480
70 cm (432-MHz band)	Moonbounce	ZL3AAD to DL9KR (West Germany)	3/23/80	18,630.9 (World Record)
70 cm (432-MHz band)	Television	ZL2TWS/P to ZL2ASF/P	1/31/82	373.1
23 cm (1296-MHz band)	Internal	ZL1THG/P to ZL2ARW/P	1/30/82	687
23 cm (1296-MHz band)	Overseas	ZL1AVZ to VK2BDN (Australia)	2/9/82	2,131
12.5 cm (2300-MHz band)	Internal	ZL1THG/P to ZL2ARW/P	1/31/82	687
9 cm (3300-MHz band)	Internal	ZL2AQE/P to ZL2ARW/P	3/6/83	547 (World Record)
5 cm (5800-MHz band)	Internal	ZL2AQE/P to ZL2ARW/P	1/29/83	225
3 cm (10,000-MHz band)	Internal	ZL1THG/P to ZL2BFC/P	1/25/81	390
1.25 cm (24,000-MHz band)	Internal	ZL2ARW/P to ZL2TRV/P	12/8/79	18.5

The VHF records are administered on behalf of NZART (Inc.) by H. N. Wiggins ZL2BFR. All claims must be made in writing to PO Box 1718, Palmerston North, giving frequencies, date, callsigns used, locations of both stations, and confirmed distance.

The antennas and residence of LA3XI. His QTH is one of the best in Norway, high up on a hill.

Svein Ovenstad LA3XI and his dog.

Club have reached the mark where they qualify for 50-year certificates—congratulations to them all. They are ZLs Bill Forbes 2OW, Bob Wright 2FX, Jim Fish 1GF, Dave Shepherd 2KD, Jack Crickett 1DY, Jock White 2GX, Bob Glassey 2ACG, C.H.R. Crawford 2JV, Dick Tout 2PO, Roy Yorke 1WY, and Dave Masterton 4LF.

Silent Keys of recent months were Norman Walding ZL2GZ, September, 1983, Peter Rothschild ZL2TY, October, 1983, Ted Pratt ZL1FY, March, 1983, and Jack Parminter ex-ZL2OU, aged 83 (who relinquished his call two years ago after holding it since 1935), in September, 1983.

NORWAY

Bjorn-Hugo Ark LA5YJ
N-3120 Andebu
Norway

As promised in earlier columns, a presentation of Norwegian DXers was bound to come, and here is the first one. I am proud to present to you my good friend Svein Ovenstad LA3XI from Lierskogen, 40 km south of Oslo on the western side of the Oslo fiord. He's forty years old, married with two more-or-less grown kids. He got his license in 1962, got the taste of DXing in 1963-64, and has ever since been totally devoted to that part of the hobby.

Around 1967-68, he was tearing up the 80-meter phone band with his tremendous signal from a rhombic stretched around his property. At that time, the activity on 80-meter DXing was rather low all over the world. Only a few had discovered the wonderful DX openings occurring on 80 meters. So his efforts really paid off. You still may hear him on the lower bands, but only occasionally, even though he does a good deal of listening. But I can assure you that if a rare one comes up, he'll be there.

Mostly you will find him scanning the 20-, 15-, and 10-meter bands very thoroughly, and if a new one is expected, he'll be nailed to that chair till he works him. This is quite understandable since he has put so much effort into reaching the DXCC Honor Roll. His standing as of November 15th was: phone 318, mixed 320, and CW 280.

He surely made it happen himself. Daily work is with an aircraft company, the Braathen SAFE airlines, as a Senior Engineer. Beside his DXing and work, he is a passionate hunter, and he and his dog are really making it quite unsafe for wildlife during the hunting season up in the mountains.

One of the most interesting parts of the story about LA3XI has to do with the kind of gear he is running. Here it is: a Drake TR-7 with RV-7 remote vfo, MN-2700 tuner, a home-brew linear giving the legal power of 800 Watts input, and a Hy-Gain TH6DXX (it used to be a 20-meter, 6-element monobander with a 17-meter boom) with a tower height of 21 meters. On the lower band, he is now just running a 40-meter sloper which he, with his Drake tuner, manages to run with a fairly good result on the other bands.

Svein has, in many years, together with LA8CJ and the late LA1KI, been the major source of first-hand DX information, always double-checking any rumors and passing the word rapidly around to all others. Earlier last year he was elected president of the LA-DX group, and he really deserved to be the first choice to hold the seat after our dear LA1KI.

In Norway, there is very little news to tell right now, but everything seems to point towards a good season for low-band DXing. W6s and W7s are starting to come through as usual at this time of the year, over the long path. And the cold and snow have come as well. Storms are breaking over the country, and the hams are very busy getting the last antennas up, so everything is just normal.

Speaking of antennas, I've been trying to get a good one up for 80 meters, but the bobtail curtain doesn't really seem to be the right one on my property. So we're trying to finish getting up that 5/8 vertical again and have already found out that a full-size, two-element quad just happens to be a little bit too large for the property, since the terrain is sloping on one side (and, of course, the house is a little too hard to move). Now the planning machine is really running at full speed again—for a mini-quad, two-element delta-quad at this moment!

I'm really wondering what I'm gonna settle with. Time is critical; winter is coming, and since I have only the weekends available (with my father celebrating his 70-year birthday and the CQ WW contest both on the same weekend), I'm getting just a little tense.

I have learned through the years and from my own experiences that I'm absolutely not the only one suffering from that kind of nuisance, and since I have managed the previous seasons, I probably will make it this time as well!

Have a good time, and work lotsa good DX, will you?

POLAND

Buczka 2/3
Poland

NEWS FROM POLAND

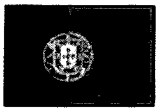
The most important event organized by PRAA (Polish Radio Amateurs Association) in June, 1983, was the Telegraphy Championship of Poland. The Championship took place on June 11th and 12th in the Youth Palace in Cracow. Seventeen competitors entered the contest. Jozef Czystowski SP3JHT, before Adam Sucheta SP9DH, won the quality competition (reception and transmission). Jozef Czystowski, before Andrzej Sikorek SP7OU, won the reception speed competition, but Adam Sucheta was better than Jozef Czystowski in the transmission speed competition. Jozef Czystowski gained an advantage over Adam Sucheta in the general classification. Among juniors, Jacek Szaro SP-0022/KS was the best. The Gorzow Wielkopolski Section of PRAA won the first place among all teams taking part in the Championship.

Constant activity sponsored by the Headquarters of PRAA, not only in the organization of competitions, makes for the revival of radio clubs in Poland, but not without problems. Some time ago a free hand at promoting new clubs was given, and this seemed to stimulate the work of hams. Some new little clubs that tried to paddle their own canoes were born in recent years, but not always did they get along with each other. First and foremost, lack of equipment did not allow them to pack on all sail. Furthermore, as a result of the suspension of PRAA in December, 1981, ties of friendship between one radio amateur and another were broken.

To meet the needs, the Headquarters of PRAA invited entries for a contest of radio amateurs' output. The contest is intended to promote the designing of new shortwave rigs, measuring devices, and auxiliary apparatus. Best designs are to be publicized and manufactured by Poles residing abroad. The contest started September 1, 1983, and ends March 31, 1984. On March 31st, the jury opens entries and generally evaluates the documentation furnished. Then at a second stage of the contest entries are more carefully screened. Decisions on results are made at an exposition of all the best entries picked at the second stage. The final judgment is based on:

- parameters of device,
- modernity and originality of solution,
- use of homemade sub-assemblies,
- practicability, and the
- clarity of documentation.

The Technical Commission of PRAA looks forward to the results of the contest. New solutions to equipment problems suitable for publication in magazines and books would be its fruit. The Technical Commission hopes that some of the innovations will be carried to production. This would improve supplies for hams in Poland. There are quite a few designers of shortwave equipment in my country, and the contest is raising new hope of more and better equipment.



PORTUGAL

Luiz Miguel de Sousa CT4UE
PO Box 32
S. Joao do Estoril
2765 Portugal

Here we are once again to give you news about ham activity in this country.

In my previous column, I wrote about reciprocal agreements that we have with several countries in Europe, Africa, and North and South America. However, on November 11, 1983, an important meeting was held in Lisbon with the Spanish and Portuguese governments, and a reciprocal agreement was signed on that date with this neighbor country.

When requesting a ham license under reciprocity, you have to send the following information with the petition: name, call, date of birth, nationality, place of birth, father's name, mother's name, profession, place staying in Portugal, number of present license, validity, passport number, place of issue, validity of the passport, and dates of operation in Portugal.

Always remember that under the reciprocity rules only 30 days are authorized, and a car registration number is necessary if a mobile station is used. Please address all this to REP (IARU member), Rede dos Emissores Portugueses, Rua D. Pedro V, #7-4, 1200 Lisboa, Portugal, and include US$30 for expenses. Finally, do not forget a Xerox® of your present ham license and passport.

NEW REGULATIONS

During the WCY we celebrated in 1983, Portuguese hams had the opportunity to receive the new Regulations for the Amateur Service, in force since July 21, 1983, and issued by the Ministry of Communications. Its contents are so controversial we easily find out that it does not have all the elementary basics of good regulations; this certainly is due to a lack of knowledge of the amateur-radio hobby. For examples:

- The output power attributed to the different classes is incompatible with the equipment and components available today.
- RFI and TVI—this chapter is a bit confused and hard to understand. According to the rules, the ham has the highest responsibility and is charged with finding solutions, including payment for devices to be connected in receiving equipment. We do not have any government institution supervising the production or the manufacturing of electronic or electric apparatus. This means that high-pass filters or other such devices are seldom used in such equipment.
- We are not allowed to use all the classes of emission for the Amateur Service, and permission to use J8E type seems strange.
- The subdivision and use of the allocated frequencies does not comply with the IARU Region 1 band plan (HF), which is practical in the countries of that region.
- It is inexplicable that hams with higher class licenses cannot operate frequencies allocated to lower classes, which we could used before. Superior classes have had a loss of privileges.

According to the new rules, we have four different classes:

Class A (the highest) hams are allowed to operate amateur-radio stations with a maximum output power of 600 Watts in every Amateur-Service band.

Class B operators—same as above, with no more than 300 Watts output.

Class C operators are allowed to use stations with maximum output power of 150 Watts with some limitations concerning frequencies and emission types.

Class D—same as above, with no more than 60 Watts.

However, the critical point of this regulation is the fact that a ham having an A or B class license cannot use frequencies and emission types where the other classes can, as follows:

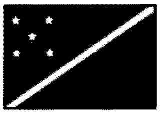
- on 40 meters—A and B: 7.000 to 7.100 kHz, A1A, F1A; 7.050 to 7.100 kHz, A3E, C3F, while D class: 7.000 to 7.050 kHz, A1A, F1A, A3E.
- On 10 meters—A or B: 28.200 to 29.700 kHz, A1A, A3E, C3F, F3E, F3F, while C class: 28.200 to 29.700 kHz, A1A, A3E, F3E, F3F, and D class: 28.00 to 28.100 kHz, A1A, F1A, and 29.000 to 29.100 kHz, A3E, F3E.

NEW BANDS AND 160 METERS

Many times we asked for the use of the new bands and also 160m but we were not lucky, then suddenly the good news came. (As they say, better late than never.) So as of November 4, 1983, Portuguese hams are allowed to work the new bands, as well as 160m on a secondary basis, according to the following: 1.830 to 1.850 kHz, 10.100 to 10.150 kHz, 18.068 to 18.168 kHz, 24.890 to 24.990 kHz.

Maximum output power for any of these bands is 60 Watts, and microphones must be kept out of the rigs, that is, CW *only*.

Best 73 from Portugal.



SOLOMON ISLANDS

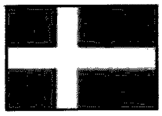
Solomon Islands Radio Society
PO Box 81
Honiara
Solomon Islands

A postage stamp featuring amateur radio has been issued by Solomon Islands as part of their World Communications Year set released on December 19, 1983.

The stamp, featuring the Solomon Islands Radio Society amateur station, callsign H44SI, is available on a special commemorative cover. The price of the cover is US$1.00, 5 IRCs, or equivalent, including postage.

The complete World Communications Year set of three covers featuring a total of 6 stamps is also available at a cost of US$6.00 or equivalent, including postage.

All orders should be forwarded to the Solomon Islands Radio Society, address above.



SWEDEN

THE SWEDISH DX FEDERATION

The Swedish DX Federation is the national umbrella organization for Swedish DXers and DX clubs. It was originally established in 1956 and reorganized in 1969. It has more than 1800 individual members and some 40 local DX clubs.

The Federation publishes a monthly offset-printed magazine in Swedish, *Eter-Aktuellt*. Through "DX-Kop," Swedish DXers can buy report forms, books, receivers, etc. The Swedish DX Federation produces regular DX programs, broadcast via the Voice of the Andes (Ecuador) and Deutschlandfunk (Federal Republic of Germany).

Member clubs are supported by the DX Federation in different ways. Examples of these activities are: supplying pamphlets about DXing, producing tape recordings and slides to be used at club meetings, completing material for a DX course for beginners, etc.

The annual meeting of the Swedish DX Federation, the DX Parliament, will be part of EDXC 84 (the European DX Council 1984 conference, in Stockholm, June 8-11, 1984). At the DX Parliament, the members of the board of directors are elected and decisions are made concerning future activities of the Federation. This part of the conference will be held in Swedish, while the rest of EDXC 84 will be in English.

We of the Swedish DX Federation are very pleased for this opportunity to work together with Radio Sweden International in arranging the 1984 EDXC conference. During the 1970s, participation in the DX Parliaments declined. One reason for this has been that many foreign DXers and station representatives have chosen instead to participate in the EDXC conferences. To some degree, the EDXC conferences have "competed" with our DX Parliaments. This is one reason why we are very happy to be able to hold the 28th DX Parliament as part of the 18th EDXC conference. We hope to combine the enjoyable atmosphere of past DX Parliaments with the somewhat larger EDXC conference.

Welcome to Stockholm June 8-11, 1984!

AWARDS

DAYTON HAMVENTION ADDS NEW AWARD

The Dayton Hamvention is adding another award this year. The award will be given for technical excellence. It will go to an individual making a significant contribution to amateur radio in the technical field.

The coveted Amateur of the Year and Special Achievement awards have long been a fixture of the Hamvention. The award for technical excellence will round out the awards by recognizing those keeping amateur radio at the forefront of the state of the art and fostering interest in technical achievement.

Anyone wishing to nominate a candidate for any of the awards should do so by writing to: Awards Committee, Dayton Hamvention, Box 44, Dayton OH 45401. The nomination(s) should provide as much information as possible about the individual(s), emphasizing the accomplishments justifying the award(s). The closing date for nominations is April 1, 1984.

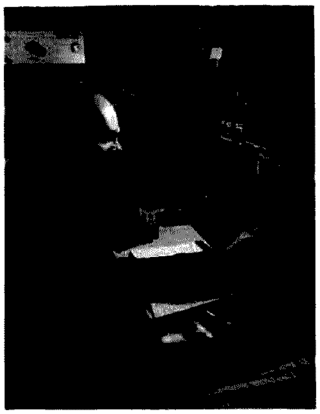
W2NSD/1 NEVER SAY DIE

editorial by Wayne Green



THE SONY SURPRISE

A couple of years ago, Sony brought out their 2001 all-band digitally-controlled receiver. It wasn't terribly sensitive, but it would tune in CW and sideband and the price was, particularly for Sony, most reasonable. This was followed by their 7600 shortwave receiver—truly a marvel of compactness, small and light enough for the jacket pocket. It also had amazing bandspread for the most popular shortwave broadcasting bands—and a surprisingly low price.

This was followed a year later by the 7600A model, with a couple more bands. I liked this one particularly because it covered 40m and the CHU time signals, a nicety skipped in the first model. I took this radio with me on all of my foreign trips so I could check the VOA newscasts and make tapes of local AM/FM and SW stations in unusual spots around Asia and the Middle East.

Then last year Sony did it. They put the digital tuning system from the 2001 into the 7600, calling it the 7600D, (digital, I presume). Wowie! Again, as with the 2001, the sensitivity is about on a par with Don Rickles, but it tunes from 150 kHz to 30 MHz, plus the FM band! It has a bfo and a vernier on the tuning so you can tune in sideband just fine. It also has ten buttons you can program for instant frequency selection. I find that handy for WWV/CHU time and my favorite FM stations. Yes, it has an automatic scanner, too.

It's possible that some of the ham dealers carry this radio. You might want to check around. If you travel much, this can be a real prize. I love checking the 20m and 15m bands from different places around the world as I travel.

I've been looking for a ham to join my staff who might, in addition to testing new ham gear in the W2NSD/1 ham shack for reviews in *73*, arrange with Sony and other such manufacturers to make non-ham products such as this available via our magazines. Every now and then I find a toy like this which I think might interest readers but which could be hard to find for most people.

I'm one of those people who rush out and buy almost anything new. I almost always have a few surprising toys in my shoulder bag when I travel. It might be a radio, a miniature TV, a new kind of digital watch, or a new briefcase computer. Some people are just now discovering the Walkman. . . I had one of those within hours of its reaching this country eight years ago.

A lot of these gadgets you see in the mail-order catalogs are dogs, despite the glowing copy and gorgeous pictures. I pore over each new Sharper Image, Markline, JS&A, and so on catalog that arrives. Yep, I've tried the hanging by the feet gadget.

For instance, take the new tiny TV sets. Great technical marvels, no question about it, but who needs a Walkman TV? On most of the TV shows these days, you can turn off the picture and lose little, so if you're an addict, why not just get a miniature radio with the TV sound channels? I doubt that we are going to see many people walking around the streets with portable TVs on their hands.

Clive Sinclair has invested an enormous amount of time and money developing a very small portable TV. But for whom? I suspect that it was more the challenge of making it than any serious market expectations which drove Clive. I'll be watching the success of the Sony Watchman and the new Casio

Doing It at Dayton

This unofficial Hamvention handbook helps attendees and dreamers alike.

Change may be a hallmark of a democratic society, but it is also the byword of the 1984 Dayton Hamvention, whose leaders have made major modifications to the annual April event.

The location is the same, Dayton's Hara Arena, and the dates for the 1984 event are in their traditional location: the last full weekend of April (27, 28, and 29, for 1984), but there have been considerable changes made in other areas, primarily the flea market. According to the cochairman of the Hamvention, Harold "Hal" Judd WA8KNM, the changes should be "99 percent to everyone's benefit."

Topping the list of changes for 1984 are the set-up times for the flea-market vendors who have waited long hours in line in the past to get a space. This year, those holding flea-market permits, which can be secured *only* by ordering in advance, will be allowed to set up as early as Wednesday or Thursday in an assigned, numbered space. The spaces will be assigned on a first-come, first-served basis, meaning those who request a flea-market space and include the appropriate money with the request ($15.00 per space, four-space maximum) will be assigned a space first. Hamvention Flea-Market Chairman, John Grody WB8TEK, hopes this will eliminate the imposing practice of vendors waiting in line, sometimes as long as three and four days, to get what some consider prime flea-market real estate on the Hara Arena parking lot.

The official times for setting up in the flea market (for those with advanced sale permits *only*) will be Wednesday, April 25, noon until 5:30 pm local time, and Thursday, 8:00 am through the time the flea market opens to the public at noon on Friday. No sales will be permitted in the flea market prior to noon Friday when the gates will be opened officially to an anticipated crowd of over 20,000. Flea-market vendors also are reminded that a general-admission ticket is required for admission to the flea market in addition to your flea-market permit, so be sure to order it when you request your flea-market permit.

Since flea-market spaces are available only by advanced sales, the wisdom of ordering early is obvious. Ordering your general-admission ticket early would also be wise since the price has been increased to $7.50 in advance and $10.00 at the door. No doubt about it this year—the early bird gets the worm, the best flea-market space, and gets to save $2.50 on his ticket.

For those who were there last year, you'll notice that the opening time for the flea market has been shifted

Hams show up in droves when April comes to Dayton. Here's just part of the typical crowd that overflows the Hara Arena each year.

You'll find anything and everything electronic at the Dayton Hamvention, even a ham who has brought his own street light.

The Silver Arena section of the Hara Arena is just one of three large areas devoted to dealers and manufacturers' representatives.

In between flea-market expeditions, vistors to the Hamvention might make a side trip to Wright-Patterson Field, home of the US Air Force Museum.

from Saturday morning (as in 1983) to noon on Friday (as it was in 1982). This means that sellers will have two and one-half days to display their wares, and it also improves their odds of getting dry weather, a must element for outdoor display of radios and other moisture-sensitive electronic equipment.

To order flea-market spaces, send $15.00 per space (maximum of four per customer) to the Dayton Hamvention, PO Box 2205, Dayton OH 45401. Grody said that no flea-market spaces will be assigned until after January, but that requests which have come in will be given spaces in order of their arrival.

For anyone needing more information, Grody and his committee have made yet another change by setting up a flea-market information hotline at (513)-223-0923; this will be answered between the hours of 8:00 am and 10:00 pm EST beginning well in advance of the Hamvention.

More Changes

The changes in Hamvention '84 don't stop with the flea market. The Hara Arena has been expanded since Hamvention '83 and now has an additional 10,000 square feet located near the Silver Arena. The new space will be used in 1984 for the many Hamvention forums, while the space previously occupied by the forums has been made available to indoor sellers. Cochairman Judd believes that between 200 and 225 exhibitors will be displaying their wares inside the arena this year, and that includes the dealers and the manufacturers' representatives from such well-known companies as Trio-Kenwood, Icom, Yaesu, Hy-Gain, Drake, and Cushcraft.

With the expanded number of indoor exhibitors and the expected 1,500 flea-market vendors, there's going to be a lot for the Hamvention attendee to peruse in a short, two-and-one-half-day tour. But never fear, there is a way to do it, and the key is planning. Plan to get an early start each day, and plan each day as carefully as possible.

As soon as you enter the indoor part of the Hamvention the first time, you will be given a plastic bag which will contain the Hamvention program. This is your key to the entire event and it is worthy of a few minutes of study. Flip through the program, find the pages allocated to overall and interior maps of the exhibit area, and orient yourself. Next, check the times of the forums and note the ones you might be interested in attending. Try to work your tour around these times because the forums come only once while the flea market and indoor exhibitors will be there for the duration. This is one way to guarantee that you won't miss anything and be forced to go home with some heavy regrets.

You might also try to plan to have some energy left after a full day of hamfesting on Saturday to attend that evening's banquet This year's banquet speaker will be Harry Dannals W2HD, past president of the Amateur Radio Relay League.

Cochairman Judd added that there have been some changes made to the banquet, not in the ticket prices—which remain $14.00 in advance and $16.00 at the door—but in the menu. Judd said that the main course this year will be filet mignon. If you've ever intended to attend the banquet, this might just be the year to do it.

CHECKLIST FOR YOUR DAYTON TRIP

- Secure room reservations early, for the nights of April 27 and 28, and if you intend to arrive early on Thursday, for April 26.
- Purchase Hamvention tickets in advance and, if applicable, flea-market-space permits.
- Have the members of your group committed to attend the Hamvention and determine your transportation requirements.
- Save enough money to cover the cost of the trip and to cover the cost of any planned purchases. Turn most of your cash into traveler's checks as these are readily accepted at the Hamvention and at the flea market. Personal checks are NOT a readily-accepted method of payment. If a dealer has a choice of a cash sale or taking a risk by accepting a personal check, he'll probably take the cash.
- Pack clothing necessary for your three- or four-day trip. Don't forget, the weather is very changeable.
- Arrange for time off from work if you're part of the laboring class.
- Make and carry a list of things you intend to purchase at the Hamvention. The abundance of equipment found at the Dayton flea market is mind-boggling and could make you forget what you came there to buy.

Necessities

Hamvention veterans are well aware of what to bring to the event and how to dress, but for the sake of the newcomer, let me review some of the time-tested practices. If you plan to drive to Dayton in a private car from 500 miles away, as our group does, set aside at least $100 for gasoline, weekend accommodations, and food. Motel reservations should be made as early as possible and the Hamvention Housing Bureau can be a big help. You would be wise to take advantage of the service this Bureau offers. In the past, food has been plentiful and tasty at the Hamvention and, I might add, reasonably priced. The same is true for most of the restaurants in and around Dayton, so if you have the money set aside for eating, you will not starve. Just make sure you budget properly.

Let me suggest that you dress for the Dayton weather—and that means bring one of everything. I've seen years where the weather has been exceptionally beautiful—70 degrees plus during the days and no cooler than 40 degrees at night—while I've also seen the worst—constant rain and near-freezing temperatures during the days and nights. So dress according to the old outdoorsman's adage, in layers so that you can take off or put on as the weather changes. And make the final layer a waterproof garment while keeping the heavy coat within reach should the temps fall to an extreme. It can happen. The weather can be great or lousy and it can be a determining factor in how good a time you have at the Hamvention, so go prepared. The weather was great in 1982 with the only problem being chapped lips, while last year's weather was fit only for the ducks and the well-prepared.

To keep up with the members of your group, I would suggest that you rely on the ever-popular two-meter handie-talkie, but try to have everyone bring a synthesized rig so that you can be flexible in finding a standby frequency. A crowd of over 20,000 hams can generate a lot of rf.

GENERAL INFORMATION

Send ticket orders to:
Dayton Hamvention
PO Box 2205
Dayton OH 45401

Flea-Market Hotline
(513)-223-0923
(Try to limit calls to between 8 am and 10 pm EST.)

Prices: Registration general admission ticket is $7.50 in advance and $10.00 at the door. Tickets on sale in advance by mail or at the arena during the regular Hamvention hours; *not available over night as in the past.*

Hamvention General Chairman
Jack Mitchell AA8Q
Asst. General Chairman
Harold "Hal" Judd WA8KNM
Flea-Market Chairman
John Grody WB8TEK
Advance Registration
Marge Mitchell WD8DSN

April 28 Banquet Speaker: Harry Dannals, Past President, the Amateur Radio Relay League. Banquet tickets—$14.00 in advance, $16.00 at the door.

Flea-Market Setup Times
Wednesday, April 25: Noon to 5:30 pm. Thursday, April 26: From 8 am, all night, through to Friday at noon when the flea market opens to general public. *All flea-market permits will be sold in advance this year. None sold during the Hamvention. Flea-market vendors must have registration tickets and flea-market permits to be admitted to the flea market during setup times.*

Flea-Market Selling Times
Friday: noon to 6 pm.
Saturday: 6 am to 5 pm.
Sunday: 6 am to prize drawing.

Finances

Don't say it; I know what you're thinking. Here I've told you about all of the great changes for the granddaddy of all hamfests, but I haven't said how you can afford to go.

First things first. Talk to your buddies on the local repeater about a possible trip and find out who would like to go, and then get a concrete commitment from them so that you can plan properly. Then have each person arrange to have the days off from work that they'll need to make the trip. Setting aside Thursday for travel and Friday morning for setting up in the flea market may work, but if you're traveling far and plan to be in Dayton for the prize drawing Sunday afternoon, you might also consider taking the following Monday off from work to convalesce. You'll enjoy the trip more if you know that you don't have to go right back to work as soon as you get home.

Enough planning. Let's get down to paying for the trip. Overtime and part-time jobs are possible sources of extra revenue, but since it's a ham-radio activity, it seems appropriate to me that ham radio should help meet the expenses. That's where all of this talk about the flea market comes in. At a cost of $15.00 a space, three people can split the expense (investment?) and sell a lot of their unused equipment. Agreed, it's a common ploy at a hamfest, but I'm talking about Dayton, and that means you'll have probably 20,000 to 25,000 radio enthusiasts checking out your high-quality castoffs. As my Daddy used to say, "With that many fish, you're bound to get a bite." And with the three or four of you taking shifts at watching over the gear, you'll get a chance to check out everybody else's offerings and still not miss a sale.

Buying Gear

I always tell myself that if I sell one particular piece of equipment, then I'll use the money made on the deal to buy that new rig I've had my eye on. Besides being a great place to sell used equipment, Dayton is also the perfect place to buy that new rig since the dealers are always in a mood to sell at a good price. Call it their annual low-price fling or whatever you want, but I have always found what I was looking for at Dayton and found it at the best price. Ask anyone who's been there and I bet they'll tell you the same thing. You'll get to see what you want to see, put your hands on it, push the buttons and turn the knobs, and then buy for the best price imaginable.

I know the dealers will probably skin me alive for saying this, but let me pass along a word of advice—spot the piece of gear you want at three or four dealers, list the prices, and then go back to each one and ask them to give you their rock-bottom, last-day-of-the-hamfest price. If you think one of them is offering you the best deal you'll see, make your purchase from

that dealer. If you think you can get it cheaper, wait until the second or maybe the last day of the hamfest and go back to the dealers again to get their prices. Be aware that if you decide to wait, all of the dealers could sell out of that rig you've been wanting so badly. With the prices being so right and so many people looking for a deal, the bargains do not last long. Once again, be prepared.

And keep one other fact in mind when you tackle the dealers—the more the dealers sell, the less they have to pack up and take home. That's why most of the best deals on the remaining equipment are made on the last day of the Hamvention, on Sunday afternoon when most folks are hanging around for the prize drawing or in the process of packing up to head home.

If you have trouble working the deal you want, get the dealer to toss in an accessory for little or nothing more. After all, it would make still less that he has to pack up and take back with him and it makes the deal even sweeter for you.

What Will I See?

When you arrive at the Hara Arena, don't worry if you think your eyes are starting to bug out. You'll probably be seeing a few things you've never seen before. Just in the past few years I've seen the first synthesized handie-talkie and the first digital-readout low-band rig make their initial appearances at the Dayton Hamvention. And there's a reason for it. Manufacturers like to take the wraps off their new items at the Hamvention because they know that it's their best chance to show it to a large share of the amateur-radio community at one time. The more people that see an item, the better the chances of selling it. Remember the 20,000 plus folks I said could be walking past your flea-market space? Most of the same people will get indoors also. The manufacturers also know that most of the hams who attend the Hamvention have a buying urge, and they'd like you to satisfy that urge by buying their product.

What else can you expect to see at Dayton? I would expect to see more computers interfaced with ham-radio equipment at the '84 Hamvention, and I would expect to see more dealers selling software for amateur applications. Last year, the RTTY-CW interfaces were on display and drew considerable crowds, so this year look for the dealers to take the next logical step and explore the computer field a few steps further. We've got satellite-tracking programs that run on VIC-20s and other basic machines, so don't be surprised if software abounds to turn all of your ham-radio drudgery into funtime with your computer. After all, it will be the coming thing for many a year to come.

Here We Go!

Okay, if you've followed me so far, you should have a pretty good idea as to how to prepare for the 1984 version of the Dayton Hamvention, the hamfest that is quickly earning the tag, "center of the ham-radio universe." So get your days off arranged, pack your clothes and the equipment you plan to sell, list the items you want to purchase, get your group together, and let's head to Dayton for April 27, 28, and 29.

The bunch of terrific guys I go with started talking about the 1984 trip on their way home from the 1983 event, so I think we'll be prepared to have another great time in Dayton, Ohio. Grab your HT and come join us. It's gonna be great! ■

Me and My Stupid Old PMOS Converter

At last, there's an easy way to get -12 V from a +5-V supply. Who said "trial and error"?

C. R. Bryan III WB1HKU/6
7311 Variel Avenue 4
Canoga Park CA 91303

Stupid old PMOS. It's slow, it runs hot, it gives protective input diodes a workout because its output low can go below ground, and it needs weird supply voltages. Most of the newer NMOS devices have been designed to make do with one 5-volt supply, either by some design rethinking or by inclusion of a substrate charge pump on the chip itself, but stupid old PMOS has to have strange supply levels provided in order to operate.

It was that last gripe that had me stymied for a while. I have an old keyboard from some junked phototypesetter somewhere, bought for all of ten bucks. It's TTL throughout, with maybe ½ A drain on the 5-V, 3-A supply in my home-brew Cosmac Elf. (One miserable PMOS shift register does have to have a −12 supply if I want anything but smoke from it.) At that, the keyboard outputs some weird code that makes sense only to the machine for which it was designed. A local outlet sells a keyboard encoder, the AY-5-2376. If I kludge-wired that onto the keyboard in place of the original logic, I'd have good old parallel ASCII coming out of a single 40-pin chip, made of. . . PMOS. Yep—it needs a −12 supply, drawing maybe 4 mA. I should build an *additional* line-powered power supply for *that?*

I've seen a few upconverter circuits around; most use

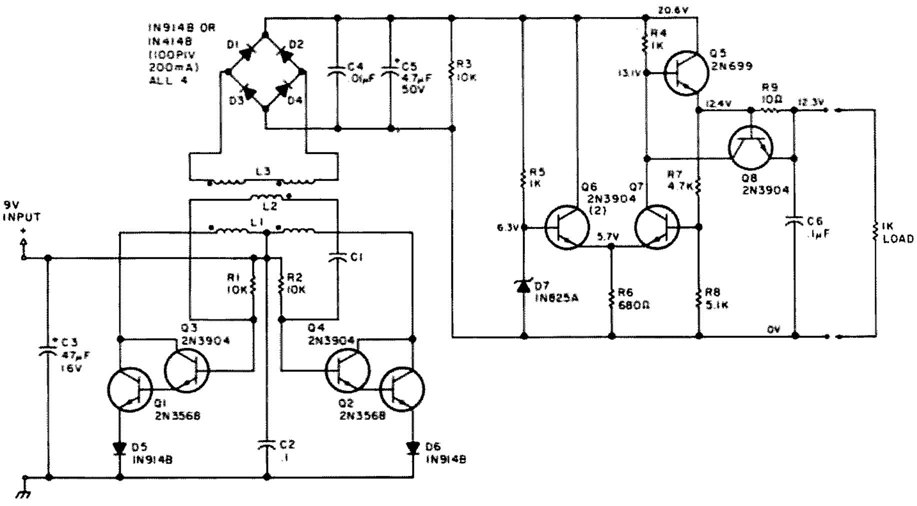

Fig. 1. Initial version. With 9 to 19 volts input, and the right toroid, this circuit might provide 50 V output. L1 is 10 bifilar turns #28, L3 is 25 to 50 bifilar turns #28 (I used 25 turns), and L2 is 8 to 10 turns #26. The toroid is a .375-inch ferrite from a Radio Shack "Ferrites" package. Capacitor C1 resonates with L2 to determine oscillating frequency; 200 pF is probably a good minimum value to keep interwinding capacitance from getting into the act. The transistors came from my junk box; the numbers listed are their rough functional equivalents. With different devices, the regulator circuit could waste a lot less current.

555s and voltage-doubler chains. Motorola even has one with a 7406. Somehow, all these capacitor-pulse designs struck me as being wasteful, inadequate, or both.

I'm a bit of a QRPp nut, and I have the toroids to prove it—some from Radiokit and Amidon, some from those blister cards Radio Shack started selling a year or so ago. I got out my dipper and my boxes of small-signal transistors, turned on the 'scope and the Weller, and waded in.

The first circuit I built does fine with at least 9 volts for a supply. The rectified secondary voltage soared up to 90 volts at one point in my experimenting—no load. That's why I put in the 10k load resistor, to keep the voltage within the survival zone of the diodes, to say nothing of any regulator I might care to put in.

As for the regulator circuitry, I must admit that I was playing. I had already decided to put a 79L12 in the finished unit, but I didn't have one on hand as yet, so I kludged this one up in order to see how much fun I could have putting together a regulator. If you look closely, you will see not only that I've abused the reference diode (which prefers to conduct only about 7.5 mA), but also that the converter is cranking out upwards of 25 mA, still with enough input headroom to the pass transistor for it to regulate. The medium-current pair of transistors in the oscillator got warm, but not hot, and nobody seemed to be hurting.

Then I dropped the supply rail to 5 volts, and the output got very mushy . . . maybe 8 volts across the output load resistor.

The problem is in the Darlingtons. I put in the second pair of transistors, Darlington-style, because the medium-current transistors weren't being driven fully under load, thus, there was not enough gain at the frequency in use. The added pair corrected that but brought in a new problem: The saturation voltage ($V_{CE\text{-}sat}$) for a Darlington pair, measured from the ganged collectors to the lower emitter, is one $V_{CE\text{-}sat}$ plus one V_{BE} for a typical circuit, because the driver-half emitter is held high by the final-half base-emitter diode (one V_{BE}), and their collectors are tied together. The collector of the driver-half can't do more than saturate—it can't go lower than its emitter. More current into either the driver's base or the two collectors only drives both voltages higher, making the problem worse. I was losing virtually 2 V_{BE} on each side of the main winding, even with the protective series diodes shorted out. That's fine for circuits with, say, 9 volts or more rail-to-rail, but down at a 5-volt supply level, the missing voltage swing was proportionately too large to be ignored.

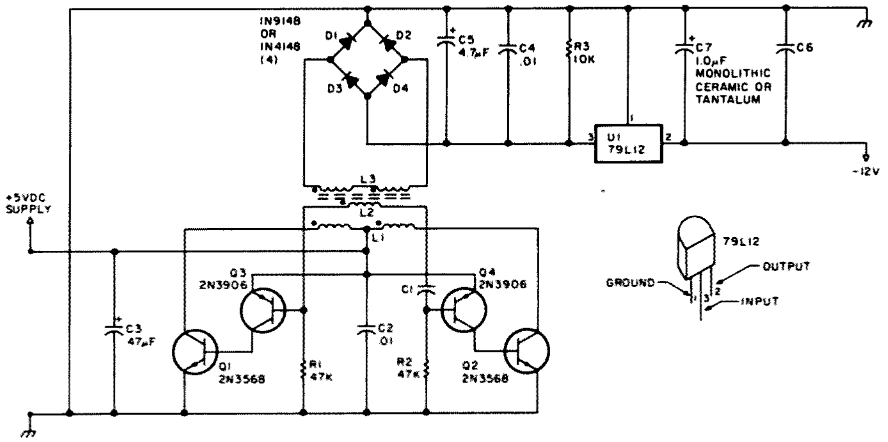

Fig. 2. 5-volt-input version. Note that L2's phase is reversed. Equivalent transistor types again. The 79L12 only burns about 4 mA.

At this point I remembered the composite PNP in the final stage of National's LM380, and the final version started emerging on paper.

I have even more voltage gain here, because the driver stage is running common-emitter rather than the common-collector driver in the Darlington version. More important, the final stage is free to pull its end of the transformer's main winding as low as possible, roughly 0.2 volts with these particular parts. That means that the total possible swing for the transformer, ignoring coil losses, is 9.6 volts—much better. Of course, I've ignored here the effect of available voltage swing on circuit impedance, which affects the available juice (wattage) from what is, in effect, a self-excited balanced transmitter. I chose a more rudimentary approach, one within my immediate comprehension. In other words, I'm lazy, so I just called it an astable multivibrator and I played around with it until it worked.

It works. The keyboard converter starts up every time and feeds a dead quiet −12 volts to the shift register. It'll do the same for the 2376 instead, when I get around to the surgery involved. Then there's that Motorola character generator for translating ASCII into a video bit stream; that needs two weird voltages—and it's NMOS! That just means there'll be two secondaries on the toroid. I've even got a couple of PMOS character generators that need ±14 volts.

There are several points of design and technique to be mentioned here. First, most bipolar transistors behave very nicely like zener diodes when their bases are driven 5 to 10 volts more negative than their emitters (positive for PNPs). Unfortunately, the localized heat in the base region of the transistor chip causes permanent changes in the doping arrangement, so the beta goes down. This is why most multivibrator designs have diodes with high PIVs in them, to keep the sharp negative spike through the capacitor from doing damage. If you are running such a circuit with a supply higher than 5 volts, you must have them too. Otherwise, if the 'scope shows that the collector voltage has a needle-thin negative spike going lower than ground on the falling edge of its waveform, your transistors are being degraded even as you watch.

The second point is one of balance. Some of Doug DeMaw's QRP amplifier designs are *crawling* with toroids, just to swamp out tolerances and force a 50% duty cycle in the output signal. I got by with just one toroid by using the twisted-pair wiring shown, but a little artistic symmetry in windings placement is required too. Caveat constructor.

The third point is the toroid itself. I used some from those Radio Shack packages, and they work very well. The ones you will pull out of there might not—it's a matter of size

and ferrite mix. The highest-permeability device is the one to use, because you get more inductance per turn of wire (mine were around 350 uH with ten turns). Such toroids are designed for a lower frequency range, so you can run them at a lower frequency, where the diodes rectify better (I've run the prototype up to 2 MHz, but its overall efficiency is best at around 50 kHz), and where it's a lot easier to contain the rf that any power oscillator spews out. The 2-MHz version wreaked havoc with an AM radio across the room; the 50-kHz version doesn't bother it a bit, even though the lower frequency is more likely to provide harmonics within easy reach of BCB carriers. My guess is that the diodes, which do take a finite amount of time to go into and out of conduction, simply digest the lower frequency more thoroughly, reflecting a lot less trash back into the oscillator.

The less rf noise, the less shielding is required, and the less hassle you have arranging for air flow to carry heat out of that shielding.

My converter simply sits parked in one corner of that keyboard, unshielded, kludge wired into holes drilled in an etched-clean section, making less noise than the keyboard scanning clock.

Obviously, anywhere one or two greedy little circuits demand a strange supply

Parts List (for Fig. 1)

C1	200-pF silver mica
C2, 4, 6	CK05, 104k, .1-uF monolithic ceramic (Better than a disc capacitor for high-frequency decoupling because the internal sandwich construction results in a low-inductance package. Substituting for one usually involves a .01-uF disc ceramic paralleled with a .001 disc or a 100-pF silver mica. Here, a .01-uF disc will do.)
C3	47-uF, 16-V aluminum electrolytic
C5	4.7-uF, 50-V aluminum electrolytic (Up to around 25 uF is useful at this current level; more than that can cause start-up problems for the oscillator, due to loading.)
D1–6	1N4148 or 1N914B switching diodes
D7	1N825A temperature-compensated reference diode (It consists of a reverse junction in the same package with a forward junction; at 7.5 mA of current through the diode, the complementary temperature coefficients of the two junctions cancel each other out. With the voltages shown, the current through the diode in Fig. 1 is nearly double the correct value, which doesn't hurt it but wastes both the current and its compensation. Newark Electronics' Catalog 105 lists it for $1.90.)
L1, 2, 3	See text
Q1, 2	NPN medium-current switching transistors (The faster the better. I used 2N3568 equivalents; 2N2219A is easier to find.)
Q3, 4	NPN switching transistors (The faster the better. 2N3904 is widely available.)
Q5	NPN medium-current transistor (Speed isn't critical, but gain and wattage are. I used a 2N699, which is barely adequate. It should be at least a heat-sunk 2N2219A, maybe a TIP48. Better to be overcautious on wattage than to worry about its surviving a short or a still-air heat buildup.)
Q6, 7, 8	NPN small-signal transistors (I used 2N3904 equivalents. With higher beta, resistor values in the regulator may be raised, conserving current. Beyond the voltages shown, start paying attention to the collector-voltage ratings of these devices.)
R1, 2, 3	10k, ¼-W (With the regulator in place, R3 isn't really necessary, but it's a cheap security blanket.)
R4, 5	1k, ¼-W (As mentioned, R5 should be a 1.8k.)
R6	680-Ohm, ¼-W
R7	4.7k
R8	5.1k (The regulator (Q5–7) regulates by keeping the R7-R8 voltage divider's tap at the same voltage as the reference (6.3 V In Fig. 1). Their ratio sets the output voltage.)
R9	10-Ohm (This resistor sets the current-limiting level. When the voltage across it reaches the .6-V turn-on threshold of Q8, Q8 will begin stealing base current from Q5, turning it off. With this value for R9, that's at 60 mA output.)

Parts List (for Fig. 2)

C1	Select in test (200-pF starting value, may end up at .01 uF or higher. In order of preference: NPO ceramic, polystyrene, silver mica, mylar™, disc ceramic. The higher the frequency, the more the capacitor's quality matters. 220-pF silver mica: Jameco DM15–221J, 49¢.)
C2, 4, 6	.1-uF monolithic ceramic or .01-uF disc ceramic (.01 uF: Jameco DC.01/50, 8¢.)
C3	47-uF, 10-V electrolytic (47-uF, 16-V: Jameco A47/16, 24¢.)
C5	4.7-uF or more electrolytic (Working voltage should be at least 1½ times unregulated output voltage. 4.7-uF, 50-V: Jameco A4.7/50, 19¢.)
C7	1.0-uF tantalum or 10-uF aluminum electrolytic. (Working voltage should be significantly higher than regulated output voltage. 1.0-uF, 35-V tantalum: Jameco TM1/35, 29¢.)
D1–4	1N4148, 1N914B, or other silicon signal diodes (Should be rated for minimums of 50 PIV, 50 mA continuous forward current, maximum switching time 10 ns or so. 1N4001-type rectifiers can't switch fast enough. 1N4148: Jameco, 15/$1.00. Fairchild rates these devices at 100 PIV, 200 mA, 4.0 ns.)
L1, 2, 3	Windings are determined by application and circuit values. See text and schematic for prototype values. Bifilar windings are prepared by twisting twin lengths of pretensilized wire with electric drill to 10–20-turns-per-inch pitch. Toroid is from Radio Shack package of ferrites. A good equivalent is Micrometals FT50-43: Radiokit, 60¢.
Q1, 2	NPN medium-current switching transistors—2N2219A, MPSU06, 2N3568 (Dissipation limit should be at least ½ W. 2N2219A: Jameco, 2/$1.)
Q3, 4	PNP switching transistors—2N2907, 2N3906 (The faster the better. 2N3906: Jameco, 4/$1; Priority-One #052N3906, 5/$1.)
R1, 2	47k, ¼-W (Priority-One #05RCQ473L, 50/$1; Radio Shack #271-1342, 5/39¢.)
R3	10k, ¼-W (Priority-One #05RCQ103L, 50/$1; Radio Shack #271-1335, 5/39¢.)
U1	Motorola 79L12 in prototype (Device choice depends on application. PC layout will accept 78XX, 79XX, LM340, and LM320 devices with inline pins (L, P, M, T types). Check pinout before installing. Positive regulator may be used to regulate negative voltage by making regulator output common. 79L12: Priority-One #05MC79L12CP, $1.00.)

Converter will be most efficient in a frequency band whose low end is determined by transformer reactance and whose high end is determined by transistor and diode speeds and capacitor quality.

voltage, you can now satisfy them, literally on the spot.

This circuit can go in any number of directions. A better design could probably run an 8080A chip set with just 5 volts input. If you have both phases of a convenient frequency clock available, you can slave the converter to the clock and save yourself a few parts, guaranteeing the converter start-up in the process. A couple of VN10KMs (VMOS) would probably suffice, provided only that the clock signals swing fully rail-to-rail. (TTL typically needs a pull-up resistor to hoist its output above 3.5 volts.) Somebody else will probably put me to shame with the efficiency of their version, but that's okay; I just wanted to get that keyboard running on just a +5-volt supply. Stupid old PMOS. ■

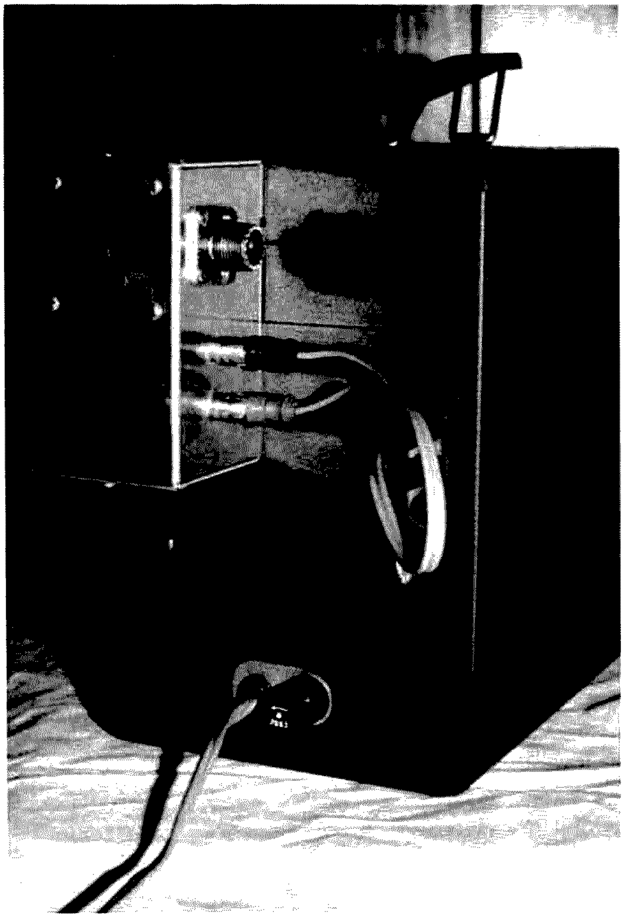
Watch That Signal!

Haul out your old oscilloscope and turn it into a signal monitor. The conversion is easy and the price is right.



An external view of the adaptor shown in Fig. 8, with shielded connections to the rear of the scope and onward to the vertical deflection plates.

Oscilloscope adaptors for rf have been around a long time. They became popular with the advent of SSB and inexpensive scopes after the end of World War II. Today, many of the leading ham equipment manufacturers, including Heath, Yaesu, and Kenwood, provide matching scope units for monitoring transmitted—and in some cases, received—signals. The equipment is excellent, but so is the price tag. There are cheaper ways to have an effective monitor, especially if you are interested only in seeing your transmitted signal. All you need is a cheap working scope and a simple adaptor. Fig. 1 shows in simplified form what we need.

As simple as this scheme is, relatively few hams monitor their transmitted signals or use monitors for making adjustments. The part of the equation that stops most hams is probably the scope itself and not the adaptor. There are several good working designs, and we shall look at a few before closing. However, the idea of owning and then modifying an oscilloscope still creates anxiety in many hams. So let's begin by looking at what makes a good scope for rf work.

Choosing a Scope for Rf

Current scope specifications make the units of even fifteen years ago look barbaric by contrast. The modern scope has triggered sweep calibrated in fractions of a second per division on the scope face. We can no longer create some

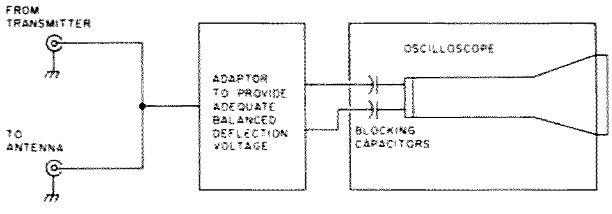


Fig. 1. The basic elements needed for rf monitoring.

of the funny pictures of yore because the recurrent sweep, calibrated in frequency, is gone. Virtually all scopes are solid state. Dual-trace capability is the rule rather than the exception. The frequency limits of the vertical amplifier have gone out of sight. Except for very expensive lab scopes, a 5-MHz limit was rare twenty years ago; today, the limit is fast approaching 100 MHz, with 20- and 30-MHz units common. One other thing has kept pace with the rising specifications: the price.

Modern scopes are excellent. If you own one, then rf monitoring is a simple matter of taking an exceedingly small sample of your transmitted signal and feeding it directly into the vertical amplifier of your scope. You need no adaptor. Unfortunately, few of us have the money for a 30-MHz scope that will get only an occasional workout in the shack. Indeed, if we have access to such a piece of equipment, it will most likely go on the test bench where it will be used more regularly.

If we do buy an older scope, our tendency is to choose one of recent vintage. This would be a solid-state scope with at least one MHz, and perhaps five, as the vertical amplifier limit. It would have recurrent sweep and single trace.

I should have stopped the moment I mentioned solid state! Although there are good solid-state scopes capable of handling the 50-odd volts of rf that we shall put into the case with at least an inch or two of lead, few of the cheap units have sufficient shielding between the amplifier boards and the neck of the scope tube where our leads are needed. The odds of popping one or more transistors is very great. We can add shielding, but our chances of successfully eliminating all rf danger are slim to nonexistent. Modern solid-state monitors begin with this problem as a design consideration, and it may be easier to build a scope from scratch than to rebuild a solid-state unit that was never intended for rf service.

Tube-type scopes of the next preceding generation do not suffer the problems of solid-state scopes. A few volts of rf in the case will not injure the tubes or other components. A hamfest will turn up many of these scopes for sale. The main item of concern is the quality of the cathode-ray tube and the power transformer. Both are difficult to replace and costly at best. If the scope puts out a bright, well-defined trace with the intensity control at the halfway point, then other faults can be repaired with the investment of troubleshooting time rather than money.

For an rf monitor at the operating desk, I prefer a smaller scope to the round-faced five-inch models. Toward the end of the tube era, a number of compact three-inch units appeared, including the Eico 435 and 430. The 8½" by 6" by 11" audio frequency 430 cost $69.95 in kit form in 1965, and it may be worth half to two-thirds of that price at a hamfest if it is in excellent condition. If you prefer a larger scope face, there are numerous Dumont and Heath models (among others) that can be picked up for a song and a few greenbacks.

Getting a scope is half the battle. Modifying it for direct rf input is simple. Locate the vertical deflector plate terminals on the scope tube socket. As close as possible to these terminals, install a pair of connectors on the rear panel of the scope. Phono connectors work well if you use thin coax for the leads from the adaptor (one lead for each terminal, since the signal will be balanced). Pin jacks or similar connectors will work if you use twinlead or other balanced lines from the adaptor;

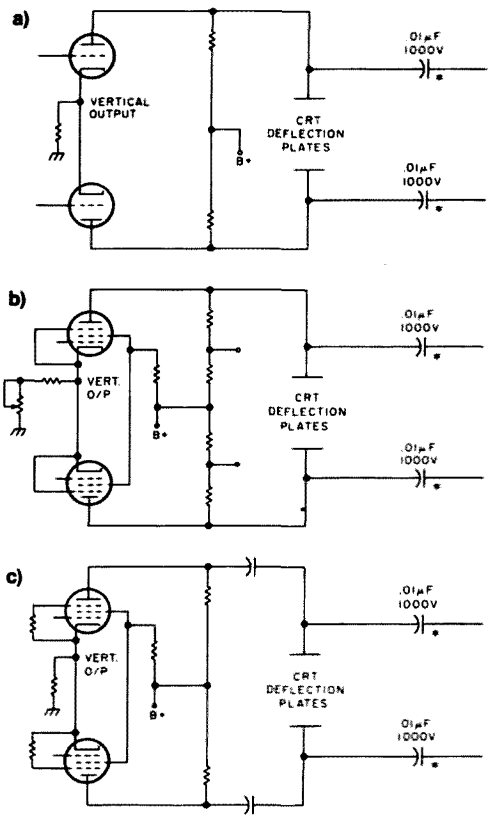

Fig. 2. Rf connections to typical vertical amplifier circuits. (a) Triode dc-coupled output stage. (b) Pentode dc-coupled output stage. (c) Pentode ac-coupled output stage.

however, shielded leads are best, especially with higher power.

Between the socket terminals and the jacks, install .01-µF disc ceramic capacitors of at least 1000-volt rating. Keep the leads as short as possible, and try to keep the capacitors at right angles to anything to which you might couple signal. Many scopes used to have accessory jacks on the rear panel for any number of improbable uses (for example, dc voltages to power units under test if they by chance happened to require exactly the voltages provided at a very limited current). If these are close enough to the scope tube socket, then mechanical work will be further minimized.

Fig. 2 shows the connections schematically, along with some typical vertical amplifier connections to the same socket pins. In most cases, you will need no other work on the scope. It will operate normally when rf is not present. When using the scope to monitor your transmitter, keep the vertical gain at minimum, and if you have input attenuator positions, set them at maximum. For monitoring, we simply bypass the vertical amplifier and generate the voltage needed to deflect the trace vertically by other means.

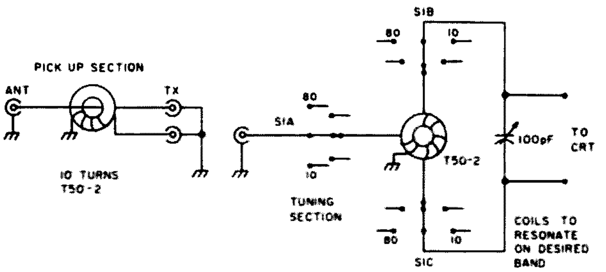

Fig. 5. A miniaturized version of Fig. 4, utilizing toroid cores.

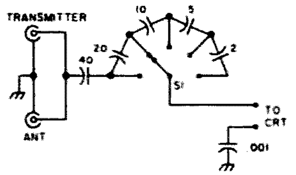

Fig. 6. A simple rf scope adaptor in wide use today.

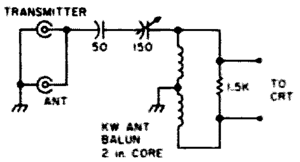

Fig. 7. The VE7CGK adaptor.

If you encounter problems with the use of the scope for non-rf purposes, then you will want to install the double-pole, double-throw switch shown in Fig. 3. This will effectively isolate the two modes of operation.

Rf Adaptors Through the Years

While almost every other piece of electronic equipment has grown more complex through the years, rf adaptors for oscilloscopes have grown simpler. I have built most of the designs, discarding them as a more compact arrangement became available. My present unit fits in a 2"×2"×4" aluminum box mounted on the back of my scope, with only one switch to manipulate. The photo shows how compact the adaptor can be. We may never reach the ultimate miniaturization in anything, but if another adaptor design comes along, I will hesitate before replacing the present unit.

Most early designs used tuned circuits, one for each band. Fig. 4 shows the general design which was fairly standard for about a decade. There were two separate boxes: a pick-up unit and a tuning unit. The pick-up box contained a one-turn coil running between the input and output coax connectors, with a two-turn link running to the tuning unit. The idea was to minimize the impedance bump in the transmitter transmission line.

The tuning unit went through stages of evolution. Initial designs were open breadboards. You were expected to tack-solder a coil each time you changed bands. Plug-in coils followed, but they required you to open the shielded box which was added to the design. In 1970, W1KLK mounted all the coils on a rotary switch (*QST*, October, 1970, p. 36). He also used the smallest diameter coils I had seen to that time, ranging from ½ inch for 10 meters to 1¼ inches for 80.

The principle of the design was to generate the necessary deflection voltage through the high Q of the tuned circuit. The tuning capacitor, insulated from the front panel and the operator's hand, provided peaking when tuned to resonance. If the voltage provided too much deflection (somewhat a rarity with older, less sensitive cathode-ray tubes), detuning the circuit attenuated it effectively. Despite its size, the unit worked very well.

The same design can be significantly miniaturized through the use of toroid cores for the inductors throughout, as shown in Fig. 5. The schematic diagram is essentially the same, although some changes have been made in the drawing to indicate the mechanical changes. A short straight line with Teflon™ insulation runs between the coax connectors and through a half-inch core. I have used from 6 to 20 turns of #28 wire in the secondary without disturbing the line impedance seriously. The tuned circuit coils in the aggregate take less room than the switch on which they are mounted. Although a three-section switch is shown, I have also used a two-section switch, with one side of each coil (and the capacitor) to a common. This did not seriously upset the balance of the output. The entire unit can be mounted in a single box with a partition between the pick-up and tuning sections.

Recent Adaptor Designs

More recently, designers have realized that tapping a 50- or 75-Ohm coax line would cause no significant problems if the tap impedance was fairly high. This has resulted in the use of almost direct connections between the rf line and the scope tube. Fig. 6 shows a generalized idea of the scheme. The switch controls a selection of capacitors arranged to successively double the reactance and lower the signal level seen by the scope plates. Since the scope deflection plates require a balanced input, the ground side is elevated off ground. The system is perfectly adequate for most monitoring purposes, although a better balance is easily achieved.

In 1979, VE7CGK presented an interesting scheme (*73*, June, 1979, p. 110); it is shown in Fig. 7. His balun used an ordinary 2-inch-diameter antenna core. The swamping resistor across the core is non-critical in value, and anything with up to a three-to-one ratio to the value given seems to work. It evens the frequency response by lowering the Q of the coil. However different his coupling scheme appears to be from that in Fig. 6, it is electrically identical. He has used a variable capacitor (with a series fixed capacitor) to replace the switch. Like all the units shown, his works well, with one exception. It is difficult to find a variable capacitor with a 150-pF top value that will go below 10 pF minimum. The 5-pF value in Fig. 6 is needed when viewing kW signals on a sensitive scope tube.

The final design that fits into the small box shown in the photo combines the best of these two designs with some miniaturization thrown in. Fig. 8 shows the circuit. The capacitor section is standard. The balun is

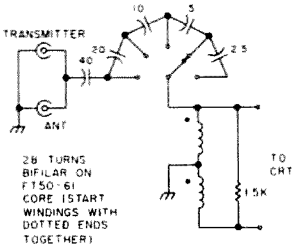

Fig. 8. The hybrid miniature scope adaptor.

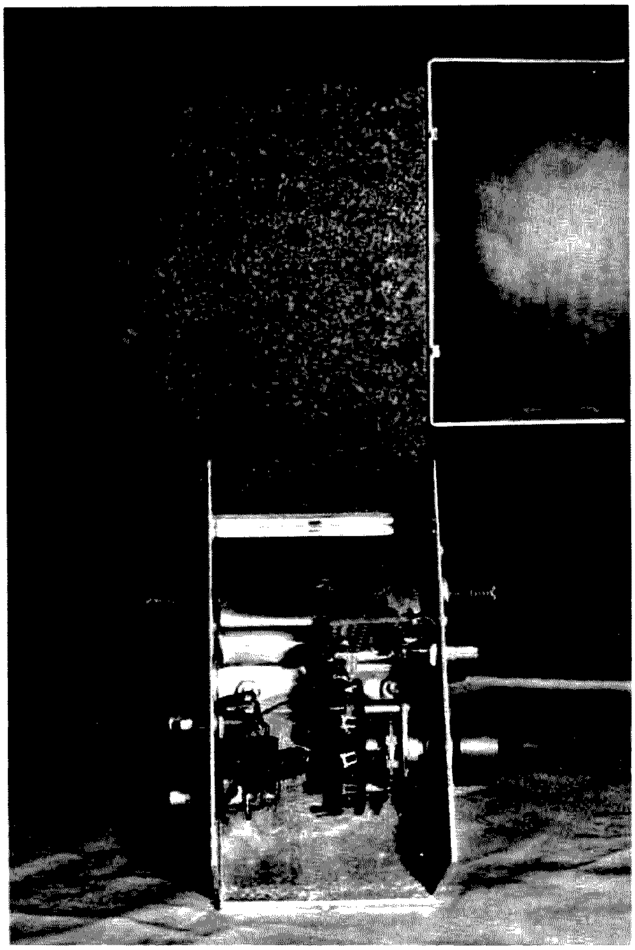
wound on an FT 50-61 core and is designed for about 1200-Ohms impedance at 3.5 MHz, or about 54 microhenries per section. Twenty-eight turns bifilar, connected as shown, meet the requirement.

Construction is simplicity itself. As Fig. 9 shows, the switch is mounted on one side of the U-shaped channel of the box, the output jacks on the other. A thin aluminum cover with a hole for the capacitor lead covers the wire between coax connectors. The remaining part of the box mounts on the rear of the scope, so the unit is almost a plug-in device. Leads from the adaptor to the scope are kept short, partly by careful thought beforehand on parts arrangement. Construction can vary according to what is convenient in terms of your scope. The only rules to follow are the usual ones about short leads for rf.

The response of this adaptor is smooth across the ham bands from 80 to 10 meters, with no significant difference in the deflection of equal power signals among bands. Nor are there any peculiar peaks or other odd quirks. In short, the adaptor does its passive task tamely but effectively. Position 2 on the switch is used for the normal 100-Watt output from the rig and yields over an inch of deflection. Position 1 permits viewing of much lower power signals. The output from my SB-200 produces about an inch and a half of deflection in position 4, thus confirming that the capacitor choice is adequate for the most common range of ham signals. The scope which the adaptor feeds, incidentally, is an Eico 430.



Interior view of the adaptor shown in Fig. 8. The metal shield near the top covers the through line from transmitter to antenna, while the switch holds the capacitor-divider. The broadband transformer balun is mounted between the output jacks at the lower right. The small perfboard holds an envelope detector for synchronizing the scope's sweep.

Using the Adaptor

Synchronizing the monitored signal to the scope sweep is desirable but not essential to the observation process. It is useful and possible with CW dots or dashes sent at a constant rate (easily done with an electronic keyer) and with two-tone tests on SSB. For the usual Christmas-tree pattern seen in casual monitoring of SSB or for AM trapezoidal patterns, sync is useless. Nonetheless, the technique for deriving a sync voltage is simple in principle and deserves mention.

Fig. 10(a) shows a simple AM detector typical of those found in rf probes. With the isolating resistor, its output is very low, too low to drive the external sync connections on many scopes. The problem becomes clear in Fig. 10(b), block diagrams of two types of sync inputs. In one case, external sync is amplified before going to the sync limiter. In the other, sync voltage goes directly to the limiter. A small external sync voltage cannot drive the second circuit without further amplification. For two-tone testing SSB signals, an audio amplifier works well, but for CW, a dc amplifier is better. If your scope has a stable sweep oscillator, this additional circuitry adds little to the effectiveness of monitoring, but it does create a need for feeding power to the adaptor which is otherwise a passive device. For standard linearity patterns, of course, a pair of detectors is needed, but since the regular horizontal and vertical inputs of the scope are used for the test, no power source is needed.

Using the monitor is an easy process. Connected as shown early in the article, the adapted scope will dis-

Parts List

1	Single-pole, 5-position rotary switch	Radio Shack and other sources
1	FT 50-61 ferrite toroidal core #28 enamel wire (28 bifilar turns on core)	Amidon and other sources
2	SO-238 coax sockets	Radio Shack and other sources
2	phono sockets	Radio Shack and other sources
1	1.5k-Ohm, ½-Watt resistor	Radio Shack and other sources
1	40-pF silver mica capacitor	Available from mail-order sources such as Semiconductor Surplus
1	20-pF silver mica capacitor	
1	10-pF silver mica capacitor	
1	5-pF silver mica capacitor	
1	2.5-pF (or two 5-pF in series) silver mica capacitor	Note: disc ceramic capacitors with 350-volt or higher ratings will substitute for the silver micas
1	2¼" x 2¼" x 4" aluminum utility box	Radio Shack and other sources

Total cost: $10, if all parts new; under $5 with surplus and/or used parts.

play CW waveforms, plus two-tone and Christmas-tree SSB patterns. No better observation of CW make-and-break patterns has been invented, and the results of adjustments to component values become immediately apparent. With respect to observation of SSB, the simple adaptor technique might be considered somewhat archaic. A spectrum analyzer will in fact provide more sensitive indications of incorrect linear-amplifier adjustment. However, a spectrum analyzer is an expensive piece of equipment.

The two-tone test provides good indications of improper amplifier adjustment if the operator takes the time to become personally familiar with and sensitive to the meaning of the curves. Handbooks of a few years back provide ample drawings of various conditions of operation and their meaning.

Some recent materials on the subject have bent over backward to discredit our ability to read two-tone envelope patterns effectively. This is true only if we do not thoroughly learn the peculiarities of our equipment. The idiosyncrasies of each amplifier and each scope require that we make extensive on-the-air and dummy-load tests to discover at what point slight flattening of the pattern top, or slight curvature to the pattern sides, means distortion of our voices or adjustments of the drive or loading which are out of spec. We may not be able to match laboratory results, but we can keep our rigs well within FCC regulatory requirements and well within what courtesy to other operators dictates.

Despite the fact that rf adaptors for old audio scopes have been supplanted by more sensitive methods of monitoring, it will be a long time before we can all afford up-to-date test equipment. In the interim, a small investment (maybe $30 to $50 for a used scope and $5 for the monitor) can go a long way toward helping us put out cleaner signals. The tiny monitor box shown here (which might even fit inside some of the large old scope cases) makes the process of monitoring one step easier. I only wonder how small the next monitor design will be. ■

Digital Design: How to Interface ICs

Connect ICs to the outside world with these hints from the author of "Digital Basics."

The reader response to my three-part series titled "Digital Basics" (*73*, September through November, 1982) was overwhelming even to an old tech-writing hack like myself. In addition to receiving more than a dozen positive letters (and no negative ones), I received a consulting offer; writing for *73* surely pays!

One theme which popped up in about one-third of the letters was digital interfacing. Readers wanted to know how to interface various digital IC logic families with each other and with the "outside world." In this extension of the original series, we will discuss interfacing techniques and how they can be applied in practical situations.

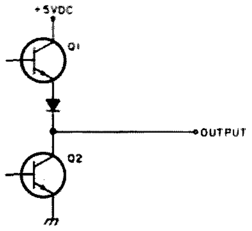

Fig. 1(a). TTL totem-pole output.

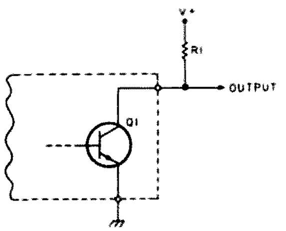

Fig. 1(b). TTL open-collector output.

Logic Family Outputs and Inputs

Most readers will be using either the transistor-transistor-logic (TTL) or complementary-metal-oxide-semiconductor (CMOS) and related MOS families. These will be the devices discussed in this article.

Before we can become too deeply involved in any discussion on interfacing, we must become familiar with just *what* is being interfaced. For digital electronics, this means a review of the input and output circuits of the devices, since these are what will be connected together.

The TTL logic family operates from a single-polarity dc power supply of +5 volts dc and ground. This supply must be regulated to keep the voltage within a narrow range—4.75 to 5.2 volts. Some texts permit slightly broader limits, but practical experience indicates that voltages lower than +4.75 volts cause erratic operation, especially of complex function devices, while potentials over about +5.2 volts lead to premature failure of large numbers of chips. I personally prefer to keep the potential within the even narrower range of +4.9 to +5.05 volts dc.

The TTL output stage is a *current sink* to ground, while the TTL input is a *current source*. Figs. 1(a) and 1(b) show two popular forms of TTL output, while Fig. 1(c) shows a typical TTL input circuit. The high and low logic levels in TTL are specified in terms of the voltages that satisfy the input requirements.

The high level will be anything between +2.4 volts and +5.0 volts. In most TTL devices, the output will produce a potential greater than +2.4 volts for high, but considerably lower than +5 volts; potentials in the 3.0-to-4.0-volt range are most frequently found. The low condition is defined as any potential between 0.0 volts and 0.8 volts, i.e., 800 millivolts. The region between 0.8 volts and +2.4 volts is undefined and is therefore to be avoided. One problem seen in some interfacing situations is the creation of a circuit that will not bring the outputs to within the defined high and low limits, thereby creating an unpredictable situation.

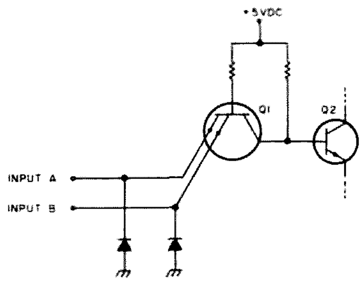

Fig. 1(c). TTL inputs.

One advantage of using IC logic elements is that we are free to avoid the problems of impedance matching (and other related headaches) when connecting the devices together in cascade. We can use the concepts of *fan-in* and *fan-out*. The term fan-in defines the load presented by any device in terms of standard TTL input loads. Since the TTL input is little more than a 1.6-milliampere current source, we define a fan-in of 1 as a current source of 1.6 mA, at standard TTL logic voltage levels. The fan-out is the drive capacity of a logic device defined in terms of the number of standard 1.6-mA TTL loads that the output will drive. In most devices, the fan-out is ten, so the device will successfully drive up to ten standard TTL loads. (In other words, it has

a 16-mA output current sink capacity.) Some special devices called *buffers* or *line drivers* typically will have fan-outs of thirty, but up to one hundred are known.

Most TTL devices have an output circuit such as the one shown in Fig. 1(a). The output circuit is a totem-pole power amplifier consisting of two NPN transistors. A blocking diode prevents current flow from the output terminal through Q1 to the +5-volt power-supply line. When the output is low, transistor Q1 is turned off and Q2 is turned on. This places the output line at or near zero volts. The actual potential will be the Vce(sat) rating of Q2, which may be as much as 0.8 volts. In the opposite condition, when the output is high, the opposite occurs: Transistor Q1 is turned on and R2 is turned off. This places a potential on the output line that is the +5-volt power-supply voltage less the Vce(sat) rating of Q1 and the junction drop of the series diode (normally 0.6 to 0.7 volts).

An alternate form of TTL output is the *open-collector* circuit of Fig. 1(b). The open-collector device is used to drive external devices and is a prime tool in interfacing with other logic families as well as with the "outside world." Transistor Q1 will be connected to the V+ (which is not always +5 volts, even though the package power-supply voltage must be +5 volts dc) through a pull-up resistor or another form of load. Normally, if a simple pull-up resistor is used for the load, we will need 2000 to 3000 Ohms for +5-volt power supplies, and proportionally higher for higher potentials. TTL devices with open-collector outputs include the following hex inverters: 7405 (+5-volt supply only), 7406 (to +30 volts at up to 30 mA), 7416 (to + 15 volts at up to 40 mA), and the following hex non-inverting buffers: 7407 (30 volts, 30 mA) and 7417 (15 volts, 40 mA). These devices are of prime concern for our interfacing chores. Note that certain other TTL devices also have open-collector outputs.

An example of a TTL input circuit is shown in Fig. 1(c). The device shown here is a two-input circuit as is found in each section of a device such as the 7400 two-input NAND gate. Each input will source up to 1.6 mA of current.

A CMOS inverter circuit is shown in Fig. 1(d). The typical CMOS device will have a pair of complementary MOSFET transistors connected in series with the output taken at the junction between the two. Transistor Q1 is a p-channel MOSFET, while Q2 is an n-channel MOSFET. These devices have opposite properties such that Q1 will be turned off (high-resistance channel) by a high applied to the input, while Q2 is turned on by a high on the input. Thus, for each different binary logic level, we will always have a series circuit consisting of a high resistance and a low (approximately 200 Ohms) resistance. For output-low conditions, there will be a high resistance to V+ (Q1 off) and a low resistance to V−(Q2 on). For the output-high condition, exactly the opposite occurs: there is a low resistance to V+ (Q1 on) and high resistance to V− (Q2 off).

Thus, we will see the CMOS output sink current on low and source current on high. Although this fact is not needed when interfacing CMOS-to-CMOS, it is useful for other interfacing chores.

The CMOS input is essentially an open circuit. CMOS devices operate using electrostatic fields derived in the channel from potentials applied to the gate terminal. This terminal is insulated by a thin metal-oxide layer and thus represents an immensely large resistance. Various

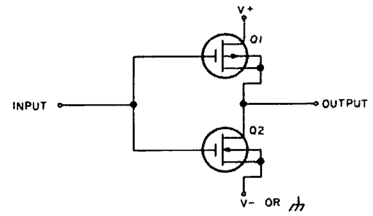

Fig. 1(d). CMOS inverter, showing inputs and outputs.

authorities quote not less than 1 megohm, with some going to 10^{12} Ohms. Thus, many CMOS devices can be driven from the same output with regard for current-driven capability. There may, however, be capacitance limitations, especially where a rapid rise time must be maintained.

Interfacing Between Logic Families

Fig. 2 illustrates some of the *circuit* situations required to interface between CMOS and TTL devices. Ordinarily, a single low-power (74L) or low-power Schottky (74LS) TTL device can be directly driven from a CMOS output, *provided* that the CMOS device is operated from a +5-volt power supply and ground. Normally, CMOS devices can operate with ±V of ±4.5 to ±15 volts dc; furthermore, these supplies need not be equal. We could, for example, operate from V+ =5 volts, and V− =0 volts (grounded). It is only this latter situation that will accommodate Fig. 2(a). Here the CMOS device will directly drive the 74L or 74LS TTL device. These TTL devices operate from lower current levels than does regular TTL.

Two specific CMOS devices will directly drive a single regular TTL input: the 4001 quad two-input NOR gate and the 4002 dual four-input NOR gate. See Fig. 2(b). Note that the B series CMOS (4001B) would probably drive more than one input.

Fig. 2(c) shows the use of the 4049 or 4050 devices. These devices are hex inverter and hex non-inverting buffers, respectively. They are specially designed to directly drive up to two regular TTL inputs (output current of 3.2 mA) *provided* that the 4049/4050 package is operated from +5 volts and ground, rather than some other V+/V− combination.

In Fig. 2(d) we see that a TTL output will drive a CMOS input (actually, several can be accommodated) provided that there is a current source. Recall that the TTL output wants to see a 1.6-mA to 16-mA current source for its load, while the CMOS input is an extremely high impedance. In order to keep the TTL device operating properly, we must pro-

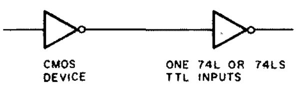

Fig. 2(a). CMOS-to-74L or -74LS devices.

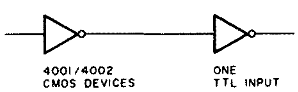

Fig. 2(b). 4001/4002 CMOS will drive one regular TTL load.

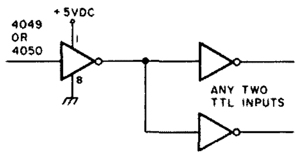

Fig. 2(c). 4049 and 4050 CMOS devices will drive up to two regular TTL loads.

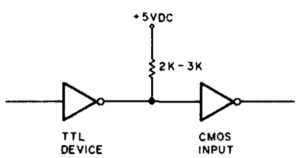

Fig. 2(d). TTL-to-CMOS (operated from +5 volt supply).

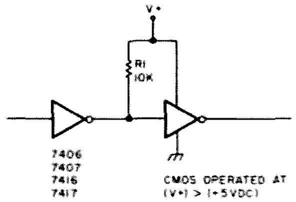

Fig. 2(e). TTL-to-CMOS (operated from V+ greater than +5 volts, and V− =0 volts).

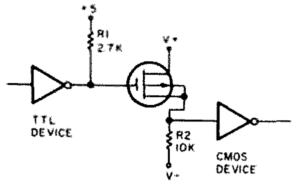

Fig. 2(f). TTL-to-CMOS (operated from ±V supplies).

vide a 2 to 3k-Ohm pull-up resistor between the TTL output and +5 volts dc. We must limit this method to those cases where the TTL voltage levels are compatible with the CMOS. If the CMOS device is operated from +5 volts and ground, then there is no problem.

Recall from the previous series on digital basics that the CMOS device output will go through a high/low or low/high transition when the input voltage is midway between the V+ and V− voltages. If, for example, the supplies are +5 volts and ground, then the transition occurs close to +2.5 volts. But, if the supplies are ±12 volts (or any other legal potential), then the transition occurs near zero. Similarly, if the potentials are V+ =12 volts and V− =6 volts, then the transition point is $\frac{1}{2}[(+12)-(-6)]=\frac{1}{2}(+18)$ or +9 volts. If this method were used in the latter case, the input of the CMOS device would jump back and forth between two "legal" low potentials, so the output

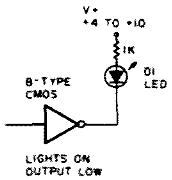

Fig. 3(a). CMOS light-on-output-low LED interfacing.

would never toggle. In Fig. 2(e) we show you how to deal with that problem.

For those cases where the CMOS device operates from power-supply potentials other than +5 volts and ground, we will need a circuit such as the one in Fig. 2(e). Here we will use one of the "high-voltage" hex inverter IC devices discussed at the beginning of this article: 7406, 7407, 7416, and 7417 are candidates; 7405 can operate only from +5 volts, so it is ruled out. Note that the package power-supply voltage for these TTL devices *must* remain at +5 volts only, but the voltage applied to the open-collector output transistor via the pull-up resistor can be up to the CMOS V+ limit of +15 volts dc. A 10k-Ohm pull-up resistor will suffice.

Fig. 2(f) shows how to interface the TTL device with CMOS devices that are operated from bipolar power supplies instead of V− = 0. In this circuit, we use a MOSFET transistor (or one section of the CMOS 4007 device) in between the two logic devices. Resistor R1 provides a current source for the TTL output, while R2 limits the MOSFET current to a safe value and develops the potential applied to the CMOS input. V+ and V− must be nearly equal.

Finally, in Fig. 2(g) we see a circuit that has a certain universality. In most cases,

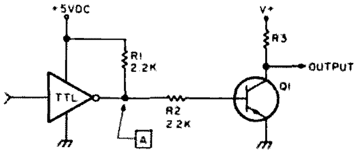

Fig. 2(g). Universal TTL to other logic devices.

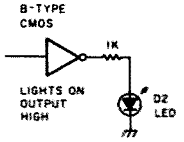

Fig. 3(b). CMOS light-on-output-high interfacing.

the function of this circuit will be to interface TTL to certain other higher-voltage logic families (such as CMOS operated from supplies over +5 volts, HNIL, HTL, etc.) In the majority of such instances, you will use a 7406, 7407, 7416, or 7417 device in place of transistor Q1, but this circuit may prove useful in some situations.

For example, in an existing device, there may be too little room to add an IC, but plenty of room to kludge on a 2N2222 or similar transistor. This situation turned up one time when I worked for a medical school electronics laboratory. It seems that one of the researchers had an elderly frequency/period counter that used zero and +12 volts as the logic levels, yet she wanted to interface this counter to a modern instrument that provided TTL output levels. The solution was to kludge R1–R3 and Q1 onto the PC board inside of the older instrument, and create a new input.

Register R1 is used, regardless of whether open-collector logic is used, and serves to provide a current for the TTL output to sink. When the TTL output is low, point A in Fig. 2(g) will be at zero potential, so the base of Q1 is turned off. Under this condition, the output is high (inverted). Similarly, when the output of the TTL device is high, the potential at point A is 3 to 4 volts, so it can bias the base of Q1 on. Under this condition, the transistor is saturated and will produce a low output. This method is useful so long as an inverted output is sufficient. Otherwise, cascade two similar stages. I

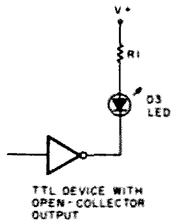

Fig. 3(c). TTL open-collector LED interfacing (circuit will also drive very-low-current lamps).

suspect, however, that any situation where cascading two Q1 stages is feasible will also permit the kludge of a 14-pin DIP, thereby making the use of the hex inverter the preferred method.

Interfacing Lamps and LEDs

Incandescent lamps and light-emitting diodes (LEDs) are often used in digital instruments to indicate logic status or to signal some event like the completion of a process, etc. The B series CMOS devices can often be interfaced directly with light-emitting diodes, provided that no more than about 15 mA of current will light the LED to an acceptable brightness (the usual case). The A series devices are not able to do this neat trick because they have as little as one-third the current sinking/sourcing capability of the B series devices.

Figs. 3(a) and (b) show the use of direct interfacing between a B series CMOS device and the low-current LED. The circuit in Fig. 3(a) uses the LED as a pull-up between the CMOS output and the positive power supply and will cause the LED to light on any output-low condition. The CMOS output in this case operates as a current source to ground. In Fig. 3(b), the LED is connected between the CMOS output and ground and will light only on output-high conditions. In this case, the CMOS output is used as a current source.

Fig. 3(c) shows the use of an open-collector TTL device to drive the LED. If V+

* OR V+ IF TTL IS 7406, 7407, 7416, OR 7417

Fig 3(e). Incandescent lamp interfacing with NPN transistor.

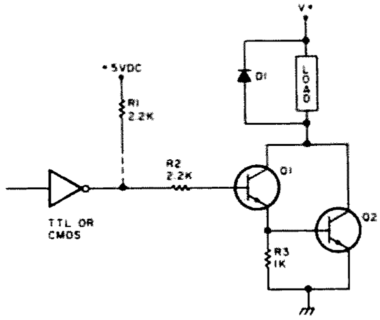

Fig. 4. Driving large loads using Darlington-pair transistors.

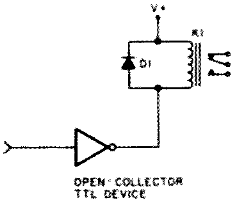

Fig. 5(a). Interfacing open-collector TTL to low-current relays.

is +5 volts, then the 7405 device may be used. The 7406, 7407, 7416, and 7417 devices may also be used at +5 volts or any potential up to the rated potential for the specific device (+15 or +30, depending upon type). Resistor R1 is used to limit the current through the LED and the TTL output to a safe value, usually 15 mA. The value of R1 is given by Ohm's law: $R1 = (V+)/I_{LED}$ or $V+/0.015$ if the 15-mA figure is acceptable. In this circuit, the TTL device operates as a current sink for the LED and will light on output-low.

Incandescent lamps typically draw a lot more current than LEDs. Some small current lamps ("grain-of-wheat" lamps) will operate directly from the 7417 TTL device, but most require too much current for safe operation directly from TTL. We can, however, use the TTL (or CMOS) device to drive a transistor switch that will, in turn, operate the lamp or other load. This situation is depicted in Figs. 3(d) and 3(e). In Fig. 3(d) we see the use of a PNP transistor to turn on the load. When the base of Q1 is made low, then the base-emitter potential is proper to turn on transistor Q1; current will flow in the c-e path to the load. If, however, the logic output is high, then the base-emitter voltage is nearly zero, so the transistor is cut off.

Fig. 3(e) shows the use of an NPN transistor for Q1. While the lamp in Fig. 3(d) will turn on for output-low, the circuit shown in Fig. 3(e) turns on for output-high. Again, either TTL or CMOS devices can be used, within certain limitations. One limitation applied to TTL devices is that a pull-up resistor (R1) be provided so that the TTL output sees a current source. For CMOS devices, we must use a transistor that has a high enough beta gain that it will saturate with the current available from the CMOS output. Resistor R2 is used to limit the current applied to the base of Q1. When the IC output is high, then a current flows in R2 that will turn on the transistor. Under that condition Q1 is saturated, so its collector will be at or near ground potential. This condition makes the load see a current flow, so if it is a lamp then it will light up.

Large loads, i.e., those of high current but limited voltage, can be accommodated with the circuit of Fig. 4. Here we extend Fig. 3(e) to account for the higher currents of the load. There are two transistors used in this circuit. In most cases, we will use a "driver" transistor such as the 2N3053 for Q1 and a "power" transistor such as the 2N3055 for Q2. Note that some semiconductor manufacturers offer TO-3 packages containing both Q1 and Q2 and term the combination "Darlington" transistors after the fact that the circuit in which these transistors are connected is called a "Darlington amplifier" or "Darlington pair."

The advantage of this circuit is the amplification of beta (H_{fe}) that occurs. The total beta is the product of the individual beta ratings, or: $H_{fe(total)} = H_{fe(Q1)} \times H_{fe(Q2)}$. If you recall your basic transistor theory, the beta is defined as the collector current divided by the base current, or I_c/I_b. For example, if the beta of Q1 is 80 and the beta of Q2 is 50, then the total beta is (80)(50) or 4,000. The implication of this is that the drive current need only be 1/4000 of the load current! Let's assume that there will be approximately 1.2 mA available to drive the Darlington pair when the TTL output is high. With a beta of 4000, the load current will be more than 4 Amperes! Of course, a transistor must be selected for Q2 that will "hack" the current of the load.

The diode shown in parallel with the load is advisable for all creative (capacitive or inductive) loads, and for most very high current loads. It is especially necessary in inductive-load circuits, for example, when the load is a relay or solenoid coil. The problem is the inductive spike produced by an inductor energized with dc when the circuit is interrupted. Under this circumstance, the energy stored in the magnetic field around the inductor will collapse and the counter-electromotive force generated will be opposite the polarity of V+ and will have a very high value (kilovolts are possible). If you have studied calculus, then you will see that $V = L(dI/dt)$ can reach a very high number in the situation where the current flow is abruptly terminated (dI/dt is negative and has a rapid fall time).

The diode is reverse-biased most of the time but will conduct when the CEMF potential is applied. Since the potential can easily reach hundreds of volts in practical situations, the diode must have a piv rating of 1000 volts or more. I recommend 1N4007 for all but very heavy inductive loads; for heavier cases, use series-connected 1N4007 devices with each diode shunted by a 470k-Ohm-to-1-megohm, ½-Watt, carbon resistor.

Fig. 5 shows two situations where electromechanical relays—those workhorses of electricity/electronics left over from the 19th century but still viable—are interfaced with digital IC devices.

In Fig. 5(a) we see the use of an open-collector TTL device for directly interfacing with a low-current relay. Some manufacturers offer low-current (40-mA and under) relays, both in regular relay packages and in packages resembling IC packages (both metal-can and DIP packages are available). Keep in mind the voltage and current limitations of the 7406, 7407, 7416, and 7417 devices listed at the beginning of this article.

For heavier relays, we will

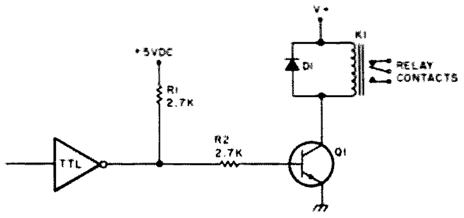

Fig 5(b). Interfacing TTL or CMOS to higher-current relays.

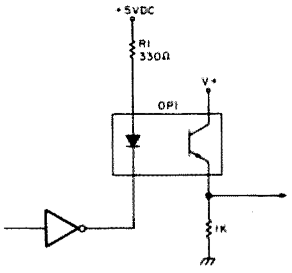

Fig. 6. Driving an isolated load.

use a switching transistor, as in Fig. 5(b). This is merely an extension of the earlier circuits. The diode transient suppressors are mandatory, however. If these are not used, especially in Fig. 5(a), the high voltage transient will blow the semiconductor.

Relays are used for many applications. Of course, if the current is too high to be conveniently handled by the semiconductor, then a relay is in order. But, today, we have numerous high-current power transistors and Darlington devices, so this application is fading. The isolation provided by the relay, however, makes it attractive whenever the logic device must be interfaced with a high-voltage circuit, or the ac power lines (115 volts ac).

Finally, we see one further method for providing isolation between a digital circuit and some outside-world load. There are devices called *optoisolators* (Fig. 6) available in which an LED and either a phototransistor or a photodiode are placed such that the LED will illuminate the transistor/diode (whichever). The pair is housed inside of an opaque DIP package that has the same 0.1" × 0.3" pinouts as the digital IC devices in the circuit. When the LED is turned on, i.e., when the logic device output is low, then the phototransistor base is illuminated, so the transistor is turned on. Under this condition, the output will be a potential close to V+. When the LED is extinguished, i.e., when the logic output is high, then the phototransistor base is turned off and there will be no voltage across the load resistor. In most cases, the dangerous isolated circuit will be on the transistor side of the optoisolator. In some cases, however, the dangerous side of the circuit will *send* the signal and thus will be on the LED side.

Conclusion

The advantages of digital logic are even greater when we can interface either between logic families or to the outside world. The techniques in this article allow us, among other things, to interface elderly digital equipment obtained on the surplus market to modern equipment, or to interface essentially non-digital circuits (control) that are still binary in nature to some digital instrument. For example, a trivial case would be the push-to-talk circuit on a transmitter. As another example, the transmitter control circuit on a linear power amplifier could be placed under control of a computer in which the digital interfacing is between a 3.2 mA (fan-out = 2) output port terminal and the radio equipment. Lots of luck. ■

Emulate an EPROM Elephant

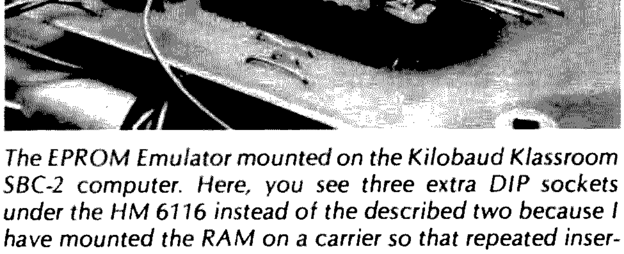
The portable RAM-faker never forgets. Well, hardly ever. . .

Members of the 2716 family of erasable, programmable, read-only memories (EPROMs) are extolled as the hobbyist's friends because of their ease of programming, either with a simple manual programmer or by microcomputer control. However, in the literature also appears a recurring theme of inconvenience. For example, you could spend four or five hours toggling in data with a manual programmer only to make a mistake in bit 16,383. What is the fix? Erase all 16,384 bits of the EPROM and begin again. Totally unacceptable! Even repeating 20 minutes of data input with a hexadecimal keyboard is too much!

Or maybe instead you eventually want a program in an EPROM but you want to try the program first before it is burned for posterity. The "EPROM Emulator," a RAM that pretends it is an EPROM, can help you.

The HM 6116 static RAM is almost pinout-compatible with the 2716 EPROM. Where the HM 6116 puts the WE on pin 21, the 2716 has Vcc pulling pin 21 high. All other pins are identical. This first suggests that empty EPROM sockets could be filled with 2K bytes of RAM to extend a small computer's memory. From here the CMOS construction makes the idea of battery backup of RAM data practical. Then the next logical step is to build a small package containing RAM with battery backup which can be programmed at full computer speed, data modified at will, but which can be removed from its socket without losing its data, placed in another socket in the same or any other computer wired for 2716 EPROMs, and used as an EPROM. Once the program is debugged and running satisfactorily in the Emulator, it can easily be copied into a 2716 for a permanent record.

A few simple modifications are made to the basic RAM circuit to make it emulate the EPROM. The Vcc must be applied through steering diodes so that the memory will see only one supply source at a time. Output enable (pin 20) is made continually low by at-



The EPROM Emulator mounted on the Kilobaud Klassroom SBC-2 computer. Here, you see three extra DIP sockets under the HM 6116 instead of the described two because I have mounted the RAM on a carrier so that repeated insertions will not hurt the RAM pins. I then can use the memory without the Emulator circuit most of the time.

Parts List

- 1 Switch, DPDT, Radio Shack 275-626 ($2.69)
- 2 Diodes, 1N914, Radio Shack 276-1620 (50 for $2.99)
- 1 Resistor, 100k Ohms, ¼ Watt (5 for $.49)
- 2 24-pin DIP sockets, Radio Shack 276-1989 ($1.69 each)
- 1 HM 6116 CMOS static RAM ($16.50 Quest; $14.95 James)
- 2 Batteries, 1½ volt

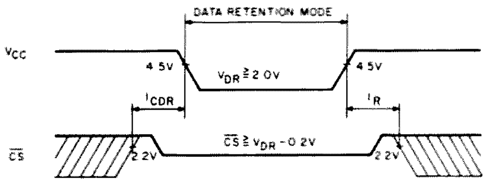


Fig. 1. Low Vcc data-retention waveform.

taching it directly to pin 12 and disconnecting it from computer pin 20. The low Vcc data-retention mode needs the chip select held at Vcc to retain the data. This is achieved with a pull-up resistor connected to memory pin 24 and a switch to disconnect the $\overline{CS}$ from external circuitry when in the data-retention mode. To enable the computer to write to memory, pin 21 is disconnected from the computer and brought out to a clip lead so that pin 21 can be connected to the computer $\overline{WE}$ line instead of being forced to Vcc in the 2716 socket. When used as a 2716, the $\overline{WE}$ line is attached to Vcc so that accidental and catastrophic writes do not occur.

These connections can be made using a small PC board to hold the components and using wire-wrap wire to make connections. I use masking tape as a PC board etch resist and cut away the tape where copper is to be removed. This is quite satisfactory for simple circuits such as this. The board then is epoxied between the pins of the bottom DIP socket and makes a secure foundation for the rest of the circuit. The components are attached to the copper side of the board facing up. Some miniaturization enthusiast could even find a way to store watch batteries in the case to make a one-box unit, although I am using an external battery pack.

To use the Emulator, I insert it into a 2716 EPROM socket with the switch set to battery supply. (It must never be inserted into the computer with the computer supply off if the switch is in the computer-supply position. The result would be a quickly-discharged battery.) The computer is then turned on and the Emulator switched to computer power. It can then be used either as RAM or ROM depending on the $\overline{WE}$ connection.

Construction

The EPROM Emulator is built on two 24-pin DIP sockets and a small PC board. This serves as the support for the HM 6116 RAM package.

1) Pin 20 of the bottom socket is removed.
2) Pin 20 ($\overline{OE}$) of the top socket is connected with a piece of wire to pin 12, the common pin.
3) Pin 18 ($\overline{CS}$) of the top socket is bent in so that no contact is made with the bottom socket. It is connected through a resistor to pin 24 of the top socket and through half of the DPST switch to pin 18 of the bottom socket.
4) Pin 21 of the bottom socket is removed.
5) Pin 21 of the top socket is connected to the computer $\overline{WE}$ line with a flexible wire and clip.
6) Pin 24 of the top socket is bent in and made to contact the PC board land to which the diode cathodes are connected.
7) Pin 24 of the bottom socket is connected to the anode of diode D1 to provide computer Vcc.
8) The second half of the DPST switch is connected across diode D1.

With the switches closed, the computer Vcc powers the memory and allows the computer to select the

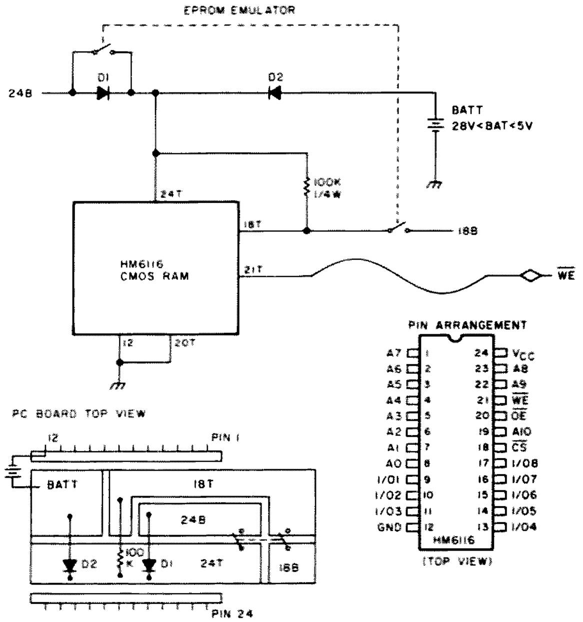

Fig. 2. The Emulator schematic. PC board is not to scale. Letters after pin numbers are B for bottom socket, T for top socket.

RAM for either a write or read. With the switch open, the battery backup can power the memory and forces $\overline{CS}$ to be at Vcc backup, putting the chip into its low Vcc data-retention mode. ■

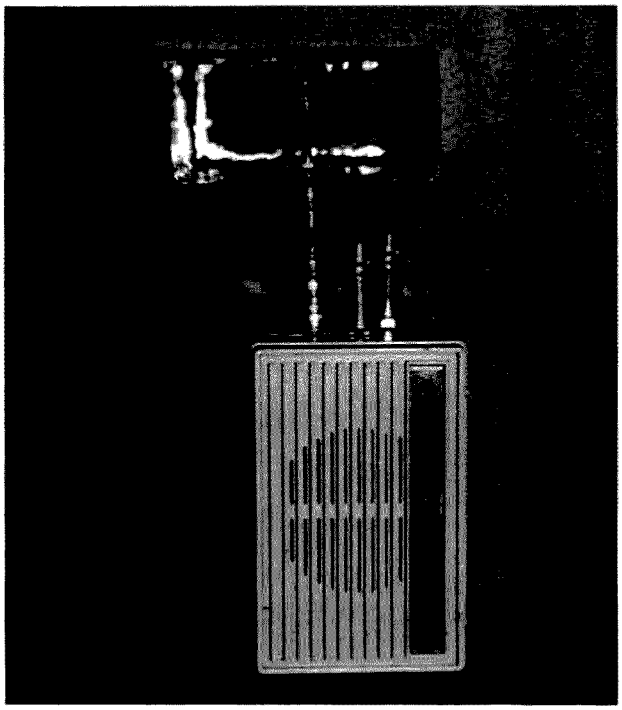
Crystal Microwave

"Easedropping" on this part of the spectrum is up to you. Here's a simple way to start.

Interest in the microwave spectrum has increased rapidly since the introduction of the "Gunnplexer" by Microwave Associates. Many amateurs, though, have expressed interest in finding a more economical way to get started. What I hope to accomplish with this article is to show how to get involved in microwaves with a minimum investment of time and money.

The microwave spectrum is populated with myriads of signals, ranging from telephone relays to television-studio links to radar to satellite signals. How can we detect and monitor these signals? The simplest way is with a crystal receiver. Don't scoff. I know of several production microwave systems that use crystal detectors or crystal video receivers as they are called. The common police radar detector is a special type of crystal video receiver.



Front view of S-band unit showing diode placement.

A crystal receiver can be broken down into four basic parts: an antenna, a tuned circuit, the detector, and an amplifier (see Fig. 1). The most common tuned circuit is not really a tuned circuit but a high-pass filter, a waveguide. In this mode, the antenna and tuned circuit can be combined. If the detector is mounted in the waveguide, then the only external component is the amplifier.

Rectangular waveguide will pass all frequencies above a cutoff frequency (f_c). The cutoff frequency is determined by the internal width dimension of the waveguide. The cutoff frequency occurs when the internal width is exactly one-half wavelength. A simple formula for calculating this is $f_c = 15/b$, where b = internal width in centimeters and f_c = cutoff frequency in GHz. For example, the most common waveguide for the 3-cm amateur band (10 GHz) has an internal width of 0.9 inches or 2.29 cm. Hence, $f_c = 6.55$ GHz.

If the frequency is raised such that the width is now one wavelength, the guide can support another mode. This occurs at $f = 2f_c$. So, the maximum stable frequency range is from f_c to $2f_c$. Well, if you consider skin losses and other factors, the practical frequency range is

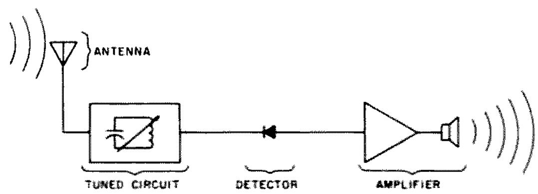


Fig. 1. Basic elements of a crystal video receiver.

from 1.25 f_c to 1.9 f_c. For the previous example, the practical or useful frequency range is 8.19 GHz to 12.44 GHz. This is in good agreement with the published range of 8.2 GHz to 12.4 GHz. Fig. 2 is a graph of the upper and lower practical frequency range of rectangular waveguides having internal widths from 2 cm to 18 cm.

The graph is not meant just to enable you to determine the frequency range of a piece of surplus waveguide. It will also enable you to decide how wide to make a piece to use. Yes, you can make your own waveguide and do it without a machine shop. Waveguide can be made from flashing copper, brass shim stock, or, my favorite, printed circuit board. To illustrate, I made a crystal video receiver to monitor several radars located near my home.

There are three S-band search radars within 20 miles of my home. The term S-band refers roughly to any frequency between 1.5 GHz and 5 GHz. Table 1 is a listing of these informal designations. Table 2 is a listing of some microwave frequency ranges of interest. The local search radars are grouped from 2.7 GHz to 2.9 GHz.

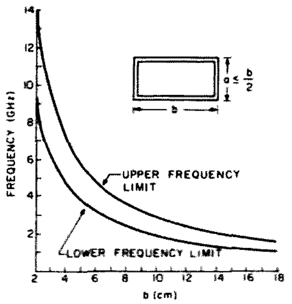

Fig. 2. Upper and lower frequencies shown for rectangular waveguides.

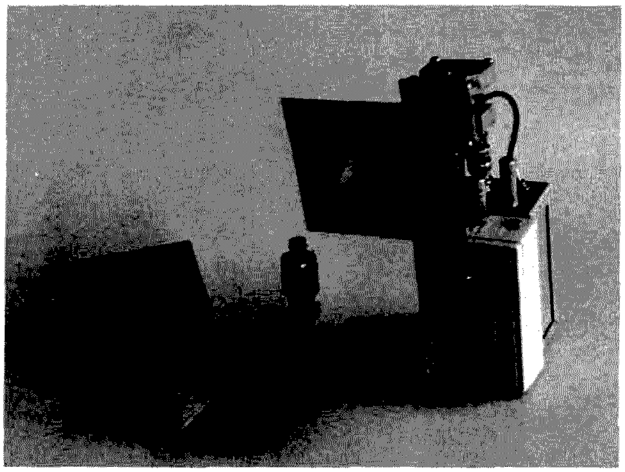
Hence, from Fig. 2, the waveguide should have an internal width between 6.9 cm and 9.5 cm. I chose 8 cm as a compromise. The internal height should be one half or less than the internal width. The guide height determines the impedance and power-handling capability of the guide. The useful frequency range of the 8-cm guide is approximately 2.4 GHz to 3.6 GHz. This range just happens to include the amateur 2400-MHz and 3300-MHz bands. Higher frequencies can travel or propagate down the guide, but the mode structure would be uncertain. I mention this because the guide will pass X-band signals and you should not be surprised to hear them.

For a crystal receiver, I prefer to make the guide 1 to 2 widths long. For the example, the guide is 9.5 cm or 1.125 widths long. This length was chosen on the basis of available pieces of circuit board. Since the receiver will not be used for a specific frequency but rather for a band, I mounted the BNC connector and detector one-half guidewidth from the shorted end.



Detector/amplifier with X-band head and nearby S- and K-band heads.

Construction is simple. The circuit board material is easily sawed or sheared to size. The BNC mounting holes and the opposing diode hole are drilled next. The guide is taped together and the seams are soldered with a 100-/150-W iron. After assembly, the diode is placed inside and soldered. No bypass capacitor is used. I find that normal construction techniques are adequate to block the microwave energy and pass only the modulation. Surplus mixers have a very efficient bypass scheme and function well as crystal receivers. I use an X-band mixer to monitor small marine radars in the harbor.

The weak detected signal is boosted by the amplifier shown in Fig. 3. An LM301 is used instead of the more common 741 because of the lower noise output of the LM301. The output of the amplifier is further boosted by Radio Shack's "Mini Amplifier-Speaker." The low current drain of the amplifier makes it inviting to obtain its power from the mini amplifier, but problems with

Band Designation	Freq. Range (GHz)

motorboating forced me to use an independent battery. The compact assembly is quite portable and accompanies me on short outings.

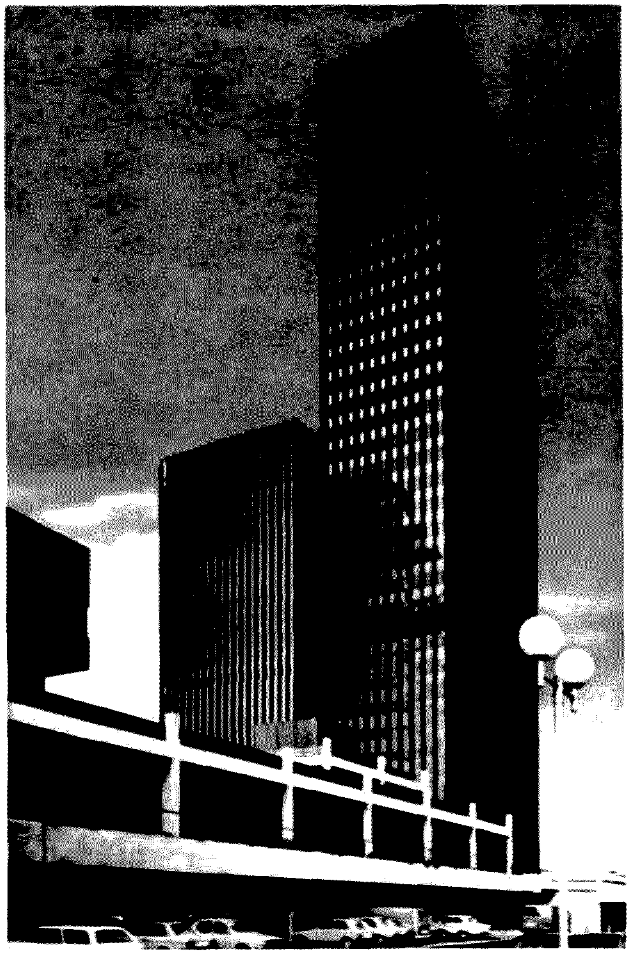
Waveguides are not the only usable form of crystal receivers. For narrowband signals, a separate antenna, tuned circuit or cavity, and detector might be better. Preamplifiers, if available, greatly enhance the overall sensitivity.

Try something simple and build one of these. This might be the easiest microwave construction article yet. Let me know what you build and how it worked, and please remember to enclose an SASE! ■

Take a Trip to Europe

These tips from the world's top SWL make it possible.

Roger N. Peterson
25 Orchard Lane
New Canaan CT 06840



The programs you hear from West Germany emanate from this brand-new Broadcasting Center of Deutsche Welle in Cologne.

Want to visit a ski resort in Switzerland? Listen to a concert in Vienna or the Scots Guard's Band on parade in London? Or go behind the Iron Curtain to hear the latest word from the Kremlin?

You can experience all of these and much more by tuning to the European shortwave broadcasters. With more than thirty stations daily sending out broadcasts in English, you have a wide variety of programs to choose from. And most are heard easily on even the most modest receivers here in North America.

The majority of these stations are state-owned and/or operated and all but one are noncommercial. Some—particularly those located in Eastern Europe—can fill your ears with propaganda, but even some of these broadcasters can offer good programs to listen to. Others, like the BBC from London, Radio Netherlands, and the Swiss Broadcasting Corporation, produce a multitude of excellent programs every week with practically no political undertones.

With so many stations and programs to choose from, you should easily be able to discover some of particular interest to you.

Are you interested in programs giving the latest DX news? There are some good ones coming out of Europe every week. The best is probably from Radio Netherlands, where every Thursday night they broadcast the popular *Media Network*. The producer, Jonathan Marks, talks with a network of correspondents in various parts of the world, examining developments in the electronic media on both the technical and the programming side. In addition to reporting changes in broadcasting frequencies by stations all over the world, *Media Network* does an excellent job of keeping listeners informed about new receivers, antennas, and other equipment for the shortwave enthusiast. Hear this on 9.590 or 6.165 MHz at 0230 GMT and 9.715 and 6.165 MHz at 0530 GMT Fridays.

Another excellent DX program comes from Switzerland—*The Shortwave Merry-Go-Round*. This features the "two Bobs," Bob Thomann and Bob Zannotti. This team answers letters with technical questions, reports on new developments in antennas and receivers, and carries on lively discussions about the state of the art. This program is on twice each month—on the 2nd

and 4th Saturdays. Hear it at 1315 GMT on 21.570 or 25.780 MHz.

Radio Sweden International brings you another fine DX program, *Sweden Calling DXers*. This is on every Tuesday and Wednesday and gives you a whole list of new or changing frequencies for stations all over the world. It is one of the best for keeping your "where to tune to" list up to date. Hear it Tuesdays at 1415 GMT on 21.615 MHz or at 2315 GMT on 9.695 and 11.705 MHz, and on Wednesdays at 0245 GMT on 9.695 and 11.705 MHz.

Radio Sofia from Bulgaria is the one broadcaster from behind the Iron Curtain that is worthwhile listening to for its DX program. It is particularly good for radio amateurs, giving club news from around the world and holding contests. You can hear it on Mondays at 0045 GMT on 9.700 MHz.

There are some nine or ten other DX programs coming out of Europe, but at this writing, the ones mentioned above are by far the best. Belgium has a nice little program on Mondays at 0045 GMT on 11.695 or 9.870, and Austria has an excellent program on Sunday mornings at 1230 GMT on 21.615 MHz.

The Spanish Foreign Radio from Madrid broadcasts a number of frequency changes and other DX matters on Mondays at 0050 on 11.880. Reception is usually excellent here in North America. And Radio Prague from Czechoslovakia has a DX show that features news and information for radio amateurs. It is very elementary, however, and most listeners won't gain much knowledge from its usual fare. The program is on Fridays at 0135 GMT, on 5.930 or 9.630 MHz.

World and local news are popular with experienced European shortwave broadcast listeners. Almost every station broadcasts news, usually at the start of their programs. Some attempt to cover the world while others tend to stay strictly with news of their own countries or sections of Europe.

The leader in news programs, by a wide margin, is the British Broadcasting Corporation (BBC). They broadcast more than 250 news programs a day from their London headquarters. News is fed to their editors from BBC correspondents located all over the world, and from their world-famous Monitoring Service which provides round-the-clock reports on what foreign broadcasters are saying over the air. This service is so popular that the BBC sells it to subscribers—other foreign broadcasters, governments, news agencies, etc.

You can hear world news in English from the BBC 16 times a day. It is broadcast on the hour except for the GMT hours of 0100, 1000, 1200, 1400, 1500, 1900, 2100, and 2200. If you are interested in local Great Britain news, listen daily at 0009, 0309, 1109, and 1809 GMT, and, on weekends, also at 0709 GMT.

The BBC has many other news-related and special-news programs such as British Press Review, Financial News, etc. A BBC buff could spend 24 hours a day listening to their programs, many of them about current affairs.

The other European stations that broadcast world news are West Germany, Radio Netherlands, Swiss Radio, Spanish Foreign Radio, Radio Portugal, Belgium, Austria, and a whole slew of Iron Curtain broadcasters. Few people would bother to tune to these stations for

These modern broadcasting facilities of Radio Netherlands at Hilversum, Holland, bring you some of the best English-language programs from Europe.

their world news alone as, for the most part, they are not in the same league as the BBC. There are, however, occasions when it does pay to tune to one of these countries. Those would be when particular news events take place in that country or area: earthquakes, revolutions, invasions, big fires, etc. This is when shortwave listening really comes into its own. You can get the story firsthand and often before the international wire services get it to your local AM radio or TV newscasters.

Some European shortwave stations skip world news entirely and stick to reporting localized news. The Scandinavian broadcasters are good examples. Rather than try to compete with the BBC for world news reporting, Radio Sweden broadcasts news only about that country. The Norwegians and Finns do likewise. (The Danes do not broadcast any English language programs, so I have no idea how they report the news.)

You can, of course, get local news from the stations that also broadcast world news, but often, as is the case with the BBC, it comes in separate and distinct programs such as the daily "News About Britain" and the weekly "Letter from London" programs.

Listeners to Europe generally either concentrate on a few select stations or on certain types of programs that appear on a number of different stations. It all depends on the listener's background or interests. If family ties are to a certain country or if travel or being stationed there during time in the service generates interest, these may be reasons for listening. Other listeners stumble onto certain stations as they tune around the frequencies and find that certain programs grow on them.

Most of the European stations try to broadcast to the US in so-called "prime time." This is the period between 0000 GMT and 0430 GMT. This is to catch the maximum number of listeners in their evening hours. Many stations will have two broadcasts of the same program, one at the earlier hour to catch East Coast listeners and the other at the later time to pick up the West Coast.

There are exceptions, like Radio Finland, which directs its broadcasts to North America only in the mornings. And some of the "powerhouses" like Radio Moscow and the BBC can be heard at almost any time.

A recent survey among shortwave listeners indicated their favorite broadcasters. The question simply asked, "What is your favorite shortwave broadcast station?" The results, in order of popularity, were as follows for European stations:

1) BBC
2) Radio Netherlands
3) Swiss Radio
4) Deutsche Welle (W. Germany)
5) Spanish Radio
6) Austrian Radio
7) Radio Moscow
8) Radio Finland
9) Vatican Radio
10) Radio Sweden
11) Radio France International

Your choice may be different. If you haven't listened to European broadcasters lately, here in alphabetical order are brief outlines of what you can expect to hear from each. See table for best frequencies and times of broadcasts.

● *ALBANIA (Radio Tirana)* —Unless you have some special interest in this country, this station is not likely to become one of your favorites. Mostly political discussions.

● *AUSTRIA (Austrian Radio)* —One of the better stations to listen to. You can hear it every night with news followed by a feature program. Additionally, Mondays are for answers to listeners' letters, Tuesdays are for sports, Fridays have music, and Sundays feature tourist attractions. This station is presently upgrading its transmitting equipment and should be easier to receive in the months ahead.

● *BELGIUM (BRT)*—Has the usual news programs first and then various features, many dealing with the European Common Market which is headquartered in Brussels. You can hear their DX program on Mondays at 0100 GMT.

● *BULGARIA (Radio Sofia)* —Their best program is their DX news on Mondays at 0045 GMT. The rest is pretty much "party line" discussions of politics.

● *CZECHOSLOVAKIA (Radio Prague)*—Many listeners feel that this is the best of the Iron Curtain broadcasters. While it has its share of political discussions, it also has a number of interesting shows that are free from that taint.

● *FINLAND (Radio Finland)* —This is one you catch in the morning hours, and reception is usually good. They start with news about Scandinavia called *The Northern Report* and then switch over to various feature programs, including pop music.

● *FRANCE (Radio France International)*—You can hear this one only in the early afternoon hours, and then you are listening to their broadcast to Africa—the only program they offer in the English language. Much of their programming is devoted to listeners' interests in Africa, such as Third World countries. Rumors persist that RFI will increase En-

glish programming, but so far this is all they offer.

● *E. GERMANY (Radio Berlin International)*—A typical "Iron Curtain" country broadcaster. Lots of news, all with political implications.

● *W. GERMANY (Deutsche Welle)*—Excellent news broadcasts and interesting current-events discussions. If you like music, listen on Saturday evenings. Want to learn German? They have a language course on Sundays.

● *GREAT BRITAIN (BBC)*—Besides news and current events, this station offers a whole slew of other programs including both jazz and concert music, short stories, and dramas. One of their most popular programs originates here in the US where Alistair Cooke tapes his *Letter from America*. There is something for everyone during the 24 hours of broadcasting by this station.

● *GREECE (Voice of Greece)*—Probably will be of interest only to those with special ties to the country or area. Can be interesting when one of the frequent quarrels with Turkey comes up or Cyprus erupts.

● *HUNGARY (Radio Budapest)*—Sometimes, but not often, you can hear an interesting program. I would rank it about in the middle as far as Iron Curtain SW broadcasters go.

● *ITALY (RAI)*—If you are a lover of music, this is the station for you. They have opera, Italian folk music, and "pops." Also, programs on other aspects of Italian culture and life. One of the better European stations.

● *LUXEMBOURG (RTL)*—This is a rare one, a commercial station that you can hear from Europe. It beams its programs to London, and you can hear commercials like those on a US AM or FM station. The programs are all "mod" music.

● *MALTA (Xandir Malta)*—This little station is heard only once a week, on Saturdays, and at an impossible hour for most of us here in North America (0700-0800 GMT). Not much to recommend, but if you can't sleep some Friday night, give it a try.

● *MONACO (TWR Monte Carlo)*—Another one with very late hours for North American listeners. This is a religious station and the programs are all in that mode.

● *NETHERLANDS (Radio Netherlands)*—Many fine programs to hear on this popular European station. On Sundays, host Tom Meyer has the *Happy Station* show. Mondays feature life in Holland. Tuesdays is *Shortwave Feedback* which answers listeners' letters. On Wednesdays listen to *Dutch Spot* on a magazine-format program about events in Holland. Thursday is devoted to that very popular DX program, *Media Net-*

work. Friday features *Opinion* and discusses some of the views of the Dutch press. Saturday is a light program with talk and music; it is pleasant listening all the way.

● *NORWAY (Radio Norway)*—This is one you have to catch on Sundays since that is the only time they broadcast. Some good programs for people interested in traveling there some day and also interested in good music.

● *POLAND (Radio Polonia)*—Not the best of reception for most of its programs. But then the programs aren't anything to write home about, anyway.

● *PORTUGAL (Radio Portugal)*—Their first program isn't on until 0300 which makes it pretty late for East Coast listeners. While their programs are not particularly earth-shattering, it is a pleasant station to listen to and most programs are non-political.

● *ROMANIA (Radio Bucharest)*—Has some interesting programs. *DX Mailbag* is on Wednesdays, and other DX programs are on Mondays and Fridays. Tuesdays they have a very interesting *Tourist News* program that makes you want to visit the country. Interested in stamp collecting? Tune in on Sundays for a special program on this hobby.

● *SPAIN (Spanish Foreign Radio)*—Another one of the top European broadcasters providing good listening on most nights. Reception is consistently good, too. Their DX program is on Mondays at 0050 GMT.

● *SWEDEN (Radio Sweden)*—Another good one from Europe. Aside from their DX program, already mentioned, they have a very fine program on the weekend called *Saturday from Stockholm.*

● *SWITZERLAND (SRI)*—One of the most popular of all from Europe. While their weekday programs, primarily news and background, are good, their weekend programs are superior. On the second and fourth Saturdays, listen to their popular DX programs—among the best on the air. On Sundays they have a new program called *Balance Sheet.* This is about Swiss business. Don't think, however, that it is dry statistical reporting. Instead, it is a very lively description of Swiss industry. Recently, for example, they had a very interesting program on the Swiss chocolate industry. Another one brought us up to date on clocks and watches.

● *USSR (Radio Moscow and Radio Kiev)*—Many people listen to Radio Moscow just to hear their viewpoint on world affairs, US diplomatic steps, etc. One of their most popular programs is called *Listeners' Forum* and you can hear this on Sundays at 0010. Right after this comes *Russian by Radio,* if you have any interest in learning to speak their language. Another good program is *Round about the USSR,* heard on Tuesdays and Saturdays at 0210 and 0510.

Radio Kiev is preferred by many people over Radio Moscow. Weekdays provide the usual news followed by feature programs—most political. They have a DX program on Wednesdays which is pretty good, but perhaps their best program is on Sundays when you can hear *Music from the Ukraine.*

● *VATICAN (Vatican Radio)*—You can hear it every evening, even though it is on for only 16 minutes. Programs express Vatican opinions on current events and other matters.

● *YUGOSLAVIA (Radio Yugoslavia)*—Strictly news, and all handpicked for political implications.

So there you have it. There is a wonderful choice of programs from Europe in English just waiting for you to tune in. Most are easily heard and offer you entertainment, education and/or enlightenment. With your shortwave receiver, you can travel to Europe every day. ■

Four Bands, One Whip

Quadruple your mobile operating pleasure, please, but don't blame us.

Did you ever want to change bands while operating mobile but didn't want to stop in the rain to change resonators? Now you can change bands without a thought about your mobile antenna. How about a bandwidth as much as one megahertz (see Fig. 8), with swr of no more than 1.5:1? You can build this mobile antenna for a fraction of the cost of a commercial mobile antenna. The materials are readily available and are not costly.

A Look at the Basics

The six-foot mast is constructed from ½" copper water pipe. The overall length is not critical, but signal reception will suffer at anything much less than a five-foot mast length. If you own a Hustler or similar mast, you already have the first part of your new multiband mobile antenna.

Multibanding is obtained by the use of multiple LC circuits—one for each band desired. A typical mobile antenna has resonators (LC circuits) with an adjustable whip. The adjustable whip is actually the C of the resonant LC circuit. You might think of such a mobile antenna as shown in Fig. 1.

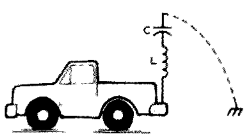

Fig. 1. Top-loaded mobile antenna.

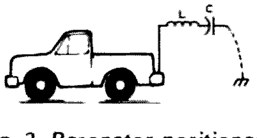

Fig. 2. Resonator positioned at 90° (vertical polarization retained).

Adjusting the whip changes the C and raises or lowers the resonant frequency. A tip: In general, a greater amount of capacitance will result in a greater bandwidth. These mobile antennas are "top-loaded," i.e., the LC circuit is at the top of the antenna and, for all practical purposes, the only part of the antenna that radiates is that portion *below* the resonator. That is the reason you should make the mast as long as is practical. Since the whip is basically C, why stick it up in the air where it will just give your antenna increased ability to reach all those nearby objects—trees, carports, etc.? You can actually place a typical resonator at a 90° angle to the mast and probably notice no difference in performance, although tuning may change slightly. This could present an eye hazard or you might even spear a bird. Let's look at this change as shown in Fig. 2.

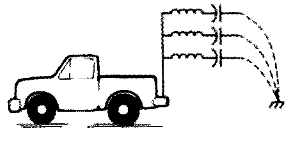

Fig. 3. Multiband antenna setup.

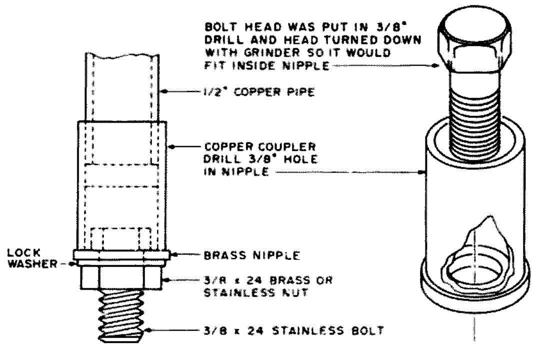

Fig. 4. Mast-to-mobile attachment.

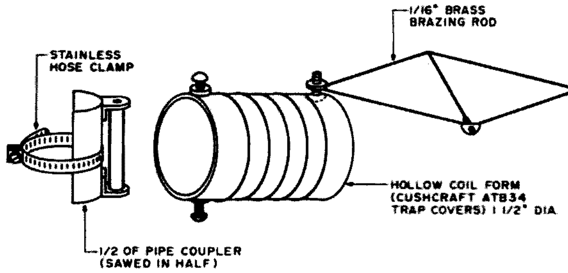

Fig. 5. Details of mounting bracket.

Capacitance does not have to come in the form of a whip. Two wires in the shape of a V form a capacitor proportional to the area within the V. The V is easy to adjust (change C). In fact, I used exactly this method in my initial experiments. It doesn't work too well for actual mobile use because the V is not rigid during vehicle motion and the vibration of the V causes fairly wide and constant changes in resonance.

Now that I had decided to place the LC in a horizontal position, I also decided to multiband the antenna by using more than one LC circuit. The configuration now becomes that shown in Fig. 3.

I am currently using four LC circuits on my mobile antenna, but you can use one, two, three, four, or more. I haven't tried five yet, but that's one of the next steps. The LC for the lowest frequency should be at the top of the mast with the next higher frequency below that and so on.

Mechanical Construction

The idea for the mast came from an article in *73 Magazine* (February, 1979, p. 42). I used non-ferrous materials to avoid any rust problems. The mast itself is a six-foot length of ½" copper water pipe. The details of the fitting which attaches the mast to your mobile mount are shown in Fig. 4. I used a brass end cap through which I drilled a 3/8" hole for the 3/8" × 24 stainless steel bolt. The brass end cap is considerably stronger than the copper end cap used in the *73 Magazine* article. However, it does require that the head of the bolt be reduced to allow it to fit in the inner diameter of the brass end cap. I simply chucked the 3/8" × 24 bolt in my 3/8" electric drill and used my shop grinder on the bolt head while letting the drill rotate the bolt for a nice even "machining." The end cap is assembled with a bronze or stainless steel lock washer and a brass or stainless steel nut. If you have any difficulty in finding a stainless steel bolt, you might try a local boat or marine dealer.

The end cap is assembled to the mast with an ordinary copper sleeve and soldered with a propane torch. Do a good job here because there is a lot of force at the base of the mast. I use a rigid mount and do not tie or guy my antenna. Now we close the end of the mast to keep out water. I soldered a flat piece of copper to the end of the mast.

LC Construction

I used some spare trap covers from my Cushcraft HF antenna for the supporting structure for the inductor and capacitor. These trap covers are thin and do not offer much wind resistance as the wind flows through them. They are probably a phenolic material, which is very suitable for an inductor form.

The part which kept me from building the antenna for over a year (I love to procrastinate) was deciding how to fasten the LC circuits to the mast. Fig. 5 and Photo A show the construction details of the mounting bracket. I cut a copper sleeve in half longitudinally and brazed copper tabs to the half coupling. Copper for the tabs was obtained by splitting a short length of copper pipe, opening it up, and flattening it with a hammer. (I had four feet of copper pipe left after cutting six feet off for the mast, so the material was handy.) The tabs were bent 90° and a piece of ¼" copper tubing was brazed between the 90° tabs so that the inductor form would not be crushed when attaching it to the bracket. Brass nuts, 6" × 32, were soldered to the top and bottom of the bracket. You might want to use one long screw to attach the whole assembly and not be bothered with the brass nuts.

A word about brazing the copper parts: The high heat anneals the copper. It becomes soft and I have had one bracket fail due to the vibration. It lasted over eight months and over 20,000 miles. The 15-meter LC was made with #12 copper wire and was quite heavy. You might solder or silver solder your bracket or find an even better method of attaching the LC assembly to the mast.

I have made inductors using #12, #18, and #20 wire. The #12 wire is quite heavy for a 20-meter LC circuit and probably impractical for a 40-meter LC circuit. The #20 wire gets warm when using a steady carrier but has caused no problem with SSB. If you run a kilowatt mobile, the #12 wire should do just fine.

The capacitance was added by using 1/16" brass welding rods. I chose the modified rhombic because it did

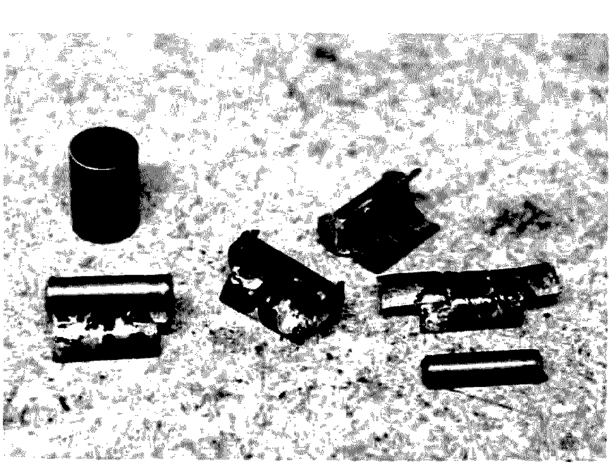

Photo A. Disassembled mounting bracket.

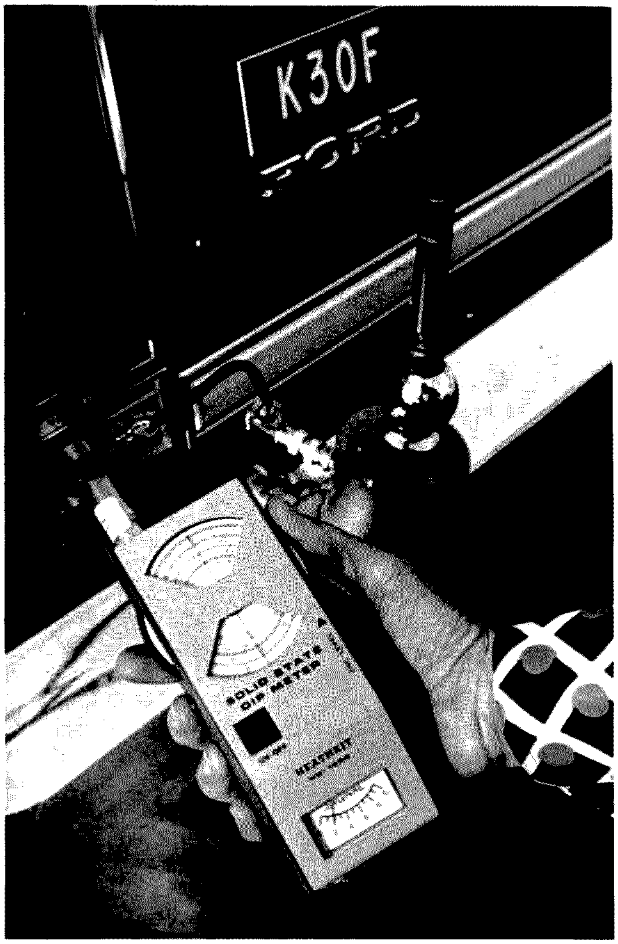

Photo B. Grid-dip meter position.

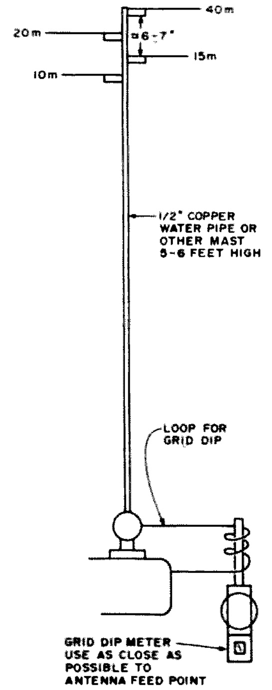

Fig. 6. Grid-dip meter positioning.

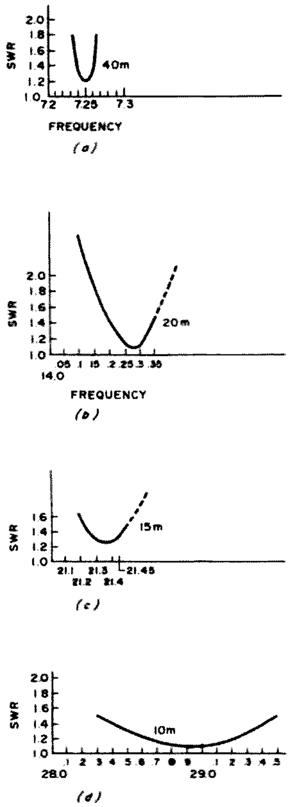

Fig. 8. Typical swr and bandwidth. (a) 40m swr (approx. 25 kHz @ 1.5 or less swr). (b) 20m swr (approx. 150 kHz @ 1.5 or less swr). (c) 15m swr (approx. 300 kHz @ 1.5 or less swr). (d) 10m swr (approx. 1.3 MHz @ 1.5 or less swr).

not have a sharp end as would a V and should avoid some static problems. I had hoped to adjust the C by bending the rhombic (increasing or decreasing its area). I found that vibration and vehicle motion caused erratic changes in resonance, so I added the adjustment spanner to the center of the rhombic. This allows easy adjustment of the resonant frequency.

Determining LC Values

If you like to experiment by trial and error, you'll love this. I spent many hours removing one turn at time, varying capacitance, and trying to find where the LC was resonant. I would be looking for a 15-meter or 20-meter resonance and would all of a sudden find myself in the 10-meter range. This is not the best way to start, although you will probably have to use this cut and try method for the 10-meter LC.

I found that I could use my Heathkit® grip-dip oscillator (gdo) to find the resonant frequency of the LC. The secret is to put a pickup coil at the base of the antenna and insert the gdo coil inside the coil (see Photo B). The Heathkit gdo is a handy piece of equipment but hardly a laboratory-grade instrument. I first found a resonant frequency of 14.2 MHz, so I connected the antenna to the transmitter and checked swr. It was not resonant anywhere in the 20-meter band! Suspecting something funny, I used the same pickup coil and connected it to my frequency counter and, since a gdo is actually a signal generator, the counter showed that the indicated 14.2 MHz was actually 13.8 MHz. It was convenient that the error was on the low side because I had to remove only one turn to raise the frequency of the LC circuit (or decrease capacitance, which would not be as desirable as it would reduce bandwidth). You don't need a frequency counter to check your gdo. Just use a short antenna on your HF rig and sweep the frequency with the gdo until you hear its signal on your HF receiver. This is an easy method to calibrate or compensate your gdo.

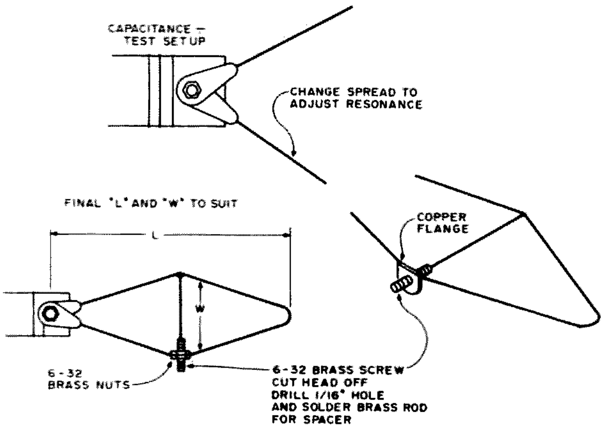

Fig. 7. Resonance adjustment assembly. Inductance—any diameter, any wire size (to suit power level), number of turns to suit frequency.

1-19/32"-Diameter Inductor Forms

	Band	# Turns	L x W
#12 Wire	20m	32	10" 2-1/8"
	15m	16	11-1/4" 1-3/8"
	10m	11	9-1/4" 1-1/8"
#20 Wire	40m	55	14-1/4" 1-1/2"
	20m	22-1/2	13-1/4" 1-1/2"

Additional data using #20 wire

92 turns = 5.5 MHz
83 turns = 5.9 MHz
67 turns = 6.6 MHz
62 turns = 6.8 MHz
59 turns = 7.1 MHz
55 turns = 7.25 MHz
38.5 turns = 11 MHz

Note: L and W are the length and width of the rhombic (C).

Table 1. Inductor winding data.

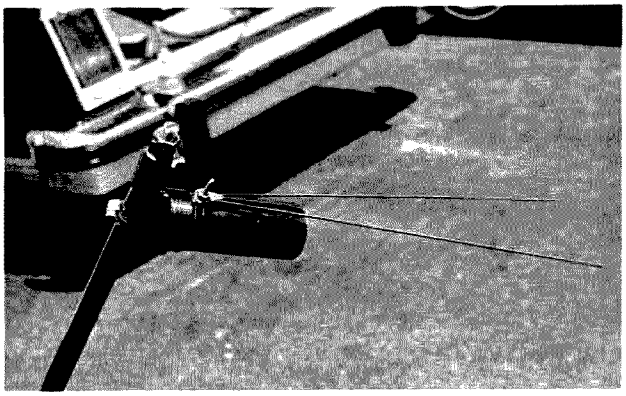

Photo C. Resonator test assembly.

As previously mentioned, I used a V configuration (Photo C) for the initial capacitance as it could be easily changed to adjust the resonant frequency. Work on one LC circuit at a time. Table 1 gives some dimensions which are intended to be a guide and give you a place from which to start. Differences in form diameter, wire size, and materials will require that you find your own right combination.

Weatherproof

Your LC assembly must be weatherproof. I learned from experience what a little rain will do to the resonant frequency. I guess I just figured out why commercial antennas use trap covers! My first attempt at weatherproofing was by dipping the LC assembly in polyurethane varnish. This lowers the resonant frequency about 500 kHz and is heavy. I have used epoxy resin, the type used to make fiberglass repairs, with good results. There is no appreciable frequency change; it is tough, medium in weight, easy to apply (pipe cleaners make excellent disposable paint brushes), and cures in about 30 minutes.

My preferred method is to put some silicone seal at the end of the LC assembly and enclose the inductor in heat-shrink tubing (obtained surplus or at a hamfest, in case you don't know how much a piece of new 2"-diameter heat-shrink tubing costs!).

Assembly and Adjustment

When you have completed the desired number of LC assemblies, they are attached using stainless steel worm-type hose clamps. The LC assemblies should be positioned fore and aft very carefully to minimize wind resistance. They should be carefully aligned or you may have one big rudder and a very "mobile" antenna. I have used care in alignment and have watched the antenna at highway speeds—it does not whip around. Proper positioning may actually create a stabilizing effect.

Fig. 6 shows the positioning I am presently using. There is some interaction between the LC assemblies, and "four in a row" caused some swr problems, particularly on 15 meters.

Adjust each LC circuit to the frequency you desire. Start with the highest frequency first (10 meters) and adjust each until you have adjusted the LC circuit of your lowest band.

More Thoughts

You don't have to make a multiband antenna. You may make an LC assembly for only one band. It might be used on a four-foot mast when height is a consideration such as on a motor home or tractor-trailer. You might combine two or more LC circuits on a single inductor form. You might use a circle instead of a rhombic for capacitance. You might leave the circle or rhombic open at the end and adjust the spread with a movable insulator. You might use a ferrite core to reduce the size of the inductor. You might use the LC assemblies for a temporary or space-restricted base antenna (with proper radials or counterpoise). You might build a small beam or rotating shortened dipole. You might . . .

The Conlog Solution

What's the key to winning contests? Put an Atari and this program at the helm of your station and find out.

Charles D. Moore N5ATD
PSC #2 Box 3000
Elmendorf AK 99504

This program enables a radio operator to keep a more accurate contest log. It fits quite handily into a 16K Atari 400/800, yet will save and compare up to 750 callsigns. The information can be saved or recalled to/from disk or cassette and output to the screen or a printer. A callsign can be compared with up to 750 others in slightly less than one second.

I never really intended to write this program. But the rest of you hackers out there will recognize the symptoms. At the request of a friend, I tried to translate a short program written in Microsoft Basic to Atari Basic. But, after adding a little bit here and a "Hey, this would be nice" there, it grew into the present monster. Well, maybe not a monster, but certainly more than I intended.

As usual, the hardest part of translating to Atari Basic is the string handling. In Atari Basic, strings cannot be directly dimensioned into arrays. Instead, DIM A$ (1000) sets aside 1000 spaces for one long string. While in some ways not being able to dimension a string array is more difficult, having a single long string is in other ways very fast and controllable. I made a single string 9000 characters long and sort of partitioned it off into segments of 12 characters each (12 * 750 = 9000). By taking, for example, the seventh callsign and multiplying it by 12, the 84th through 95th characters in A$ can be accessed by A$(84,95). In other words, for N=7, A$(N*12,N*12+11). The subroutine to search CALL$, the string that holds all the callsigns, is a machine-language subroutine loaded into page six by line 445. The subroutine searches the length of CALL$ for a match to the current entry using X= USR(XX). This is accomplished in lines 160 through 170. The variable GOOD is used to count the number of good contacts. I used GRAPHICS MODE 2 because the letters were bigger and I could throw in a little color without using up room needed for string space by taking advantage of the additional colors available in MODE 2 with inverse letters, lowercase letters, and inverse lowercase letters. The sound is simple, but I found that anything more elaborate tended to slow down the program a great deal. If a callsign is good (it has not been encountered before), a high tone is sounded. A bad callsign will result in a low tone. This way the operator cannot tell if an entry is good without looking at the screen.

Operating Conlog

First of all, type in the program. It helps, believe me. Hopefully, upon RUN, the screen will display the number of stations worked, zero at this point. In the text window, two lines of information are displayed in inverse video. The first merely reminds you that no more than 12 characters may be made on each entry; the program will ignore any extra. The second line gives the functions. To access these instead of a callsign, type: SCREEN for output to the screen, PRINTER for an output to the printer, or MENU for saving or loading information. The output to the screen is pretty quick but may be stopped and restarted by CNTL 1 at any time. The output to the printer is one callsign per line because I was running out of program space. Now you are ready to enter a callsign. Upon typing one in and RETURN, the program will print the callsign in the box and then search the string CALL$ for a duplication. A message, GOOD or WORKED, will be printed below the callsign in the box.

If at any time you desire to save or load information, use MENU and follow the questions you will be asked. First, you will be asked if you are using disk or cassette. Just press the first letter, D or C. If you are using disk, you will be asked for a file name. Follow the general guidelines for a file name given in the Atari Basic reference manual. Next, a message SAVE LOAD QUIT will be printed. When you press S or L, you will be asked to ready the device you are using. Q will return to the callsign entry portion. Now, if you operate on a band and want to change

Program listing.

bands for a while because conditions change, you can dump the information to disk or cassette and easily start again later by calling up prior callsigns by file name. This can lead to a few less headaches and improved eyesight.

Notes

Unfortunately, there was very little room left for remarks, so they are rather sparse in the listing. If you are using disk, you of course have more than 16K, so it would be easy to expand the number of entries. When you save the information, be sure you have plenty of room, as 750 entries takes about 75 sectors on a disk and a correspondingly great amount of cassette space.

This program is designed as a help for contest logging, but it could be used to check for duplicate entries for just about anything. With minor effort, the string partitions could be shortened or lengthened. Likewise, the graphics could easily be changed to fit a specific application. The substring search would only need to be changed so that the new length of the substring is used for comparison.

I hope this program will make all the users of other than Atari Basic jealous. It runs quickly and looks nice. With the small blend of machine language, the program makes a nice addition to the ham's computer library. If you really mess up and break the program, you can restart it by GR.2:GOTO 35 and nothing will be lost or affected. If you have any comments, questions, or (hopefully) improvements, please let me know. I'll answer/comment on anything with an SASE. Also, if you would like a copy of this program, just send a blank disk or cassette with a stamped, self-addressed mailer and $3.00 to PSC #2 Box 3000, Elmendorf AK 99504.

Credit Department

I learned the technique used for the substring search from a very good article by E. C. Smith in the August, 1982, issue of *Compute* magazine. My Basic version of the same type of search took about 13 seconds to compare 750 entries. ■

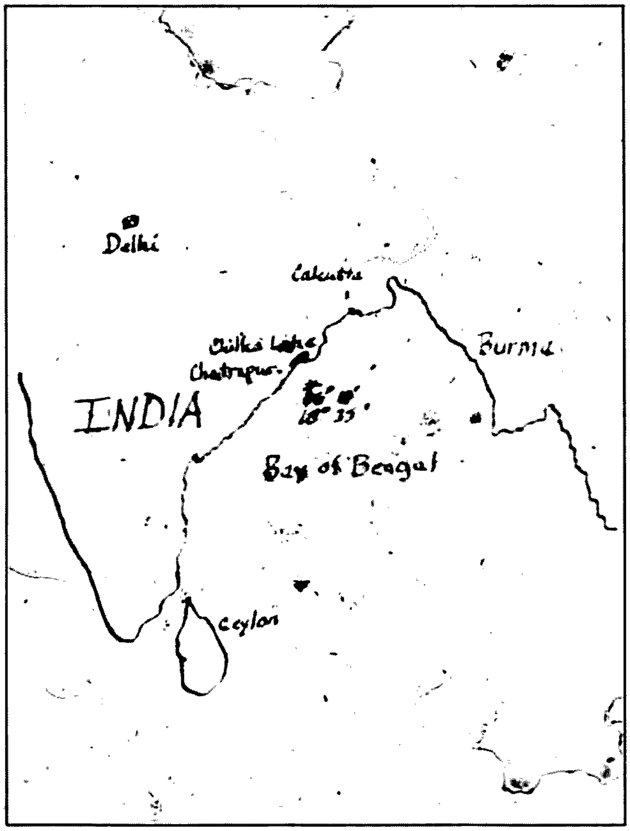
Ishmod's Journal

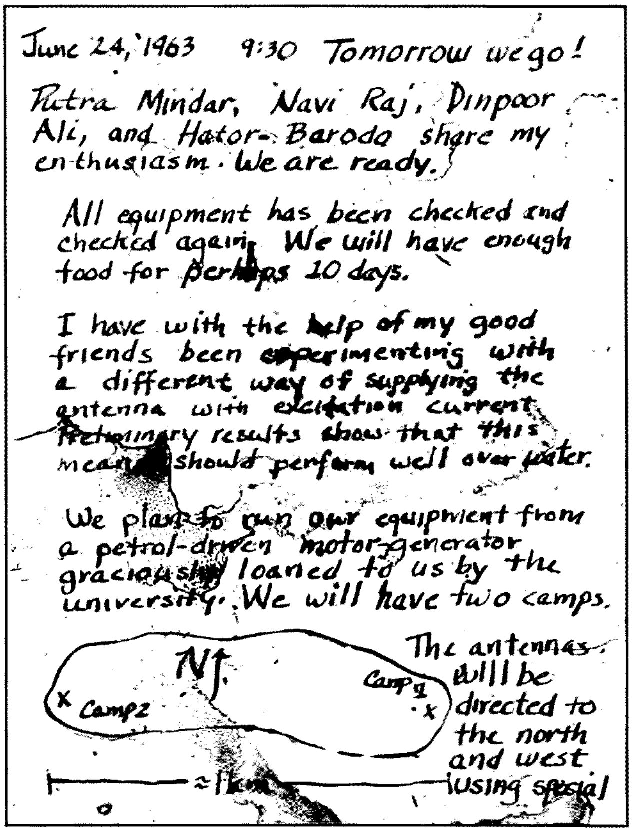
What happened in 1963 finally surfaced in 1983. Was he a fool?

It all started out innocently enough. Planning a DXpedition to an area that was thought to be in the control of one of the Balkan States. But what a story. I had agreed with Ishmod that the story would not be told until he was gone. He believed that the telling of his story would provide him with a great deal of money and power and he wanted nothing but to be left alone.

It began in early July in 1967. My wife and I had spent a relaxing holiday on Capri. On our way back to Athens she wanted to do some more shopping, so we looked for a locker at the train station to temporarily store some of our packages. When I opened it, a crumpled paper bag was in it. Curious as to its contents, I looked inside. A strangely familiar sequence of letters and numbers caught my eye on the front of an old leather-bound notebook—



Map page from the Ishmod Journal. The map is hand-drawn and centers around the Bay of Bengal and the tiny speck of land that was to be the DXpedition's destination. Water damage has obliterated the coordinates of the island and other critical parts of the puzzle.



June 24, 1963 9:30 Tomorrow we go!

Putra Mindar, Navi Raj, Dinpoor Ali, and Hator-Baroda share my enthusiasm. We are ready.

All equipment has been checked and checked again. We will have enough food for perhaps 10 days.

I have with the help of my good friends been experimenting with a different way of supplying the antenna with excitation current. Preliminary results show that this means should perform well over water.

We plan to run our equipment from a petrol-driven motor-generator graciously loaned to us by the university. We will have two camps.

The antennas will be directed to the north and west using special

Another loose page from the journal. These entries were made the night before Ishmod and his friends were ferried to the island.

what turned out to be what I would later call the Ishmod Journal

Unaware of its historic importance, I tucked the ragged notebook under my arm, figuring I would take a quick look at it while my wife made still another of her forays into the local shops. So, when I did look at the cover again, it dawned on me why the faded legend on the cover seemed familiar. It read S7Z2B. That could well be an amateur-radio callsign, although I had no idea to which country it might have belonged. Settling under an olive tree, I began to read. When my wife came back about 40 minutes later, she thought I was crazy from too much sun. I was babbling about someone named Ishmod and that the world had to know about him. So this is Ishmod's story, at least as well as I could put it together. I say that because there still are some areas that can't be accurately put together.

Though the handwriting was poor and some of the pages were damaged from moisture, I think I figured out most of it. I do wonder, though, because most of it, if I interpreted it correctly, is almost too much to believe. Hams around the world have had some wonderful and disastrous DXpeditions, but this one takes the cake. And through an incredibly intricate string of events, the story has remained hidden all these years. A novel could be based on the travels of the journal itself.

It seemed that Ishmod Kaduk S7Z2B, an amateur-radio operator from the Indian state of Sikkim, had gathered a group of fellow hams from two neighboring villages to share in his dream of putting a new prefix on the air. Ishmod had intended to use a barren rocky footprint of land about 70 miles off the coast of India in the Bay of Bengal. The exact location is hard to determine as this information was on one of the pages damaged by water, but it appeared to be southeast of Chilka Lake, which is about 200 air miles from Calcutta, down the eastern coast of India.

Apparently, Ishmod was an experienced sailor, having grown up in Chatrapur, a small village near Chilka Lake and the sea. He had spent his boyhood there until he went off to the university at Delhi. This much was clear.

One summer after his next to last exams in what was to lead him to the equivalent of an electrical engineering degree, he had packed his small sturdy sailboat with enough provisions for a week and was planning a relaxing cruise in the familiar bay. Three days out, he saw something ahead in the water. There was no land indicated on any of his charts, but there it was. Using a sextant, he noted his position and resumed his vacation from his studies.

When he returned to school in Delhi, he spent some time in the great libraries and government record buildings looking for some reference to the small island he had found the previous summer. Having grown up in that area and sailed there all his life, he could not recall any mention of the land from the sailors he used to talk with down on the dock near his village.

Eventually, he did find an old document at the Indian Registry of Vessels that warned ship captains of the menace of a reported shoal at about the location he had seen the rocky island. The document also noted that "landing rights thereon" had been claimed over a hundred years ago by a Serbo-Croation prince through some special diplomatic agreement. Although claimed by the prince, the landfall had not become the legal territory of any country. Ishmod could not believe what he read. The following summer he planned to have his DXpedition. And this was the beginning of the adventure chronicled in the Ishmod Journal.

Late in the evening on June 24, 1963, Ishmod and four other hams sat around a small table on the dock at Chatrapur, double-checking their equipment lists. They had pooled their money and chartered the only boat large enough to ferry their equipment and provisions to the rocky island that was to be home for the next six days. Little did they know then that they were about to make history. They were to be the first to observe a phenomenon that defied the laws of physics and electromagnetism. The rocks of the island exhibited the incredible capacity to alter the infundib-

The Terminal Terminal Unit

Build this variable-shift TU. Its performance will knock you dead.

Following the advent of the affordable home computer, increased interest in RTTY operation was generated in the amateur community. The benefits of being able to do away with the noisy printer and use video displays for received and transmitted data moved this mode of operation into the electronic age. Since computers are not normally designed to perform RTTY operations unaided, specialized hardware interfaces between receiver/demodulator and transmitter, as well as software to control them, were required. Aside from those specialized or dedicated systems for RTTY now available from manufacturers such as Hal, Robot, and DGM, hardware/software is commercially available for the popular Radio Shack TRS-80,* Apple,** and the Pet*** computer systems to provide this added capability to the ham station.

For RTTY/Baudot operation, the requirements of the demodulator/terminal unit (TU) for computer operation have changed very little from the days of the Model 15 printer and current loop driver/relay. The input signal is still provided by the receiver audio, filtered and conditioned by the TU, and output as either an "on" or "off" level, depending upon the mark or space frequencies. However, while the output for the Teletype® printer was required to be a 20- or 60-milliamp current driver for the mechanical system, the computer requires only a plus-five-volt (1) or zero-volt (0) level.

Over the years, many "improved" TU designs were produced to overcome the effects of signal fading, interference, noise, etc. The variation of mark and space shift, that is, the separation between these frequencies, required different filters to be incorporated in the TU to be able to copy the desired signals. Similarly, in order to copy different speeds, switchable-speed filters were required. Amateurs have almost universally standardized on the 170-Hz shift for better noise immunity and on 60 words per minute, since most surplus printers are equipped for this speed. With the approval by the FCC of ASCII operation on the ham bands, new requirements were necessary to enable amateur use of this new mode. Many surplus ASCII machines are available, but not too many amateurs desire to purchase and maintain two machines to be able to operate both Baudot and ASCII. Additionally, ASCII operation is authorized on the HF bands to 28 MHz at speeds of 110 and 300 baud. These speeds are approximately 1.7 and 4.6 times faster than 60 words per minute, respectively, thus affecting TU filter parameters for reliable copy.

In originating design requirements for a TU oriented to computer operation, a number of trade-offs must be considered. First,

*TRS-80 is a registered trademark of Tandy Corp.

**Apple is a registered trademark of Apple, Inc.

***Pet is a registered trademark of Commodore Business Machines.

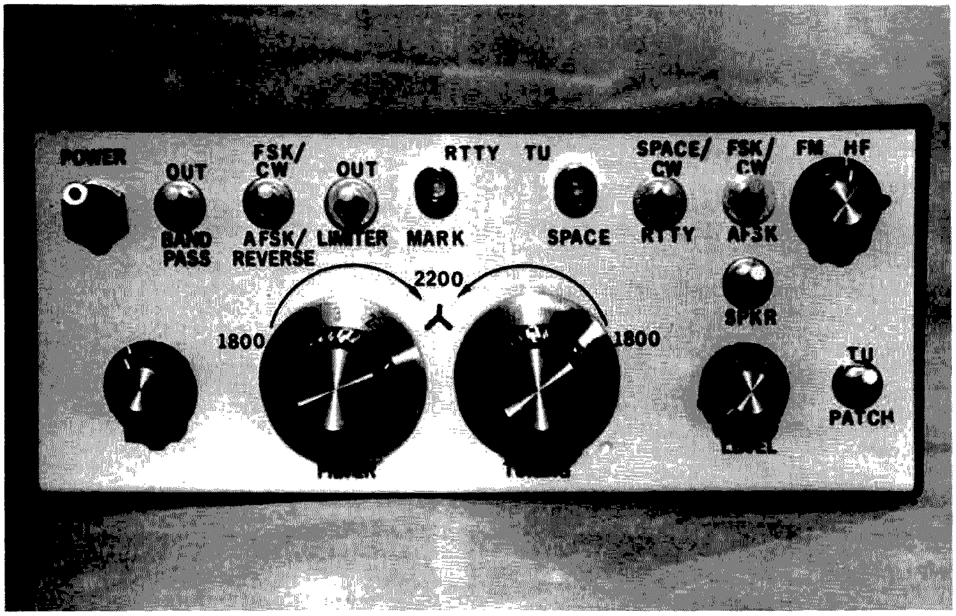

Photo A. Terminal unit front-panel layout.

we must decide whether we will be satisfied with copying only amateur 170-Hz-shift signals as opposed to the older 850-Hz-shift and commercial RTTY stations, such as news service at 425-Hz shift. The trade-off incorporated into the described design provides an input bandpass filter to allow reliable copy of the 170-Hz shift and the capability to switch this filter out of the circuit to pass wider shifts. Differing shifts mean different mark and/or space frequencies which lead to the requirement for multiple filters. This problem is solved by using active filters and designing the space filter with a center frequency which can be varied by front-panel control over the shift range desired. For additional selectivity on wide-shift signals, an available receiver filter may be used to perform the function of the switched-out bandpass unit.

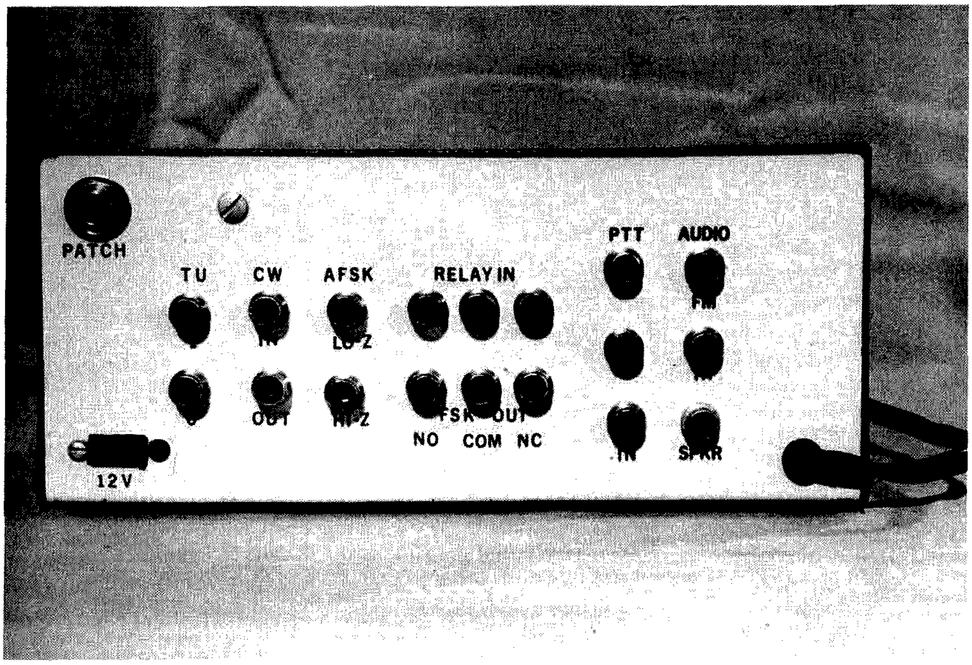

Photo B. Terminal unit rear-panel jack arrangement.

Second, we must determine the amount of sophistication or "bells and whistles" we desire to add. The incorporation of a limiter circuit is a basic requirement for accommodating signal fading. However, the capability of switching out the limiter or changing its parameters for AM-type signals or interference thresholding should also be available and is included in the design. Since this TU is also used to copy CW signals with a TRS-80, a threshold control is provided to allow the level of the desired signal above interference to be set with or without the limiter in the circuit.

Active filters are sensitive to increases in signal level over the design amplitude and distortion in the desired response will occur if this parameter is not considered. Therefore, a single transistor stage has been included which adjusts the signal level when the limiter is switched out of the circuit and precludes overdriving the mark and space filter through the use of clipping diodes in the base circuit. Fig. 1 shows the circuit performance for varying input-signal levels with the limiter switched in and out.

Filter response/width is a function of signal intelligence bandwidth versus noise and interference. Theoretically, a filter of bandwidth "n" should be able to pass "2n" bits of intelligence. However, this figure does not take into account noise, fading, and interference. Naturally, we would like to have the narrowest filter response which will cut off all interference on either side of the desired signal, but one wide enough to preclude having to retune for drifting transmitter oscillators.

The input bandpass filter used in this design can be tuned by the circuit-board trimmers for a bandwidth of 160 Hz with the values shown. This is wide enough to pass 170-Hz-shift mark and space signals without any problems at both 60-word-per-minute Baudot and 110-baud ASCII. However, at 300 baud, with the input filter tuned for maximum amplitude at 2210-Hz center frequency (f_o), the filter response drops off rather sharply, decreasing the mark/space intelligence bandwidth (as shown in Fig. 1).

In order to provide a good recovery capability for 300-baud signals, the input filter is slightly detuned, as described later, to widen the 3-dB width. The LM3900 op amp used for the active filters is a Norton amplifier. It differs from the common 741 op-amp series in that it is a current-differencing device. The main consequence of this difference is that it makes the amplifier a low-impedance device as opposed to the high-impedance 741. Further information on the LM3900 is available from National Semiconductor Corporation in their AN72-15 *Application Note.*

With the values shown and careful alignment, the 2295-Hz mark filter achieves

Sensitivity	0.1 volts p-p
Input filter width, 3 dB	170 Hz (adjustable)
Space filter width, 3 dB	85 Hz (adjustable on panel from 1700-2700 Hz f_o)
Mark filter width, 3 dB	85 Hz, 2295 Hz f_o
Shift reception	100–600 Hz with both mark and space filters in use; adjustable from panel
Adjacent-channel filter rejection	20 dB
Dynamic range (limiter out)	>30 dB
Minimum threshold separation	0.2 volts
Output	5 volts (1) or 0 volts (0) on space or mark
Supply voltage	+ 12.5 volts
Current drain, space on	100 mA; add 100 mA for relays

Table 1. Terminal unit specifications.

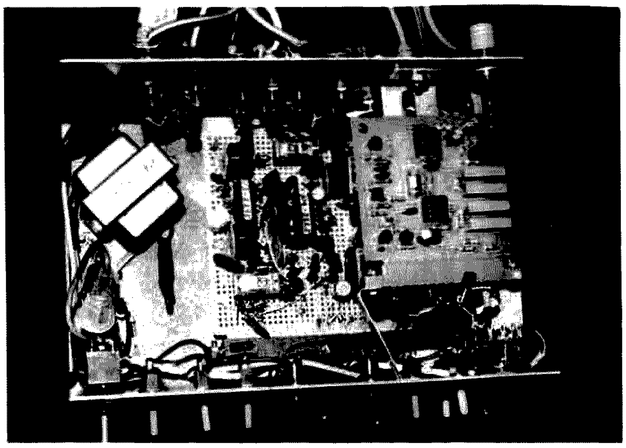

Photo C. Internal view, AFSK board at top right.

a 3-dB bandwidth of 85 Hz. This value is about optimum for any of the RTTY modes encountered in the HF bands. The space filter is that part of the design which provides the capability for copying different frequency shifts and varying bandwidth signals. Front-panel controls allow the operator to tune the filter for a 3-dB width of 85 Hz at the nominal 170-Hz shift frequency of 2125 Hz or tune the center frequency over a wide range of values to accommodate other frequency shifts.

With the component values shown, the old shift of 850 Hz cannot be tuned. This was considered an unnecessary requirement that would have lowered the Q and response of the filter. Obviously, the wider shifts can be implemented, if desired, by switching in different component values.

Although the specifications in Table 1 indicate that 100 Hz is the lowest frequency shift copyable, the TU will copy smaller shifts, depending only on adjacent channel interference and fading. As shown in Fig. 1, the skirts of the mark and space filters are not steep enough to provide more than 20-dB rejection at frequency shifts of less than 100 Hz, but if the only signal in the passband is the desired one and feedthrough in the adjacent filter is not excessive, smaller shifts are possible.

At my QTH, the TU is interfaced to my TRS-80 computer through a Macrotronics M80 unit. Only the space frequency is required for copy. However, this is not an advantage which allows only one channel of the RTTY signal to be processed from receiver to computer. Rather, if such a scheme is attempted on other than a clear FM channel, noise and interference will cause erratic copy and an amount of "garbage" which is directly proportional to the speed of the desired signal versus that of the noise/interference. This anomaly occurs due to the fact that, in a single-channel system which reacts only to the space signal level, when the desired signal is not there (normal mark condition), a time span is open to receive any type of interference which might simulate a space signal.

This problem can be minimized by clocking the desired signal only, but cannot be completely eliminated due to the variation which must be allowed for pulse timing. Therefore, the simplest method of precluding the occurrence is to process the mark signal in the normal manner in the TU and use its detected level to keep the output from switching in the absence of a space signal.

Of course, this method is not valid for copying CW using the space frequency filter. In this mode, we rely on the threshold control to set the switching circuit input to react to the desired signal level only, while the mark channel is switched off. Although the design allows the separation of desired and undesired signal levels to be within 0.2 volts of each other, the desired signal must always be the stronger for reliable copy.

The facility for reversing mark and space filter outputs for AFSK operation is included in the design; a Flesher FS-1 AFSK oscillator board is installed in the TU cabinet for transmitting in this mode on FM.

Circuit Description

Audio input for the TU is obtained from the receiver speaker jack, as shown in Fig. 3. A jack on the rear panel allows the connection of a speaker which can be turned off via a front-panel switch. Transformer T1 converts the 4/8-Ohm audio input to a 500/600-Ohm impedance signal which is controlled in amplitude by a front-panel-mounted 5k pot and switched either to a phone-patch jack or the RTTY/TU position for the demodulator. The 8.2k-Ohm resistor precludes loading down the U1 filter input, while the back-to-back diodes ensure that the input signal will be clipped at a level which precludes overdriving U1.

Relay K1 allows filter U1 to be switched out of the circuit to enable copying wide-shift signals outside of U1's passband. Bandpass filter U1 consists of a 2-pole configuration tuned to a center frequency (f_o) of 2210 Hz. Trimmers R1 and R2 allow the tuning of the filter poles, while the overall Q and gain of the circuit are controlled by the 27k-Ohm feedback resistors. The response with this filter, as shown in Fig. 1, sets the overall bandpass capabilities of the TU. Test point TP1 provides a convenient monitoring point for the output of the bandpass filter.

Limiter U2 captures the strongest signal provided at its input and maintains the output level of that signal despite a decrease in signal strength caused by fading or adjacent signal "pulling." The operation of the limiter circuit for varying signal levels is depicted in Fig. 2. Trimmer R3 sets the offset voltage on pins 2 and 3 to plus six volts, while the 390k-Ohm feedback resistor controls the gain and symmetry of the limiter. The output of U2 is a symmetrical square wave monitored via TP2.

Relay K2 allows the limiter to be switched out of the circuit for better reception of AM/CW-type signals. Transistor stage Q1 maintains the signal level to the mark/space filters when U2 is switched out and clipping diodes in the base circuit ensure that the signal level does not reach a point at which the filters will be overdriven. When relay K2 is activated, relay K3 also switches input resistors to the mark/space filters to maintain appropriate signal level.

The mark and space filters, U3 and U4, operate similarly to bandpass filter U1. The mark frequency of 2295 Hz is set by trimmers R4 and R5, while the space filter frequency of 2125 Hz (or other shift frequency) is set by two pots located on the front panel. The output of these filters is a sine wave which can be monitored at TP3 and TP4.

Relay K4 allows the mark and space filter outputs into the detectors to be switched for AFSK or reverse-shift operation. The detectors convert the sine waves from the filters to a doubled dc level and filter the remaining ac to ground. Test points 5 and 6 provide a means of monitoring the detector output voltage and ensuring that

both mark and space signals are equal in level. The diodes in the base circuit of Q2 and Q4 prevent any interaction between the detectors and transistors, while S7 deactivates the mark output for CW or space-only operation.

Pot R9 is mounted on the front panel and sets the threshold level to Q4, which in turn determines at what point output transistor Q8 will switch to "on." This capability precludes triggering on interference or signals of the same frequency as that of the desired signal but lower in level. When S7 is in the open position, Q2 cannot receive the necessary bias to drive mark indicator Q3 into conduction or turn Q4 off, preventing an output. Thus, any interference in the mark channel during CW or space-only operation will not affect copy.

When driven "on" by the detected space signal, Q4 draws current and applies approximately 4.5 volts on the emitter. This voltage and available current then turn on Q6 (to give an LED indication of space) and Q7, which drives Q8 to the on state, switching the high input from the Macrotronics M80 interface key terminal to ground.

Construction

The TU circuitry was fabricated using a Radio Shack prototype board (which has solder pads for each hole) and point-to-point wiring. This is a time-consuming process requiring careful attention to detail to prevent shorts. However, this procedure was adapted in lieu of the hassle of designing a printed-circuit pattern and to allow ease in circuit modification between breadboard and final-design stages.

Almost all parts are available through local Radio Shack stores; the part numbers listed are Radio Shack numbers. Major exceptions are the power-supply transformer and the AFSK generator board. The power-supply design is not shown since any supply of 500 milliamps or better will work. A regulated voltage is necessary to ensure constant filter parameters; this requirement is easily accomplished via a 12-volt, 1-Watt zener diode.

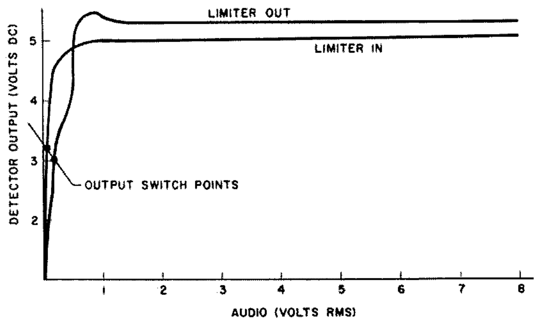

Fig. 1. Circuit performance curves.

Although Radio Shack stocks 12-volt transformers, these units are not enclosed in a metal shield. The metal case is necessary to prevent coupling of the ac field into the audio lines and circuit of the TU. Appropriate transformers are available from a number of supply houses such as Circuit Specialists or from local consumer electronics repair shops which handle Japanese equipment from Panasonic, Pioneer, etc.

Vernier dials or 10-turn pots were considered for the space-filter tuning controls but not incorporated due to the increase in cost over the last year. However, good-quality pots are necessary to preclude dead spots or dropouts when tuning. The FS-1 AFSK oscillator board is available from Flesher Corporation, PO Box 976, Topeka KS 66601, with connector, for $37.50.

Circuit-board wiring is not critical, with the exception that components such as capacitors, which are located in each mark/space channel, should not be placed in close proximity to each other (to prevent adjacent-channel signal pickup). Those capacitors which function as frequency-determining components in the filter circuits should be of mylar™ or polyester construction while others may be of the disk type.

Resistors are quarter-Watt, five percent, for minimum board-space requirements. Sockets are used for all integrated circuits, but transistors are soldered directly to the board. Intracabinet wiring for audio lines should be shielded and the power-supply ac wiring kept away from other cables. The DIP relays should have a dab of contact cement applied to each side where the relay touches the socket to ensure that vibration does not cause them to rise out of the sockets.

The Radio Shack Model 270-253 cabinet provides just enough front-to-back space to mount the prototype board and connector on the bottom of the chassis. There is space on either side of the board for the power supply and input-audio transformer. The AFSK board is mounted above the TU board with connector brackets made from thin aluminum stock and anchored by two of the front-panel switches and an L-bracket support from the rear panel. Intracabinet wiring is shown in Fig. 4.

Power-supply wiring should be done first in the enclosure, followed by the TU-board connector wiring. Installation of the switches, pots, and jacks is then completed, followed by installation and wiring of the AFSK board/connector. The space-filter tuning pots are mounted in the front panel so that the left and right controls both have maximum frequency setting at a marking between the two. Wiring to the pots must be reversed on each to allow the left to operate in a clockwise direction for maximum frequency while the right pot is moved in a counterclockwise direction for the same frequency. Decals or transfers should be applied to the front panel to indicate scale marks around the control knobs.

Alignment

After the normal checks for solder bridges and power-bus shorts, alignment can begin. None of the switches needs to be connected for calibration, but a shorting wire should be connected across the S7 diode if it is mounted on the board. Use temporary connections to the LEDs, which will be panel-mounted later. As a signal source, an audio signal generator is required. If that piece of test equipment is not part of your inventory, you might consider building a breadboard variable audio generator using a function-generator integrated circuit or a 555 timer chip.

Another option is to use the calibrator on your transceiver and adjust the beat note to provide the necessary audio output. In any case, a frequency counter is required to ensure that what you see is what you get. The filters are extremely narrow and any alignment which is off the desired frequency will produce lower gain, distortion, and undesirable operational characteristics.

An oscilloscope is helpful in tracing the signal and confirming relative waveshapes and amplitude. However, the Q of the filters, which makes precise tuning/alignment essential, precludes the use of the scope for monitoring maximum filter response while calibrating. A VOM/VTVM with a dB scale is much simpler to use

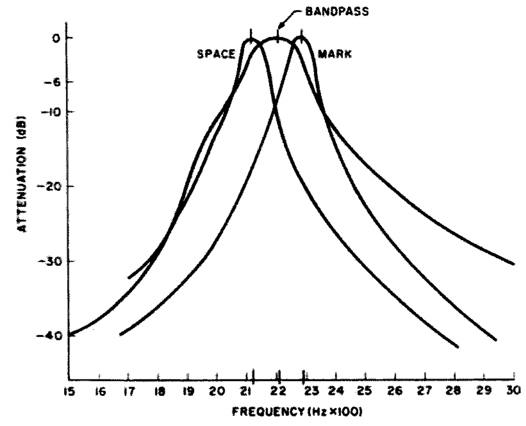

Fig. 2. Active filter response.

for this function. After coupling via a 0.1-uF capacitor from the applicable test point, the meter will show the change in signal level as the filter is aligned to the input frequency. Any oscillation or false response will exhibit a higher-than-normal swing of the VOM needle and should be monitored by the oscilloscope.

As a first step in the alignment procedure, adjust R3 for plus six volts at pins 2 and 3 of limiter U2. Next, attach an input signal source of 2210 Hz to the input and couple (via a 0.1-uF capacitor) the output of filter U1 from TP1 to the VOM/VTVM which has been set to the 10-volt scale. Adjust R1 and R2 until the meter indicates maximum output at this frequency. The 3-dB bandwidth will now be approximately 160 Hz.

If you do not desire to copy anything other than 170-Hz shift in Baudot or 110-baud ASCII, the response of the filter is fine. However, if you desire to use the filter for 300-baud ASCII, you may wish to retune the bandwidth to increase the width and noise characteristics. This may be accomplished by alternately changing the frequency of the input signal from 2125 Hz to 2295 Hz and adjusting R1 and R2 for a meter reading 3 dB below the maximum value obtained at 2210 Hz. Repeat this procedure until the meter reading at both the mark and space frequency is equal.

As you change the input frequency from the lower to the higher frequency, you will notice that maximum gain is still at 2210 Hz, showing that the response has not been degraded but only widened at the 3-dB point via stagger tuning. Note that this adjustment will not affect the capability of the bandpass filter to accept only 170-Hz-or-less shifted signals.

If a scope is available, check the output of the limiter, which should appear as a square wave of equal pulse widths. A check of the filter outputs should show a sine wave without distortion. Once the input signal has been set to the limiter capture level, which is matched to the limiting effect of the diodes across the input and the gain of U1, there should be no noticeable change in output amplitude for further increases in signal level.

Bandpass filter U3 is aligned at 2295 Hz in a manner similar to that accomplished at U1. Use TP3, a 0.1-uF capacitor, and adjust R4 and R5 for maximum meter indication. No further tuning for widening the response of this filter is required.

Bandpass filter U4 is aligned during operation from the front panel by pots R6 and R7. After wiring the pots and connecting the leads to the circuit-board connector, ensure that a frequency range of 1800–2150 Hz can be covered and that when both pots are set to the same frequency, the output level is approximately the same as that provided by U3 at its center frequency.

During the alignment procedure, the appropriate indicator LEDs should have lighted as the filters were tuned. If all is well to this point, continue the alignment. Otherwise, go back and determine where the problem exists.

Set the input frequency for 2295 Hz and attach the meter leads across TP5 with the meter set to read 5.5 volts dc. Record the indicated value. Now, move the meter leads to TP6 and ground and change the input frequency to 2125 Hz. Adjust the front-panel filter controls for maximum meter indication and note the value. If the two readings are not the same, adjust R8 and repeat the procedure. Note that equal output of the detectors is mainly dependent upon the alignment of U1 to pass equally both frequencies and the alignment and gain of U3 and U4.

Since the mark and space voltages drive different parts of the circuit after detection, you should check to ensure that both LEDs light with the same level of input signal. Set the signal generator for 2125 Hz, tune the space filter for maximum output/LED brightness with the FSK/CW/AFSK/Reverse switch in the FSK position, and lower the generator level until the LED is just lighted. If the FSK switch is not yet wired into the circuit, the relay will still be in this position, unactivated. Now put the switch in the Reverse position, or apply 12 volts to the relay lead for K4, and note the brightness of the mark LED. If the mark and space LEDs do not light at the same level, adjust R8 until they do.

Depending on whether you have used the mark or space signal to provide a high or low output, the appropriate LED should illuminate when that signal is applied to the input. The output should measure either 4.5 volts at the "1" jack or almost zero at the "0" jack.

Check the front-panel switches to ensure that they all work, activating the relays or switching the appropriate parts of the circuit in or out. A continuity check with the VOM of the output/input jacks on the rear panel will prevent surprises after the cover is attached.

Operation

After a complete bench check and filter alignment, you are ready to place the TU on line and connect all the interfacing cables. Online tests should start with reception of various RTTY signals to allow you to become familiar with the operation of the TU. Some apprehension was originally felt during the design phase about the ability to tune a signal into the mark channel before tuning the space filter. Operation of the completed unit has shown that this is not really a concern and that the procedure is quickly learned. I had also previously installed a 1-mA meter on the original space output LED of the Macrotronics M80 interface, which helps in the fine-tuning of the space filter and displays the actual level of the switching signal from the TU.[3]

For normal RTTY operation, with all filters and the limiter in operation, the audio-level control on the receiver need only be set in the low range, 2 or below, for a front-panel scale of 1 to 10. The level control on the TU will then provide satisfactory copy for an S9 signal when set about one-third of the way into its range. It is important to ensure that the

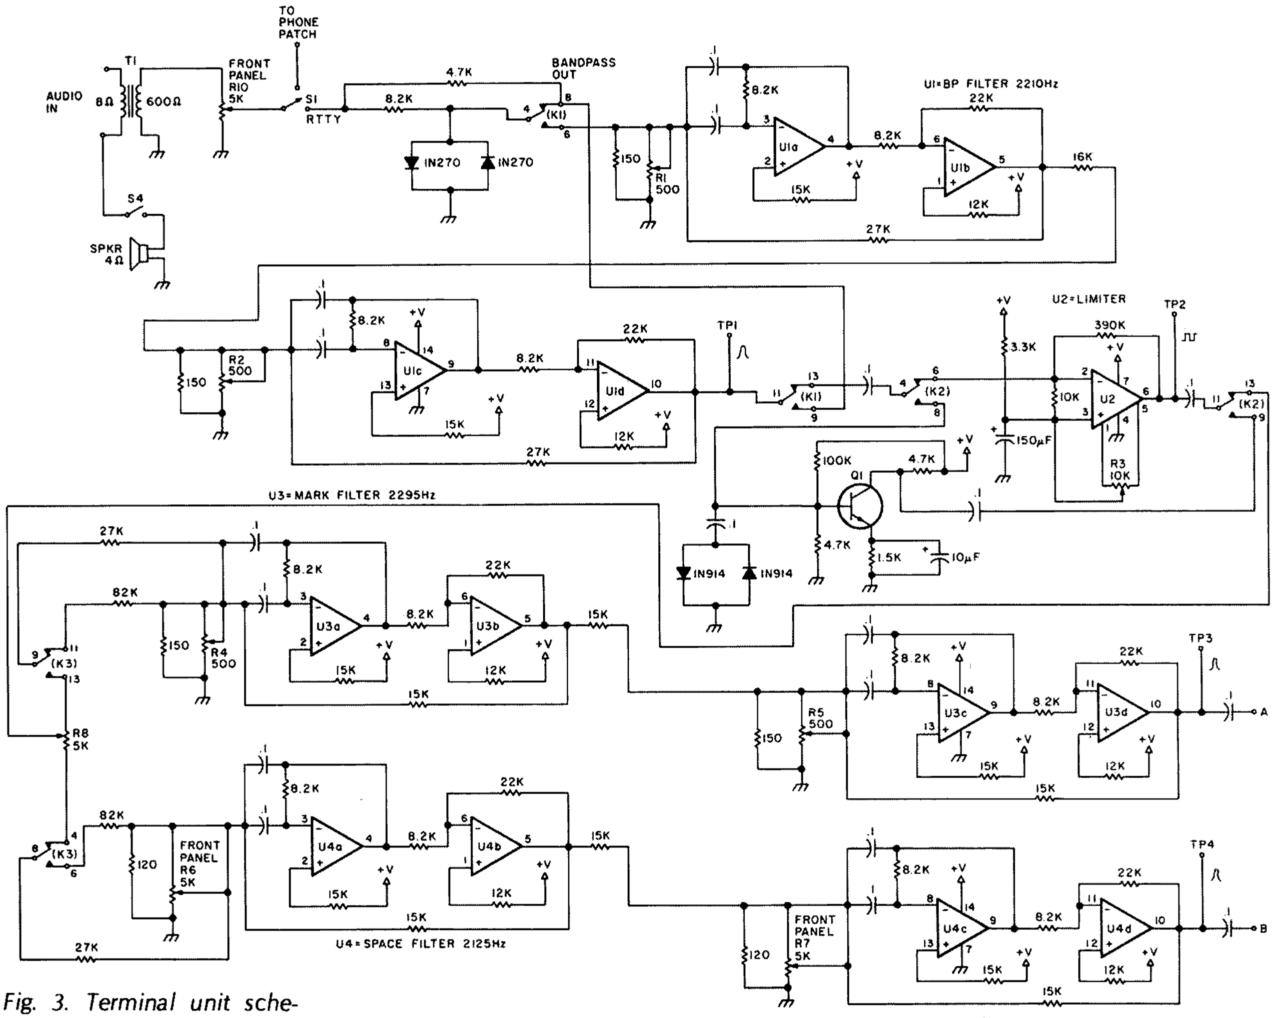

Fig. 3. Terminal unit schematic. T1: 8-Ohm primary, 600-Ohm secondary, or 273-1380. U1, U3, U4: quad op amp 276-1713. U2: 741 op amp 276-007. Q1: 2030 276-2030. Q2-Q7: 2N2222 276-1617. Q8: 2N1305 276-2007. K1-K4: 12-V DIP relay 275-213. LEDs: jumbo 276-021. All front-panel pots have linear taper; all others are miniature trimmers.

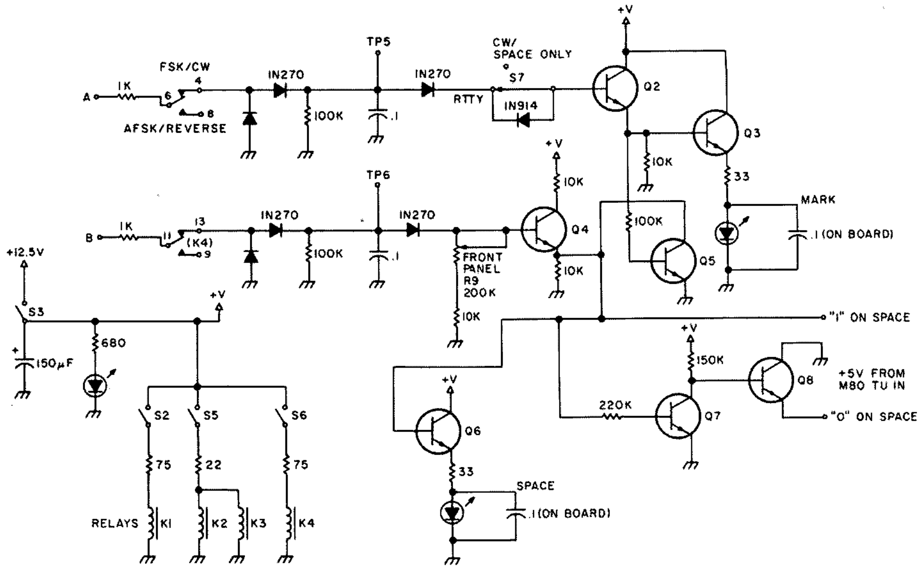

input level is great enough to place the signal in the upper portion of the limiter curve for reliable copy on fading signals.

The threshold control is normally left in the extreme counterclockwise position unless it is being used to prevent triggering of an interfering lower-level signal. Once the space filter controls are set to the approximate shift value by the front-panel markings, the signal can be tuned to give an indication on the mark LED. If correctly tuned, the meter on the M80 will show no deflection if there is no space signal. Depending on how close the original settings on the space filter controls were, the space LED may flicker or light with a corresponding M80 meter deflection. The tuning of the first and then second space-filter pole controls will display an equal mark/space LED intensity and maximum space signal on the meter.

Printer or CRT copy should also be evident. Switching to AFSK/Reverse should reverse the mark/

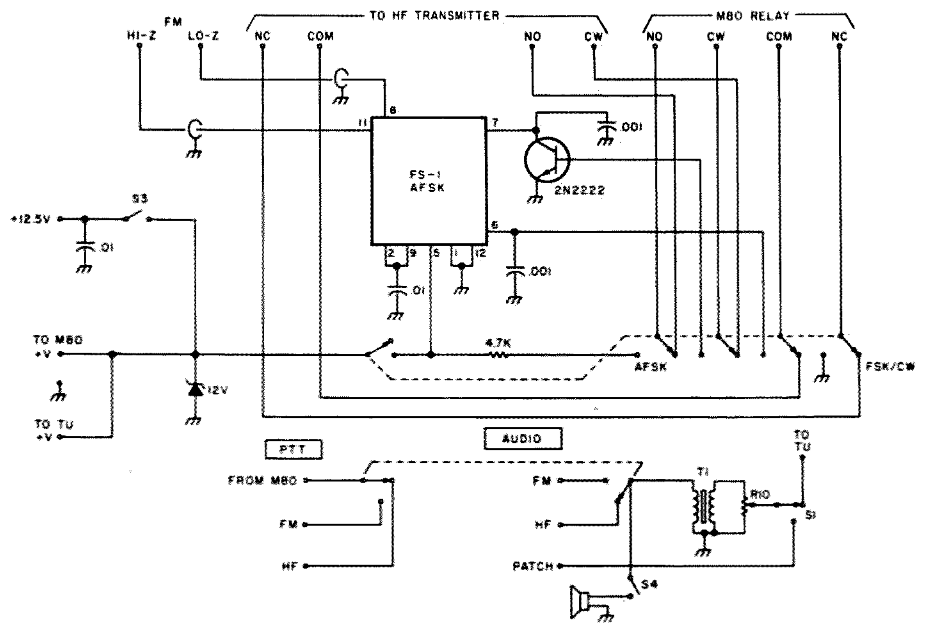

Fig. 4. Cabinet wiring.

space LED indication and meter response and print garbage. The only difference in receiving AFSK, as opposed to FSK, with the function switch in the AFSK/Reverse position is that you are now receiving the 2125-Hz signal on the mark LED. This is due to the fact that AFSK mark and space frequencies are reversed for VHF operation. Therefore, the tuning of the filter controls must be monitored on the mark LED and the first tuning (if not channelized FM) done on the space LED and M80 meter. It is easiest to tune in the normal manner and then switch to AFSK.

For CW or AM signals on HF (such as AFSK), you may find that switching the limiter out of the circuit will provide better reception when noise or interference is present. When this is done, the input level should be adjusted to maintain a reliable switching point and compensate for the hold-in range of the switched-out limiter. The same level adjustment should be made when switching out the bandpass filter to copy shifts wider than 170 Hz.

Referring to Fig. 4, the FSK/CW-AFSK transmit function switch makes all connections for the selected mode. The relay on the M80 interface board is activated by the computer in transmit, but all relay contacts are brought to the TU for the appropriate mode connections. In AFSK, the relay contacts are connected directly to the transmitter vfo.[3] In AFSK, the relay contacts are connected to provide a mark/space keying input to the Flesher AFSK board.

The CW output of the M80 interface is connected to the ID input of the Flesher board through a switching transistor which precludes transmitting the CW ID tone at the same time as the mark tone. When the transmit function switch is in the AFSK position, the mark tone is on and a 2125-Hz signal is sent to the transmitter. The AFSK board has the capability of supplying either 850- or 170-Hz shift. Since only 170-Hz shift is used at my QTH, the 170-Hz position is hard-wired on the AFSK board connector.

Parts List

Part No.	*Description*	*Source*	*Price*
276-153	Plug-in circuit board	Radio Shack	$ 3.69
276-1551	44-pin card-edge connector	Radio Shack	2.99

276-021	Jumbo LEDs	Radio Shack	2/.89
276-080	LED holder	Radio Shack	2/1.19
276-563	12-V, 1-W zener	Radio Shack	2/.89
270-253	Enclosure	Radio Shack	4.79
276-1995	8-pin DIP socket	Radio Shack	2/.59
276-1999	14-pin DIP socket	Radio Shack	2/.89
275-624	SPST toggle switch	Radio Shack	1.59
275-625	SPDT toggle switch	Radio Shack	1.69
E2-169	2-position, 6-pole rotary switch	Circuit Specialists	1.80
276-1123	1N270/1N34 diodes	Radio Shack	10/.99
276-1122	1N914 diodes	Radio Shack	10/.99
272-1029	220-uF (150-uF) electrolytic	Radio Shack	.89
276-1101	Rectifier diodes	Radio Shack	2/.49
271-210	500k pot (place 270k fixed resistor across for 200k)	Radio Shack	1.09
271-226	500-Ohm trimmer	Radio Shack	.59
271-1714	5k pot	Radio Shack	1.09
FS-1	AFSK board/kit	Flesher Corp.	37.50
M 1143	AFSK board connector	Flesher Corp.	
	Miscellaneous fixed resistors	Radio Shack	4.80
	Miscellaneous capacitors	Radio Shack	6.00
274-392	Knobs	Radio Shack	3/1.99
274-346	Phono jacks	Radio Shack	4/1.79

Most rigs will take the low-Z output of the AFSK board, but both the levels are brought out to the rear panel for use as required.

The FM/HF switch selects both the audio and push-to-talk relay line from the desired transmitter. When using the M80 interface unit with the M800 software, a PTT module is provided which automatically activates the transmitter. The M80 PTT output is the control line which is switched in the TU.

For CW operation, the CW/Space Only switch is used to inactivate the mark circuitry in the TU. Only the space LED is used for tuning with the filter controls, to provide maximum M80 meter deflection. The threshold control can be used to set the switching level to prevent lower-level adjacent-signal interference. In CW transmit, the transmit function switch connects the CW output of the M80 through the TU switch to the transmitter key input. This same connection is made for FSK.

Operation has been both gratifying and educational. It is interesting to watch the independent fading of mark versus space signals, as shown by LED brightness and M80 meter deflection. The only other evidence of poor copy occurs when the signal of interest fades while a background signal, which was not heard before, increases in strength and captures the limiter. Good copy has been obtained on low-level signals which are not strong enough to provide an LED indication. ■

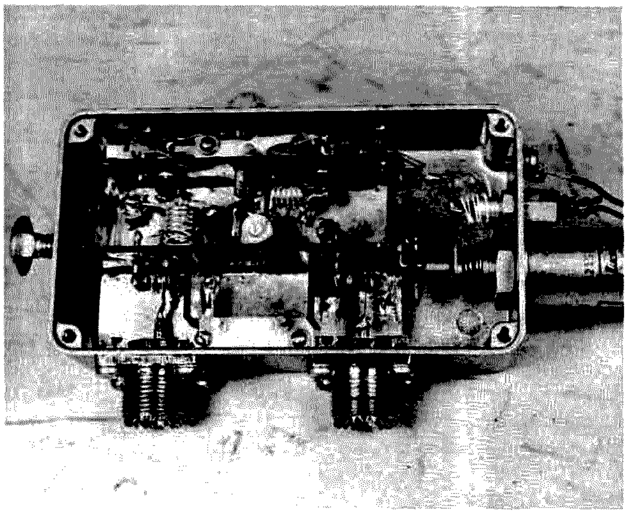
Wheeling and Dealing with Preamps

For a switch, from the remote hills of West Virginia comes a great antenna idea.

Robert E. Brossman W8PMS
115 Oakmont Hills
Wheeling WV 26003



An overall view of the completed preamp.

After many years of 2-meter FM operation, I found myself increasingly interested in SSB operation on the lower portion of the band. After spending an evening in the shack with Don WB8ZTV and hearing for myself the potential of SSB and CW operation, I was soon the proud owner of a brand new all-mode rig.

The old 11-element vertically-polarized beam soon went to its storage place (holding up tomato plants) and a homemade 6-element horizontal took its place on the tower. Local FM operation was unaffected by this change, and contacts out to 75–125 miles were possible with the 10-Watt output of the all-mode rig.

A 4CX250 amplifier that provided around 300 Watts output in linear or Class C had been around for a while and this enabled occasional contacts in the range of 150–200 miles. Before anyone scoffs at the limits, let me remind them that this area of West Virginia is quite hilly and that I live well below the tops of the surrounding aforementioned geographic features; hence, I felt reasonably pleased with the performance of my equipment.

My only problem was listening to Don run his weekly SWOT net and realizing that I didn't hear half of the stations that he was routinely conversing with week after week. Now, don't get me wrong, I fully realized that he had a superior location, stacked 88-element super whizbangs, and an antenna-mounted GaAsFET preamp, so I decided that my first project would be to try putting together a respectable preamp to mount at the antenna.

After researching several articles on preamp construction, it became apparent that one of the major problems and least discussed chores associated with remote devices such as this was switching the preamp in and out of the transmission line during use.

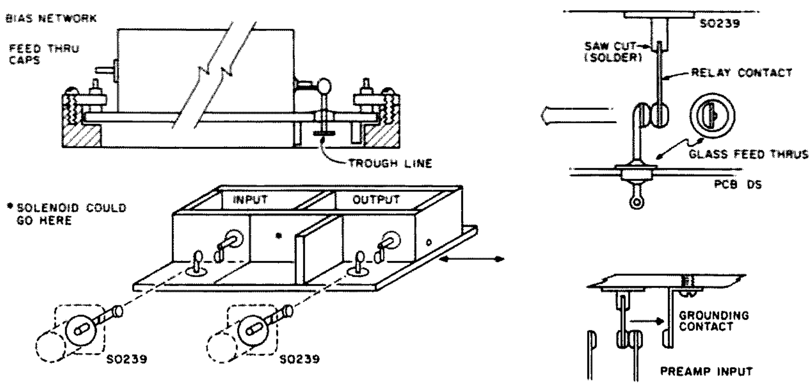


Fig. 1. The approximate method of fabricating the double-sided printed circuit board base and shielding of the preamp. The shields are covered with copper foil "lids" that are soldered to the edges of the shield enclosures. The drawing also shows the mechanical details of the switching contacts.

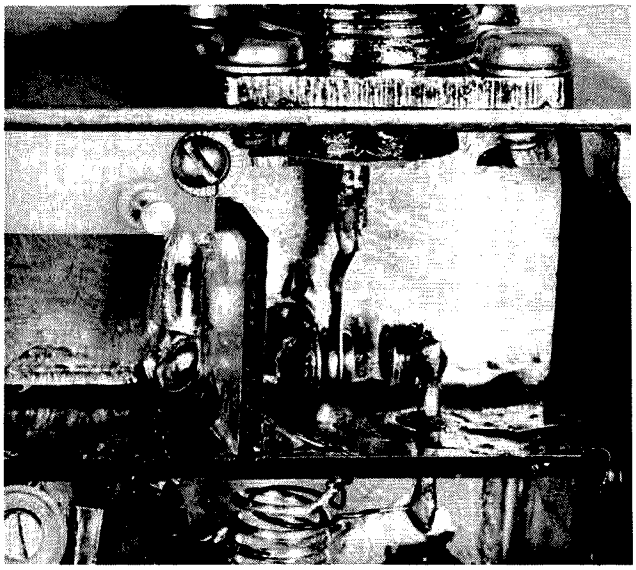
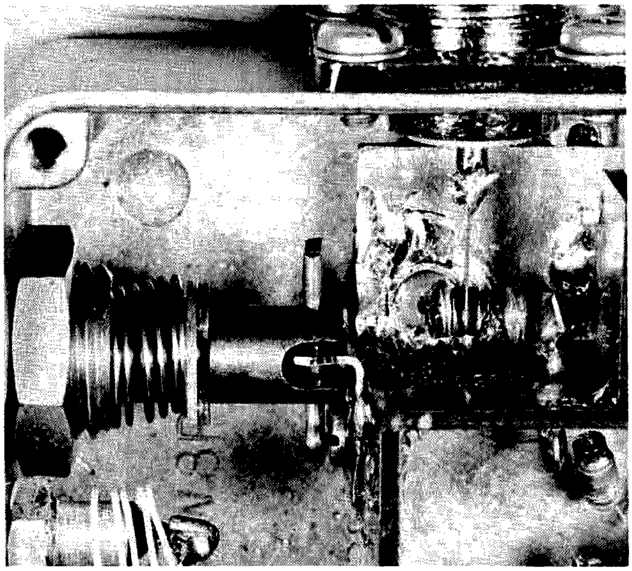


A detailed view of the input contacts of the preamp. The glass feedthroughs are visible, and the method of attaching the relay contacts to the feedthroughs can be seen.



Some details of the output end of the preamp. The relay contacts and the mounting of the solenoid are seen. The copper foil covers of the preamp shields are not in place.

Being a peculiar type of person that hates to cut and strip coax for BNC connectors, I felt that there had to be another means of switching a device like a preamp without the need for multitudes of ¼-wave cables and 2 BNC-type relays. What could be simpler than making the whole PC board (containing the preamp circuits) switch back and forth with a solenoid?

After several attempts, the mechanical layout shown in Fig. 1 was produced. The rf circuit does not represent the state-of-the-art in VHF rf amplifiers, but it does serve to illustrate the concept. With the addition of a few more contact strips, it would be possible to either ground the input and output of the preamp during transmission or switch them to ground through 50-Ohm resistors. The latter method seems to be the manner of choice when using GaAsFETs.

The preamp is switched out of the transmission line until the solenoid is energized. Power for the preamp is now supplied separately through an extra pair of wires in the antenna rotor cable. A 24-volt-dc supply is used, and an LM317 adjustable voltage regulator is now inside the preamp box. Remember to include the bypass capacitors on the regulator input and output. The solenoid is also shunted with a 1N4004 diode to protect against the voltage spike produced when the magnetic field collapses on turn-off.

Isolation of the preamp circuit during transmission is at least as good as some of the VHF BNC relays and could be increased by physically increasing the spacing between contacts. The design routes the rf path during transmission to the underside of the double-sided PC board where it forms an air-insulated troughline between the PC board and the diecast box. Granted, there would be other ways to improve the impedance bump that this arrangement produces, but it is no worse than the average swr indicator.

I plan to eventually dedicate an MGF-1400 GaAsFET to the MRF-901's role, but it did provide a wealth of experience in rf amplifier design at a low cost. The original circuit (Fig. 2) proved to be extremely unstable, even with several changes of transistors, and the circuit of Fig. 3 eventually evolved. It was much easier to tame while still providing usable gain. The instability is a function of the device and only means that the MRF-901 is really a poor choice for a 2-meter rf preamp. Anyone who would like to check out that statement is referred to an article by B. H. Krauss WA2GFP, in the December, 1981, issue of *QEX*.

Construction

The circuit is mounted inside a diecast metal box approximately 4.5″ × 2.5″ × 1″ (Hammond 1590B). Input and output connectors shown are SO-239, but BNC- or N-types are easily substituted. A fine saw is used to cut a slit in the center pin of the connector in order to mount the fixed contactor (salvaged from a 5-Amp DPDT relay). The saw blades are available from X-acto® and can be found in any hobby or hardware store.

The feedthrough connectors are an item I picked up in a flea market and are

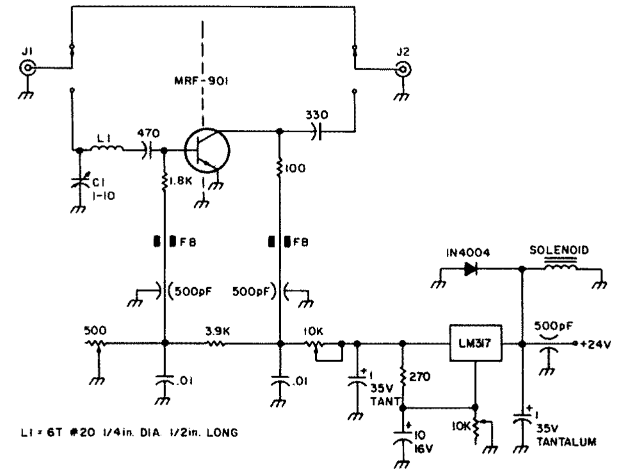


Fig. 2. The original circuit diagram. The MRF-901 proved to be very unstable in this configuration.

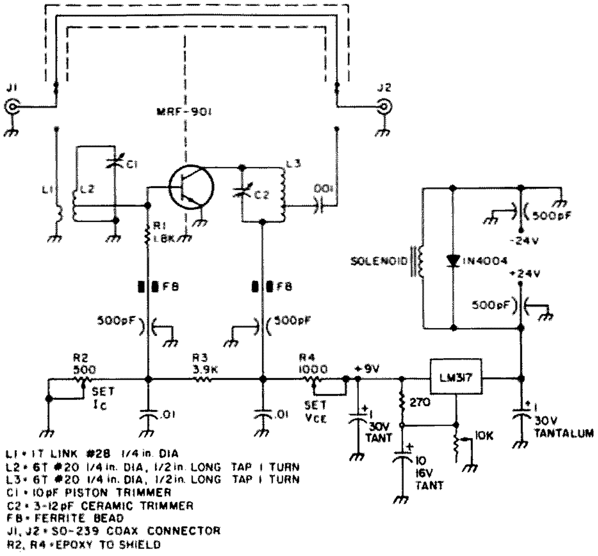

Fig. 3. The final circuit that was used in this version. It is reasonably stable once the initial tune-up is completed. It is much more narrow-banded than the original.

glass insulated. They represent the only parts that might have to be specially fabricated and might be substituted by using brass rod epoxied in the center of brass grommets. These are available anyplace that sells sewing supplies. The silver contacts for the relay end should be soldered to the rod before trying to fill in the epoxy resin. I made loads of these for feedthrough use years ago, and they can be made by sticking the rod into a wax block (paraffin canner's wax), centering the grommet, and filling in the center of the grommet with epoxy on a small screwdriver blade.

The PC board is mounted on a pair of brass rails that act as guides during the mechanical shifting. A springy piece of finger stock maintains a good ground contact on the underside of the PC board during operation. Teflon® blocks are attached to the side rails and are used to hold the PC board. Any method that will permit good electrical contact with freedom of motion should suffice.

The solenoid used is a Ledex #12180133-REV A. It just surfaced in the junk box; however, it is possible to modify any screw-mounted solenoid to perform the task of pushing the PC board into its preamp position. There is sufficient spring tension to return the PC board to the neutral, or transmit, position when power is removed from the solenoid. Radio Shack is currently selling a 12-volt solenoid that should be usable.

A final construction tip is to drill and tap a hole on the end of the diecast box that will allow you to run a ¼-20 screw into the shielding to manually switch the preamp to receive position during tune-up.

I would not recommend trying to use the Hammond box out in the weather. It is not waterproof, and the solenoid, having a steel armature, will probably rust and freeze up if used where it can get wet. The whole assembly should be packaged inside a weatherproof enclosure of metal or plastic if it is mounted at the antenna. ■

AUSTRALIA

Jim Joyce VK3YJ
44 Wren Street
Altona 3018, Victoria
Australia

It has been claimed that no two nation's people are more alike in all ways than Australians and New Zealanders. Considering our common heritage, it is not surprising that there were moves in the late 1900s to make New Zealand another state of Australia, but the plans were eventually dropped.

With New Zealand being closer to the eastern states of Australia than our own West Australian city of Perth and with, up until lately, no travel restrictions between our two countries (e.g., passports, health certificates, etc.), it is no wonder we have a unique relationship with our Kiwi (as we call them) neighbors.

With this in mind, the annual VK-ZL-Oceania contest has a special significance to both of us in further cementing our close relationship via amateur radio. Sponsored jointly by the WIA and NZART on alternative years, this contest aims at attracting overseas participation looking for contacts in those areas.

This year there should be a good chance of picking up a rare one with Warrick ZL8AFH from Kermadec, if he gets the time with his work load—and also if he gets his amateur gear fixed. At the present time, he is waiting for an air drop of either another rig or parts to repair his own gear. Warrick also has been heard using commercial marine gear, operating on both 40 and 80 meters, the frequencies being 3874-3855 and 7774.

David VK0CK is operating from Macquarie Island; with an added bonus of a six-meter beacon in operation from this location, VK0GL should be active from Mawson with an interest in both HF and VHF.

I cannot guarantee that these stations will be on frequency during this contest, but with most of the South Pacific islands having at least one or two Australian or New Zealand amateurs as residents, the chance of picking up a new one is quite good.

This contest is held on the first and third weekends in October each year, with phone on the first weekend and CW on the third. The contest lasts for the full 48 hours each weekend.

We in VK have lately been given extensions to our frequencies of operation, two of which should be of interest to OX operators, considering the downturn in the sunspot cycle. We now can operate on 40 meters from 7000 to 7300, and we have a DX window of 3795 to 3800 on 80 meters.

When listening, please don't forget that our Novice operators can operate only on 10 meters up to 28600, on 15 meters up to 21200, and 80 meters up to 3825. With only 30 Watts PEP output allowed, you will have to listen real hard to hear them, with the band conditions of late.

Any queries regarding VK contests in the 1981-1984 period should be directed to our Federal Awards Manager, Reg Dwyer VK1BR, PO Box 238, Jamison, Australian Capital Territory 2614, Australia.

Good luck in the contest!

RFI SYMPOSIUM

Sponsored by the Brazilian Amateur Radio League (LABRE) and the National Telecommunications Department (DENTEL), the symposium was held in the city of Porto Alegre, the first such trying to solve RFI problems between the radio operators and the sound listeners. The most important factories of sound equipment in Brazil were represented, among them, Philco/Hitachi, Sharp, Telefunken, Sanyo, and Evadin.

According to Brazilian laws, the participants agreed that RFI should always be considered as due to the sound equipment, and all complaints must be met by the factories. This decision made the radio operators happy, and it was a big step toward solving also the TVI problem, when sometimes it is due to the TV manufacturers.

WORLD COMMUNICATIONS YEAR STAMP

To commemorate World Communications Year, the Brazilian Post issued a special stamp. A must for collectors, the stamp shows the domestic Brazilian satellite and is printed in offset, in blue and orange over phosphorescent gummed paper. If you are interested in the special stamp, you may request it from: Divisao Central Filatelica, Edificio-Sede, ECT, SBN, Conjunto 3, Bloco A, 20° andar, 70002 Brasilia, DF, Brazil.

144-MHz EXPEDITIONS

During the last weekend of June, 1984, will be held the Third 144-MHz Expeditions, an event which brings together Brazilian operators interested in propagation experiences on the two-meter band. The expeditioners reach the top of the higher hills with their equipment—generators, antenna arrays, etc., doing their best to make long-distance QSOs. Last year, in spite of poor weather conditions, more than 1,500 long-distance QSOs were made by about fifty expeditioners.

DMS AWARD

Sponsored by LABRE in the state of Mato Grosso do Sul, the DMS Award is available to all licensed amateurs for confirmed contacts with PT9 stations as follows: South American countries: 10 contacts; other countries: 5 contacts. QSOs must have been made after February 2, 1978, on any amateur band and any mode. No QSLs; send GCR list of PT9 stations worked (call, date, time, band, mode, and report) and 15 IRCs for mailing expenses to DMS Manager, PO Box 08, 79100 Campo Grande, MS, Brazil.

SAO PAULO A/Z AWARD

Sponsored by the Brazilian Amateur Radio League of the State of Sao Paulo (LABRE-SP), the Sao Paulo A/Z Award is available to all licensed amateurs for confirmed contacts with 28 stations located in the state of Sao Paulo (PY2) which have all 28 different letters, considering only the last letter of each call. Example: PY2XXA, PY2XXB. . .PY2AAY, PY2ABZ. Contacts must have been made after August 1, 1977, on any amateur band. Only two-way CW mode. No QSLs; send GCR list of stations worked (call, date, time, band, mode, and report) and 15 IRCs for mailing expenses to LABRE-SAO PAULO, Diretoria de Concursos e Diplomas, PO Box 22, 01000 Sao Paulo, SP, Brazil.

FRENCH LISTENERS (FE)

For two years new French SWLs have not been receiving official licenses. As a matter of fact, before the CB legalization and during the big growth of CB, many CBers asked for this FE call (free of charge), this way getting the official OK for their antennas. Next year, it is likely they will be issued again, nevertheless with, probably, two alterations: an annual charge (why not!), and no official OK for an antenna. So, till then, don't be afraid to receive some French SWL QSLs with calls like REF, URC, or eventually, FEM, instead of the official FE. In fact there are provisional "calls" issued by different ham associations (association code numbers).

70-CM BAND

In 1984, a new band plan will be used for a maritime radio-navigation system called Syledis. French hams living near coasts and harbors are rather worried; they have to share the 430-434-MHz part exactly in the new UHF repeater's band. Some years ago, this part was unused. Fortunately, Syledis is known as a very excellent system, and QRM could be weak. We'll wait and see. . .

COLUMBIA, STS-9, W5LFL, AND EUROPEAN SPACELAB

For this event, the French broadcast station Europe 1, thanks to its scientific reporter Albert Ducrocq, had the bright idea to light up the Greenwich meridian (and also partly the Paris meridian) when the shuttle crossed this line, for the beginning of this mission. This was done with hundreds of headlights along about a 180-mile line! The center (La Fleche airport) was marked by a fiery cross. Thanks to clear skies, the shuttle's passengers should have seen this winking!

W5LFL was heard by many hams here, and many hoped to receive the first space QSL!

EXPEDITION RUMORS IN 1984

FO Clipperton with W and FO8 hams, and YV0.

SOME FRENCH OVERSEAS AWARDS

The usual conditions apply to these awards. Sent certified log extracts only. QSLs are not required.

1) *FO: Tahiti*—6 contacts with FO8 stations; fee: 12 IRCs; manager: Radio Club Oceanien, BP 374 Papeete.

2) *FK: Nouvelle Caledonie*—6 contacts with FK8 stations; fee: 12 IRCs; manager: Guy Francois FK8DH, Villa 55 Tontouta.

3) *FP: Saint Pierre Et Miquelon*—Two classes: phone, 3 contacts with FP stations, and CW, 2 contacts with FP stations; fee: 3 IRCs; contact after January 1, 1981, manager: Henry Lafitte FP8HL, BP 1107, 97500 St. Pierre et Miquelon.

4) *FY: Guyanne*—6 contacts with FY stations; fee is 3 IRCs; manager: Christian Loit FY7AN, Cite Rebard, BP 748, 97305 Cayenne. (Note: In French Guiana there is a 50,035-MHz beacon call: FY7THF (100 Watts, GP antenna); Send reports to FY7AZ, BP 1001 Cayenne.)

5) *Diplome des Ameriques Francaises*—Certified contacts (after January 1, 1966) with 2 FP8s, 2 FG7s, 2 FY7s, and 1 FM7 or FS7; for Asian or Oceanian stations, only one contact is required; fee: 10 IRCs; manager: Alex Desmeules VE2AFC, 2525 La Fleche Sainte Foy, Quebec G1V 1J9, Canada.

THE UK SCENE

By the time you read this, the flight of W5LFL in *Columbia* will be some months old and will have entered the realm of ham folklore. However, as I write this piece, the shuttle has barely landed and I guess the computers are still warm.

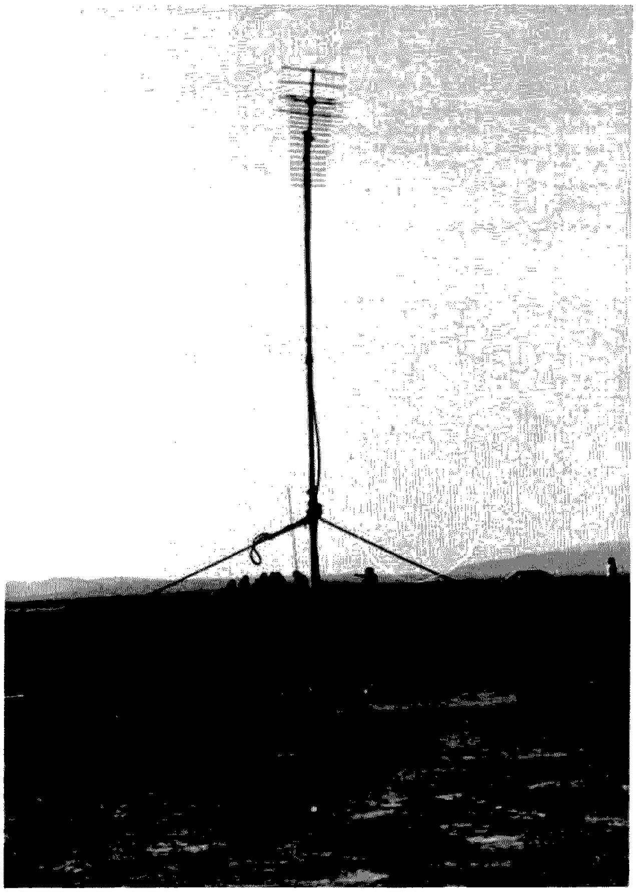
You might be wondering why I have chosen even to mention the project knowing it will be so long before this is in print. I am doing so because I feel that there is a lesson to be learned and a message to be repeated loudly to all hams. The message is, of course, do not let us have another ham in space.

Please don't give up reading in disgust at this point, thinking I am a head-in-the-sand merchant against progress and innovation. Far from it; I do like to see new activities, new ventures, and new technology. I also think the entire shuttle program is a marvelous tribute to American technological know-how, and W5LFL is my new hero.

Why then, the antipathy towards any further such missions? Well, this is largely because, I am sorry to say, W5LFL's trip brought out a side of amateur radio I would not wish to see again. I will explain this, but first some background.

There has been keen interest in the United Kingdom in the ham-in-space program since it was first mooted about some time ago. When NASA gave tentative approval there was considerable activity. The RSGB magazine, *Radio Communication*, outlined the proposals as did the AMSAT-UK newsletter, *Oscar News*.

With the shuttle flight quite close, *Radio Communication* featured a long article describing the proposed operating method and suggesting likely times of



One of the test antennas.

spacecraft visibility in the UK. *Oscar News* featured more detailed information on the orbital parameters expected. As the time of launch drew closer, the Sunday morning news bulletins from RSGB (on 2 meters and 80 meters) gave very comprehensive coverage of the final plans for operating and the expected launch program. AMSAT-UK nets on 80m and on OSCAR 10 talked of little else but the shuttle program, and much time was spent swapping orbital prediction programs and planning strategy.

The RSGB set up a telephone-answering machine giving up-to-the-minute information. (So popular was this, that I ended up calling Westlink in California after trying unsuccessfully for two days to get through to RSGB.) The Sunday morning newscasts became daily, with bulletins each evening at 1700 local time on 80m for the duration of the mission. AMSAT-UK of course was having a field day with nets and special news sheets (even *Radio Communication* for December carried a loose insert with the latest orbital predictions).

So you would expect everyone to know what to expect and to know what to do. I was active for five of the projected overpasses of the UK. I did not hear W5LFL, but I did hear enough to suspect that he would not wish to have had any QSOs with UK stations. First, there were the lids who can't read, didn't read, or just did not believe what they were given by the RSGB. Calling on the downlink was the favorite of course—even by some G3s whose callsigns indicate that they have held a license for at least 15 years (and are presumably, therefore, of mature years).

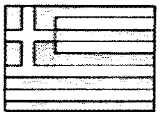
Lids also invented their own brand of brief, short, snappy calls to minimize uplink occupancy: *CQ CQ CQ W5LFL*—and *CQ CQ CQ* Columbia, and *CQ CQ CQ* Columbia, *this is G6??? calling from Puddlehampton in* . . . all of which was enough to occupy the entire pass, never mind the one-minute listening period. Mind you, stations were heard calling *Columbia* up to one hour before the computed (and much publicized) AOS times.

One could, perhaps, forgive the above-mentioned operators for just enthusiasm. But what of the following—

- running RTTY (RYs) on one of the uplink frequencies
- publicly stating that 145.550 (the downlink) is for everybody's use, and calling CQ
- responding with foul language to a polite request to move from the downlink frequency
- telling listeners that the mission is "silly" and threatening to jam if heard
- boasting of running enough power to drown every other UK station

I might have heard more, but I gave up listening. I did not think hams anywhere could behave so badly, but to hear it in England was very sad.

I salute the shuttle program and Dr. Garriott, but please don't give him a rig again.



GREECE

Manos Darkadakis SV1IW
PO Box 23051
Athens 11210
Greece

With AMSAT's new bird, OSCAR 10, the need for a good UHF antenna is a must for somebody who wants to work with it. So, many amateurs in Greece, after the successful departure of the satellite, were thinking of what antenna they should put on. Since Greece doesn't offer many choices for buying goods like that, many of us make our own antennas, but there are not suitable instruments to test them.

So, one day while on a round table on a local channel on two meters, SV1DH promised to bring a very accurate power meter in order to test the homemade an-

Left to right: SV1OE, SV1RJ, SV1DC, SV1IW, SV1DH, and SV1HM.

Left to right (standing): SV1DS, SV1DH, SV1DC, SV1AB, SV1RJ, and SV1RC; squatting: SV1BL, SV1OE, SV1RL, and SV1IW.

tennas along with some commercial ones, too.

The antenna party was organized very fast, and about ten days later on a beautiful Sunday morning, more than 25 SV hams were gathered in Spata, a place some 10 miles east of Athens. This place is a very large area free from obstacles of any kind, as the new International Airport of Athens will be there.

In the transmitting position, an FT-790R UHF transceiver was put with a 23-element Fracaro antenna on a 20-foot mast. On the other end, 200 feet apart, the HP-432A power meter was ready with all the antennas under test.

The measurements for the antennas are in Fig. 1. Note that all of them were put on a similar 20-foot mast just like the transmitting antenna. As you can see, for some of the home-brewers things are not so easy, while on the other hand a few have made very good copies of some popular antennas such as the Jaybeam Parabeam.

Finally, besides all of these measurements, it was a very pleasant Sunday morning; the weather helped a lot for about 25 people to meet and have fun playing amateur radio!

Antennas	Gain	Front to back	Front to side L	Front to side R	Manufacturer's gain
19-element F9FT	12.7	22	18	15	16
21-element F9FT	14	20	17	12	18
88-element Jaybeam's Multibeam	15.2	21	11	13	18.5
15-element Ouagi (homemade from SV1RL)	10.5	4	11	14	15

THE MASADA EXPEDITION

"Masada? You'll never be able to get a signal out from there down by the Dead Sea!"

That was the kind of reaction received by Dani 4Z4GU and Adam 4X6IY when they let it be known that they were organizing an amateur-radio expedition to this ancient fortress.

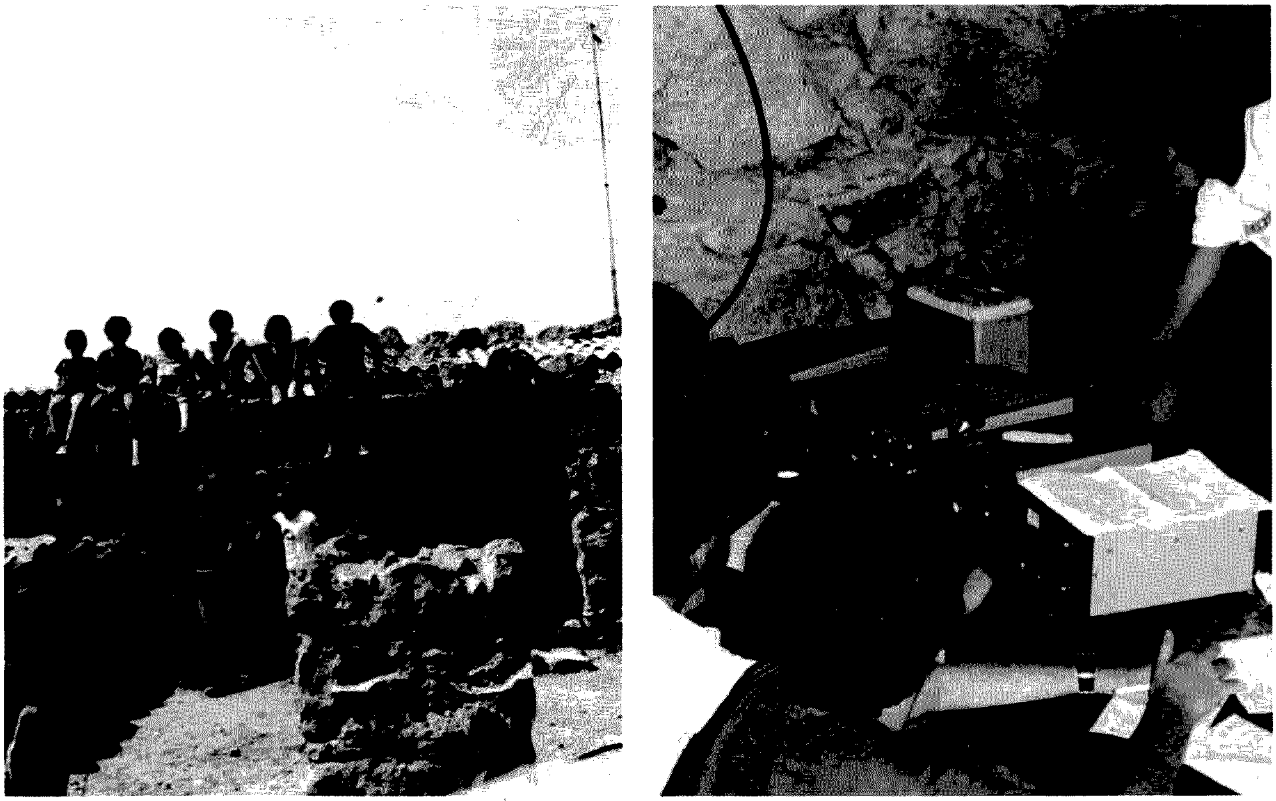
The event—the 1983 Scouts' International Jamboree On The Air; the place—Masada, a fortress dating back to the time of Christ situated on a rock plateau overlooking the Dead Sea, the lowest spot on the face of the Earth. Dani and Adam, leading six members of the Tel Aviv Sea Scouts' radio club, ventured out to this foreboding spot, set up 4Z4HS/Masada, and dispelled for once and for all the myth that this area is an rf trap!

A few words about the history of Masada: Situated in the parched Judaean desert, hovering 1,425 feet over the Dead Sea, stand the remains of this stronghold built by King Herod around the year zero. Containing vast food stores and a cleverly-engineered system of drainage canals and cisterns to catch every valuable raindrop, King Herod designed this place to be both his winter palace and a place of refuge from his many enemies, both real and imagined. Perched on top of sheer rock cliff, it was easily defensible.

A few generations later, with the Jewish rebellion against the Roman Empire, Masada was the site of the last stand of the Zealots. Jerusalem fell to the legions of Emperor Titus in 70 AD, and Masada's defenders held out under siege for three more years. Painstakingly building a massive embankment up to the top of the plateau, the Romans were able to bring their catapults and battering rams to the walls of Masada. When they reached the top and entered, they found that the defenders had taken their own lives rather than fall into captivity. This closed the last chapter of Israel's independence in ancient times.

Today, Masada has become a kind of national shrine. Excavated by archeologists, many of its ruins have been reconstructed to give an idea of what it was once like. A few years ago, a cable car was installed to ease the visitor's ascent up the rock face.

Armed with a TS-830, gasoline generator, storage battery, a twenty-foot mast and assorted dipoles, the group from the Sea Scouts made their way from Tel Aviv to the Dead Sea in the Great Rift Valley. Unloading the gear from the cable car, the



The Tel Aviv Sea Scouts on the 1983 Scouts' International Jamboree On The Air, at Masada, overlooking the Dead Sea. (Photos by Dan Shalem 4Z4GU.)

setting up of the station went without a hitch and it looked like clear sailing ahead.

Suddenly a sandstorm blew up from the Judaean desert. The scouts were forced to retreat into a reconstructed building, and when they got back on the air they found that they were in what had once been King Herod's bedroom!

The twenty-meter band was in good shape and good, clear signals were pouring in from Europe and Africa, with weaker ones being heard from Oceania and the Americas. In the finest tradition of the Jamboree On The Air, Dani and Adam's scouts were making contact with their counterparts around the world, exchanging their names and ages. Many pages of the log were filled, and the group felt the venture to be a huge success.

Masada will be on tha air again! Dani has invited me to a similar expedition he is planning with the Sea Scouts. So, in October, 1984, keep your ears open for 4X4HS/Masada!

QUESTIONS MOST OFTEN ASKED ABOUT JAPAN

Throughout the years as a resident here in Japan, I have been asked many questions about ham radio in this country, such as regulations, statistical information, etc., as well as many non-ham-related items. Here are some of the most-often-asked questions along with the answers, which I thought might be interesting. This also might possibly be saving of my time so that I don't have to answer the same questions more than once!

Q: How many Japanese hams are there?

A: There are 1,080,000 operators and 578,000 stations at the present time.

Q: Why this difference between operators and stations?

A: In Japan, the operator's license (good for life) and the station license (5 years) are separata.

Q: It looks like a lot of operators don't have a station. Right?

A: Right. Many are high-school and university students who confine their operating to the school club station and have never applied for their own station licenses. Also, in Japan some families have a "family club callsign," which all family members with an operator's permit may use. Another factor is that since the operator's license is lifetime, the big number doesn't reflect those who have lost interest in ham radio.

Q: Since there are so many hams in Japan, I am surprised that the DX Callbook lists so few. Why is that?

A: Simply because no one has taken the time to translate the Japanese callbook into English. The Japanese calls and addresses listed in the American *DX Callbook* have apparently either been sent in by the Japanese ham himself or sent in by an American ham friend. Incidentally, the Japanese ham callbook is enormous—as you would expect. It contains 1,500 pages, weighs over 4 pounds, and costs approximately $27.00. And, as stated above, it is entirely in Japanese.

Q: I am a US citizen planning to be in Japan for a month. Can I operate?

A: As of the date of this writing there is no reciprocal agreement yet, but you could possibly operate a club station. The problem is that it takes from two weeks to a month to obtain permission to operate, assuming that you find a club willing to lend you its callsign. The Tokyo International Amateur Radio Association (TIARA) might be able to help you. Just call 585-2236 after you arrive in Japan.

Q: Is repeater operation permitted in Japan?

A: Yes, on 435 and 144 MHz, since 1982.

Q: How about phone patches?

A: Not allowed.

Q: How about fax, RTTY, and slow-scan TV?

A: Yes, they are allowed.

Q: What are the power limitations?

A: The two Novice classes are limited to 10 Watts output; Second class is 100 Watts; and First class generally is 500 Watts although First class is actually open-ended, applications being considered on a case-by-case basis. For instance, I know of one Japanese ham who runs 13 kW legally. In Japanese law, no distinction is made between amateur and commercial regulations. The power limits given above apply to the HF bands. On VHF and higher, the limitation is 50 Watts output.

Q: I understand that the Japanese have another code in addition to the Morse code.

A: Yes, it is called "wabun" and is one of the requirements to obtain a First-class license. When a Japanese operator listens to wabun he writes down Japanese letters on the paper, not English. When you first listen to wabun it sounds like ordinary Morse until you come to some "new" characters—like four dashes, for instance.

Q: Has any American ever passed the Japanese amateur-radio test?

A: As far as is known, no non-Japanese has ever sat for the First-class exam, which would include a wabun exam. But on the other hand, several Americans and others have passed the "denwakyu" or Novice no-code exam. We believe that the first non-Japanese ham to pass the Japanese Novice test was Norman Smith G3HFO in 1970 while he was working for the British embassy here in Tokyo. Since that time several Americans have taken and passed the test, and more recently a New Zealander, Keith Wilkinson ZL2BJR, passed the Second-class test. Definitely a first!

Q: So I assume that those who pass the test can get a callsign and go on the air.

A: No, they cannot! At this writing, only Japanese citizens can receive a station license and callsign. Passing tha test gives one only an operator's license, which you could obtain by showing your ham license from your own country if you happen to be American, German, Irish, or Finnish. (So why bother with the Japanese test?) You still need to find a club station to operate. But that may all be behind us by the time you read this, as we soon may have a full reciprocal agreement with Japan.

Q: It is pretty well known that the Japanese are generally law-abiding citizens, so based on that information I would assume that there are not many violations with regard to amateur-radio operators in Japan. Is that right?

A: There are some problems. I am told that many First-class operators apply for low power to escape a station inspection, then operate with 2 kW or more. Also, there is a lot of repeater jamming. Deliberate jamming, apparently. Also, we often observe out-of-band operation on the 40-meter band, which seems to be deliberate as the operators use fake or comical callsigns. The percentage of bad apples is probably very low, but the repeater jamming has really gotten out of hand. We are told that English-speaking hams are special targets for these jammers. This seems to be true. We also have heard singing, dirty talk, and sex tapes on 2 meters from time to time. (Some people cheer them on.) Then, too, there was a problem when Owen Garriott orbitted this part of the world, bringing the jammers out in force. Japanese country-style "enka" music was heard on one of the downlink frequencies, ruining it for everyone. It was a lot of fun. Generally, Japanese hams have a good reputation on the OX bands and are known for their good manners and good operating techniques.

Q: Who is tha president of the JARL?

A: Shozo Hara JA1AN is the president of the JARL. He is 57 years old and has been JARL president for 14 years.

Q: Can I save money by buying a *rig in Japan and bringing it home?*

A: Yes, if you hand-carry it with you. But be sure the rig you buy has an English manual, that the warranty is good in your country back home, that it has taps for 110/120 volts, and in the case of a 2-meter rig, that it covers the entire band and not just 144 and 145 (Japan frequencies). Incidentally, since the companies went to a lot of trouble to set up dealerships in the US and other countries, they prefer that you buy in your own country through those dealers.

Q: I'd like to stay in a Japanese inn, called "ryokan," in Tokyo. Can you recommend one to me?

A: We're not in the travel business, and since we live here we don't need to look for a ryokan in Tokyo to stay in, but I understand there are some inns in Tokyo that cater to foreigners. The information desk at the New Tokyo International Airport can provide you with information. Incidentally, the Japanese hot baths are very good for arthritis sufferers like myself. Outside of Tokyo at the various resorts you can find many beautiful inns that you might enjoy. Generally, supper and breakfast are included in the price, which ranges from $40 to $300 a night, per person!

Q: Is English understood widely in Japan?

A: No, not really. You will have no problems at international hotels and restaurants, but outside of that you're on your own.

Q: What one piece of advice would you give to a person coming to Japan as a tourist?

A: Bring large buckets of money! Prices are high here.

LIBERIA

Brother Donard Steffes, C.S.C.
EL2AL/WB8HFY
Brothers of the Holy Cross
St. Patrick High School
PO Box 1005
Monrovia
Republic of Liberia

How would you like to know all the amateurs in the United States?

Well, in Liberia the amateurs all know each other. When a new call is heard on the air, all the hams want to know who he is, where ha lives, where he came from, and what ha is doing in Liberia. It ia not unlike many small communities in tha States. There is one exception, though. Here the new amateur is always welcome and any doubts will be erased on his first contact.

The country, from its northwestern tip to its southeasterly point, runs about three hundred miles, and it is about the same diagonally from southwest to northeast. But in area, the country, roughly rectangular, is quite a bit smaller. Liberia is divided into nine counties. The most densely populated is Montserrado (EL2) in which is found Monrovia, the capital city and the greater part of the Firestone Rubber Plantation. More than half of the hams in Liberia operate from Montserrado County, so many of the amateur operators around the world get the idea that Liberia is EL2-land. Most of the radio amateurs in Liberia are expatriates, and in the Monrovia area most of them are either American or German. The Americans are associated with the embassy, with the Voice of America, or with the administrative offices of various American government activities. Also, a number of Americans are engaged in hospital and dispensary work and in education. The Germans, for the most part, are engineers.

Nimba County (EL8) has seven amateurs and all of them are missionaries. Bong County (EL7) has four amateurs. They are engineers operating an iron-ora mine. Grand Cape (EL9) has four amateurs who are missionaries. Grand Bassa (EL1) had two. One of them has left, so in that county the count is down to one. Sinoe (EL3) has none. Maryland County (EL4) has one. Lofa County (EL5) has four. Grand Gedah (EL6) has one, and all of these are missionaries.

Some of the missionaries up and down Liberia use commercial-type fixed-frequency radios for their business communications and use the amateur radio to keep in touch with their friends both in Liberia and in their homelands. Communication in this country is difficult or nonexistent except for the radio. In the outlying areas there is either no electrical power at all or it is supplied for a few hours a day. Radios in those areas are operated on battery power.

The problem of building amateur radio among the natives becomes more understandable. The missionaries must supply the instruction and the equipment, otherwise little is going to happen in this area. Area club stations seem to be the answer and it is in this direction that present efforts are going.

It would be an interesting project to contact all the amateurs in Liberia. There are less than a hundred. Perhaps one of these years, the LRAA (Liberia Radio Amateur Association) will issue an award for such an accomplishment. Wouldn't it be nice to have a beautiful certificate on the wall of your shack stating that you have contacted every ham in Liberia?

How to Have a Sunny Field Day

When Michigan hams turned to solar power, they got more than they asked for. Does success mean anything?

Our club, The Monroe County Radio Communications Association, has always earned the natural-power bonus points at Field Day by hand-cranking a generator and using the power produced to operate a 5-Watt CW QRP rig. Believe me, it takes real concentration on the handles when the operator keys down to adjust the antenna tuner.

Well, to a radio ham who is always looking for a better way to improve a station, it seemed that there had to be a better way to earn the bonus points. I had seen a demonstration of photovoltaic power at a local hamfest and it sure seemed like a better way to go.

Battery box, charge controller, and solar panel with (from left to right) Paul DeNapoli WD8AHO, Lee Loose KD8DA, Dave Smith W8YZ, and Ron Loveland KA8RNE.

We contacted Mr. Paul DeNapoli WD8AHO, the Communications Director for The Encon Corporation (27600 Schoolcraft Road, Livonia MI 48150, (313)-523-1850). Paul was glad for the opportunity to demonstrate his company's products. To our surprise, he told us to plan on running at least one solid-state rig of the 200-Watt class for the entire period on equipment that he would loan us for demonstration purposes. We expected only to run a handheld on 2 meters for five contacts.

We took Paul at his word. One of our members supplied an Icom IC-740 for the project. This station was to be operated on both 80-meter phone and CW with capability for other bands as well. We planned to use it around the clock.

The equipment provided by Encon was four Exide renewable-energy, deep-cycle, 6-volt batteries connected in series parallel, 12 V dc @ 370-Ah storage, an Encon charge controller, and three Encon solar panels each measuring 17 by 42 inches. The latter were mounted on an aluminum framework and pointed south under Paul's direction. We expected to need to rotate the framework to follow the sun, but Paul explained that this was not needed.

We started Field-Day operation using the mad-scramble technique which permits 27 hours of operation. The solar installation proved to be easier to set up than a gas generator. Paul brought the whole installation to our site in the back of a compact automobile. All that was needed was to make several connections to the rig and batteries with #10 copper wire and aim the panels south.

We were quickly able to make the needed 5 contacts

for the natural-power bonus points. Everything was working fine and we continued to operate the station full bore on both phone and CW.

The charge controller supplied by Encon had a battery voltmeter as well as a separate charge and discharge ammeter. The voltage remained at a steady 13.4 volts while the charge indicator indicated between 1 and 6 Amperes to charge. This was due to the periodic cloud coverage. Under full sun, we had 6.6 Amps. The output ammeter fluctuated wildly between 1 and 20 Amperes while we were operating!

The station was on the air all night and of course there was no charge current to the batteries. The voltage dropped to 12.6 volts. This was quickly recovered, however, with the batteries topping off at full charge by 10 am. The charging current from the panel array was 6.6 Amperes.

It became clear at this point that the three panels and batteries were large enough to run at least one more rig. We had failed to consider how low the full-current duty cycle is with solid-state amateur gear, even during a contest.

Considering the advantages of solar power for Field Day, one must think beyond multipliers and bonus points. For example, there were a couple of times when the solar station was the only station operating, once because of a breakdown of a generator when a spark plug fouled and another time when there was a fuel-line blockage. It was clear that the solar installation is far superior for emergency applications. Also, there was no ignition noise to contend with when the generator failed. The "ears" on the solar station got even better.

This demonstration of amateur radio was well covered by the press with all area papers giving it attention. The county's general-coverage paper, *The Monroe Evening News*, did a half-page photo story on our Field Day with particular emphasis on the solar-power aspect. This publicity got a lot of attention for our hobby and provided many opportunities for the club members to explain to their friends the hobby with its unique emergency capabilities.

One response is most interesting. The local power company contacted the club and offered to "do whatever is needed," including setting poles and transformers free of charge and providing free power, for any future field activities of the club. They wish to emphasize the dependability of commercial power.

In Michigan, users pay a penalty for "excess use" of electricity. Consumption beyond 810 kwh is charged at a rate of 14¢ a kwh. This means that any optional use of electricity such as amateur radio must be considered to cost the penalty rate. Nearly every ham I know has a part of his electrical consumption in the "excess" category; any home application of photovoltaics must take into account ham operating at the penalty rate.

Also, hams who are especially interested in emergency preparedness would do well to consider the potential of photovoltaic power for their home stations. After all, a widespread outage of commercial power would have no effect on an operational photovoltaic system, while the demands upon a ham who was needed to send health and welfare traffic might well include cleaning spark plugs and gas lines of infrequently used equipment before the traffic could be sent. Clearly, there is an advantage in using something that works every day of the year. ■

Painless Op-Amp Filter Design

Custom applications can be easy. Just follow this step-by-step guide to a perfect triple op-amp filter.

The triple op-amp audio filter has become a standard, not only in amateur circles but in commercial design as well. Easy to design and nearly foolproof in construction, the various configurations of this filter have found their way into a large percentage of existing ham shacks, either hidden within a transceiver or sitting on the speaker as an audio adjunct. Numerous small companies offer post-receiver audio units using from one to eight filter units.

Even though popular, op-amp filters seem to confuse most ham builders. Despite the low cost of parts, few hams build their own. A simple but effective single filter with a bandpass of between 100 and 200 Hertz would cost about $10.00 for parts, excluding the case and power supply, which together might double the cost. This is a small investment in selectivity, considering what one might learn in the process. Still, there are few takers.

Part of the problem stems from the volume of material that has been written about triple op-amp filters. There are at least three semi-distinct configurations of these filters, but only two different models. However, because designers recast schematic diagrams in different ways, the average ham comes to believe there may be dozens of models. Going even further, different designers choose different circuit values without explaining their choices; the variations seem to grow without limit and without any clear sense. The available books on filter design mire the ham builder in theoretical design math while simultaneously claiming simplicity. There is *some* necessary math to designing a personally-satisfying triple op-amp filter, but it is straightforward hand-calculator stuff.

For the CW buff, most of the existing designs have limitations. Many are fixed-frequency units allowing no tuning to please the ear. The units that permit tuning tend to cover 300 to over 3000 Hz, a fine range for the SSB fan who can use high- and low-pass capabilities built into the filter, but extraneous for CW. A filter that covers a span ranging from 300 to 400 Hz at the bottom to perhaps 1200 Hz at the top would reach two goals. First, the filter would cover the main receiver passband for CW, which runs (depending upon preference) from 400 to 800 Hz wide. Second, the filter would spread its narrower tuning range across the filter frequency dial, permitting the operator to find more easily the desired signal. Unfortunately, most home-brew designers have merely guessed their way into a tuning range.

There is a very direct and easy-to-follow procedure for designing triple op-amp filters in the ham shack. Not only will the procedure ensure a filter that works, but also it will allow the builder to refine the filter's tuning range to his desires. The following notes present a procedure used to design several dozens of different filters for experimental, evaluative, and operational use, and those who have tried the procedure claim they

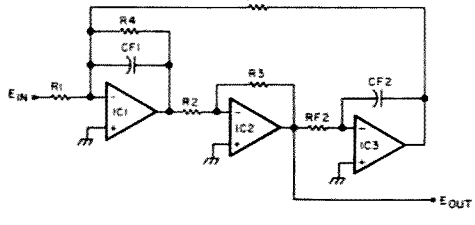

Fig. 1. The basic bi-quad filter.

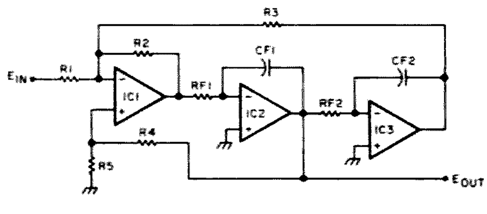

Fig. 2. A basic state-variable filter (−SVF).

have finally made a filter that works and that they like. The procedure even includes steps that show how to let a hand calculator do most of the work.

Some Op-Amp Basics

There are many triple op-amp filter designs but only two fairly distinct types. Unfortunately, the history of op-amp filter terminology has obscured the subject. Originally, the mathematical methods of designing filters gave rise to the name "bi-quad" as a label for all designs. Newer derivations yielded the name "state-variable filter." For some, these names refer only to the design methods; for others, they refer to circuit configurations. At the risk of arousing the wrath of some professional designers, let's follow the latter course.

The bi-quad (or B-Q) appears in Fig. 1. Note that the input op amp is an integrator, as is the third op amp. (Theory aside, an integrator circuit is little more than an op amp whose feedback is provided by a capacitor rather than a resistor.) The middle op amp is an inverter, and we take our bandpass output from this stage. Feedback from the first and third stages is fed back to the first stage input. By controlling the amount of feedback from one of these stages, the first, we control both the gain and the Q or selectivity of the filter. The components marked RF1, CF1, RF2, and CF2 control the frequency of the filter.

Fig. 2 shows the other triple op-amp filter design. The state-variable filter (or −SVF, with the minus sign to be explained very soon) also consists of two integrators, but this time in positions two and three, with a summing amplifier as the input stage. Feedback from the integrators combines with the input signal at the inverting or negative input of the first op amp. We control the gain and Q of the filter by the ratio of resistors R4 and R5, and we set the frequency by the components marked to correspond to those in the B-Q filter. Bandpass output comes from the middle stage, this time an integrator. Unlike the B-Q filter, the −SVF design provides high-pass and low-pass outputs, but at different signal levels than the bandpass output.

The −SVF filter has a near twin which we can call the +SVF. Fig. 3 shows the configuration. The major difference between the SVFs is that this version feeds the input signal to the non-inverting or positive input of the summing op amp. (The reason for the labels +SVF and −SVF should now be clear.) Gain and Q feedback also return to this pin, now being controlled by the ratio of R4 to R1. Although this filter belongs in the SVF family, some of its components require slightly different values from its brother, and the gain vs. Q characteristics will differ. Otherwise, it works perfectly well.

The B-Q and SVF filters have different properties that, for various needs around the shack, give one advantages over the other. First, both SVF filters will have a constant Q and gain throughout their tuning ranges. This means that the bandwidth, when measured in Hertz, will increase as the filter frequency increases. In contrast, the B-Q filter has a constant bandwidth in Hertz, but consequently increases in Q and gain with frequency. For fixed-frequency filters, this phenomenon is meaningless, but for tunable filters, it is important. The constant output of the SVF designs makes follow-up amplification simple. However, every SVF section (i.e., three op-amp filter) requires a dual potentiometer to change RF1 and RF2 together.

The B-Q filter is tunable in the same way but may also be tuned by changing just RF1. Since, like virtually all other filter sections, these filters will ring if the Q is very high, we can cascade two lower Q B-Q sections for a sharper bandpass using only one dual pot. Dual pots are hard enough to find; four-section pots in audio (log) taper are nearly impossible to come by, being either inaccessible or very expensive (which amounts to the same thing for most of us). A newer variety of op amp, the operational transconductance amplifier (OTA), promises to relieve us of these problems, but few practical ham designs using the device have yet to appear.

Notice that there is no clear winner in the contest between the B-Q and the SVF filters. Rather, we must design around their limitations. For example, we can overcome the gain change of the B-Q filter by making the Q resistor, R4, variable, or by following the filter with a limiting amplifier such as the one in Fig. 4. This is the W4MLE variable-compression version of the N6WA Audio Elixir. (See *73* for September, 1979, p. 116, and November, 1982, p. 32.) Until OTAs become more common, there is no way to solve the multiple-pot problem of cascaded SVFs; however, for most work on CW, a single-section, moderate-Q filter requiring just one dual pot will do wonders. A Q of 20 theoretically yields a half-power bandwidth of just 30 Hz at 600-Hz center frequency. Even allowing for low-precision components, we do not need excessively high Q filters to enhance CW. In practice, design Qs in the range of 15 to 20 will yield −6 dB (half-voltage) bandwidths in the 100-to-120-Hz range for a 600-Hz center frequency.

Designing Your Filter

In Fig. 1 through Fig. 3, components having comparable duties have the same designation. For all designs, the frequency-determining components are the same although differently placed. R2 and R3 provide feedback and can be treated as alike in all three cases. In the −SVF design, R1 equals the feedback resistors, while in the +SVF version, it will be half their value. In the B-Q, the input resistor can equal the feedback resistors

Fig. 5. A comparison of filter design relationships.

or vary somewhat from their value according to the needs of the Q relationship. Only in the −SVF design does Q leave the input resistor unaffected, being determined by the relationship between R4 and R5. In the other designs, the input resistor will be a compromise (if needed) between the dictates of Q and the desired situation of having the input resistor correctly related to the feedback resistors.

This discussion may make designing a filter appear difficult. In fact, design is quite easy if done according to a straightforward procedure. Taken step by step, the procedure almost ensures satisfying success. Let's start with some basic relationships, as shown in Fig. 5.

This table reveals where the differences between designs will occur. Calculating R4 will be slightly different for each case. Notice that the +SVF filter has twice the gain of the other designs for a given Q. This may or may not be an advantage. For a filter inserted between the detector and audio amplifier of a receiver, the doubled gain with a low-level input can be useful. For post-receiver use with normal speaker input to the filter, the lower gain of the −SVF and B-Q designs may be more than we need. In all cases, we should have a means of varying the input level.

Aside from these points, design of the three-filter versions will be nearly identical. The first step is to think about the ICs we will use. The LM324 is perhaps standard for both single- and dual-voltage supply applications. Its current requirements are relatively small and it is easy to handle. The TL084 is an FET input version with an identical pinout; its current requirements are even less. The 3900 Norton amplifier also is popular in single-voltage designs, but its biasing is different. Fig. 6 shows the basic configuration of the +SVF design with Norton biasing. Notice the additional formula that sets the values of the bias resistors to the non-inverting positive op-amp inputs. Otherwise, our work will be the same as for regular op amps.

Much of the available literature on filters is still written in terms of the relatively high current 741 op amp. Hence, about the highest value shown for feedback resistors is 10k. In fact, 10k should be about the minimum value for R1, R2, and R3. Something approaching 100k is more appropriate, although we will not freeze that value at this point. Instead, we will start by selecting an op amp and the desired frequency range.

This differs from textbook procedures, but for good reasons. First, the ham builder ordinarily has access to components with 5% or 10% tolerances rather than the 1% and .1% tolerances commercial designers prefer. Consequently, absolute peak performance from ham models of op-amp filters is not possible. Very good performance is possible and practical. Since we will aim at good though imperfect performance, we can take a few liberties with absolute precision at some points to gain better precision at points more important to hams.

Second, one of the most evident shortcomings of home-brew filter designs is the fact that tuning controls for frequency and Q rarely cover the most desirable ranges. The techniques for designing filters are easy, but almost never described.

Third, the current crop of op amps available for filter work is very forgiving when we compare the precise operating level to overall filter performance. Hence, we can set our own priorities when establishing a design procedure. In fact, feel free to modify the following procedure to suit personal needs and desires.

While the procedure involves twelve individual steps, they cover only three areas of concern: setting the frequency or tuning range of the filter, ensuring correct feedback, and setting the selectivity and gain of the filter. With a few reservations noted in the procedure steps, these are almost independent design operations. To make the procedure more thoroughly clear, let's step through it, working an example as we go along.

Twelve-Step Filter Design

Step 1. Select an op amp.

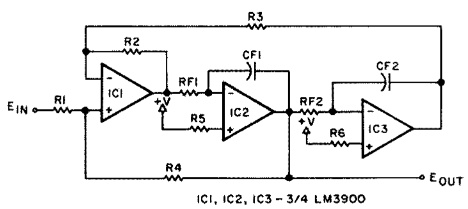

Fig. 6. A +SVF filter using the 3900 Norton amplifier.

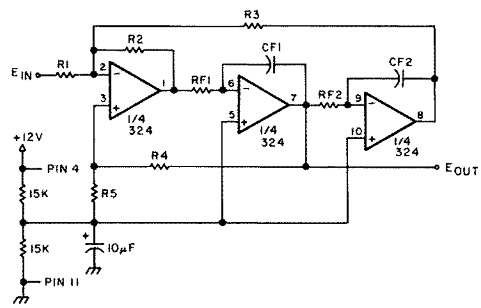

Fig. 7. Setting up the 324 for filter design.

In this case, let's use the reliable LM324.

Step 2. Select a circuit. We can start with the −SVF of Fig. 2 and later see what happens when we convert the design to the other circuits.

Step 3. Choose a power supply. In this example, we have chosen a single 12-volt source. This forces us to provide a voltage divider to feed the positive input lines that we would directly ground if we used a dual supply. Fig. 7 shows the basic configuration of our circuit, with the 324 pins and power connections drawn in.

Step 4. Choose a frequency range. For CW, let's try 300 to 1200 Hz.

Step 5. Find the center frequency, F_c. This is our first calculation. Let k be the ratio of the highest (F_{hi}) and lowest (F_{lo}) frequencies of our chosen range. Then: $k = F_{hi}/F_{lo} = 1200/300 = 4$.

The square root of k is 2 (and let's call this ks). If we have not made a mistake, then $F_c = F_{hi}/ks = F_{lo}ks = 1200/2 = 300 \times 2 = 600$ Hz.

This is the design center of our filter. Since the filter is tunable, let's next turn to the task of being sure it tunes exactly the range we want it to tune.

Step 6. Choose a dual pot to tune the filter. This is a practical decision. Since we have already said that we would like to keep the feedback resistors well above 10k and hopefully near 100k, a dual 500k pot would be nice. Dual 100k audio-taper pots may be more accessible, so let's see what happens if we use this value.

Step 7. Calculate R_{hi} and R_{lo}. In order to limit the tuning range to specific values (e.g., 300 to 1200 Hz), we will need a fixed resistor and a pot in series to make up each of the frequency-controlling resistors. R_{hi} will be the needed resistance when the frequency is the lowest, and R_{lo} will be the resistance at the highest frequency.

We know something about these values, even though we have not yet selected a capacitor. First, we know that their difference will be 100k, the value of the pot. Hence, $R_{hi} - R_{lo} = 100k$. We also know that $R_{hi} = 4R_{lo}$, since the ratio of low to high frequency is 4:1. (Note: If we hold the capacitance constant, as we will do with a fixed-value unit, the frequency and resistance will vary inversely with each other, i.e., $F_{hi}/F_{lo} = R_{hi}/R_{lo}$.)

Knowing the two relationships between the highest and lowest resistances lets us substitute and solve for R_{lo}. Since the ratio of the resistances is 4:1, then $R_{hi} = 4R_{lo}$. In the difference formula, we now can say that $4R_{lo} - R_{lo} = 100k$, or $3R_{lo} = 100k$. Dividing 100k by 3, we get $R_{lo} = 33.3k$. Since the highest resistance is 100k higher, $R_{hi} = 133.3k$. As a check, we can use the other original formula and let $R_{hi} = 4R_{lo} = 4 \times 33.3k = 133.2k$.

I have carried out the calculation to more precision than we can possibly get with real components to show how good the method is. In fact, since real pots are often shy of 100k by as much as 10%, it is wise to have a pot in hand before working out a design. The decimal places might get long, but rounding to the nearest whole number for resistors and keeping k and ks to no more than two decimal places will give perfectly good design accuracy.

We now know the fixed series resistor for RF1 and RF2 will be 33k, with the 100k pot making up the rest of the resistance. If we discover that our dual pot does not track and can determine by how much it is off, we might make one of the two fixed resistors a 50k trimmer pot. (Adjustment of trimmers in the frequency-determining circuits of a filter is best done with the circuit wired but the op amp out of its socket, using a precise ohmmeter. Accurate adjustment with the circuit in operation requires a scope with frequency-scanning capability. Output-level readings taken on an ac/audio voltmeter can be misleading.)

Step 8. Calculate capacitors CF1 and CF2. At all frequencies, the resistance will equal the capacitive reactance. Hence, the standard formula for calculating capacitance from frequency and reactance becomes $CF1 = CF2 = 1/2piFR_f$. In this case, start with either end of the tuning range. For the example, use 300 Hz, where the resistance is 133k. If your calculator has a 1/X key, you can just multiply all the denominator numbers together and then hit the inverse key. The answer is likely to appear in exponential notation. For example, $C_f = 1/(2 \times 3.14 \times 300 \times 133{,}000) = 3.99 \times 10^{-9}$.

We need to convert this to either microfarads (10^{-6}) or picofarads (10^{-12}) to see what capacitors we should purchase. 3990-pF or .04-uF capacitors will do the job. We can parallel some 5% polystyrene capacitors to hit 4000 pF fairly closely. Given the fact that we can rarely buy the exact value that the formula says we need, we should design the frequency range of the filter with an extra 5% on either end to allow for the slight range shift our approximations will produce.

We can check our work by calculating the two frequency-determining capacitors from the other end of the range. This time, $C_f = 1/(2 \times 3.14 \times 1200 \times 33{,}000) = 4.02 \times 10^{-9}$, or about 4000 pF again. Because we used pi to only two decimal places and dropped the last 300 Ohms off the resistance values, the answers diverge by about 1%, well within the 5% component tolerance. Note that had we used the 500k pot we considered at the beginning of the example, our capacitors would be about one-fifth the present value. Some builders have difficulty obtaining 5% capacitors in the higher values and may want to use the larger pot in order to combine it with capacitors in the 800-pF range.

Step 9. Calculate the resistance at the center frequency, F_c. Since the resistance at center frequency will equal the reactive capacitance, $R_{fc} = 1/2piF_cC_f = 1/(2 \times 3.14 \times 600 \times 4 \times 10^{-9}) = 66{,}348$ Ohms. This is the resistance value of the frequency-determining resistors at the design center of the filter. We will use this figure in a very broad way to determine the remaining resistors in the filter. Most filter-design manuals scale a filter from an initial assumption of equal value resistors throughout as much of the design as possible. On this assumption, R1 through R3 should equal the center-frequency resistance, and R5 should approximate it, if possible. Similar assumptions apply to the other filter designs, with adjustments for values that must differ.

In practice, using components readily accessible to amateurs, the assumption is not very important as long as filter resistor values fall within the range that permits the op amps to perform well. Values from 10k to 100k have been used with no specifically noticeable change of performance. As a rule of thumb, try to let the feedback resistors fall within a 2 to 1 or 3 to 1 ratio of the center-frequency resistance.

Step 10. Determine the feedback and input resistors, R1 through R3. On the basis of the previous calculation and discussion, 68k resistors appear to be the closest value to the calculated center-frequency resistance. In practice, 100k resistors do not change the filter performance. What is important is to use the same value for all three. Since 100k is a nice round value found in most ham junk boxes, let's use it. No-

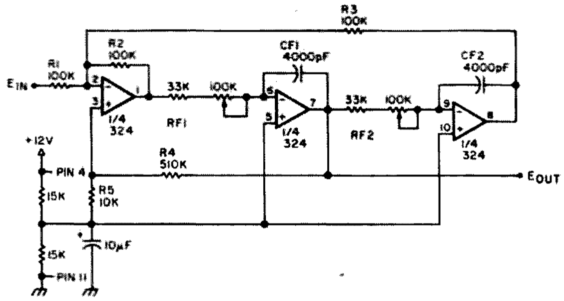

Fig. 8. A fixed-Q −SVF filter.

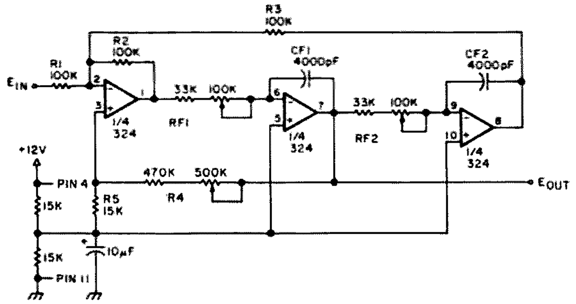

Fig. 9. A variable-Q −SVF filter.

tice that, like many ham building decisions, the grounds for our choice have little relationship to theory. If our value does not work for some reason, we have another value to try.

Step 11. Select a value for Q and choose the Q-determining resistors, R4 and R5. Since both resistors affecting Q and gain are independent of the input resistor, we have more latitude in choosing values than with the other two designs. For CW filters, there is rarely a need for a Q greater than 25, and the range of 10 to 20 will generally produce sufficient selectivity without ringing. For greater selectivity, we should use identical successive filters which will give us a steeper bandwidth curve and greater ultimate rejection on unwanted signals. As a rule of thumb, using 5% and 10% components, I anticipate that the half-voltage (−6 dB) bandwidth will approximate $3F_C/Q$, about 50% wider than theory indicates. For the SVF filters, bandwidth in Hz will vary directly with frequency. Thus, if I choose a 100-Hz bandwidth for the 600-Hz center frequency, it will vary from 50 Hz at the 300-Hz end of the range to 200 Hz at the 1200-Hz upper end of the tuning range. If this bandwidth is acceptable, then $Q = 3F_C/BW_{fc} = (3 \times 600)/100 = 18$. Let's see what happens if we use this figure.

From the formulas governing the −SVF filter, $R4 = R5(3Q-1)$. For our case, $3Q-1 = (3 \times 18) - 1 = 53$, and $R4 = 53R5$. If we let R4 $= 100k$, then $R5 = 5.3$ megohms; use either 4.7-megohm or 5.1-megohm standard resistor values. In fact, we can change the values proportionately by factors of ten without disrupting filter performance. Values of 10k and 510k work well and may be easier to find. A rule of thumb is to let R4 be the highest easy-to-find value that permits R5 (or R1 in the other two designs) to approach its proper theoretic relationship to the other resistors. However, other considerations may enter into the final selection. Fig. 8 shows our completed fixed-Q design.

One major consideration is whether we wish to be able to vary the Q of the filter and thereby to broaden or narrow the bandwidth over some useful range. For example, we might wish to have a Q ranging from 10 to 20 for this design. At $Q = 10$, the resistor ratio $(3Q-1)$ will be 29, and at $Q = 20$, the ratio will be 59. Suppose that we have a 500k pot we wish to use to vary the Q. Since we will not vary the Q to nothing, we will need a series resistor with the pot to make up R4. We know that the value of R4 at $Q = 20$ will be the series resistor R_S + 500k, the highest value of the pot. At $Q = 10$, R4 will be just R_S, the value of the fixed series resistor. At the higher Q, $R5 = (R_S + 500{,}000)/59$, while at the lower Q, $R5 = R_S/29$. We can solve for the series resistor by letting $R_S/29 = (R_S + 500{,}000)/59$. Cross multiplying, we get $30R_S = 29 \times 500{,}000$, or $R_S = 1{,}450{,}000/30 = 483{,}333$ Ohms. This is the series resistor to go with the 500k pot for R4. $R5 = R_S/29 = 483{,}333/29 = 16{,}667$ Ohms. (As a check, $R5 = (483{,}333 + 500{,}000)/59 = 16{,}667$.) We can choose a 15k or 18k resistor for R5 and a 470k or 510k resistor for R_S, respectively. Exactness will not matter too much here since we will tune the control for best reception rather than for some specific value of Q. Fig. 9 displays our completed variable-Q design.

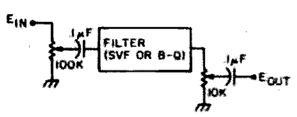

Fig. 10. Filter input- and output-level controls.

Step 12. Consider the gain. This step does not require special calculations, but it does bring the matter of gain to your attention. For the −SVF design, gain will equal Q. If you design a fixed-Q filter, you can accommodate the filter gain with preceding and succeeding level controls, as shown in Fig. 10. Set the input-level control so that the strongest signal will not drive the filter to clipping. A scope will show this as a sharply flattened sine wave. Since the voltage gain will be considerable, the filter may drive the succeeding stage too hard, causing distortion in the amplifier feeding the speaker or phones. We can kill the unwanted voltage with another trimmer set to hold the amplifier relatively distortionless at full volume.

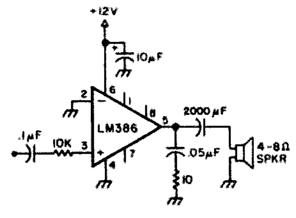

Fig. 11. A simple post-filter amplifier for speaker or phones.

If the filter has a variable-Q control, then its gain will also vary. To avoid the need for constant volume-control adjustments, the compression amplifier shown in Fig. 4 should follow the filter and precede the output amplifier. With the values shown for the compression circuit, a normal CW signal will leave the speaker quiet between dots and dashes. The circuit needs no input-setting pot, and the output-level control serves the same function as the filter-output control in Fig. 10.

These 12 steps complete the design phase of the work. The next step is to breadboard a model, verify its operation, and finally construct a permanent version complete with case and power source. Robbing power from the receiver and installing the filter in either the receiver cabinet (especially if inserted between the detector and audio stages) or the speaker cabinet (along with an audio amplifier such as the LM386 circuit shown in Fig. 11) is one popular way to handle final construction. However, to avoid cabinet and circuit modifications, you may

wish to make the filter a self-contained unit.

Additional Procedures—+SVF and B-Q Designs

The first eight steps of the procedures just outlined are identical for all three filter designs. Nothing changes until Step 10, selection of the input resistor, where we have only a minor modification for the +SVF filter. R1 should be half the value of either R2 or R3 if we wish to have the relationship of Q and gain follow the formulas given with Fig. 5. Other ratios are possible, although the input resistor should not be greater than the feedback resistors. The gain will change but remain constant across the tuning range.

Let's look more closely at the final steps of the procedure, customizing them for each particular design. First, the bi-quad filter:

Step 11: B-Q. Select a value for Q, and choose the Q-determining resistors. In the B-Q design, the input resistor, R1, interacts with R4 to determine Q and gain. Having selected an input resistor, R4=QR1. Selecting Q follows the same guidelines given for the −SVF design, with the proviso that Q will vary across the tuning range, since bandwidth in Hertz is constant. Using our −6-dB (half-voltage point) rule of thumb, we can design with the formula $Q=3F_c/BW$, where BW is the desired bandwidth in Hertz. If we wish about 100 Hz, then Q = (3 × 600)/100 = 18. RV = 18R1 = 18 × 100k = 1.8 megohms, a usable value. However, with very little change in performance, we can reduce both R1 and R4 as long as we keep them in the proper ratio. Fig. 12 shows the full results of our design work.

We can vary the Q and consequently the bandpass of B-Q filters. We need only make R4 variable. Suppose we wish to vary the Q between about 10 and 20. If R1 is 100k, then R4 needs to be 1 megohm for a Q of 10 and 2 megohms for a Q of 20. We can use a one-meg fixed resistor in series with a one-meg pot for R4, and the problem is solved. Fig. 13 shows the changes necessary for variable Q.

Step 12: B-Q. Consider the gain. Variable Q plus the natural gain variability of the B-Q filter makes a compression amplifier almost mandatory. However, the 100-to-1 compression capability of the audio elixir circuit will more than cover the situation. The natural gain variability of a fixed B-Q filter with the 300-to-1200-Hz tuning range is about 4 to 1, while Q variability expands the total range to 40 to 1, well within the amplifier's capabilities and with room to spare for audio signal strength variations.

The B-Q filter has one special property not shared by either SVF design. You can tune the B-Q using only RF1, leaving RF2 fixed for F_c. The variable resistor, however, will change frequency only with the square root of the resistance change, meaning that the pot will have to have a much wider range to cover the chosen frequency range. Since the frequency limits in the example are $2F_c$ and $F_c/2$, the resistance range must be $R_{fc}/4$ and $4R_{fc}$. In this design, R_{fc}=66,348 Ohms. The lowest resistance (for the highest frequency) will be 66,348/4=16,587, while the highest resistance (for the lowest frequency) will be 66,348 × 4=265,392. The difference is 248,805. A 250k pot in series with a 15k fixed resistor will form a satisfactory RF1. An audio taper or reverse log pot is mandatory in this application, since even with a log pot the frequency will compress at one end of the scale.

In this example, we were fortunate to wind up with a required value close to an existing potentiometer value. For designing a single pot B-Q filter from scratch, we can begin at Step 6, choosing a pot to tune the filter. Let's select a 500k pot and see what happens.

Step 7: B-Q, single pot. Calculate R_{hi} and R_{lo}. Since frequency will vary as the square root of resistance changes, the total resistance change will be k^2, where k is the frequency ratio. Since k=4 (1200/300 Hz), $k^2=16$. $R_{hi}=16R_{lo}$. We also know that $R_{hi}=R_{lo}+500k$. Now we can solve for R_{lo}: $16R_{lo}=R_{lo}+500{,}000$, or $R_{lo}=500{,}000/15=33{,}333$ Ohms. This is the value of the fixed-series resistor. $R_{hi}=33{,}333+500{,}000=533{,}333$ Ohms. As a check, 533,333/16=33,333 Ohms.

The resistance at center frequency (and fixed frequency-determining resistor RF2) will be $R_{hi}/4=4R_{lo}$= 533,333/4=33,333 × 4= 133,333 Ohms. We can use 100k and 33k resistors in series or use the nearest standard value.

Step 8: B-Q, single pot. Calculate capacitors CF1 and CF2. This calculation uses the same procedure as in the −SVF filter. Since resistance and capacitive reactance are the same at the center frequency (and we must use F_c for this calculation), $C_f=1/2\pi F_cRF2=1/(2\times3.14\times600\times133{,}333)=1.99\times10^{-9}$. This is about 2000 pF, an obtainable value in polystyrene capacitors.

Determine the remaining values for the filter in the ordinary way. 100k feedback and input resistors appear to be in order, since they vary only a little from the value of RF2. Considerations of Q and gain will be identical to those for the dual-pot biquad design. Fig. 14 shows our new filter.

The SVF filters always require dual pots. Therefore, the only difference between the +SVF filter and the −SVF design concerns Q and gain.

Step 11: +SVF. Select a value for Q, and choose the Q-determining resistors. Q selection for the +SVF is

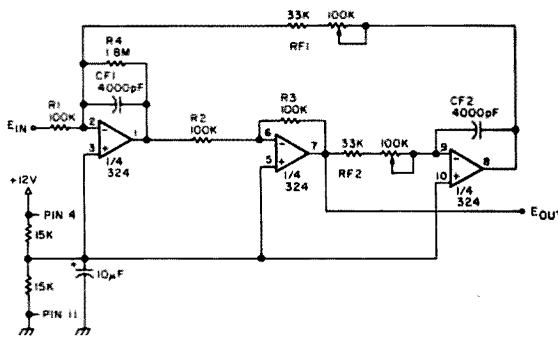

Fig. 12. A fixed-Q B-Q filter.

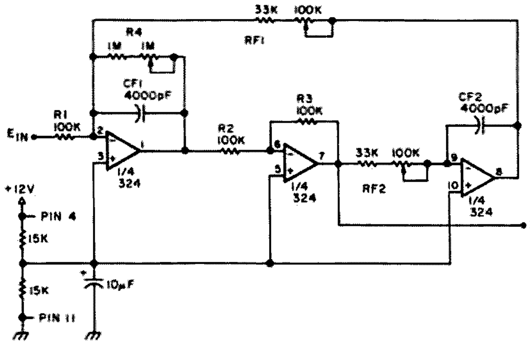

Fig. 13. A variable-Q B-Q filter.

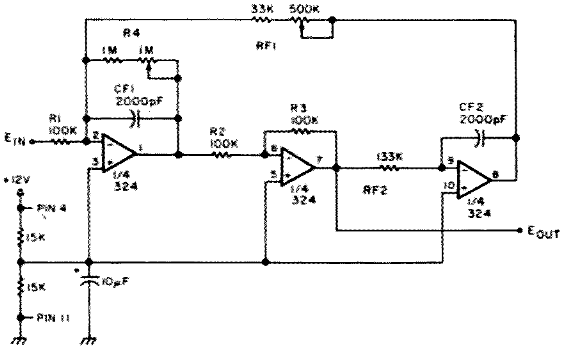

Fig. 14. A single-pot tunable variable-Q B-Q filter.

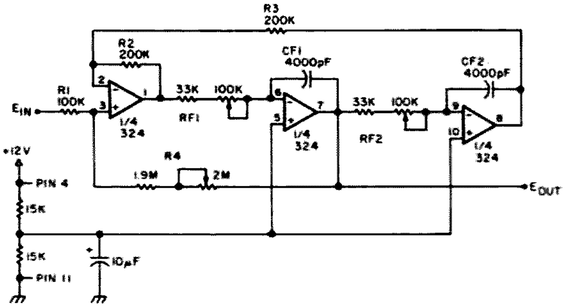

Fig. 15. A variable-Q +SVF filter.

identical to that for the −SVF design. We must make mental note that gain will double Q if we follow recommended resistor relationships. Let Q=18. R4=R1 (2Q−1). If we use 100k resistors for feedback, the R1 is 50k. Many designs use 200k values for R2 and R3, in which case, R1=100k. Let's use this latter value for our design. For a Q of 18, 2Q−1=35, and therefore R4=100k×35=3.5 megohms. 3.3 megohms would work well. For a variable Q of, say, 10 to 20, the maximum resistance value of R4 would be 39R1 and the minimum value would be 19R1. R4 will range from a series resistor value of R_S to R_S+pot, where pot is the potentiometer value we select. Let's try a 2-megohm pot. Then R1=R_S/19 at low Q and (R_S+2,000,000)/39 at high Q. Solving for R_S, we get R_S=38,000,000/20=1.9 megohms. R4 thus becomes a 1.9-megohm fixed resistor in series with a 2-megohm pot. R1=R4/(2Q−1)=3.9 megohms/39=1.9 megohms/19=100k, a desirable value.

Step 12: +SVF. Consider the gain. The gain of this +SVF filter, shown in Fig. 15, ranges from 20 to 40, depending upon the variable Q. Again, following this design with a compression amplifier is a must for easy use.

Construction and Results

All of the designs shown in the examples have been breadboarded to confirm that they will work. In fact, they all work even when some non-frequency-determining components vary by 20% from the design values. Fig. 16 charts the test results. (Always test a design on a breadboard before wiring a final version. If nothing else, the breadboard test will turn up bad components. More important, adjusting the design to more precisely meet your needs is much simpler on a breadboard.)

Construction of the final model can take any form. Perfboard and printed circuit board peform equally well. Layout is not critical with the LM324. The TL084 requires some care to prevent inadvertent coupling, a more serious concern with the very high impedance inputs to each section. One easy way to overcome the problem is to avoid compressing the components into too small a space. Spreading the fixed components at the IC corners in a radial pattern tends to prevent unwanted coupling and makes component replacement simpler. Beyond this, construction is left to individual ingenuity.

Part of the construction ease stems from the low Q of these filters. Most practical filter articles still manage to repeat the virtually useless fact that these designs are good to a Q of 500. At normal CW audio, the bandwidth would be just over 1 Hz, and the filter would ring for a week with just one receiver electron pop, if it was not already oscillating. With normal components, practical Qs of 5 to 25 ensure good stability and

Figure	Filter	Tuning Range	Bandwidth	Q	Output Voltage Ratio	Notes
8	−SVF, fixed Q	330-1250 Hz	25-100 Hz	26	1.08:1 F_{hi}:F_{lo}	3900 pF, 5% C*; reduce R4 from 510k to 330k**
9	−SVF, variable Q	330-1250 Hz	40-75 Hz at (at F_c)	16 to 30	2.5:1 Q_{hi}:Q_{lo}	Reduce fixed-series Q resistor from 470k to 330k
12	B-Q, fixed Q	330-1250 Hz	30 Hz	35 at F_C	1.4:1 F_{hi}:F_{lo}	Reduce R4 from 1.8 megohms to <820k
13	B-Q, variable Q	330-1250 Hz	30 Hz at Q_{hi} 50 Hz at Q_{lo} (at F_c)	35 21	2:1 Q_{hi}:Q_{lo} 2.8:1 total change due to both F and Q	Reduce fixed series Q resistor from 1 megohm to 470k
14	B-Q, single pot, variable Q	350-1330 Hz	55 Hz at Q_{hi} 140 Hz at Q_{lo} (at F_c)	18 7.3	2.6:1 total change due to both F and Q	2000 pF, 10% C_t; increase fixed tuning resistor from 33k to >47k to adjust tuning range
15	+SVF, variable Q	340-1260 Hz	40 Hz at Q_{hi} 75 Hz at Q_{lo} (in passband)	32 17	1.6:1 total change due to both F and Q at R4	Reduce fixed series Q resistor from 1.9 megohms to <1 megohm

Notes: *All filters except the single-pot B-Q used 3900-pF, 5% polystyrene capacitors. The single-pot B-Q model used 2000-pF, 10% polystyrene capacitors. **In any of the filters, raise or lower Q by raising or lowering R4, the Q-determining resistor.

Fig. 16. Test results and comments on the six sample filters.

NEW PRODUCTS

DANISH SWITCHES ARE MADE USER-FRIENDLY

MEC, a Danish company situated in Ballerup, a suburb of Copenhagen, Denmark, has been a switch manufacturer since 1938, until recently concentrating on rotary wafer switches. It now announces the multipurpose UNIMEC modular switch range.

Fig. 1 shows the basic alternate-action version of the PCB-mounting switch (the other option being a momentary-action version). The innovation is that each of the two switches contains all the contacts necessary to provide five alternative contact functions: two c/o contacts two make contacts, two break contacts, two make and two break contacts, and reversed polarity.

From the point of view of ordering and stocking, this gives the great advantage that only two types of switch need to be held in store. The required function is determined by simply selecting the appropriate switch terminal with the PCB tracking.

The UNIMEC is a low-profile switch (10 mm high) designed for 2.54-mm-grid PCB mounting. The housing and key are of glass-reinforced polycarbonate (Makrolon), the keycap system is ABS (Novodur), and the contacts, both fixed and moving, are 0.006-mm silver-plated brass, with gold plating available on request. Stainless steel is used for the moment spring, latch pin, and keyspring. The switch has a minimum lifetime of 1 million cycles. It can be positioned on the board straight or with a 180° twist. Contact resistance after 1 million cycles is typically 20 milliohms and contact bounce is less than 1 ms.

Figs. 2 and 3 show the assembly of the finished switch with knob and bezel. The design is intended to have tactile appeal, and the keys, knobs, and bezels are all available in a choice of ten colors. In addition to the color-coding possibilities, the UNIMEC can also be illuminated with up to four LEDs on any one switch. The LEDs are available in rectangular or pinhead format.

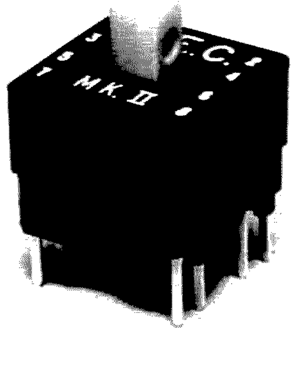

Fig. 1. UNIMEC modular switch.

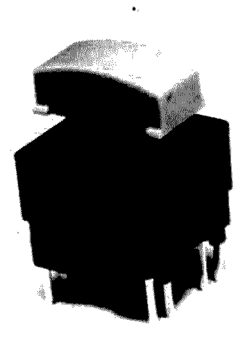

Fig. 2. UNIMEC switch with button.

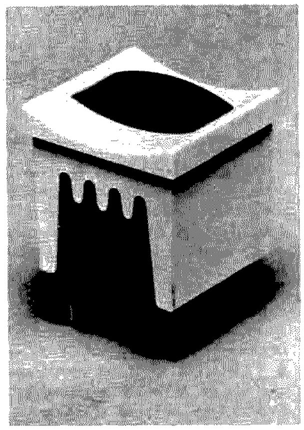

Fig. 3. UNIMEC switch with knob and bezel.

In order to make up individual switches into a keyboard, MEC produces the Vario-Support, a Makrolon matrix system available in any cell combination up to 10 × 10 (Fig. 4). The support it provides to the switch ensures accurate alignment and enables the switch to be mounted on a front panel. Pressure on the PCB is minimized, and PCB mounting is, in fact, no longer necessary.

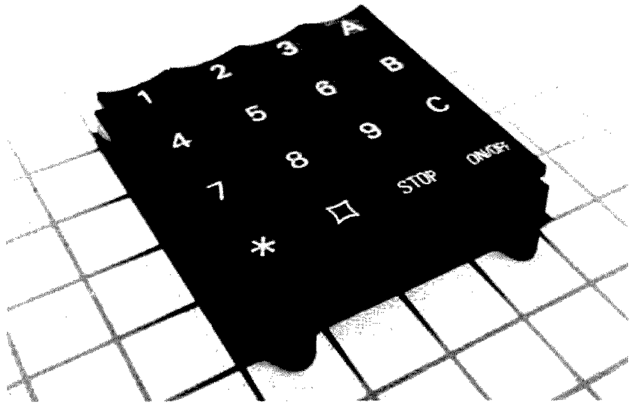

Fig. 4. The Vario matrix system for design-to-purpose panels.

The whole emphasis is on making things easy—the designing, ordering, and assembling—while the materials satisfy the engineer and the emphasis on a tactile design makes the finished product easy and pleasant to use.

To get the name of distributors in countries other than the US, contact MEC, PO Box 26, DK-2750 Ballerup, Denmark. The US distributor is *Electronic Components Group, 26 North Fifth Street, Minneapolis MN 55403; (612)-375-1606.* Reader Service number 480.

HAM HELP

I am looking for a schematic diagram and/or manual for the Electronics International Corporation model 150 VHF receiver.

John Vining
1514 A, 2nd Street, West
Cornwall, Ontario
K6J 1J3 Canada

I need a copy of the Kenwood phone patch PC-1A manual. Will pay for the reproduction gladly.

Albert S. Wilde W8JZZ
5580 E. Galbraith Road
Cincinnati OH 45236

Wanted: schematics for (1) RCA WO-33A scope, (2) Radio Shack catalog no. 40-217 stereo amp, (3) Olson RA-193 stereo receiver, and (4) Realistic 13-1180 stereo receiver. Advise cost.

J. L. Orysen
2025 Sunkist Ave.
Waukesha WI 53186

I need installation instructions for the Icom AH-1 automatic mobile antenna tuner.

Tom Phipps KA4CSG
PO Box 5404
Ft. Hood TX 76544

A friend of mine in Africa asked me if I could get for him a circuit diagram (schematic diagram) for a Hallicrafters HT-32 A and a National HRO model STA 1.

I will gladly pay postage and copying costs if anyone can supply these.

Rob Harrington
PO Box 3434
Littleton CO 80161

I need service literature and an operating manual for a Friden 2305A TTY Flexwriter. Name your price. Also, does anyone know the location of the manufacturer?

Bob Somers W2QYH
411 Hamilton Rd.
Glassboro NJ 08028

NEW HAMTRONICS CATALOG

Hamtronics, Inc., has announced publication of their new 1984 mail-order catalog for the VHF/UHF/OSCAR enthusiast and two-way radio shops. The 36-page two-color catalog features many new products, including an expanded line of FM repeaters and accessories such as power amplifiers, DTMF tone decoder/controllers, and autopatches. Also included are the lines of FM and AM receivers, FM transmitters, VHF and UHF transmitting and receiving converters, space-shuttle receivers, 800-MHz scanner converters, preamps, and other products Hamtronics has long been noted for.

For your free copy of this attractive new catalog, write to *Hamtronics, Inc., 65F Moul Rd., Hilton NY 14468, or call (716)-392-9430.* (For overseas mailing, please send $2.00 or 4 IRCs.) Reader Service number 479.

REGENCY'S 10-CHANNEL PROGRAMMABLE SCANNER

Regency Electronics, Inc., now offers a 10-channel programmable scanner with an arsenal of advanced features—including a little extra help during programming. Regency (the only American-made scanner brand) has announced the production of its Z10, covering six complete VHF and UHF frequency bands for access to thousands of police, fire, public service, business, commercial, and amateur-radio frequencies and channels. Selected frequencies from any band are easy to program into the scanner's memory; the Z10 can scan the frequencies in its memory or search the bands for whomever happens to be there.

The Z10 can scan its 10 channels in 2/3 of a second. Searching its three VHF bands, it can cover 1 MHz (200 frequencies in 5-kHz increments) in about 17 seconds; on its three UHF bands, it can search 1 MHz (80 channels in 12.5-kHz increments) in about 6 seconds. An automatic priority control checks any selected channel every two seconds and switches instantly if it's active.

Programming the Regency Z10 is made easier by a series of plain-language messages that appear on its display. These prompts identify the action that's in process or required next. Individual channels are programmed by using the numeric keypad to enter a desired frequency or by identifying a desired frequency when searching. A special circuit saves these entries in memory for up to a week (should power fail or if the unit is transported or temporarily stored); it does so without batteries (the usual method of memory protection) to avoid problems associated with battery failure from neglect.

The Z10 can pick up most transmissions in the low VHF (30–50 MHz), VHF two-meter amateur (144–148 MHz), standard UHF (450–470 MHz), and extended UHF (470–512 MHz) bands. Its telescoping antenna is

electronically optimized for each band, and an antenna jack is provided for an optional external antenna.

A channel lockout excludes selected channels from being scanned, a useful feature when interest is in monitoring some limited number of channels or when a selected channel becomes only occasionally of interest. Scanners in newsrooms, for example, often exclude fire-department tactical channels except during major fires.

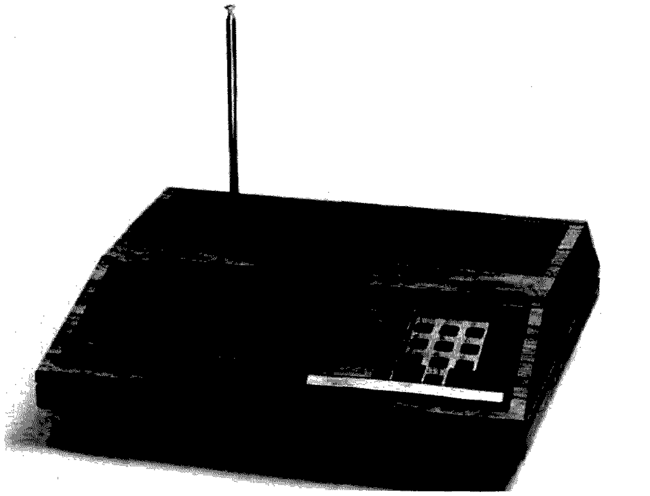
A scan-delay feature helps keep on top both sides of a conversation on channels where calls are usually met by replies. With scan delay selected, the Z10 waits for about two seconds at the end of a transmission (in case there's a reply) before it resumes scanning; without scan delay, scanning resumes in about six-tenths of a second.

When searching, the Z10 delays four seconds after a transmission before resuming its search. This not only allows time to listen for a reply, but also provides enough time to select the frequency for programming into one of the ten scanner channel memories—or simply to note the frequency on paper.

The human factors in the design of the Regency Z10 are quite apparent. Its easily-readable (vacuum fluorescent) display has big digits and a choice of two brightness levels. Sliding volume and squelch controls are easy to position accurately and easy to read with a glance. Its audio amplifier delivers a full 1 Watt at less than 10% distortion, and a jack for an external speaker is provided. The keyboard and display are angled for easy legibility.

Dual power supplies are built in to permit plug-in ac operation at home or dc operation in a car or other vehicle (where not prohibited by law).

The Regency Z10 is UL-listed and FCC-certified (Part 15, Subpart C). It measures 10-3/4 inches wide by 2-7/8 inches high by 8-3/8 inches deep.



The Regency Z10 scanner.

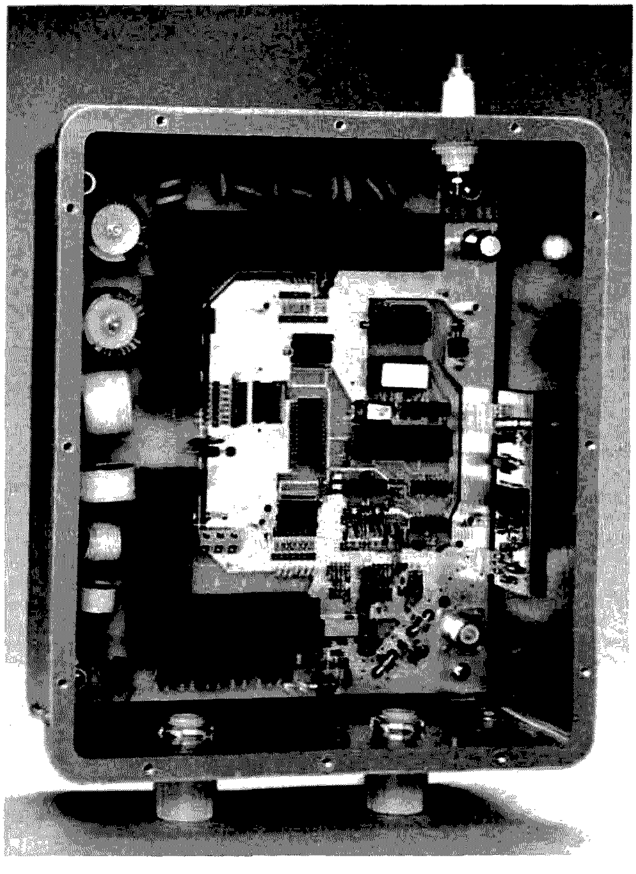
SEA'S AUTOMATIC ANTENNA COUPLER

Stephens Engineering Associates (SEA) has just introduced the SEA 1612 fully automatic antenna coupler. A state-of-the-art microprocessor-based coupler, the SEA 1612 features a "learning mode" that allows it to remember, store, and immediately access data for instant recall and matching the next time the same frequency is used. On-the-spot tuning is fast, accurate, and automatic.

The 1612 activates on the first syllable of a voice transmission and functions automatically to effect optimum transceiver-to-antenna power transfer over a full 1.6-to-25-MHz frequency range. The matching procedure is fully automatic and requires no action by the operator other than the normal press-to-talk function. The SEA 1612 does not require setup by a technician and has virtually no channeling limitations, providing an infinite number of channels within its specified frequency range.

The 1612 will operate with any HF/SSB transceiver that has standard 50-Ohm output. Connections between a transceiver and the coupler consist only of 50-Ohm coax and a 13.6-volt-dc cable. An "Antenna Tuned" flag line is also available to signal the operator that the antenna system has tuned. A single 23- to 75-foot antenna is all that is required.

The coupler is self-contained within a sturdy housing of molded fiberglass with a gasket-sealed weatherproof cover. For complete details and technical specifications, please contact *Stephens Engineering Associates, Inc., 7030 220th SW, Mountlake Terrace WA 98043; (206)-771-2182.* Reader Service number 478.



The SEA automatic antenna coupler.

SOLDERING SYSTEM HAS OVER 270 OPTIONS

With Wahl Clipper Corporation's new assortment of 15 miniature soldering irons and 23 tips, a user can choose from over 270 different soldering combinations to match precise soldering needs.

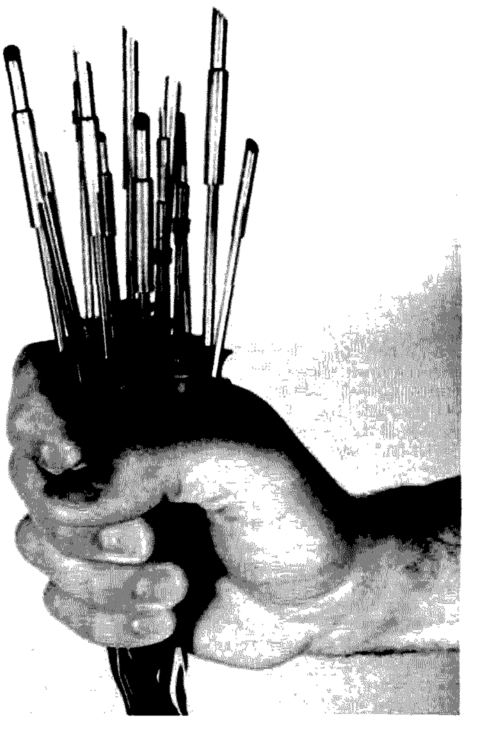
The 15 Oryx® miniature irons, each weighing ½ an ounce or less, are available for temperatures ranging from 575° to 850° F, from 5 to 25 Watts, and from 4.5 to 24 volts. Their compact size and precise temperature control make them useful for soldering heat-sensitive components.

The irons can be combined with any of 23 tips ranging in size from 1/25" to 3/32" in several choices of configuration. Tip construction is nickel-plated or iron-plated copper for most applications, with solid nickel, gold-end, and bare copper alloy (NASA) tips available for special requirements. Tip changes are easy and no tools are required. Cooled tips simply slide off and on.

For further information, contact *Wahl Clipper Corporation, Sterling IL 61081; (815)-625-6525.* Reader Service number 483.

FLESHER CORPORATION'S NEW TU-1200

The new TU-1200 UHF/VHF RTTY terminal unit from Flesher Corporation is in answer to rapidly-growing high-speed com-



The Oryx miniature soldering system.

Flesher Corporation's TU-1200.

munication needs. The TU-1200 receives all Baudot and ASCII rates to 1200 baud and uses Bell 202 standard tones (1200 Hz and 2200 Hz). The TU-1200 has many applications for modern communications, including RTTY repeater systems. The TU-1200 provides TLL- and RS-232C-compatible I/O and includes transmitter PTT output for complete remote control. It also provides AFSK output and RDA (received data available).

Front-panel controls include only three push-button switches to operate: POWER, SEND, and NORMAL/REVERSE SHIFT. Three LED indicators show their status. The TU-1200 is constructed with a all-metal case for protection. It's 5-1/8" W × 1-3/4" H × 6" L, and rear-panel DB-25 I/O connectors make installing and using the TU-1200 simple.

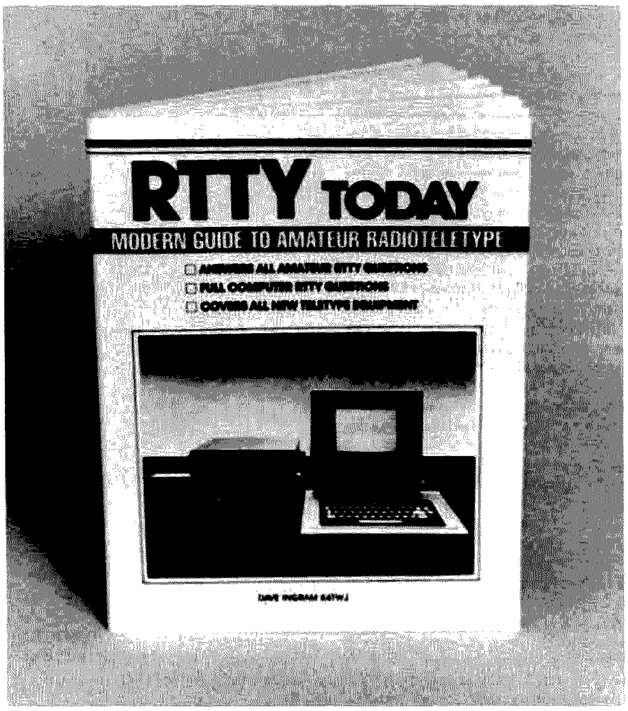
Available either wired or in kit form, the TU-1200 comes complete with a mating DB-25 I/O plug, power supply, and an operator/assembly manual. The TU-1200 will be available for delivery by April 30, 1984.

For more information and for a catalog, write the *Flesher Corporation, PO Box 976, Topeka KS 66601 or call 1-800-HAM-RTTY.* Reader Service number 482.

RTTY TODAY

RTTY Today is a completely new guide to amateur RTTY which covers all phases of radioteletype. This new book answers many questions asked about amateur RTTY and other areas such as the home computer for RTTY use.

Authored by Dave Ingram K4TWJ, a noted authority on all phases of RTTY, it's written in a clear, concise manner; all material is new and up-to-date and covers the most recently developed RTTY equipment and systems. *RTTY Today* is fully illustrated with photos, diagrams, RTTY-station setups, and equipment.



K4TWJ's new guide.

In a large 8½" × 11" softbound edition with an easy-to-read type style and format, the book's eleven chapters cover: The Exciting World of Amateur RTTY, Operating Parameters and Concepts of RTTY, Straight Talk on Home Computers and RTTY, RTTY Systems for Home Computers, RTTY Converts You Can Build, Dedicated RTTY Terminals and Systems, New Mini-RTTY Systems, Fascinating RTTY Outside the Amateur Bands (Press, Military, Weather, Etc.), Frequency list of Commercial Press Services, Secrecy and Other Codes Used in Radioteletype Work, and Tables of Abbreviations Used in RTTY.

For further infomation, or to order, write or call *Universal Electronics, Inc., 4555 Groves Road, Suite 3, Columbus OH 43227; (614)-866-4605.* Reader Service number 481.

RTTY LOOP

Marc I. Leavey, M.D. WA3AJR
6 Jenny Lane
Pikesville MD 21208

Last month I wrote a bit about a new toy here at WA3AJR, a TRS-80C Color Computer. Based on the most powerful eight-bit microprocessor around, the Motorola 6809, this is a fascinating computer which gives huge potential at a bargain price.

Well, I have had a chance to take a quick look at one piece of RTTY software available for the CoCo—a RTTY/CW program from Clay Abrams Software. Clay is known to us 68xx mavens from way back and has been one of a kernel of boosters for 68xx systems for many years. This looks like one fine piece of software, folks. I will have a full review next month, but for those of you who just can't wait, let me dangle a few choice tidbits. This program will receive and transmit RTTY at all common speeds, either in Murray or ASCII, and receive and transmit Morse at up to 99 words per minute. It has buffers for transmit, tape save, and more. Not all is golden, Clay, but I am impressed! More about this gem next month.

Not to stay stuck in one CPU vein, I have a card here from Henry Kirchmer KF4UW in Rockledge, Florida. Henry asks, "Do you know if anyone makes an interface for RTTY and CW and the software for the Timex/Sinclair 1000 or new 1500 that I could use with my (transceiver)?" Well, by a stroke of serendipity, also in the mail arrived an issue of *QZX*, billing itself as "The Journal Covering Amateur Radio and Sinclair Computers—ZX-80, Micro Ace, ZX-81, and Timex/Sinclair 1000/1500." In the issue I received (November, 1983), articles include several for interfacing the Timex/Sinclair-type machines on RTTY and CW, with explanations of ASCII and Murray (although they call it Baudot) code for the computerist ham. They even have a short bibliography in the back with articles in various amateur-radio magazines related to RTTY. I am a bit disturbed, however, that while they have a listing for *73: Amateur Radio's Technical Journal*, they do not mention this column. Oh well, I quess somebody at *QZX* reads this column—after all, I did get a copy. Anyway, interested prospective readers might drop them a line at *QZX*, 2025 O'Donnell Drive, Las Cruces, New Mexico 88001. A year's subscription is $12, according to the information received. It wouldn't hurt if you mentioned that you read about them in "RTTY Loop," would it?

Another source of RTTY for the Timex/Sinclair is Ken Carpenter KC4UG who makes a series of programs under the business name of Kentronics. That is not to be confused with Kantronics, mind you! Well, Ken offers a series of programs, including RTTY transceive programs, Morse programs, and some amateur-radio utilities, all designed for the Timex/Sinclair 1000 or Sinclair ZX-81. His RTTY program, for example, is touted as featuring receive and transmit buffers, split-screen display, multiple baud rates for either Murray or ASCII modes, hardcopy option, and more. Requirements include a computer with 16K or more of RAM, a RTTY I/O port, and a terminal unit capable of interfacing with TTL-level (not RS-232) signals.

That I/O port is designed around an 8250 ACIA which takes care of providing a baud clock along with converting serial to parallel and back again. Apparently, there are also transistors provided for some degree of isolation from outside voltages. No mention is made of optoisolators or the like.

Typical prices for these items are $25 for a tape of the RTTY program, guaranteed to load or it will be replaced upon return, and $70 for an assembled and tested interface unit, plus postage and handling. I have no information on how well or easily this RTTY interface operates; maybe some of you who have played with it will let me know. However, it does seem as though more is becoming available for this truly low-cost computer.

If you would like more details, write to Ken at his office, Kentronics, Inc., PO Box 586, Vernon, Alabama 35592. Be sure to watch the spelling of their name, and drop ours, OK?

While I cannot speak from the experience of having used the following program myself, a letter from Jerry Welkrauch KØHZI in North Riverside, Illinois, speaks very highly of a RTTY program for the VIC-20 and Commodore-64 computers. Available from RAK Electronics, these packages feature software to turn either computer into a basic RTTY terminal and sell for under twenty dollars each. Sounds like quite a bargain! You have to provide a terminal unit or some other way to turn the receiver audio into on/off pulses and an AFSK oscillator to generate the necessary tones. If you're interested, drop RAK a line at PO Box 1585, Orange Park, Florida 32067-1585. I don't need to prompt you as to where to tell them you read about them, but let me know what you think if you try the software.

Going from systems that seem to have a lot written for them to the other extreme, I have a letter here from Philip Shulins WD4OSS in Daytona Beach, Florida. Phil notes that he is "drooling with anticipation" looking for a RTTY program for his Kaypro-2 computer. Well, Phil, as I have indicated here before, there have been relatively few programs, or even program announcements, that have crossed my desk for the IBM-type computers. If you can run a standard CP/M-type program, you may be able to find one on a local RBBS, but otherwise, I am afraid I draw a blank. I will keep my eyes out, though, and pass along any information I receive here to you and the rest of the gang.

I have a letter here from Hughie Chavis (I can't find the envelope, so I am not exactly

sure where he is). Anyway, Hughie is trying to run a Teletype® KSR-35 from his TI-99/4A computer by running data out of an RS-232 module. He writes, "The KSR-35 is set for 100-wpm serial data transfer. The lowest baud rate for the TI RS-232 module is 110 baud. The TI RS-232 module has a PIA port in addition to the serial I/O port. My question is, how do I connect the KSR-35 to the RS-232 module so the printer capability can be utilized?"

Well, there is a very basic problem with connecting these two units together; they are not speaking the same language. Forget dialects, I'm talking major languages—ASCII and Murray are about as different as English and Hebrew. It would not be too hard to connect the parallel port of the TI interface module to a simple UART chip (such as the common 1013 variety), provide a clock circuit, and put the data out at the correct rate, but the problem remains that the data coming out of the computer is in the wrong code.

Let me explain. To begin with, realize that the "baud" designation merely refers to how many data bits per second are being transmitted. There is no relation between the "baud rate" and the type of encoding used to send the data. With plain old Murray code—the one we are all familiar with on RTTY, and the one which your KSR-35 speaks—one common speed is the so-called 60 words per minute. Now, not to go into all the math right now, each character consists of five data bits, one start bit, and a stop bit which is a tad longer than the others. This works out to 7.41 units per character, with each unit being one bit of 21 ms length. Each character thus takes 7.41 times 0.021 seconds, or 0.163 seconds. In one minute, there would be 368 characters; in one second, 6.134 characters. Now, 6.134 characters per second times 7.41 bits per character (remember how the units canceled out in algebra?) yields 45.45 bits per second. This is 45.45 baud.

Without working through all this math again, trust me that the commonly called "100-wpm" speed is about 75 baud. That's one problem, and we're still talking five-level Murray code.

The TI computer, as most others, uses seven-bit ASCII to communicate with the outside world. Now each character consists of a start bit, seven data bits, a parity bit, and either one or two stop bits, depending often on the hardware involved. These bits do not in any way, shape, or form correspond to the RTTY Murray code. What you will have to do is convert the ASCII coming out of the computer to Murray, shift speeds, then put it in a form that the KSR-35 can accept.

I'll let you think on that one for a bit, and next month I'll show you a few ways to accomplish this task. While software techniques have been the most popular with users of some computers, the limited access to the TI-99/4A's innards might well hamper that approach, and I feel that you might be inclined to stick with a totally outboard approach. Let me get out the drafting board and see what develops.

Now, a note to all of you who have tried to call me on the phone over the last few months. Please don't. It's not that I dislike your calls, but I am a physician and my home number is not listed. It will stay that way for professional reasons. My office number, or answering service, has fielded a number of RTTY calls in past months, and they don't always know what to do with them. So, if you have a question or would like to offer some words to the column, jot them down on a card or letter and mail them to me at the above address. If you would like a reply, enclose a self-addressed, stamped envelope, and I shall try to answer you as soon as possible. I try to scribble something down, usually at the bottom of your letter, and return it to you within a few days, unless I need to hold it for information, publication, or the like. I love hearing from you all, pro and con, and it is often your input, suggestions, and questions which make many readers write that the first thing they look for when they get their copy of *73* is "RTTY Loop."

Atco NJ 08004

HOLIDAY-IN-DIXIE QSO PARTY
1800 GMT to 2300 GMT April 7

The seventh annual Holiday-In-Dixie QSO Party will be sponsored again this year by Shreveport, Louisiana, ham-radio operators. Operators will be working on 40 meters, 20 meters, and 15 meters. If 10 meters is open, we will try it from 1800Z to 1900Z.

Holiday-In-Dixie is an annual ten-day celebration of the Louisiana Purchase.

EXCHANGE:

RS(T) and QTH.

FREQUENCIES:

CW—60 kHz up from low edge of 40-, 20-, and 15-meter bands.

SSB—7240, 14280, 21370, and 28570.

Novice—7125 and 21125.

AWARDS:

Send an SASE with QSL card to Holiday-In-Dixie QSO Party, PO Box 4842, Shreveport LA 71104. 8½"×11" certificates will be mailed upon receipt of the SASE and QSL card.

QRP ARCI APRIL QSO PARTY
Starts: 1200 GMT April 21
Ends: 2400 GMT April 22

Stations may be worked once per band for QSO multiplier credits. Participants may operate a maximum of 24 hours during the contest period.

EXCHANGE:

Members—RS(T), state-province-country, and QRP ARCI membership number. Nonmembers—RS(T), state-province country, and power output.

SCORING:

Each member QSO counts 5 points regardless of location. Nonmember QSOs are 2 points with US and Canadian stations, others 4 points each. Multipliers are as follows: 4-5 Watts output—×2, 3-4 Watts output—×4, 2-3 Watts output—×6, 1-2 Watts output—×8, and less than 1 Watt output—×10. Entries from stations running more than 5 Watts output will count as check logs only. Stations are eligible for the following bonus multipliers: if 100% natural power (solar, wind, etc.) with no storage—×2, if 100% battery power—×1.5.

Final score is total QSO points times total number of states-provinces-countries per band times the power multiplier times the bonus multiplier (if any).

FREQUENCIES:

1810, 3560, 7040, 14060, 28060, 50360. Novice/Tech—3710, 7110, 21110, 28110. No 30-meter contacts will be counted!

AWARDS:

Certificates to the highest-scoring station in each state, province, or country with 2 or more entries. Entries automatically considered for annual Triple Crowns of QRP Award. A special MILLIWATT certificate is being sponsored by W9RSP for

NEWSLETTER OF THE MONTH

Dateline Nashville: Source of muffled guffaws emanating from city sewers confirmed. RATS! Don't panic, Music City, it's only members of the Radio Amateur Transmitting Society of Nashville enjoying the latest issue of *Rat's Tale*.

This publication is a pleasure to read. Surrounding the obligatory meeting announcements are the exploits of Chairman Mac, Boy George, and the ubiquitous Dr. Jack Byrd. Animals tiptoe across the pages. Seedy rodents in three-piece suits adorn the masthead.

Despite the lighthearted mood of *Rat's Tale*, editor Wayne Renardson NZ4W has skillfully tempered the hilarity with genuine news stories, thought-provoking commentary, and scathing letters from the membership. Close attention to mechanical detail rounds out a package any RAT would be proud of.

To enter your club's newsletter in *73*'s Newsletter of the Month Contest, send it to *73*, Pine Street, Peterborough NH 03458, Attn: Newsletter of the Month.

the highest-scoring station in the less-than-1-Watt category, provided there are two or more entries in that power category.

LOGS AND ENTRIES:

Separate log sheets are suggested for each band for ease of scoring. Send full log data, including full name, address, and bands used. Also send a work sheet showing details and time(s) off air. Make sure your callsign is written on the top margin of every page submitted! No log copies will be returned. All entries desiring results and scores please enclose a business-size envelope with return postage for one ounce or an IRC. It is a condition of entry that the decision of the QRP ARCI Contest Chairman is final in case of dispute. Logs must be received by May 21 to qualify. Send all logs and data to: QRP ARCI Contest Chairman, Eugene C. Smith, Jr. KA5NLY, #16 Fairmont Drive, Little Rock AR 72204.

MASSACHUSETTS QSO PARTY
Starts: 1600 GMT April 28
Ends: 2400 GMT April 29

Sponsored by the Pilgrim Amateur Wireless Association. A station may be worked once per band. Phone and CW are considered separate bands. No cross-band or repeater contacts are permitted. Mobiles and portables may be contacted each time a county change takes place.

EXCHANGE:

RS(T) and state, VE province, or Massachusetts county. Massachusetts stations also will indicate if member of PAWA.

SCORING:

All stations count 2 points for each completed SSB exchange and 4 points for each completed CW exchange. Massachusetts stations then take the total QSO points and multiply by the total number of Massachusetts counties, states, provinces, and PAWA members worked to compute the final score. Others, multiply the total QSO points by the total number of Massachusetts counties and PAWA members worked. Multiplier credit for PAWA club members worked may be counted only once.

FREQUENCIES:

Phone—1820, 3960, 7260, 14290, 21390, 28590, and 50110.

CW—1810, 3560, 7060, 7120, 14060, 21060, 21120, 28060, and 28120. Use of FM simplex is encouraged. Please use CW on CW bands only!

AWARDS:

Certificates will be awarded to 1st-, 2nd-, and 3rd-place winners in each Massachusetts county, state, and VE province, plus the high-scoring Novice in each state. A plaque will be given to the Massachusetts station submitting the highest number of QSOs bettering the record of 1483 QSOs now held by K1GSK in the 1979 Massachusetts QSO Party.

ENTRIES:

Logs must show date, time, band, mode, callsign, state and province worked, and exchange RS(T). Submit a separate summary sheet along with the logs. Summary sheet should include: name, call, mailing address, Massachusetts county, total QSO points, multipliers claimed, and total score. All entries with more than 100 QSOs please send a dupe sheet. Deadline for mailing is May 31. For awards and results include $0.40 postage (no envelope). Address entries to: Ed Peters K1KJT, 29 Greenbrier Drive, New Bedford MA 02745.

COUNTY HUNTERS SSB CONTEST
0001 to 0800 GMT April 28
1200 GMT April 28 to 0800 GMT April 29
1200 to 2400 GMT April 29

Please note the two 4-hour rest periods. Mobiles may be worked each time they change counties or bands. Mobiles that are worked again from the same county on a different band count for point credit only. Mobiles that are contacted on a county line count as one contact but 2 multipliers. Mobile teams count as two contacts if both participate in the exchange. Fixed stations may be worked by other fixed stations only once during the contest. Repeat QSOs between fixed stations on other bands are not permitted. Fixed stations may be worked by mobiles each time they change counties or bands. Repeat contacts between mobiles are permitted provided they are on a different band or county. Mixed-mode contacts are permitted provided that one station is on SSB. Contacts made on net frequencies will not be allowed for scoring in this year's contest.

EXCHANGE:

Signal report, county, and state or country.

FREQUENCIES:

Suggested frequencies are as follows: 3920-3940, 7220-7240, 14275-14295, 21375-21395, 28625-28850. There will be a "mobile window" of 10 kHz on the following frequencies: 3925-3935, 7225-7235, 14280-14290. Mobiles will be in this 10-kHz segment and fixed stations are asked to refrain from calling "CQ contest" in the mobile window. After working mobiles in the window, fixed stations are requested to QSY outside the window to work fixed stations in the contest. This will allow the mobiles running lower power a chance to be heard and worked in the contest.

SCORING:

Contact with a fixed US or Canadian station—1 point. Contact with a DX station (KL7 and KH6 count as DX)—5 points. Contact with a mobile station—15 points. Contact with a mobile team station—30 points. The multiplier is the total number of US counties plus Canadian stations worked. The final score is this multiplier times the total QSO points.

AWARDS:

MARAC plaques to the highest-scoring fixed US or Canadian station, DX station, mobile team, and top 2 mobile stations. Certificates to the top 10 fixed, mobile team, and mobile stations in the US and Canada, and to the highest-scoring station in each DX country.

ENTRIES:

Logs must show date and time, station worked, reports exchanged, county, state, band, claimed QSO points (1, 5, 15, or 30), and each new multiplier must be numbered. Logs and summary sheets are free for a #10 SASE or SAE and appropriate IRCs. Write to: John Ferguson WØOWS, 3820 Stonewall Ct., Independence MO 64055. All entries must be received by June 15 to be eligible for awards. DX entries should use air mail. Winners will be announced at the 1984 Independent County Hunters Convention during July, and in the *MARAC Newsletter.*

HELVETIA CONTEST
Starts: 1300 GMT April 28
Ends: 1300 GMT April 29

Use all bands, 1.8 to 28 MHz, on CW or phone. Each station can be worked once per band regardless of mode.

EXCHANGE:

RS(T) plus three-figure serial number starting at 001. Swiss stations will also give their 2-letter canton.

SCORING:

Each contact with an HB station counts 3 points. The multiplier is the sum of Swiss cantons worked on each band, 26 maximum per band. Final score is the sum of QSO points multiplied by the sum of cantons worked on each band.

ENTRIES AND AWARDS:

Certificates will be given to the highest scorer in each country. USA and Canadian call area are considered as separate countries. Entries with more than 1 log sheet must have QSOs separated per band. A multiplier checklist is appreciated. Use a summary sheet as usual and indicate call, name, address, single or multi-operator, number of QSOs, points and multipliers per band, plus total final score. Also include station description, power output, and declaration that rules of the contest and license regulations have been observed. Logs must be postmarked not later than 30 days after the contest and sent to: Gody Stalder HB9ZY, Tellenholf, CH-6045 Meggen, Switzerland. Canton abbreviations are: ZH, BE, LU, UR, SZ, OW, NW, GL, ZG, FR, SO, BS, BL, SH, AR, AI, SG, GR, AG, TG, TI, VD, VS, NE, GE, JU.

H26 AWARD:

This award is for contacts made after January 1, 1979. Send a list and QSL for each of the 26 cantons worked to: Kurt Bindschedler HB9MX, Strahleggweg 28, CH-8400 Winterthur, Switzerland.

THE WONDROUS WWV

What one station do hams listen to more than any other? WWV probably has the lock on that statistic. WWV has been providing time and frequency information to amateurs and others for more than 60 years. Let's have a close look at the station and how WWV can improve your DXing.

First, you have to hear the station. Almost every modern amateur rig has a separate position on the bandswitch to receive WWV, usually on 10 MHz. Simply connect an antenna, switch to the WWV position, and tune to the appropriate frequency. Note that WWV transmits in AM, so use the AM position on your receiver or turn off the bfo.

The first thing you will hear is a steady 500- or 600-Hz tone, interrupted every second by a "tick" or pulse. At the end of each minute, the tone stops and a voice gives the time in Coordinated Universal Time (UTC). The next minute begins with a longer tone of 1000 Hz. The *start* of this longer tone is the exact *start* of the minute just identified by the voice announcement. In other words, you hear "At the tone 17 hours, 19 minutes Coordinated Universal Time. . . . Beep." The time is exactly 1719 UTC at the start of the beep.

Probably the first thing a DXer will do when listening to WWV is to reset his or her watch and radio-shack clock. Every DXer should have at least one reasonably accurate clock set to UTC. Since you can purchase a digital watch or small, stick-on clock for less than five dollars, there is really no excuse not to have a timepiece dedicated to UTC. And do you know how you can tell a true DXer? His wristwatch is set to UTC!

How often should you reset your clock or watch? That depends on how well it keeps time. My ancient Tymeter clock (the one with the numbers on plastic cylinders which provided a "digital" readout years before liquid-crystal displays) keeps such good time that I only reset it every month or so. You can note the time you reset the clock in your log so that you can look back to see how much time your timepiece has gained or lost. If your clock is off by more than one minute a day, reset it every day.

An error of only a few minutes in your log can make the difference between confirming the contact and not. A DX station might be making as many as 6 contacts a minute. If your time on your QSL card is off by only 3 minutes, your callsign might be 20-30 calls away from your claimed time. The DX station or QSL manager may have to search an entire log sheet for your call. By having your time accurate to the minute, you can reduce the chances that the DX station will not find your call.

You can also check the time on your shack clock *after* an important contact. Simply tune immediately to WWV and note the time difference between WWV time and your clock. Then change the time in your log to match the correct time. You can trust WWV to broadcast the correct time.

The Atomic Clock

Let's have a look behind the signal and see why you can trust the accuracy of WWV. The time broadcast on WWV derives from *the* clock a few miles south, in Boulder, Colorado. There, nestled against the Rockies, only a few miles from the Continental Divide, sits NBS-6 (see Photo A). NBS-6 is the latest in a line of cesium-beam clocks produced by the National Bureau of Standards. These cesium-beam clocks use an automatic feedback system to produce a microwave signal of exactly 9,192,831,770 Hz. This frequency is a resonant frequency of the cesium atom, upon which the atomic clock is based.

During the 30 years that the National Bureau of Standards has been working on atomic clocks in Boulder, they have produced the most accurate and stable timepiece in the world. In fact, scientists recently redefined the international unit of length, the meter, on the basis of the ac-

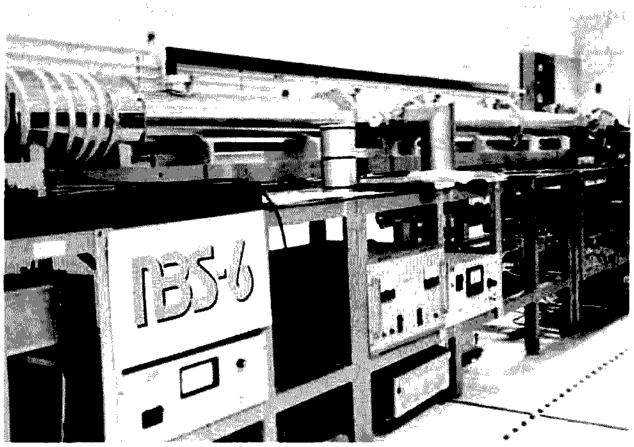

Photo A. NBS-6, the cesium-beam atomic clock at the National Bureau of Standards in Boulder, Colorado. This clock is the most accurate timepiece in the world!

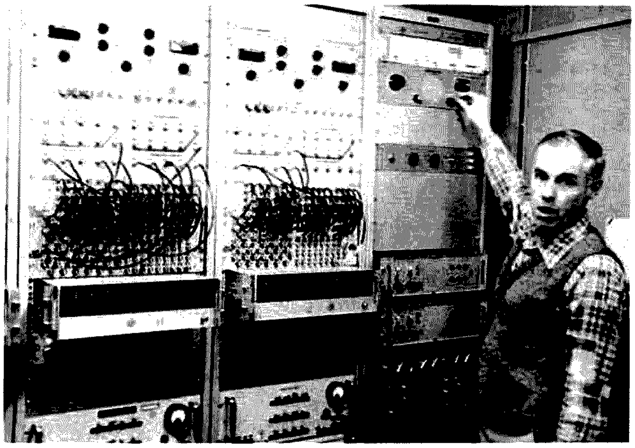

Photo C. Engineer Howard Machlan with two of the three identical cesium-beam clocks which keep the time at the WWV transmitter site in Fort Collins.

curacy of the cesium-beam clock. NBS-6 is accurate to better than one part in 10 trillion. That's about one second in 3 million years!

NBS-6 is so accurate that the time it determines is more accurate than the Earth's rotation. Since all our clocks are based on the cesium-beam atomic clock in Boulder, it would be possible for this time to be "out of synch" with the real world. Midnight would move slowly toward evening. A far more practical problem would be that sailors navigating by the stars would find themselves in the wrong place! Scientists got around this problem by agreeing to add "leap seconds" to UTC as often as needed to keep atomic time in step with sunrises and sunsets. About once a year they add an extra second to the day at midnight, to keep everyone on the same time scale.

But all this is down in Boulder, about 30 miles from the site of WWV, outside Fort Collins, Colorado. What's the connection between the atomic clock in Boulder and the WWV transmitters? Surprisingly, there is *no* direct connection. The time transmitted by WWV is generated right there at the WWV site, by smaller cesium-beam clocks. WWV uses three of these Hewlett-Packard commercial-model cesium clocks (at about $25,000 each).

Why three clocks? The argument is as follows: If you have only one clock, it might break down, putting you off the air, or it might be wrong. There would be no way to check its accuracy. On the other hand, if you had two clocks, and they showed different times, you wouldn't be able to tell which one was correct. Only with three clocks can you tell if one is incorrect. If one of the three clocks malfunctions, an operator must repair it as quickly as possible, to avoid the two-clock problem.

Of course, these atomic clocks keep pretty good time all by themselves. I watched a strip-chart recorder measure the time variation in the WWVB clocks, and with a full scale of only one microsecond, the pen didn't even wiggle down the center of the chart! Even so, the time they generate is regularly compared to that produced by the master atomic clock down in Boulder.

At one time they physically moved a portable atomic clock from one town to the next to make this comparison, but the WWV Chief Engineer, John Milton ex-WØDAV, came up with a better way using Denver TV stations. He compares the time a certain reference point on the TV signal arrives at Boulder and at the WWV site further north. He knows how much further Fort Collins is from Denver than Boulder and can determine the extra time the reference point should take to reach his receiver. A custom computer program handles the actual comparison and recalibrates the WWV atomic clocks daily.

Even without this daily check, John Milton feels confident enough of his equipment that he could maintain the high accuracy of the WWV information. "We know the drift rates of each clock so well that we can keep going for months without any reference standard," John says. This drift isn't much: about one-tenth of a microsecond in four hours!

Getting the Word Out

Of course, all the accuracy in the world would be worthless if you had to go to Fort Collins to check your watch. Thanks to WWV, however, you don't have to travel to Colorado for this information.

All the WWV signals, tones, and even the basic carrier frequencies are derived from the same cesium-beam clocks which keep track of the time. The extremely stable signal from the clock is divided and mixed to produce each different signal, tick, tone, and beep. Only the voice announcements don't come out of the clock. This means that just about everything you hear on WWV (carrier frequency, tone frequencies, etc.) has the same high degree of accuracy. That mass of cables above the digital readout (see Photo C) is a patch panel for all the frequency dividers and other circuits which produce the pattern of tones and ticks on the WWV signal.

Photo B. John Milton, chief engineer at WWV, keeps the time-and-frequency-standard station on the air, on time, and under budget.

The only parts of the WWV signal which are *not* produced by the cesium clocks are the voice announcements of time and other factors. These voices are recorded on high-quality drums and added to the WWV signal at the appropriate time. No, there isn't anyone sitting there reading the time all 24 hours.

All the WWV signals, on 2.5, 5, 10, 15, and 20 MHz, are amplitude modulated (AM). After the basic signal is generated by the clock, complete with tones, etc., it leaves the heavily-shielded clock room and goes to the series of 8 amplifiers arranged in the circle around the building. These transmitters are linear amplifiers which take the low-level signal from the clock room and amplify it to about 10,000 Watts output! (The 2.5- and 20-MHz amps run a mere 2,500 Watts.) For good reliability, these amplifiers are 40,000-Watt units, run at low power.

Reliability is a key factor at WWV. The total "down time" is less than 0.002%! Engineer John Milton has developed a complete package of procedures and equipment to ensure this fantastic reliability. First, each of the three cesium clocks has a backup battery system, should commercial power fail. A huge diesel generator sits in the back of the WWV building, ready to kick in at a moment's notice and power all the transmitters. And each transmitter has an automatic reset feature. If the transmitter fails for whatever reason, the built-in system will restart the transmitter. If it fails again, one of the standby transmitters takes over.

There is a "dedicated" standby transmitter for the 5-, 10-, and 15-MHz signals, all wired and tuned, set for automatic replacement. WWV monitors the actual transmitted rf, listening for any change in signal strength.

The signals leave the WWV building through gas-filled coaxial lines to one-half-wavelength, vertical antennas. These are simply dipoles stood on end. This gives a good omnidirectional pattern. There are even spare antennas: Two all-band verticals stand ready to take over if one of the primary antennas is damaged.

WWV has achieved this excellent on-line record in spite of major cutbacks in funding. The station had as many as 20 people at one time, monitoring the equipment around the clock. Now, thanks to automated backups, the staff consists of exactly three engineers and a single secretary, all working standard hours. The rest of the time the entire station is deserted, except for dozens of fuzzy brown rabbits

and an occasional deer. The entire annual budget for the station, including the low-frequency WWVB, is about $200,000, and that includes an electricity bill of about $6,000 per month!

One casualty of the budget crunch has been the 25-MHz signal, which was discontinued in 1977. It wasn't taken off the air because it cost too much to operate; the transmitter was needed as a dedicated standby for the other frequencies. Still, WWV is *one* government organization which provides an excellent service for a remarkably small amount of money.

(Next month we'll look at some of the *other* (non-time) reasons to listen to WWV. Meanwhile, tune in to 10.00000000 MHz at 18 minutes after the hour.) Don't worry; we'll show how this WWV information is vital to successful DXing in future columns.

DEVIL'S MOUNTAIN

Churum-Vena Expedition. In one of the more unique DXpeditions of 1984, a group of Venezuelan amateurs will operate from Devil's Mountain, deep in the heart of Venezuela. Churum Vena is better known as Angel Falls. At 3213 feet, it is the highest waterfall in the world. The waterfall (named after its discoverer, James Angel) plunges down the side of seldom-climbed Devil's Mountain. The normal viewing point for the falls is at the bottom of the canyon below, but at the end of March and early April, 4M5ARV/6 will be on all bands from the top. Frequencies are: CW—3710, 7010, 14010, 21110, and 28110 (Novices take note!); SSB—3795, 7095, 14195, 21295, and 28595. QSL via PO Box 3636, Caracas 1010-A, Venezuela.

And who is that you hear on 15-meter SSB? VP2ML? Montserrat might not be the rarest of DX, but *I* look forward to working you the last week in March and the first week in April. QSL via K1RH. 73, and see you on the bands!

SOCIAL EVENTS

Listings in this column are provided free of charge on a space-available basis. The following information should be included in every announcement: sponsor, event, date, time, place, city, state, admission charge (if any), features, talk-in frequencies, and the name of whom to contact for further information. Announcements must be received by 73 Magazine *by the first of the month, two months prior to the month in which the event takes place. Mail to Editorial Offices,* 73 Magazine, *Pine St., Peterborough NH 03458.*

FRAMINGHAM MA
APR 1

The Framingham ARA, Inc., will hold its annual spring flea market on Sunday, April 1, 1984, beginning at 10:00 am at the Framingham Civic League Building, 214 Concord Street (Rte. 126), downtown Framingham. Admission is $2.00 and tables are $10.00 (pre-registration required). Sellers may begin setups at 8:30 am. There will be radio equipment, computer gear, and food in-house. Talk-in on 147.75/.15 and .52. For more information, contact Jon Weiner K1VVC, 52 Overlook Drive, Framingham MA 01701, or phone (617)-877-7166.

TRENTON NJ
APR 1

The Delaware Valley Radio Association will hold its 12th annual flea market and computer show on Sunday, April 1, 1984, from 8:00 am to 4:00 pm, at the New Jersey National Guard 112th Field Artillery Armory, Eggerts Crossing Road, Lawrence Township, Trenton NJ. There will be an indoor and outdoor flea-market area, commercial dealers, and refreshments. Sellers are asked to bring their own tables. Talk-in on 146.52 and 146.07/.67. For advance tickets and space reservations, please send an SASE to Walter L. Sharpe KB2ZY, 140 Susan Drive, Trenton NJ 08638.

CHICAGO IL

For additional information or table reservations, write Bill Inkrote K2NJ, RD 10, Box 294, Quakertown-Croton Road, Flemington NJ 08822, or call (201)-788-4080.

GREENCASTLE IN
APR 7

The Putnam County Amateur Radio Club will hold its second Amateur Radio and Electronics Auction on April 7, 1984, at the Putnam County Fairgrounds, US 231, north of Greencastle IN. Admission is $1.00, sales commission is 5%, and there will be a $1.00 service charge on buybacks. Doors will open at 8:00 am and the auction will start at 10:00 am. Bring your equipment to be sold on consignment. All activities will be inside and food will be available. Talk-in on 147.93/.33. For more information or a flyer, contact John Underwood K9IIB, RFD 1, Box 10, Fillmore IN 46128.

KANSAS CITY MO
APR 7-8

The PHD Amateur Radio Association, Inc., will sponsor the 1984 Missouri State ARRL Convention on Saturday and Sunday, April 7-8, 1984, from 10:00 am to 5:30 pm (both days), at the Trade Mart Building, at the downtown Kansas City MO airport. For both days, registration is $4.00 and swap tables are $10.00, which includes one registration with each table. Commercial exhibitors may set up from 7:00 pm to 9:00 pm on Friday or 7:00 am to 10:00 am on Saturday; swappers may set up at 9:00 on Saturday. The Saturday-night banquet at the world-famous Gold Buffet is $10.50. Those desiring banquet tickets and swap tables are urged to order in advance. Other features will be a complete program of forums, commercial booths, a large flea market, a home-brew contest, Missouri-Kansas Amateur-of-the-Year and CW Contest awards, and on Sunday, a Missouri-Kansas Repeater Council meeting, as well as QCWA and YL luncheons. Unlimited free parking, including RV space (no hookups), will be available. Talk-in on 146.34/.94. For more information and registrations, write PHD Amateur Radio Association, Inc., Liberty MO 64068-0011, or call (816)-781-7313 or 452-9321. All pre-registrations will be held at the door.

AMBOY IL
APR 8

The 19th annual Rock River ARC Hamfest will be held on Sunday, April 8, 1984, beginning at 8:00 am, at the Lee County 4-H Center, one mile east of the junction of 52 and 30. Ticket donations are $2.00 each in advance and $3.00 at the gate; 8-foot tables are $5.00 each. Camping space will be available for a nominal charge and breakfast and lunch will be served. There will be an auction of amateur-related gear. Talk-in on .37/.97 repeater. For more information or advance tickets (available until April 1, 1984) and tables, write to Shirley Webb KA9HGZ, 618 Orchard Street, Dixon IL 61021, or phone (815)-284-3811.

MADISON WI
APR 8

The Madison Area Repeater Association, Inc. (MARA), will hold its 12th annual Madison Swapfest on Sunday, April 8, 1984, at the Dane County Exposition Center Forum Building in Madison WI. Admission is $2.50 per person in advance and $3.00 at the door. Children twelve and under will be admitted free. Flea-market tables are $4.00 each in advance and $5.00 at the door. Doors will open at 5:00 am for commercial exhibitors, 8:00 am for flea-market sellers, and 9:00 am for the general public. Features will include commercial exhibitors, a flea market, an all-you-can-eat pancake breakfast, and a barbecue lunch. Plenty of parking space and nearby hotel accommodations are available. Talk-in on 146.16/.76 (WB9AER/R). For reservations (early ones are advised) or more information, write to MARA, PO Box 3403, Madison WI 53704.

MUSKEGON MI
APR 14

The Muskegon Area Amateur Radio Council will hold the ARRL Michigan State Convention and Muskegon Hamfest on April 14, 1984, at the L. C. Walker Arena, 4th at Western, Muskegon MI. PIKES PEAK CO
APR 14-15

The Pikes Peak Radio Amateur Association will present the 1st annual Electronic Exhibition and Trade Show on Saturday and Sunday, April 14-15, 1984, from 10:00 am to 6:00 pm, at a site soon to be confirmed. A fee will be charged at the door. Well-known equipment manufacturers will present seminars on Saturday, starting at 1:00 pm, and admission will be free. Live TV and radio broadcasts will be on during the show. Talk-in on 146.52 simplex or 146.97/.37.

JACKSON MS
APR 14-15

The Jackson Amateur Radio Club will host the Capital City Hamfest and 1984 ARRL Mississippi State Convention on Saturday and Sunday, April 14-15, 1984, at the Communications Workers of America Building, I-220 at Country Club Drive. Hours on Saturday are 9:00 am to 5:00 pm and on Sunday, 8:00 am to 1:30 pm. Admission is free and flea-market tables are $5.00 each. Attractions include commercial dealer exhibits, a large indoor flea market, concessions, forums, and free parking (including self-contained RVs). For special hamfest rates, contact the Holiday Inn Southwest directly. Talk-in on 146.16/.76. For further information, contact Carol Kemp NA5Y, 3581 Beaumont Drive, Pearl MS 39208, or phone (601)-939-7612.

RALEIGH NC
APR 15

The Raleigh Amateur Radio Society will hold its 12th annual hamfest and flea market (all under cover) on Sunday, April 15, 1984, beginning at 8:00 am, at the Crabtree Valley Shopping Mall, located at the intersection of US 70 west and US 1 and 64. Admission is $4.00 at the gate, with no extra charge for tailgaters. Tables will be available for rent. Features will include a CW contest, a home-brew contest, and special-interest meetings. Talk-in will be on 146.04/146.64 (W4DW) and 146.28/146.88 (K4ITL). For more information, contact Pete Thacher N4HQZ at (919)-876-4073 or Jim Bradley WA4AOO at (919)-851-2437 from 6:00 pm to 8:00 pm weekdays or on weekends, or write RARS, PO 19127, Raleigh NC 27619.

DAYTON OH
APR 27

The 15th annual B*A*S*H will be held on Friday night, April 27, 1984, at the Dayton Hamvention at the Convention Center, Main and Fifth Streets, Dayton OH. Admission is free and parking is available in the adjacent city garage. There will be sandwiches, snacks, and a COD bar, as well as live entertainment. For further information, contact the Miami Valley FM Association, PO Box 263, Dayton OH 45401.

DAYTON OH
APR 27

The Dayton-Cincinnati Chapter of the Quarter Century Wireless Association will hold its annual banquet during the Dayton Hamvention on Friday, April 27, 1984, at Neil's Heritage House Restaurant, 2189 S. Dixie Drive, Dayton OH. Tickets are $12.50. The cash bar will open at 6:30 pm and dinner will begin at 7:30 pm. The dinner speaker is Dr. Jerrold Petrofsky, developer of computerized equipment that enables paraplegics to walk. The presentation will be illustrated. For more details, write Doug Horner W8PH, 186 Golfwood Drive, Dayton OH 45449, or call (513)-859-3210.

DAYTON OH
APR 27-29

The 1984 Dayton Hamvention's International VHF/UHF Conference will be held concurrently with the Hamvention from Friday through Sunday, April 27-29, 1984, at the Hara Arena and Exhibition Center, Dayton OH. There will be technical forums by acknowledged experts; noise-figure, dynamic-range, and antenna-range measurement contests; and a hospitality suite with refreshments. Technical papers and presentations on VHF/UHF topics of interest are being solicited for consideration. Potential speakers should submit their requests immediately. For further information, contact Jim Stitt WA8QNQ, VHF/UHF Conference Moderator, 4126 Crest Manor, Hamilton OH 45011.

DAYTON OH
APR 27-29

The Dayton Amateur Radio Association, Inc., will sponsor the Dayton Hamvention on April 27-29, 1984, at the Hara Arena and Exhibition Center, Dayton OH. Admission, valid for all three days, is $7.50 in advance and $10.00 at the door. The Saturday evening Grand Banquet and Entertainment is $14.00 in advance and $16.00 at the door. Harry Dannals W2HD, past president of the ARRL, will be the featured speaker. Because seating is limited, early reservations are requested. There will be a giant flea market starting at noon on Friday and continuing all day Saturday and Sunday. Flea-market space is $15.00 for all three days and will be sold in advance only. Entrance for setups will be available starting Wednesday and the special flea-market telephone is (513)-223-0923. Other features will include forums, awards, and exhibits. For special motel rates and reservations, write Hamvention Housing, Box 1288, Dayton OH 45402; no telephone reservations will be accepted. Address all other inquiries to Box 44, Dayton OH 45401, or phone (513)-433-7720. Please send advance registration checks to Dayton Hamvention, Box 2205, Dayton OH 45401.

HARTWELL GA
APR 28-29

The Anderson, Hartwell, and Toccoa Ham Clubs will sponsor the sixth annual Lake Hartwell Hamfest on April 28-29, 1984, at the Lake Hartwell Group Camp located on Highway 29, about 2 miles south of Hartwell Dam. Admission, camping, and flea-market space are all free. Activities will begin at 9:00 am on Saturday and include a horseshoe tournament and a left-footed CW contest. The camping area will be open Friday and Saturday nights. Talk-in on 146.895/.295 and 146.19/.79. For further information, contact Carl Davis KY4T, 203 College Avenue, Hartwell GA 30643.

EAST HARTFORD CT
APR 29

The seventh annual Pioneer Valley Radio Association (PVRA) Flea Market will be held on Sunday, April 29, 1984, from 10:00 am to 4:00 pm, at Penney High School, Forbes Street, East Hartford CT. Talk-in on .19/.79. For reservations and more information, write Jon Patz KA1FYL, 34 Whiting Lane, West Hartford CT 06119, or call (203)-232-8772 (evenings).

BRAINTREE MA
APR 29

The South Shore Amateur Radio Club of Braintree MA will celebrate its 53rd year in amateur radio by holding an indoor flea market on Sunday, April 29, 1984, rain or shine, from 11:00 am to 4:00 pm, at the Viking Club, 410 Quincy Avenue, Braintree MA. The entrance fee is $1.00 and 8-foot tables are $10.00 (which includes 1 free admission per table). Vendors will be admitted at 9:30 am and plenty of parking will be available. For advance table reservations, send a check payable to the South Shore Amateur Radio Club to Ed Doherty W1MPT, 236 Wildwood Avenue, Braintree MA 02184. A confirmation of check receipt will be sent and there will be no cancellation refunds after April 25. For more information, call Ed at (617) 843-4431, evenings.

E) Despise it

49) If you heard an emergency net in progress, would you immediately join in and offer your services?
A) Yes
B) No

50) Should all hams be required to join some type of national amateur-radio organization?
A) Yes
B) No

FCC

47 CFR Part 97

[PR Docket No. 83-27; RM-4229]

Allow the Use of Volunteers to Prepare and Administer Operator Examinations in the Amateur Radio Service and Correction

AGENCY: Federal Communications Commission.

ACTION: Final Rules and Correction.

SUMMARY: This document corrects FCC rules regarding the use of voluntary and uncompensated volunteers to prepare and administer amateur operator examinations in order to eliminate unintended inconsistencies in the rules adopted in the *Report and Order* in this proceeding.

EFFECTIVE DATE: January 11, 1984.

FOR FURTHER INFORMATION CONTACT: John J. Borkowski, Federal Communications Commission, Washington, D.C. 20554, (202) 632-4964.

Errata

In the matter of amendment of Parts 0, 1 and 97 of the Commission's rules to allow the use of volunteers to prepare and administer operator examinations in the Amateur Radio Service (PR Docket No. 83-27 RM-4229).

Released: December 30, 1983.

1. On September 22, 1983, the Commission adopted a *Report and Order*, 48 FR 45653 (October 6, 1983), in the above captioned proceeding. In the *Report and Order*, the Commission amended Parts 0, 1 and 97 of its Rules to allow the use of volunteers to prepare end administer operator examinations in the Amateur Radio Service.

2. In the rules set forth in the Appendix to the *Report and Order*, volunteers are given ten days from the time they administer an examination to forward candidates' applications to the VEC (§ 97.28(h)). However, VEC's are given only ten days from the date of the examination to forward candidates' applications to the FCC (§ 97.519(c)). This could result in a VEC having no time to perform the functions listed in § 97.519, and was not intended. The Commission intended to give the VEC adequate time to perform these functions.

3. At paragraph 28 of the *Report and Order*. The Commission stated: ". . . we have incorporated all of the present telegraph requirements and guidelines from our present rules." With respect to telegraphy examination grading, no changes were intended. However, § 97.29 (c) in the Appendix imposed an additional burden not included in the present rules of grading on the basis of "one continuous minute." Inclusion of this new burden was not intended.

4. Sections 97.503 and 97.515 of the Rules in the Appendix cross-reference § 97.30. There is no § 97.30. The cross-references should be deleted.

5. Section 97.28(i)(2) provides for FCC retesting of any person who obtained an operator license through the volunteer examination process. It does not indicate what the FCC will do if such a person does not pass the examination. This was an inadvertent omission. Therefore, we are adding a new paragraph (j) to § 97.28 to clarify that an examinee who fails to appear for readministration of an examination or who fails to pass the retested examination element(s) will have his/

her operator's license cancelled and will be issued a new operator license for the operator license class previously held by the examinee. We are also clarifying that FCC retesting applies only for examinations above the Novice Class.

6. Additionally, the definition of the term "Amateur Code Credit Certificate" in § 97.3 was inadvertently retained.

7. Finally, the wording of § 97.513 regarding where VEC's may coordinate examinations is unintentionally ambiguous. While this wording was designed to permit VEC's to coordinate examinations outside of the regions listed in § 97.507(b) (such as United States military bases in foreign countries), it was not intended to permit one regional VEC to coordinate examinations in another region.

8. Accordingly, the following corrections are made to the Appendix of the *Report and Order* in this proceeding:

§ 97.3 [Corrected]

1. Paragraph (aa) of § 97.3 is removed and reserved.

2. Section 97.28 is amended by revising paragraph (i) and adding a new paragraph (j) as follows:

§ 97.28 Examination administration.

* * * * *

(i) The FCC reserves the right, without qualification, to:

(1) Administer examinations itself; *or*

(2) Readminister examinations itself or under the supervision of an examiner designated by the FCC to any person who obtained an operator license above the Novice Class through the volunteer examination process.

(j) If a licensee fails to appear for readministration of an examination pursuant to paragraph (i)(2) of this section, or does not successfully complete the examination element(s) which are readministered, the licensee's operator license is subject to cancellation; in an instance of such cancellation, the licensee will be issued an operator license consistent with completed examination elements which have not been invalidated by not appearing for or failing readministration of an examination.

3. The words "for one continuous minute" are removed from the first sentence of paragraph (c) of § 97.29.

4. The cross-references to § 97.30 are removed from § 97.503(b) and from § 97.515.

5. The first two sentences of § 97.513 are revised to read:

§ 97.513 Scheduling of examinations.

A VEC will coordinate the dates and times for scheduling examinations (see § 97.26) throughout the region(s) it serves. Any VEC may also coordinate the scheduling of testing opportunities outside of the regions listed in § 97.507(b).

* * * * *

6. Paragraph (c) of § 97.519 is revised to read:

§ 97.519 Examination procedures.

* * * * *

(c) Forward the application within ten days of its receipt from the examiners to: Federal Communications Commission, Licensing Division, Private Radio Bureau, Gettysburg, Pennsylvania 17325.

* * * * *

(Secs. 4(i) and 303 of the Communications Act of 1934, as amended, 47 U.S.C. 154(i) and 303)

47 CFR Part 97

[PR Docket No. 83-584; FCC 84-16]

Making Additional Frequencies Available to the Radio Amateur Civil Emergency Service During Declared National Emergencies

AGENCY: Federal Communications Commission.

ACTION: Final rules.

SUMMARY: This document amends the Amateur Radio Service Rules to make additional frequencies available to the Radio Amateur Civil Emergency Service (RACES) during declared national emergencies. Additional RACES frequencies are needed since, even in peacetime, the number of RACES frequencies are inadequate. The effect of this action is to assure that sufficient RACES frequencies would be available if the President invokes the war emergency powers.

EFFECTIVE DATE: March 28, 1984.

ADDRESS: Federal Communications Commission, Washington, D.C. 20554.

FOR FURTHER INFORMATION CONTACT: Maurice J. DePont, Private Radio Bureau, Washington, D.C. 20554.

List of Subjects in 47 CFR Part 97

Civil defense, Defense communications, Radio.

Report and Order

In the matter of amendment of the Amateur Radio Service Rules, Part 97, to make additional frequencies available to the Radio Amateur Civil Emergency Service during declared national emergencies (PR Docket No. 83-524).

Adopted: January 16, 1984.

Released: January 19, 1984.

By the Commission.

1. On May 26, 1983, the Commission adopted a Notice of Proposed Rule Making (48 FR 26647; June 9, 1983) proposing to make additional frequencies available to the Radio Amateur Civil Emergency Service (RACES) in the event of an emergency which causes the President to invoke certain war emergency powers, pursuant to Section 606 of the Communications Act of 1934, as amended. Also proposed were operational limitations on the additional frequencies so as to provide protection to the Government Radiolocation Service, to the Aeronautical Radionavigation Service and to Canadian radio stations. The restrictions that limited RACES operations to thirty days and to specific geographical areas were also proposed to be deleted. Nineteen comments were filed in this proceeding.

2. This proceeding originated in response to a request from the Department of Defense (DOD), through the National Telecommunications and Information Administration (NTIA) and the Interdepartmental Radio Advisory Committee (IRAC), for additional frequencies for RACES stations during a declared national emergency. DOD had reviewed the role of RACES in support of civil defense activities during a national emergency declared by the President and had concluded that additional RACES frequencies are needed under war emergency conditions. DOD said that since the presently available RACES frequencies have proven inadequate in peacetime, they would be completely unsatisfactory in wartime. In addition, DOD noted that although the number of amateur radio repeater stations have increased, they operate on frequencies which are not now available to RACES. Hence, DOD wanted the frequencies that repeaters operate on made available to RACES stations. For the same reason, DOD asked that frequencies used by high frequency (HF) nets also be made available to RACES stations. The deletion of the restriction on the use of certain RACES frequencies to the initial 30 days of the emergency and the areas where they could be used was proposed since those restrictions are no longer needed.

3. The comments generally supported the proposal to make additional frequencies available to RACES stations.[1] Robert N. Dyruff wanted all of the Amateur Radio Service frequencies made available to RACES. He also suggested that the RACES rules should be deleted in their entirety and replaced by a joint working arrangement between the Federal Emergency Management Agency, State Offices of Emergency Services and local organizations of amateur radio operators. The suggestions of Mr. Dyruff are so broad as to exceed the scope of this proceeding. In our Notice of Proposed Rule Making, we proposed to make the frequencies 146-148 MHz available for RACES operations. Several of the commenters, however, suggested that the repeater subband 144.50-145.50 MHz be included for RACES operation. In this connection, the American Radio Relay League, Inc. (ARRL) stated that this would make it unnecessary for anyone to alter existing equipment, especially repeaters, to operate on RACES frequencies during a declared emergency, since Amateur Radio Emergency Service (ARES) members could switch from ARES to RACES immediately without a shift in equipment.

4. We referred the matter of inclusing the subband 144.50-145.50 MHz to DOD (through IRAC). It interposed no objection. Therefore, since inclusion of these frequencies will bring more repeaters into RACES operation and will expand the potential for use of RACES stations in the future, we will include the 144.50-145.50 MHz subband in these final rules. Some commenters suggested that additional frequencies in the 6, 10, 40, and 75-meter bands be added for RACES operations. Those frequencies were not included in DOD's original request. Therefore, we have not included them in these final rules.

5. In our proposal, we stated that additonal amateur radio frequencies in the 10 MHz and 18 MHz frequency bands might also be considered if the United States ratified the final acts of the World Administrative Radio Conference (WARC), 1979. Although such ratification took place on September 6, 1983, it would not be appropriate to include those frequencies in this Report and Order since the Amateur Rules have not yet been amended to make those bands available for use in the Amateur Radio Service on a regular basis.

6. We will adopt the rules as proposed, with the inclusion of the additional 2-meter band frequencies. The thirty day limitation on the use of the frequencies is deleted since the use of amateur frequencies for RACES would undoubtedly be authorized beyond the thirty day period if an emergency continued beyond that time. Also, we have deleted the geographic limitations since to retain them could hinder emergency communications between the continental United States and the States of Hawaii or Alaska, or between the continental United States and U.S. possessions. These latter amendments are in keeping with our continuing efforts to eliminate unnecessary rules and restrictions. Finally, necessary corrections have been made to the table in § 97.185(b).

7. It is ordered, that Pert 97 is amended as set forth in the Appendix hereto. This action is taken pursuant to the authority contained in Sections 4(i) and 303(r) of the Communications Act of 1934, as amended. It is further ordered, that these rule amendments shall become effective March 28, 1984.

8. It is further ordered, that the Secretary shall cause a copy of this Report and Order to be published in the Federal Register.

9. It is further ordered, that this proceeding is terminated.

10. Information in this matter may be obtained by contacting Maurice J. Depont, (202) 632-4904, Private Radio Bureau, Federal Communications Commission, Washington, D.C. 20554.

Federal Communications Commission.

William J. Tricarico,

Secretary.

[1] The late-filed comments of John A. Carroll are accepted and have been considered insofar as they relate to this proceeding.

Appendix

PART 97—[AMENDED]

Part 97 of Chapter I of Title 47 of the Code of Federal Regulations is amended, as follows:

1. Section 97.185 is revised to read as follows:

§ 97.185 Frequencies available.

(a) All of the authorized frequencies and emissions allocated to the Amateur Radio Service are also available to the Radio Amateur Civil Emergency Service on a shared basis.

(b) In the event of an emergency which necessitates the invoking of the President's War Emergency Powers under the provisions of § 606 of the Communications Act of 1934, as amended, unless otherwise modified or directed, RACES stations and amateur radio stations participating in RACES will be limited in operation to the following:

FREQUENCY OR FREQUENCY BANDS—Continued

	Limitations
kHz:	
1800-1825	
1975-2000	1
3500-3550	
3930-3980	
3984-4000	
3997	2
7079-7125	
7245-7255	
14047-14053	
14220-14230	
14331-14350	
21047-21053	
21228-21267	
MHz:	
28.55-28.75	
29.237-29.273	
29.45-29.65	
50.35-50.75	
53.30	2
53.35-53.75	
144.50-145.71	
146-148	
220-225	4
420-450	3, 5, 6
1240-1300	3
2390-2450	3

(c) *Limitations.* (1) Use of frequencies in the band 1975-2000 kHz is subject to the priority of the LORAN system of radionavigation in this band and to the geographical, frequency, emission, and power limitations contained in § 97.61 (Subpart C of this part pertaining to Technical Standards).

(2) For use in emergency areas when required to make initial contact with a military unit; also, for communications with military stations on matters requiring coordination.

(3) Those stations operating in the bands 420-450, 1240-1300 and 2390-2450

MHz shall not cause harmful interference to, and must tolerate any interference from, the Government Radiolocation Service; and also the Aeronautical Radionavigation Service in the case of the 1240-1300 MHz band.

(4) Those stations operating in the band 220-225 MHz shall not cause harmful interference to, and must tolerate any interference from, the Government Radiolocation Service until January 1, 1990. Additionally, the Fixed and Mobile Services shall have equal right of operation.

(5) In the band 420-430 MHz, no station shall operate North of Line A. Line A begins at Aberdeen, Washington, running by great circle arc to the intersection of 48° N., 120° W., thence along parallel 48° N., to the intersection of 95° W., thence by great circle arc through the southernmost point of Duluth, Minn., thence by great circle arc to 45° N., 85° W., thence southward along meridian 85° W., to its intersection with parallel 41°N., thence along parallel 41° N., to its intersection with meridian 82° W., thence by great circle arc through the southernmost point of Bangor, Maine, thence by great circle arc through the southernmost point of Searsport, Maine, at which point it terminates.

(6) In the band 420-450 MHz and within the following areas, the peak envelope power output of a transmitter used in the Amateur Radio Service shall not exceed 50 watts, unless expressly authorized by the Commission after mutual agreement, on a case-by-case basis, between the Federal Communications Commission Engineer-in-Charge at the applicable District Office and the Military Area Frequency Coordinator at the applicable military base:

(i) Those portions of Texas and New Mexico bounded on the south by latitude 31° 45' North, on the east by longitude 104° 00' West, on the north by latitude 34° 30' North, and on the west by longitude 107° 30' West;

(ii) The entire State of Florida including the Key West area and the areas enclosed within a 200-mile radius of Patrick Air Force Base, Florida (latitude 28° 21' North, longitude 80° 43' West), and within a 200-mile radius of Eglin Air Force Base, Florida (latitude 30° 30' North, longitude 86° 30' West);

(iii) The entire State of Arizona;

(iv) Those portions of California and Nevada south of latitude 37° 10' North, and the areas enclosed within a 200-mile radius of the Pacific Missile Test Center, Point Mugu, California (latitude 34° 09' North, longitude 119° 11' West).

(v) In the State of Massachusetts within a 160-kilometer (100 mile) radius around locations at Otis Air Force Base, Massachusetts (latitude 41° 45' North, longitude 70° 32' West).

(vi) In the State of California within a 240-kilometer (150 mile) radius around locations at Beale Air Force Base, California (latitude 39° 08' North, longitude 121° 28' West).

(vii) In the State of Alaska within a 160-kilometer (100 mile) radius of Clear, Alaska (latitude 64° 17' North, longitude 149° 10' West). (The Military Area Frequency Coordinator for this area is located at Elmendorf Air Force Base, Alaska.)

(viii) In the State of North Dakota within a 160-kilometer (100 mile) radius of Concrete, North Dakota (latitude 48° 43' North, longitude 97° 54' West). (The Military Area Frequency Coordinator for this area can be contacted at: HQ SAC/SXOE, Offutt Air Force Base, Nebraska 68113.)

LETTERS

PET PEEVE, CROSS LINK

W1UKZ's article ("Breakthrough In Boston: The Birth of Crosslinking," 73, January, 1984) provides me with an opportunity to air a pet peeve about wiring diagrams shown as schematics.

A drawing such as shown in Fig. 2 of David's article may be good to use while wiring the unit, but a "flow-of-information" type of drawing would better help the reader understand what the writer is saying.

This is an excellent article, doing just what 73 does best—breaking new ground. Keep up the good work.

W. S. (Bill) Kemper W4KOF
Miami FL

Your comments make sense, Bill, but to avoid drawing two diagrams I think that a circuit description a la good old BSP (Bell System Practices) would make better sense. That way we need show only the wiring diagram (most necessary). I have written such a circuit description for the crosslink logic box. (See below.)

I notice that in redrawing the circuit you found the error in the original drawing with the article. Pin 9 of RY1 does NOT connect to the microphone circuit as shown but, instead, should connect to the top of the coil of RY1, contact 13.

Thank you very much for your insight, Bill.—David P. Allen W1UKZ

CIRCUIT DESCRIPTION

When connected as shown in Fig. 2 and turned on with both rigs powered, the circuit defaults to receive mode in both transceivers. Signals normally would be heard via external speakers (not shown) paralleling the external speaker circuits for each rig. None of the LEDs will be illuminated.

When microphone PTT switch is closed, ground pin 1 of RY3 is grounded through D6, operating RY3. RY3 contacts 4 and 8 close, illuminating LED2 to indicate microphone "on" condition. PTT ground is passed through normally-closed contacts 3 and 11 of RY1 and RY2, keying both transceivers. Normally-closed contacts 2 and 10 of RY1 and RY2 feed microphone audio into both transceivers. When the microphone is released, default receive mode is restored and RY3 releases.

From default condition, if SX1 is pressed to close contacts 1 and 2, and 4 and 5 (HF listen, VHF xmit), then the following takes place: Vcc is fed through normally-closed contacts 4 and 6 of RY3 through contacts 1 and 2 of SX1, through normally-closed contacts 1 and 9 of RY2, to the coil of RY2. Since Q2 is forward-biased by Vcc through R4, Q2 acts as a closed switch between emitter and collector, providing a ground for RY2 coil. RY2 operates and LED1 is illuminated. Contacts 5 and 9 close on RY2, providing latching voltage for RY2, and RY2 remains operated when SX1 returns to neutral. Closed contacts 7 and 11 of RY2 provide keying ground for the VHF rig and closed contacts 6 and 10 of RY2 feed HF speaker audio into the microphone input of the VHF rig. C2 provides holding voltage for RY2 while contact 9 is travelling from contact 1 to contact 5.

If, at this point, microphone PTT switch is closed, RY3 operates opening contacts 4 and 6 of RY3, thus releasing RY2. Simultaneous local keying of both rigs will follow as described above.

If instead of local microphone PTT keying, SX1 is thrown downward, then the following sequence will happen: Closed contacts 5 and 6 of SX1 remove the forward bias from Q2. This opens the circuit between emitter and collector of Q2, opening the ground circuit of RY2, and RY2 drops open. By process described above for operation of RY2, RY1 now operates and audio is transferred from the VHF speaker output to the HF microphone input. If SX1 were pressed upwards, then contacts 4 and 5 of SX1 would cause O1 to open the ground circuit of RY1, dropping RY1 as RY2 operates. Thus signals may be transferred from rig to rig by the local operator by successive reverse operations of SX1. LED1 and LED3 will show the current status.

EXTRA PANE RELIEVER

I've read KC8DU's article, "Instant Pane Relief" (73, January, 1984), and I believe a few follow-up comments are needed to round out the article.

KC8DU stated that one of his goals was to produce a weathertight and insect-tight assembly. Having worked most of my adult life in the building-material industry, I believe I have spotted an oversight in his reasoning.

Gary described an efficient system for making a weathertight seal as far as it goes. However, the article failed to mention that raising the sash *breaks* the weatherseal between the top and bottom sashes of the window.

To fix this problem, something has to be slid in between the overlapping top and bottom sashes to seal the gap created by separating the sashes. Fiberglass insulation or sponge rubber come to mind to do this. If a storm window is mounted on the prime window, don't forget to seal between those sashes, too. A piece of weatherproof tape placed across the gap should resolve the storm-sash problem.

James C. Burtoft KC3HW
Washington PA

WEST INDIES THANKS

On behalf of the Trinidad and Tobago Amateur Radio Society, I would like to extend our sincere thanks to you and 73 magazine for the books, magazines, and tapes you so generously donated for use in our WCY exhibit. All of the materials arrived in good condition and in time for the exhibition. They were all used in our publications exhibit and helped to illustrate to our visitors what a well-organized and well-supported hobby amateur radio is.

Our exhibit was visited by several thousand persons, many of whom had never even heard of this hobby before. The demonstration radio stations made about 1000 contacts during the weeklong exhibition on the various bands, on SSB, CW, and RTTY. The exercise turned out to be a very successful public relations one and we have added about 40 new associate members as a direct result of it. Many of them have joined the training courses presently being conducted in preparation for this year's amateur-radio exam. The materials you provided have been passed on to those responsible for the training course, and the Morse-code tapes should prove invaluable to our tutors.

Once again, thank you for your support, and I wish you prosperity in 1984.

John L. Webster 9Y4JW
Trinidad, West Indies

And welcome, 9Y4JW, to 73. (See the Trinidad and Tobago column in "73 International.")—Editor.

DX WORLD ON THE C-64

Received the February, 1984, issue and adapted the WB7RLX computer program for the VIC-20 to the Commodore 64 ("Put the DX World on a Screen"). While making the necessary changes, I found a few errors that others might correct when typing:

Line 1059—DATA omitted
Line 1088—OCEN should be OCEAN
Line 1037—SAUDIA ARABIA should be SAUDI ARABIA (line 1125 has the correct spelling, but the two lines would not cross reference).

My compliments to Gene for a very FB program. Mine works beautifully on my C-64. I've changed the screen colors for better contrast and formatted the screen printouts to fit the C-64. Memory required is 12.6K, which is no problem for the Commodore.

If anyone is interested in the C-64 program listing, send me $2.00 plus an BASE; a personalized tape is available for $8.00 if you include your OTH's latitude and longitude.

I love it! Congratulations to WB7RLX and to 73!

Charleston SC 29406

LIMELIGHT PROBLEMS

I had to chuckle as I read your last editorial regarding the impression by others that your ego is suffering from overindulgence!

We share the problems and benefits of being in the limelight and suffering scrutiny by the public. Too often our images, projected to that public, are far different from real life.

I am often amused by the reaction that I receive when meeting new amateurs here in Indianapolis. There is a sudden "recognition" that flashes across their faces when they realize that the fellow standing in front of them, dressed in cut-offs, a T-shirt that touts the joy of computerized RTTY, and a much abused hat, is really the "star" they see each night on television!

Just making an appearance without a three-piece suit is enough to prove that I am, after all, an OK guy.

I can't count the times that newcomers to my circle of friends have made the comment that I am certainly a lot different in real life than I am on television. What they expect of me I have never been able to nail down, other than the fact that they expect the "image" and not the real person!

To those who offer you the adjective of egotistical, you may use this quote—no charge!

There are those who do,
and those who don't.
Winners achieve their dreams,
The others just . . . won't.

There is certainly a difference: professional desire and inner-drive versus egotism. I believe that your comments over

the months have been composed more as an intended inspirational message for your readers, not mere backslapping. So keep up the good work. If you can get just one or two of those beer-guzzling, television addicts to reconsider their lifestyle, you will have achieved a worthy goal.

For me, each new day has to be filled with some tangible achievement.

I have the unique opportunity of having most of the day for my personal pursuits and then working at the television station in the evenings.

I decided at the first of the year that I was going to do more writing, a pleasurable pursuit that I have neglected for about five years. My free time needed to become money-making time.

It took me a couple of weeks to get organized, and Monday I sat down to research some ideas.

I mailed a letter to your editorial staff at *73* this morning, with four story ideas . . . and found two more this afternoon that look promising.

I had been working on a computer database that provides a listing of beam headings for almost 600 DX, US, and Canadian cities. After six months of hesitation, the program is complete, and another letter will leave here this afternoon addressed to the "Barter 'N' Buy" column. After all, why enjoy the results of the labor without sharing it with others, at a modest price?

In addition, I outlined query letters for the local city magazines for four stories and completed a much-needed giveaway booklet about Indiana weather for the TV station advertising sales team.

By this time, you are probably asking, what's the point?

Tell people to quit dreaming and start doing!

Tell those who doubt your advice to quit questioning and take action. The hardest part of achieving a dream is the fear of failure. Failure can at times be a success in itself; after all, Columbus sailed west to find The East. He failed in his quest, but his failure proved to be more profitable than his original dream!

Cheers, and thanks for listening!

HW-8 ON 30 AT 2.1 W

I just completed modifying my Heathkit HW-8 for 30 meters as described by Kerry Holliday WA6BJH in your December, 1983, issue ("A Perfect Match for the HW-8"). I really appreciate the great job Kerry did researching and documenting the modification.

Kerry reported that the 30-meter output of the modified HW-8 was about 1.2 Watts. That seemed low since my HW-8 puts out a full 2 Watts on 40 and 20. The problem turned out to be that the mixer output circuit, L15/C68, does not reach resonance when retuned for 10 MHz. As Kerry describes in step 6, a peak output is noted when the slug is turned almost to the bottom. However, the rf voltage at the test point, the emitter of Q5, was only about 0.6 V while the other bands produced between 1.1 V and 1.5 V. Adding 68 pF in parallel with the existing C68 brought the adjustment range of the slug within reach of 10 MHz, and a peak of about 1.2 V was noted. The rf output rose to 2.1 Watts, virtually the same as on 40 meters.

Incidentally, there is yet another tuned circuit at the output of the driver, Q8. It is a very broad-tuned circuit, however, and no adjustment was provided in the original circuit. Adding more capacitance to bring the resonant peak to 10 MHz only increased the power output by another 0.03 dB; clearly this is not worth the effort!

Again, thanks to Kerry for making the move to 30 so easy!

Santa Cruz CA

S-UNITS ON A PINHEAD?

Regarding VE1BZJ's "Thank You for Listening" (*73*, January, 1984), he says, "It certainly adds a few S units when trying to make a QSO through the QRM."

One S unit = 4 to 6 dBs; 2 S units = a couple. A few S units would seem to be at least *12 to 18* dBs. Most S-meters react to peak power, not average power. Can you have BZJ explain how his "expander" increases peak power by a factor of 40 or so?

LXXIII,

A. J. Massa W5VSR
New Orleans LA

I have not actually been able to count the S units at the distant station and could only go by the reports received from the other stations which confirm that my signal is not copyable without the compressor/expander unit turned on.

The statement concerning "a few S units" was figuratively written to convey the point that the signal does get enhanced. Since this is a technical journal and article, I will not waste your time and mine in explaining semantics. It would be more enlightening if the reader experimented with the unit rather than nit-picking the literary style or choice of words of the article.

I am hoping that someone else will build the unit and then perhaps I could judge for myself, and from my end, the exact number of S units that make the difference.—Dennis P. Sladen VE1BZJ.

THE END OF AMATEUR RADIO

Nothing has prompted more argument among hams than the issue of no-code licenses. Many feel that the code requirement is what keeps the amateur band civilized. It has been argued that the code is the only thing that keeps large numbers of "undesirables" off the amateur bands; without it, we would have chaos.

For some reason, many hams want to make it extremely difficult to obtain a license, and a Morse code requirement fulfills this need nicely. Apparently, those that take this position don't seem to realize that a large ham population is in the best interest of amateur radio. With a large and active body of hams there could be more amateur-radio-related business. Also, other services would be less likely to want a piece of our already-diminished portion of the radio spectrum.

In New York, the FCC now gives ham exams quarterly. This is bound to discourage many people from getting their tickets—something sure to please those who want to restrict the ham population. The way I see it, this could easily cause the amateur-radio service to disappear. As David Byrne said: "Watch out—you might get what you're after."

PACKET RADIO UPDATE

The newest amateur-radio frontier is packet radio. Interest in this mode is steadily growing, although slowly.

A few months ago, I mentioned *SLAPR Protocol*, the St. Louis Area Packet Radio Club's newsletter. The newsletter is no longer being published, and the group is being reorganized. If you are in the St. Louis area and want to get involved in packet radio, their new address is:

- St. Louis Area Packet Radio (SLAPR), c/o Spence Branham KA0IXI, 9926 Lewis and Clark, St. Louis MO 63138.

St. Louis is certainly not the only area where packet radio is thriving. If you live near Tucson, Vancouver, or Menlo Park CA, you will find the following groups useful:

- Tucson Amateur Packet Radio (TAPR), PO Box 22888, Tucson AZ 88734.
- Vancouver Amateur Digital Communications (VADCG), c/o Don Oliver VE7AOG, 818 Rondeau St., Coquitlam BC V3J 5Z3, Canada.
- Pacific Packet Radio Society (PPRS), c/o Hank Magnuski KA6M, 311 Stanford Ave., Menlo Park CA 94025.

NARROWBAND VOICE MODULATION, REVISITED

A few years back, there was much talk about a "new" mode. The American Radio Relay League thought this mode (which in my opinion was just a fancy speech processor) was so important that they devoted a chapter to it in their annual *Handbook*. It never did catch on—I suppose NBVM went the way of quadraphonic sound and other similar technological "breakthroughs."

Now that computers have entered the ham-radio scene, there is a low-cost way to have extremely narrowband voice signals transmitted over the air. What's more, this technique only takes up 170 Hz (!) of bandwidth and is legal in the CW portions of the band.

The way to accomplish this is to use a phoneme speech synthesizer. One such device is the Votrax (500 Stephenson Highway, Troy, Michigan 48084) SC-01 speech-synthesizer IC, which is the basis of a number of speech-synthesizer products (e.g., Votrax Type 'n' Talk). Of course, there is a limitation—one must provide phonetic data for the synthesizer, which can be encoded manually or by computer. There are a number of firms offering text-to-speech programs for microcomputers. These programs take ASCII-encoded English, and by following a set of rules, convert it into the phonetic equivalent.
